NOTE: As new scientific information becomes available through basic and clinical research, recommended treatments and drug therapies undergo changes. The authors and publisher have done everything possible to make this book accurate, up to date, and in accord with accepted standards at the time of publication. However, the reader is advised always to check product information (package inserts) for changes and new information regarding dose and contraindications before administering any drug. Caution is especially urged when using new or infrequently ordered drugs.

DEDICATION

In loving memory of my older children, Samantha Ann and Randy Eli, both struck and killed by a drinking driver on January 9, 1997. They remain forever in our hearts. The wonder and joy they brought to our lives continues to inspire us.

To Stu, for his continued support and love.

To my daughter Hanna, whose hard work, talent and grace never cease to amaze me.
To my son Reuben, whose smile warms my heart and whose energy is boundless.
To my parents, Charlotte and Kurt Hopfer, who continue to inspire me.

JHD

To my father, Keith Hazard, whose love and support are always there.
To my mother-in-law, Roberta, who remains a guiding presence in my life.
To my son, Ben, whose sensitivity and sense of humor make even the toughest day easier.
To my daughter, Katharine, whose fearlessness and determination in seeking her goals I admire.
To my husband, Warren, my colleague and friend, whose encouragement and love I have always cherished.

AHV

ACKNOWLEDGMENTS

We offer our thanks to the students and nurses who have used our book for over 20 years. We hope our book provides you with the current knowledge of pharmacotherapeutics you need to continue to give quality care in our rapidly changing health-care environment.

Judi and April

HOW TO USE *DAVIS'S DRUG GUIDE FOR NURSES*

Davis's Drug Guide for Nurses provides comprehensive, up-to-date drug information in well-organized, nursing-focused monographs. It also includes extensive supplemental material in 18 appendices and the accompanying CD-ROM, thoroughly addresses the issue of safe medication administration, and educates the reader about 50 different therapeutic classes of drugs. In this 11th edition, we have continued the tradition of focusing on safe medication administration by adding a new **Medication Safety Tools** color insert and even more information about health care's most vulnerable patients: children, the elderly, pregnant women, and breastfeeding mothers. Look for more Pedi, Geri, OB, and Lactation headings throughout the monographs. In addition, we've expanded our information relevant to Canadian students and nurses. You'll find a new appendix comparing Canadian and U.S. pharmaceutical practices, more Canada-only combination drugs in the Combination Drugs appendix, and additional Canadian brand names in the drug monographs. To help you find this information quickly, we've also added a maple leaf icon (🍁) in the index next to each Canadian entry. Use this book to enhance your competence in implementing and evaluating medication therapies. The following sections describe the organization of *Davis's Drug Guide for Nurses* and explain how to quickly find the information you need.

Safe Medication Use Articles

"Medication Errors: Improving Practices and Patient Safety", "Detecting and Managing Adverse Drug Reactions", "Special Dosing Considerations", and "Educating Patients About Medication Use", comprise the safe medication use articles and provide an overview of the medication safety issues that confront practitioners and patients. Leading off this series, the medication errors article familiarizes you with the systems issues and clinical situations repeatedly implicated in medication errors and suggests practical means to avoid them. It also teaches you about *high alert* medications, which have a greater potential to cause patient harm than other medications. "Detecting and Managing Adverse Drug Reactions" explains the different types of adverse reactions and provides guidance on how to detect and manage them. "Special Dosing Considerations" identifies the patient populations, such as neonates and patients with renal impairment, who require careful dose adjustments to ensure optimal therapeutic outcomes. "Educating Patients About Medication Use" reviews the most important teaching points for nurses to discuss with their patients and their families. In addition to these safety articles, other critical information is highlighted in red throughout the drug monographs. This allows the reader to quickly identify important information and to see how nursing practice, including assessment, implementation, and patient teaching, relates to it.

Classifications Profile

Medications in the same therapeutic class often share similar mechanisms of action, assessment guidelines, precautions, and interactions. The Classifications Profile provides summaries of the major therapeutic classifications used in *Davis's Drug Guide for Nurses*. It also provides patient teaching information common to all agents within the class and a list of drugs within each class.

Medication Safety Tools

New to this edition is a color insert with tables and charts that nurses can use for a quick but thorough reference to information that will help them avoid making medication errors. It includes compatibility charts; dilution tables for pediatric medications; lists of drugs that are associated with adverse reactions and falls in the elderly; high alert drugs; sound-alike, look-alike drugs and more.

Drug Monographs

Drug monographs are organized in the following manner:

Copyright © 2008 by F.A. Davis

High Alert Status: Some medications, such as chemotherapeutic agents, anticoagulants, and insulins, have a greater potential for harm than others. These medications have been identified by the *Institute for Safe Medication Practices* as **high alert drugs**. *Davis's Drug Guide for Nurses* includes a high alert tab in the upper right corner of the monograph header in appropriate medications to alert the nurse to the medication's risk. The term "high alert" is used in other parts of the monograph as well, to help the nurse administer these medications safely. See the new **Medication Safety Tools** color insert for a complete list of high alert medications in *Davis's Drug Guide for Nurses*. Refer to ISMP.org for all solutions, groups, and individual high alert drugs.

Generic/Trade Name: The generic name appears first, with a pronunciation key, followed by an alphabetical list of trade names. Canadian trade names are preceded by a maple leaf (🍁). Common names, abbreviations, and selected foreign names are also included.

Classification: The therapeutic classification, which categorizes drugs by the disease state they are used to treat, appears first, followed by the pharmacologic classification, which is based on the drug's mechanism of action.

Controlled Substance Schedule: All drugs regulated by federal law are placed into one of five schedules, based on the drug's medicinal value, harmfulness, and potential for abuse or addiction. Schedule I drugs, the most dangerous and having no medicinal value, are not included in *Davis's Drug Guide for Nurses*. (See Appendix I for a description of the Schedule of Controlled Substances.)

Pregnancy Category: Pregnancy categories (A, B, C, D, and X) provide a basis for determining a drug's potential for fetal harm and are included in each monograph. The designation UK is used when the pregnancy category is unknown. (See Appendix I for more information.)

Indications: Medications are approved by the FDA (Food and Drug Administration) for specific disease states. This section identifies the diseases or conditions for which the drug is commonly used and includes significant unlabeled uses as well.

Action: This section contains a concise description of how the drug produces the desired therapeutic effect.

Pharmacokinetics: Pharmacokinetics refers to the way the body processes a medication by absorption, distribution, metabolism, and excretion. This section also includes information on the drug's half-life.

Absorption: Absorption describes the process that follows drug administration and its subsequent delivery to systemic circulation. If only a small fraction is absorbed following oral administration (diminished bioavailability), then the oral dose must be much greater than the parenteral dose. Absorption into systemic circulation also follows other routes of administration such as topical, transdermal, intramuscular, subcutaneous, rectal, and ophthalmic routes. Drugs administered intravenously are usually 100% bioavailable.

Distribution: This section comments on the drug's distribution in body tissues and fluids. Distribution becomes important in choosing one drug over another, as in selecting an antibiotic that will penetrate the central nervous system to treat meningitis or in avoiding drugs that cross the placenta or concentrate in breast milk. Information on protein binding is included for drugs that are >95% bound to plasma proteins, which has implications for drug-drug interactions.

Metabolism and Excretion: Drugs are primarily eliminated from the body either by hepatic conversion to inactive compounds (metabolism or biotransformation) and subsequent excretion by the kidneys, or by renal elimination of unchanged drug. Therefore, drug metabolism and excretion information is important in determining dosage regimens and intervals for patients with impaired renal or hepatic function. The creatinine clearance (CCr) helps quantify renal function and guides dosage adjustments. Formulas to estimate CCr are included in Appendix E.

Half-Life: The half-life of a drug is the amount of time it takes for the drug level to decrease by 50% and roughly correlates with the duration of action. Half-lives are given for drugs assuming the patient has normal renal or hepatic function. Conditions that alter the half-life are noted.

Copyright © 2008 by F.A. Davis

Time/Action Profile: The time/action profile table provides the onset of drug action, its peak effect, and its duration of activity. This can aid in planning administration schedules and allows the reader to appreciate differences in choosing one route over another.

Contraindications and Precautions: Situations in which drug use should be avoided or alternatives strongly considered are listed as contraindications. In general, most drugs are contraindicated in pregnancy or lactation, unless the potential benefits outweigh the possible risks to the mother or baby (e.g., anticonvulsants, antihypertensives, and antiretrovirals). Contraindications may be absolute (i.e., the drug in question should be avoided completely) or relative, in which certain clinical situations may allow cautious use of the drug. The precautions portion includes disease states or clinical situations in which drug use involves particular risks or in which dosage modification may be necessary. Extreme cautions are noted separately to draw attention to conditions under which use of the drug results in serious, potentially life-threatening consequences.

Adverse Reactions and Side Effects: Although it is not possible to include all reported reactions, major side effects for all drugs are included. Life-threatening adverse reactions or side effects are **CAPITALIZED**, and the most frequent side effects are underlined. Those underlined generally have an incidence of 10% or greater. Those not underlined occur in fewer than 10% but more than 1% of patients. Although life-threatening reactions may be rare (fewer than 1%), they are included because of their significance. The following abbreviations are used for body systems:

CNS: central nervous system
EENT: eye, ear, nose, and throat
Resp: respiratory
CV: cardiovascular
GI: gastrointestinal
GU: genitourinary
Derm: dermatologic
Endo: endocrinologic
F and E: fluid and electrolyte
Hemat: hematologic
Local: local
Metab: metabolic
MS: musculoskeletal
Neuro: neurologic
Misc: miscellaneous

Interactions: Drug interactions are a significant risk for patients. As the number of medications a patient receives increases, so does the likelihood of drug-drug interactions. This section provides the most important drug-drug interactions and their physiological effects. Significant drug-food and drug-natural product interactions are also noted as are recommendations for avoiding or minimizing these interactions

Route and Dosage: Routes of administration are grouped together and include recommended doses for adults, children, and other more specific age groups (such as geriatric patients). Dosage units are expressed in the terms in which they are usually prescribed. For example, penicillin G dosage is given in units rather than in milligrams. Dosing intervals also are provided in the manner in which they are frequently ordered. If a specific clinical situation (indication) requires a different dose or interval, this is listed separately for clarity. Specific dosing regimens for hepatic or renal impairment are also included.

Availability: This section lists the strengths and concentrations of available dose forms. Such information is useful in planning more convenient regimens (fewer tablets/capsules, less injection volume) and in determining whether certain dosing forms are available (suppositories, oral concentrates, sustained- or extended-release forms). Flavors of oral liquids and chewable tablets have been included to improve compliance and adherence in pediatric patients. General availability and average wholesale prices of commonly prescribed drugs have also been added as an aid to nurses with prescriptive authority.

Nursing Implications: This section helps the nurse apply the nursing process to pharmacotherapeutics. The subsections provide a step-by-step guide to clinical assessment, implementation (drug administration), and evaluation of the outcomes of pharmacologic therapy.

Assessment: This section includes guidelines for assessing patient history and physical data before and during drug therapy. Assessments specific to the drug's various indications are also included.

Copyright © 2008 by F.A. Davis

The **Lab Test Considerations** section provides the nurse with information regarding which laboratory tests to monitor and how the results may be affected by the medication. **Toxicity and Overdose** alerts the nurse to therapeutic serum drug levels that must be monitored and signs and symptoms of toxicity. The antidote and treatment for toxicity or overdose of appropriate medications also are included.

Potential Nursing Diagnoses: The two or three most pertinent North American Nursing Diagnoses Association (NANDA) diagnoses that potentially apply to a patient receiving the medication are listed. Each diagnosis includes the pharmacologic effect from which the diagnosis has been derived. For instance, the patient receiving immunosuppressant drugs should be diagnosed with Risk for Infection. The diagnosis is followed by the term Side Effects in parentheses. Since patient education is fundamental to all nurse-patient interactions, the diagnosis Knowledge Deficit should be assumed to be a nursing diagnosis applicable to all drugs.

Implementation: Guidelines specific for medication administration are discussed in this subsection. **High Alert** information, i.e., information that directly relates to preventing medication errors with inherently dangerous drugs, is included first if applicable. Sound-alike look-alike name confusion alerts are also included here. Other headings in this section provide data regarding routes of administration. **PO** describes when and how to administer the drug, whether tablets may be crushed or capsules opened, and when to administer the medication in relation to food. The **IV** section includes specific information about administering the medication intravenously. It has been thoroughly updated for this edition beginning with a more prominent IV Administration heading that introduces this section. New bold, red headings have been added to highlight the recommended **diluents** and **concentrations**. These new headings complement the **Rate** heading and make this critical information easy to find. Wherever possible, new information has been added to these topics. Several subsections comprise the IV Administration section. The first section, **Direct IV**, which refers to administering medications from a syringe directly into a saline lock, Y-site of IV tubing, or a 3–way stopcock, provides details for reconstitution, concentration, dilution, and rate. **Rate** is also included in both other methods of IV administration, direct or intermittent infusion **Intermittent Infusion** and **Continuous Infusion** specify standard dilution solutions and amounts, stability information, and rates. In addition, a quick reference for information about dilution amounts in neonates and infants, who are extremely sensitive to excess fluids, is contained in the new **Medication Safety Tools** color insert. **Syringe Compatibility/Incompatibility** identifies compatibile medications when mixed in a syringe. Compatibility of medications in a syringe is usually limited to 15 minutes after mixing. **Y-Site Compatibility/Incompatibility** identifies medications compatible or incompatible with each drug when administered via Y-site injection or 3-way stopcock in IV tubing. **Additive Compatibility/Incompatibility** identifies medications compatible or incompatible when admixed in solution. Compatibility of diluted medications administered through a Y-site for continuous or intermittent infusion is usually limited to 24 hours. **Solution Compatibility/Incompatibility** identifies compatible or incompatible solutions for dilution for administration purposes. Compatibility information is compiled from Trissel's *Handbook of Injectable Drugs*, ed 14. Compatibility and incompatibility information is also located in charts contained in the **Medication Safety Tools** color insert. A printable version of syringe compatibilities is also available at www.drugguide.com.

Patient/Family Teaching: This section includes information that should be taught to patients and/or families of patients. Side effects that should be reported, information on minimizing and managing side effects, details on administration, and follow-up requirements are presented. The nurse also should refer to the **Implementation** section for specific information to teach to the patient and family about taking the medication. **Home Care Issues** discusses aspects to be considered for medications taken in the home setting.

Evaluation: Outcome criteria for determination of the effectiveness of the medication are provided.

Copyright © 2008 by F.A. Davis

EVIDENCE-BASED PRACTICE AND PHARMACOTHERAPEUTICS: Implications for Nurses

The purpose of evidence-based practice is to improve the outcomes of treatment for patients. How pharmacologic agents affect patients is often the subject of research; such research is required by the Food and Drug Administration (FDA) before and after drug approval. Any medication can be the subject of an evidence-based clinical review article. But what does ''evidence-based'' mean and how does it relate to nursing?

According to Ingersoll, ''Evidence-based nursing practice is the conscientious, explicit and judicious use of theory-derived, research-based information in making decisions about care delivery to individuals or groups of patients and in consideration of individual needs and preferences'' (2000, p. 152). Still subject to debate are questions about the sufficiency and quality of evidence. For example, what kind of evidence is needed? How much evidence is necessary to support, modify, or change clinical practice? And, were the studies reviewed of ''good'' quality and are their results valid?

In general, clinicians use **hierarchy of evidence** schemas to rank types of research reports from the most valuable and scientifically rigorous to the least useful. The hierarchy makes clear that some level of evidence about the effect of a particular treatment or condition exists, even if the evidence is considered weak. Figure 1 illustrates a hierarchy of evidence pyramid with widely accepted rankings: the most scientifically rigorous at the top, the least scientifically rigorous at the bottom. Practitioners and clinicians should look for the highest level of available evidence to answer their clinical questions.

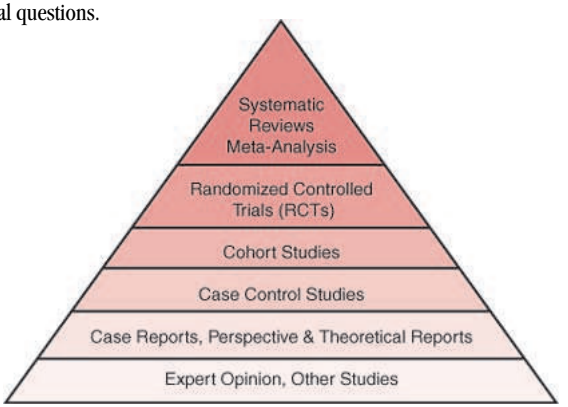

Figure 1 Hierarchy of Scientific Evidence Pyramid

Evidence-Based Practice and Its Importance in Pharmacology

Evidence-based practices in pharmacology generally are derived from well-designed randomized controlled trials (RCTs) or other experimental designs that investigate drugs' therapeutic and nontherapeutic effects. However, although FDA-approved pharmacologic agents have undergone rigorous testing through RCTs, nurses have the responsibility to evaluate the findings for the best scien-

Copyright © 2008 by F.A. Davis

tific evidence available and to determine the most appropriate, safest, and efficacious drugs for their patients.

While numerous databases are available through Internet searches, two valuable and quickly accessible resources for evaluating the current highest level of pharmacologic evidence are 1) the Cochrane Database of Systematic Reviews and the Central Register of Controlled Trials and 2) the National Guidelines Clearinghouse (NGC), supported by the Agency for Healthcare Research and Quality (AHRQ). The Cochrane library and databases provide full text of high-quality, regularly updated systematic reviews, protocols, and clinical trials. The Web address is http://www.cochrane.org/reviews.clibintro.htm.

AHRQ's Evidence-Based Practice Centers (EPCs) provide evidence reports and technology assessments that can assist nurses in their efforts to provide the highest quality and safest pharmacologic health care available. The EPCs systematically review the relevant scientific literature, conduct additional analyses (when appropriate) prior to developing their reports and assessments, and provide guideline comparisons. The Web address is http://www.guideline.gov.

Evidence-based systematic reports and guidelines provide nurses with instantaneous access to the most current knowledge, enabling them to critically appraise the scientific evidence and its appropriateness to their patient population. This is especially important given the need for nurses to keep abreast of the rapidly changing pharmacologic agents in use. New drugs are approved each month, compelling nurses to know these drugs' intended uses, therapeutic effects, interactions, and adverse effects.

Evidence-based practice requires a shift from the traditional paradigm of clinical practice—grounded in intuition, clinical experience, and pathophysiologic rationale—to a paradigm in which nurses must combine clinical expertise, patient values and preferences, and clinical circumstances with the integration of the best scientific evidence in order to make conscientious, well-informed, research-based decisions that affect nursing patient care.

MEDICATION ERRORS: Improving Practices and Patient Safety

It is widely acknowledged that medication errors result in thousands of adverse drug events, preventable reactions, and deaths per year. Nurses, physicians, pharmacists, patient safety organizations, the Food and Drug Administration, the pharmaceutical industry, and other parties share in the responsibility for determining how medication errors occur and designing strategies to reduce error.

One impediment to understanding the scope and nature of the problem has been the reactive ''blaming, shaming, training'' culture that singled out one individual as the cause of the error. Also historically, medication errors that did not result in patient harm—near-miss situations in which an error could have but didn't happen—or errors that did not result in serious harm were not reported. In contrast, serious errors often instigated a powerful punitive response in which one or a few persons were deemed to be at fault and, as a result, lost their jobs and sometimes their licenses.

In 1999, the Institute of Medicine (IOM) published *To Err Is Human: Building a Safer Health System*, which drew attention to the problem of medication errors. It pointed out that excellent health care providers do make medication errors, that many of the traditional processes involved in the medication use system were error-prone, and that other factors, notably drug labeling and packaging, contributed to error. Furthermore, the IOM report, in conjunction with other groups such as the United States Pharmacopeia (USP) and the Institute for Safe Medication Practices (ISMP), called for the redesign of error-prone systems to include processes that anticipated the fallibility of humans working within the system. This initiative is helping shift the way the health care industry addresses medication errors from a single person/bad apple cause to a systems issue.[1]

The National Coordinating Council for Medication Error Reporting and Prevention (NCCMERP) developed the definition of a medication error that reflects this shift and captures the scope and breadth of the issue:

> ''A medication error is any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use.''[2]

Inherent in this definition's mention of related factors are the human factors that are part of the medication use system. For example, a nurse or pharmacist may automatically reach into the bin where dobutamine is usually kept, see ''do'' and ''amine'' but select dopamine instead of dobutamine. Working amidst distractions, working long hours or shorthanded, and working in a culture where perfection is expected and questioning is discouraged are other examples of the human factors and environmental conditions that contribute to error.

The goal for the design of any individual or hospital-wide medication use system is to determine where systems are likely to fail and to build in safeguards that minimize the potential for error. One way to begin that process is to become familiar with medications or practices that have historically been shown to be involved in serious errors.

High Alert Medications

Some medications, because of a narrow therapeutic range or inherent toxic nature, have a high risk of causing devastating injury or death if improperly ordered, prepared, stocked, dispensed, adminis-

Copyright © 2008 by F.A. Davis

tered, or monitored. Although these medications may not be involved in more errors, they require special attention due to the potential for serious, possibly fatal consequences. These have been termed **high-alert medications**, to communicate the need for extra care and safeguards. Many of these drugs are used commonly in the general population or are used frequently in urgent clinical situations. The Joint Commission (JC) monitors the use of frequently prescribed high-alert medications, which include insulin, opiates and narcotics, injectable potassium chloride (or phosphate) concentrate, intravenous anticoagulants (such as heparin), sodium chloride solutions above 0.9 percent, and others. See the High Alert Drugs table in the **Medication Safety Tools** color insert, and Table 2 in this article for a complete list of the high alert meds found in *Davis's Drug Guide for Nurses*. (Visit the Institute for Safe Medication Practices at www.ismp.org for more information on high alert drugs.)

Causes of Medication Errors

Many contributing factors and discrete causes of error have been identified, including failed communication, poor drug distribution practices, dose miscalculations, drug packaging and drug-device related problems, incorrect drug administration, and lack of patient education.[3]

Failed Communication: Failed communication covers many of the errors made in the ordering phase, and although ordering is performed by the prescriber, the nurse, the clerk, and the pharmacist who interpret that order are also involved in the communication process.

- ***Poorly handwritten or verbal orders.*** Handwriting is a major source of error and has led to inaccurate interpretations of the drug intended, the route of administration, the frequency, and dose. Telephone and verbal orders are likewise prone to misinterpretation.
- ***Drugs with similar-sounding or similar-looking names.*** Similar sounding names, or names that look similar when handwritten, are frequently confused. Amiodarone and amrinone (now renamed inamrinone to help prevent confusion), or Zebeta® and Diabeta® are two examples. The United States Pharmacopoeia (USP) has identified over 700 "sound-alike, look-alike" drugs. Mix-ups are more likely when each drug has similar dose ranges and frequencies. Several of the sound-alike/look-alike drugs were targeted for labeling intervention by the FDA, which requested manufacturers of 33 drugs with look-alike names to voluntarily revise the appearance of the established names. The revision visually differentiates the drug names by using "tall man" letters (capitals) to highlight distinguishing syllables (ex.: acetoHEXAMIDE versus acetaZOLAMIDE or buPROPrion versus busPIRone. See the TALL MAN Lettering table in the **Medication Safety Tools** color insert for the list of the pairs of drugs that are commonly confused, often with serious consequences.
- ***Misuse of zeroes in decimal numbers.*** Massive, ten-fold overdoses are traceable to not using a leading zero (.2 mg instead of 0.2 mg) or adding an unnecessary trailing zero (2.0 mg instead of 2 mg) in decimal expressions of dose. Similar overdosages are found in decimal expressions in which the decimal point is obscured by poor handwriting, stray marks, or lined orders sheets (e.g., reading 3.1 grams as 31 grams). Underdosing also may occur by the same mechanism and prevent a desired, perhaps life-saving effect.
- ***Use of apothecary measures (grains, drams) or package units (amps, vials, tablets) instead of metric measures (grams, milligrams, milliequivalents).*** Apothecary measurements are poorly understood and their abbreviations are easily confused with other units of measurement. Use of such measures should be abandoned. Errors also occur when dosage units are used instead of metric weight. For example, orders for 2 tablets, ½ vials, or 2 ampoules can result in overdose or underdose when the medications ordered come in various strengths.
- ***Misinterpreted abbreviations.*** Abbreviations can be misinterpreted or, when used in the dosage part of the order, can result in incorrect dosage of the correct medication. For example, lower or upper case "U" for units has been read as a zero, making 10 u of insulin look like 100 units when

Copyright © 2008 by F.A. Davis

handwritten. The Latin abbreviation "QOD" for every other day has been misinterpreted as QID (4 times per day). See Table 2 for a list of confusing abbreviations and safer alternatives.

- ***Ambiguous or incomplete orders.*** Orders that do not clearly specify dose, route, frequency, or indication do not communicate complete information and are open to misinterpretation.

Poor Distribution Practices: Poor distribution includes error-prone storing practices such as keeping similar looking products next to each other. Dispensing multidose floor stock vials of potentially dangerous drugs instead of unit doses is also associated with error as is allowing non-pharmacists to dispense medications in the absence of the pharmacist.

Dose Miscalculations: Dose miscalculations are a prime source of medication error. Also, many medications need to be dose-adjusted for renal or hepatic impairment, age, height and weight, and body composition (i.e., correct for obesity). Complicated dosing formulas provide many opportunities to introduce error. Often vulnerable populations, such as premature infants, children, the elderly, and those with serious underlying illnesses are at greatest risk.

Drug Packaging and Drug Delivery Systems: Similar packaging or poorly designed packaging encourages error. Drug companies may use the same design for different formulations, or fail to highlight information about concentration or strength. Lettering, type size, color, and packaging methods can either help or hinder drug identification.

Drug delivery systems include infusion pumps and rate controllers. Some models do not prevent free flow of medication, leading to sudden high dose infusion of potent and dangerous medications. The lack of safeguards preventing free flow and programming errors are among the problems encountered with infusion control devices.

Incorrect Drug Administration: Incorrect drug administration covers many problems. Misidentification of a patient, incorrect route of administration, missed doses, or improper drug preparation are types of errors that occur during the administration phase.

Lack of Patient Education: Safe medication use is enhanced in the hospital and the home when the patient is well informed. The knowledgeable patient can recognize when something has changed in his or her medication regimen and can question the health care provider. At the same time, many issues related to medication errors, such as ambiguous directions, unfamiliarity with a drug, and confusing packaging, affect the patient as well as the health care provider, underscoring the need for careful education. Patient education also enhances adherence, which is a factor in proper medication use.

Prevention Strategies

Since medication use systems are complex and involve many steps and people, they are error-prone. On an individual basis, nurses can help reduce the incidence of error by implementing the following strategies:

- Clarify any order that is not obviously and clearly legible. Ask the prescriber to print orders using block style letters.
- Do not accept orders with the abbreviation "u" or "IU" for units. Clarify the dosage and ask the prescriber to write out the word units.
- Clarify any abbreviated drug name or the abbreviated dosing frequencies q.d., QD, q.o.d., QOD, and q.i.d or QID. Suggest abandoning Latin abbreviations in favor of spelling out dosing frequency.
- Do not accept doses expressed in package units or volume instead of metric weight. Clarify any order written for number of ampoules, vials, or tablets (e.g., calcium, 1 ampoule or epinephrine, 1 Bristojet).
- Decimal point errors can be hard to see. Suspect a missed decimal point and clarify any order if the dose requires more than 3 dosing units.

Copyright © 2008 by F.A. Davis

- If dose ordered requires use of multiple dosage units or very small fractions of a dose unit, review the dose, have another health care provider check the original order and recalculate formulas and confirm the dose with the prescriber.
- If taking a verbal order, ask prescriber to spell out the drug name and dosage to avoid sound-alike confusion (e.g., hearing Cerebyx for Celebrex, or fifty for fifteen). Read back the order to the prescriber after you have written it in the chart. Confirm and document the indication to further enhance accurate communication.
- Clarify any order that does not include metric weight, dosing frequency, or route of administration.
- Check the nurse's/clerk's transcription against the original order. Make sure stray marks or initials do not obscure the original order.
- Do not start a patient on new medication by borrowing medications from another patient. This action bypasses the double check provided by the pharmacist's review of the order.
- Always check the patient's name band before administering medications. Verbally addressing a patient by name does not provide sufficient identification.
- Use the facility's standard drug administration times to reduce the chance of an omission error.
- Be sure to fully understand any drug administration device before using it. This includes infusion pumps, inhalers, and transdermal patches.
- Have a second practitioner independently check original order, dosage calculations, and infusion pump settings for high alert medications.
- Realize that the printing on packaging boxes, vials, ampoules, pre-filled syringes, or any container in which a medication is stored can be misleading. Be sure to differentiate clearly the medication and the number of milligrams per milliliter versus the total number of milligrams contained within. Massive overdoses have been administered by assuming that the number of milligrams per ml is all that is contained within the vial or ampoule. Read the label when obtaining the medication, before preparing or pouring the medication, and after preparing or pouring the medication.
- Educate patients about the medications they take. Provide verbal and written instruction and ask the patient to restate important points. Refer to Educating Patients about Safe Medication Use on page 21 for recommendations on what patients should understand about their medications.

As stated previously, errors are a result of problems within the medication use system and cannot be eliminated by the vigilance of any one group of health care providers. System redesign involves strong leadership from administration and all involved departments. Health care facilities should consider the following when addressing the issue of medication errors:

- Do not provide unit stock of critical, high alert medications. If eliminating these medications from floor stock is not feasible, consider reducing the number available and standardizing the concentrations or forms in which the medication is available.
- Create committees that address safety issues.
- Install a computer physician order entry (CPOE) system to help reduce prescribing orders. Link order entry to pertinent lab, allergy, and medication data.
- Implement bar code technology to ensure the right drug reaches the right patient.
- Develop policies that discourage error-prone prescribing practices such as inappropriate use of verbal orders, use of confusing dosing symbols, and use of abbreviations.
- Develop policies that encourage better communication of medication information such as requiring block-style printing of medications, including indication in prescription, and using both the trade and generic name in prescriptions.
- Ensure a reasonable workload for pharmacists and nurses, and provide a well-designed work area.
- Limit the availability of varying concentrations of high alert medications.
- Provide standard concentrations and infusion rate tables.
- Supply pharmacy and patient care areas with current reference material.
- Cultivate a culture that does not assign blame when medication errors occur but looks for root causes instead.

Table 1: High Alert Medications in Davis's Drug Guide for Nurses

aldesleukin	DOXOrubicin hydrochloride	meperidine
alemtuzumab	DOXOrubicin hydrochloride liposome	methadone
altretamine	epinephrine	methotrexate
amiodarone	epirubicin	metoprolol
arsenic trioxide	eptifibatide	midazolam
asparaginase	esmolol	milrinone
bleomycin	etoposides	morphine
buprenorphine	fentanyl (oral, transmucosal)	nalbuphine
busulfan	fentanyl (parenteral)	nesiritide
butorphanol	fentanyl (transdermal)	oxycodone compound
calcium salts	fluorouracil	oxymorphone
capecitabine	fondaparinux	pancuronium
carboplatin	gemcitabine	pentazocine
carmustine	gemtuzumab ozogamicin	potassium phosphates
chloralhydrate	heparin	potassium supplements
chlorambucil	heparins (low molecular weight)	pramlintide
cisplatin	hydrocodone	propranolol
codeine	hydromorphone	sodium chloride
colchicine	hypoglycemic agents, oral	thrombolytic agents
cyclophosphamide	imatinib	tirofiban
cytarabine	insulin mixtures	topotecan
DAUNOrubicin citrate liposome	insulins (short-acting)	trastuzumab
DAUNOrubicin hydrochloride	insulins (intermediate-acting)	vinBLAStine
decitabine	insulins (long-acting)	vinCRIStine
digoxin	insulins (rapid-acting)	vinorelbine
DOBUTamine	labetalol	warfarin
docetaxel	lidocaine	
DOPamine	magnesium sulfate (IV, parenteral)

Table 2: Abbreviations and Symbols Associated with Medication Errors

Abbreviation/Symbol	Intended Meaning	Mistaken For	Recommendation
AZT	Zidovudine	Azathioprine	Use full drug name
CPZ	Compazine	Thorazine (chlorpromazine)	Use full drug name
HCl	Hydrochloric acid	KCl (potassium chloride)	Use full drug name
HCT	Hydrocortisone	hydrochlorothiazide	Use full drug name
$MgSO_4$*	Magnesium sulfate	Morphine sulfate	Use full drug name
MS, MSO_4*	Morphine sulfate	Magnesium sulfate	Use full drug name
MTX	Methotrexate	Mitoxantrone	Use full drug name
Nitro drip	Nitroprusside	Nitroglycerin	Use full drug name
Norflox	Norfloxacin	Norflex	Use full drug name
PCA	Procainamide	Patient controlled analgesia	Use full drug name
PIT	Pitocin	Pitressin	Use full drug name
μg†	microgram	Mg (milligram)	Use mcg
/ (slash mark)	"per"	"1" (numeral one)	Spell out per
HS or hs†	Half strength or hour of sleep	One mistaken for the other	Spell out half strength or bedtime
+	Plus sign	"4" (numeral four)	Spell out and
Zero **after** a decimal point (e.g. 1.0 mg)*	1 mg	10 mg	DO NOT USE zero after a decimal point
No zero **before** a decimal point (e.g.,. 1 mg)*	.1 mg	1 mg	ALWAYS USE zero before a decimal point
u or U*	units	0 (zero), 4 (four) or cc	Spell out unit
I.U.*	International Units	IV or 10	Spell out unit
HS*	Half strength	Hour of sleep	Write out medication strength
q.d. or QD*	Every day	q.i.d. (4 times per day)	Write out daily
q.o.d. or QOD*	Every other day	q.i.d. (4 times per day) or qd (daily)	Write out every other day
SC, SQ, sub q†	subcutaneously	SC mistaken as SL (sublingual), SQ as "5 every" or "every"	Use subcut or write out subcutaneously
AD, AS, AU†	Right ear, left ear, each ear	OD, OS, OU (right eye, left eye, each eye)	Spell out right ear, left ear, each ear
OD, OS, OU	Right eye, left eye, each eye	AD, AS, AU (right ear, left ear, each ear)	Spell out right eye, left eye, each eye
Cc†	cubic centimeters	u (units)	Use ml
@	At	2	Use at
&	And	2	Use and
+	Plus or and	4	Use and
°	hour	Zero (q 1° seen as q 10)	Use hr, h, or hour
Drug name and dose run together. Example: Inderal40 mg	Inderal 40 mg	Inderal 140 mg	Leave space between drug name, dose, and unit of measure
Numerical dose and unit of measure run together. Example: 10mg	10 mg	100 mg	Leave space between drug dose and unit of measure

DETECTING AND MANAGING ADVERSE DRUG REACTIONS

An *adverse drug reaction* (ADR) is any unexpected, undesired, or excessive response to a medication that results in:

- temporary or permanent serious harm or disability
- admission to a hospital, transfer to a higher level of care, or prolonged stay
- death.

Adverse drug reactions are distinguished from adverse drug events, in which causality is uncertain, and side effects, which may be bothersome to the patient and necessitate a change in therapy but are not considered serious.[1] Although some ADRs are the result of medications errors, many are not.

Types of ADRs

The Food and Drug Administration (FDA) classifies ADRs into 2 broad categories: Type A and Type B.[2] Type A reactions are predictable reactions based on the primary or secondary pharmacologic effect of the drug. Dose-related reactions and drug-drug interactions are examples of Type A reactions. Type B reactions are unpredictable, are not related to dose, and are not the result of the drug's primary or secondary pharmacologic effect. Idiosyncratic and hypersensitivity reactions are examples of Type B reactions.

Dose-Related Reactions (Toxic Reactions): In dose related reactions, the dose prescribed for the patient is excessive. Although a variety of mechanisms may interact, reasons for this type of reaction include:

- renal or hepatic impairment
- extremes in age (neonates and frail elderly)
- drug-drug or drug-food interactions
- underlying illness. Dose-related reactions are often the result of preventable errors in prescribing in which physiologic factors such as age, renal impairment, and weight were not considered sufficiently, or in inadequate therapeutic monitoring. Medications with narrow therapeutic ranges (digoxin, aminoglycosides, antiepileptic drugs) and those that require careful monitoring or laboratory testing (anticoagulants, nephrotoxic drugs) are most frequently implicated in dose-related reactions.[3,4] Dose-related reactions usually are managed successfully by temporarily discontinuing the drug and then reducing the dose or increasing the dosing interval. In some instances, the toxic effects need to be treated with another agent (e.g. Digibind for digoxin toxicity or Kayexalate for drug induced hyperkalemia). Appropriately timed therapeutic drug level monitoring, review of new drugs added to an existing regimen that may affect the drug level, and frequent assessment of relevant laboratory values are critical to safe medical management and prevention of dose-related reactions.

Drug-Drug Interactions: Drug-drug interactions occur when the pharmacokinetic or pharmacodynamic properties of an individual drug affect another drug. Pharmacokinetics refers to the way the body processes a medication (absorption, distribution, metabolism, and elimination). In a drug-drug interaction, the pharmacokinetic properties of one drug can cause a change in drug concentration of another drug and an altered response. For example, one drug may block enzymes that metabolize a second drug. The concentration of the second drug is then increased and may become toxic or cause adverse reactions. Pharmacodynamic drug-drug interactions involve the known effects and side-effects of the drugs. For example, two drugs with similar therapeutic effects may act together in a synergistic way. The increased anticoagulant effects that occur when warfarin and aspirin are taken together, or the increased CNS depression that results when two drugs with CNS depressant effects potentiate each

Copyright © 2008 by F.A. Davis

other, are examples of pharmacodymanic drug-drug interactions. Certain classes of drugs are more likely to result in serious drug-drug interactions and patients receiving these agents should be monitored carefully. The medication classes include anticoagulants, oral hypoglycemic agents, nonsteroidal anti-inflammatory agents, MAO inhibitors, antihypertensives, antiepileptics, and antiretrovirals. In addition, specific drugs such as theophylline, cimetidine, lithium, and digoxin may result in serious ADRs.

Idiosyncratic Reactions: Idiosyncratic reactions occur without relation to dose and are unpredictable and sporadic. Reactions of this type may manifest in many different ways, including fever, blood dyscrasias, cardiovascular effects, or mental status changes. The time frame between the occurrence of a problem and initiation of therapy is sometimes the only clue linking drug to symptom. Some idiosyncratic reactions may be explained by genetic differences in drug-metabolizing enzymes.

Hypersensitivity Reactions: Hypersensitivity reactions are usually allergic responses. Manifestations of hypersensitivity reactions range from mild rashes, to nephritis, pneumonitis, hemolytic anemia, and anaphylaxis. Protein drugs (vaccines, enzymes) are frequently associated with hypersensitivity reactions. In most instances, antibody formation is involved in the process and therefore cross-sensitivity may occur. An example of this is hypersensitivity to penicillin and cross-sensitivity with other penicillins and/or cephalosporins. Documenting drugs to which the patient is allergic and the specific hypersensitivity reaction is very important. If the reaction to an agent is anaphylaxis the nurse should monitor the patient during administration of a cross-hypersensitive agent, especially during the initial dose, and ensure ready access to emergency resuscitative equipment.

Recognizing an ADR

Adverse drug reactions should be suspected whenever there is a negative change in a patient's condition, particularly when a new drug has been introduced. Strategies that can enhance recognition include knowing the side effect/adverse reaction profile of medications. Nurses should be familiar with a drug's most commonly encountered side effects and adverse reactions before administering it. (In *Davis's Drug Guide for Nurses*, side effects are underlined, and adverse reactions are CAPITALIZED and appear in second color in the **Adverse Reactions and Side Effects** section.) As always, monitoring the patient's response to a medication and ongoing assessment are key nursing actions. Learn to recognize patient findings that suggest an ADR has occurred. These include:

- rash
- change in respiratory rate, heart rate, blood pressure or mental state
- seizure
- anaphylaxis
- diarrhea
- fever.

Any of these findings can suggest an ADR and should be reported and documented promptly so that appropriate interventions, including discontinuation of suspect medications, can occur. Prompt intervention can prevent a mild adverse reaction from escalating into a serious health problem. Other steps taken by the health care team when identifying and treating an ADR include:

1. Determining that the drug ordered was the drug given and intended.
2. Determining that the drug was given in the correct dosage by the correct route.
3. Establishing the chronology of events: time drug was taken and onset of symptoms.
4. Stopping the drug and monitoring patient status for improvement (dechallenge).
5. Restarting the drug, if appropriate, and monitoring closely for adverse reactions (rechallenge).[2]

Copyright © 2008 by F.A. Davis

Prevention

Healthcare organizations have responded to consumer, regulator and insurer pressures by developing programs that aim to eliminate preventable ADRs. In the inpatient setting, computer systems can display the patient's age, height, weight, and creatinine clearance or serum creatinine level and send an alert to the clinician if a prescribed dose is out of range for any of the displayed parameters. Allergy alerts and drug-drug interactions can be presented to the clinician at the time an order is entered.

In the outpatient setting, strategies that increase the patient's knowledge base and access to pharmacists and nurses may help prevent adverse reactions.[5] Outpatient pharmacy computer systems that are linked within a chain of pharmacies may allow the pharmacist to view the patient's profile if the patient is filling a prescription in a pharmacy other than the usual one. Many pharmacy computers have dose limits and drug-drug reaction verfication to assist pharmacists filling orders.

Such strategies are a valuable auxiliary to, but cannot replace, conscientious history taking, careful patient assessment, and ongoing monitoring. A thorough medication history including all prescription and non-prescription drugs, all side effects and adverse reactions encountered, allergies, and all pertinent physical data should be available to the prescriber. The prescriber is responsible for reviewing this data, along with current medications, laboratory values, and any other variable that affects drug response.

It is not expected that practitioners will remember all relevant information when prescribing. In fact, reliance on memory is error-fraught and clinicians need to use available resources to verify drug interactions whenever adding a new drug to the regimen. Setting expectations that clinicians use evidence-based information rather than their memories when prescribing, dispensing, administering or monitoring patients has the potential to reduce the incidence of preventable ADRs.

Food and Drug Administration MedWatch Program

To monitor and assess the incidence of adverse reactions, the Food and Drug Administration (FDA) sponsors MedWatch, a program that allows health care practitioners and consumers the opportunity to report serious adverse reactions or product defects encountered from medications, medical devices, special nutritional products, or other FDA-regulated items. The FDA considers serious those reactions that result in death, life-threatening illness or injury, hospitalization, disability, congenital anomaly, or those that require medical/surgical intervention.

In addition to reporting serious adverse reactions, health care providers should also report problems related to suspected contamination, questionable stability, defective components, or poor packaging/labeling. Reports should be submitted even if there is some uncertainty about the cause/effect relationship or if some details are missing. This reporting form may be accessed at www.fda.gov/medwatch/report/hcp.htm. Reports also may be faxed to the FDA (1-800-FDA-0178). Reactions to vaccines should be reported to the Vaccine Adverse Event Reporting System (VAERS; 1-800-822-7967). Nurses share with other health care providers an obligation to report adverse reactions to the MedWatch program so that all significant data can be analyzed for opportunities to improve patient care.

SPECIAL DOSING CONSIDERATIONS

For many patients the average dose range for a given drug can be toxic. The purpose of this section is to describe vulnerable patient populations for which special dosing considerations must be made to protect the patient and improve clinical outcomes.

The Pediatric Patient

Most drugs prescribed to children are not approved by the FDA for use in pediatric populations. This does not mean it's wrong to prescribe these drugs to children, rather it means that the medications were not tested in children. The lack of pediatric drug information can result in patient harm or death, such as what occurred with the drug chloramphenicol. When given to very young children, chloramphenicol caused toxicity and multiple deaths. Referred to as "gray syndrome," this toxic reaction was eventually found to be dose dependent. The FDA now requires that new drugs that may be used in children include information for safe pediatric use. For this edition of *Davis's Drug Guide for Nurses*, we have had the pediatric dosing for the top 100 drugs used in children revised and updated by a pediatric doctor of pharmacology.

The main reason for adjusting dosages in pediatric patients is body size, which is measured by body weight or body surface area (BSA). Weight-based pediatric drug dosages are expressed in number of milligrams per kilogram of body weight (mg/kg) while dosages calculated on body surface area are expressed in number of milligrams per meter squared (mg/m^2). BSA is determined using a BSA nomogram (Appendix F) or calculated by using formulas (Appendix E).

The neonate and the premature infant require additional adjustments secondary to immature function of body systems. For example, absorption may be incomplete or altered secondary to differences in gastric pH or motility. Distribution may be altered because of varying amounts of total body water, and metabolism and excretion can be delayed due to immature liver and kidney function. Furthermore, rapid weight changes and progressive maturation of hepatic and renal function require frequent monitoring and careful dosage adjustments. Gestational age, as well as weight, may be needed to properly dose some drugs in the neonate.

The Geriatric Patient

Absorption, distribution, metabolism and excretion are altered in adults over 55 years of age, putting the older patient at risk for toxic reactions. Pharmacokinetic properties in the older patient are affected by

- percentage of body fat, lean muscle mass, and total body water
- decreased plasma proteins, especially in the malnourished patient, which allows a larger proportion of free or unbound drug to circulate and exert effects
- diminished GI motility and blood flow, which delays absorption
- slower hepatic and renal function, which delays excretion.

All of these variables change with age, however, and not predictably. Older patients should be prescribed the lowest possible effective dose at the initiation of therapy followed by careful titration of doses as needed. Just as importantly, they should be monitored very carefully for signs and symptoms of adverse drug reactions.

Another concern is that many elderly patients are prescribed multiple drugs. As the number of medications a patient takes increases, so does the risk for an adverse drug reaction. One drug may negate, potentiate, or otherwise alter the effects of another drug (drug-drug interaction). This situation is compounded by concurrent use of nonprescrip-

Copyright © 2008 by F.A. Davis

tion drugs and natural products. In general, doses of most medications (especially digoxin, sedative/hypnotics, anticoagulants, thrombolytics, nonsteroidal anti-inflammatory agents, and antihypertensives) should be decreased in the geriatric population. The Beers List/Criteria, which appears in the *Medication Safety Tools section*, is a list of drugs to be used with caution in the elderly, and is based on these concerns.

The Patient of Reproductive Age

Generally, pregnant women should avoid medications, except when absolutely necessary. Both the mother and the fetus must be considered. The placenta protects the fetus only from extremely large molecules. The fetus is particularly vulnerable during the first and the last trimesters of pregnancy. During the first trimester, vital organs are forming and ingestion of teratogenic drugs may lead to fetal malformation or miscarriage. Unfortunately, this is the time when a woman is least likely to know that she is pregnant. In the third trimester, drugs administered to the mother and transferred to the fetus may not be safely metabolized and excreted by the fetus. This is especially true of drugs administered near term. After the infant is delivered, he or she no longer has the placenta to help with drug excretion, and drugs administered before delivery may result in toxicity.

Of course, many conditions, such as asthma, diabetes, gastrointestinal disorders, and mental illness affect pregnant women and require long-term medication use. When the medications are used, whether over the counter or prescription, prescribing the lowest effective dose for the shortest period of time necessary is the rule.

The possibility of a medication altering sperm quality and quantity in a potential father also is an area of concern. Male patients should be informed of this risk when taking any medications known to have this potential.

Renal Disease

The kidneys are the major organ of drug elimination. Failure to account for decreased renal function is a preventable source of adverse drug reactions. Renal function is measured by the creatinine clearance (CCr), which can be approximated in the absence of a 24-hour urine collection (Appendix E). In addition, dosages in the renally impaired patient can be optimized by measuring medication blood levels.

Patients with underlying renal disease, premature infants with immature renal function, and elderly patients with age-related decrease in renal function require careful dose adjustments. Renal function may fluctuate over time and should be re-assessed periodically.

Liver Disease

The liver is the major organ of drug metabolism. It changes a drug from a relatively fat-soluble compound to a more water-soluble substance, which means that the drug can then be excreted by the kidneys. Liver function is not as easily quantified as renal function, and it therefore is difficult to predict the correct dosage for a patient with liver dysfunction based on laboratory tests.

A patient who is severely jaundiced or who has very low serum proteins (particularly albumin) can be expected to have some problems metabolizing drugs. In advanced liver disease, portal vascular congestion also impairs drug absorption. Examples of drugs that should be carefully dosed in patients with liver disease include theophylline, diuretics, phenytoin, and sedatives. Some drugs require the liver for activation (such as sulindac or cyclophosphamide) and should be avoided in patients with severely compromised liver function.

Heart Failure

Heart failure results in passive congestion of blood vessels in the GI tract, which impairs drug absorption. Heart failure also slows drug delivery to the liver, delaying metabolism. Renal function is frequently compromised as well, adding to delayed elimination and prolonged drug action. Dosages of

Copyright © 2008 by F.A. Davis

drugs metabolized mainly by the liver or excreted mainly by the kidneys should be decreased in patients with congestive heart failure.

Body Size

Drug dosing is often based on total body weight. However, some drugs selectively penetrate fatty tissues. If the drug does not penetrate fatty tissues (e.g., digoxin, gentamicin), dosages for the obese patient should be determined by ideal body weight or estimated lean body mass. Ideal body weight may be determined from tables of desirable weights or may be estimated using formulas for lean body mass when the patient's height and weight are known (Appendix E). If such adjustments are not made considerable toxicity can result.

Body size is also a factor in patients who are grossly underweight. Elderly patients, chronic alcoholics, patients with AIDS, and patients who are terminally ill from cancer or other debilitating illnesses need careful attention to dosing. Patients who have had a limb amputated also need to have this change in body size taken into account.

Drug Interactions

Use of multiple drugs, especially those known to interact with other drugs, may necessitate dosage adjustments. Drugs highly bound to plasma proteins, such as warfarin and phenytoin, may be displaced by other highly protein-bound drugs. When this phenomenon occurs, the drug that has been displaced exhibits an increase in its activity because the free or unbound drug is active.

Some drugs decrease the liver's ability to metabolize other drugs. Drugs capable of doing this include cimetidine and chloramphenicol. Concurrently administered drugs that are both highly metabolized by the liver may need to be administered in decreased dosages. Other agents such as phenobarbital, other barbiturates, and rifampin are capable of stimulating the liver to metabolize drugs more rapidly, requiring larger doses to be administered.

Drugs that significantly alter urine pH can affect excretion of drugs for which the excretory process is pH dependent. Alkalinizing the urine will hasten the excretion of acidic drugs. Acidification of the urine will enhance reabsorption of acidic drugs, prolonging and enhancing drug action. In the reverse situation, drugs that acidify the urine will hasten the excretion of alkaline drugs. An example of this is administering sodium bicarbonate in cases of aspirin overdose. Alkalinizing the urine promotes renal excretion of aspirin.

Some drugs compete for enzyme systems with other drugs. Allopurinol inhibits the enzyme involved in uric acid production, but it also inhibits metabolism (inactivation) of 6-mercaptopurine, greatly increasing its toxicity. The dosage of mercaptopurine needs to be significantly reduced when coadministered with allopurinol.

The same potential for interactions exists for some foods. Dietary calcium, found in high concentrations in dairy products, combines with tetracycline and prevents its absorption. Foods high in pyridoxine (vitamin B_6) can negate the anti-Parkinson effect of levodopa. Grapefruit juice inhibits the enzyme that breaks down some drugs, and concurrent ingestion may significantly increase drug levels and the risk for toxicity. There are no general guidelines for nutritional factors. It is prudent to check whether these problems exist and to make the necessary dosage adjustments.

Many commonly taken natural products interact with pharmaceutical drugs. St. John's wort, garlic, ephedra, and other natural products can interact with medications and cause known or unpredictable reactions.

Nurses and prescribers should consult drug references and remember that the average dosing range for drugs is intended for an average patient. However, every patient is an individual with specific drug-handling capabilities. Taking these special dosing considerations into account allows for an individualized drug regimen that promotes the desired therapeutic outcome and minimizes the risk of toxicity.

EDUCATING PATIENTS ABOUT SAFE MEDICATION USE

Research has shown that patients need information about several medication-related topics, no matter what the medication. A well-informed patient and/or family can help prevent medication errors by hospital staff and is less likely to make medication errors at home. Adherence to the medication regimen is another goal achieved through patient education.
Before beginning any teaching, however, always assess the patient's current knowledge by asking if he or she is familiar with the medication, how it is taken at home, what precautions or follow-up care is required, and other questions specific to each drug. Based on the patient's current knowledge level and taking into consideration factors such as readiness to learn, environmental and social barriers to learning or adherence, and cultural factors, discuss the following:

1. **Generic and brand names of the medication.** Patients should know both the brand and generic names of each medication for two reasons. It helps them identify their medications when a generic equivalent is substituted for a brand name version and it prevents patients or health care providers from making sound-alike confusion errors when giving or documenting a medication history. An example of this is saying Celebrex but meaning or hearing Cerebyx.

2. **Purpose of the medication.** Patients have a right to know what the therapeutic benefit of the medication will be but also should be told the consequences of not taking the prescribed medication. This may enhance adherence. For example, a patient may be more likely to take blood pressure medication if told lowering high blood pressure will prevent heart attack, kidney disease, or stroke, rather than saying only that it will lower blood pressure.

3. **Dosage and how to take the medication.** To derive benefit and avoid adverse reactions or other poor outcomes, the patient must know how much of the medication to take and when to take it. Refer to dosages in metric weight (i.e., milligram, gram) rather than dosage unit (tablet) or volume (1 teaspoon). The patient must also be informed of the best time to take the medication, for example, on an empty or a full stomach, before bedtime, or with or without other medications. If possible, help the patient fit the medication schedule into his or her own schedule, so that taking the medication is not difficult or forgotten.

4. **What to do if a dose is missed.** Always explain to patients what to do if a dose is missed. Patients have been reported to take a double dose of medications when a missed dose occurs, putting themselves at risk for side effects and adverse reactions.

5. **Duration of therapy.** It is not uncommon for patients to stop taking a medication when they feel better or to discontinue a medication when they cannot perceive a benefit. For very long term, even lifelong therapy, the patient may need to be reminded that the medication helps maintain the current level of wellness. Patients may need to be reminded to finish short-term courses of medications even though they frequently will feel much better before the prescription runs out. Some medications cannot be discontinued abruptly and patients should be warned to consult a health care professional before discontinuing such agents. Patients will need to know to refill prescriptions several days before running out or to take extra medication if traveling.

6. **Minor side effects and what to do if they occur.** Inform the patient that all medications have potential side effects. Explain the most common side effects associated with the medication and how to avoid or manage them if they occur. An informed patient is less likely to stop taking a medication because of a minor and potentially avoidable side effect.

Copyright © 2008 by F.A. Davis

7. **Serious side effects and what to do if they occur.** Inform the patient of the possibility of serious side effects. Describe signs and symptoms associated with serious side effects, and tell the patient to immediately inform a physician or nurse should they occur. Tell the patient to call before the next dose of the medication is scheduled and to not assume that the medication is the source of the symptom and prematurely discontinue it.

8. **Medications to avoid.** Drug-drug interactions can dampen drug effects, enhance drug effects, or cause life-threatening adverse events such as cardiac dysrhythmias, hepatitis, renal failure, or internal bleeding. The patient and family need to know which other medications, including which over-the-counter medications, to avoid.

9. **Foods to avoid and other precautions.** Food-drug interactions are not uncommon and can have effects similar to drug-drug interactions. Excessive sun exposure resulting in severe dermal reactions is not uncommon and represents an environmental-drug interaction. Likewise, the patient should be informed of what activities to avoid, in case the medication affects alertness or coordination, for example.

10. **How to store the medication:** Medications must be stored properly to maintain potency. Most medications should not be stored in the bathroom medicine cabinet because of excess heat and humidity. In addition, thoughtful storage practices, such as separating two family members' medications, can prevent mix-ups and inadvertent accessibility by children (or pets). Review storage with patients and ask about current methods for storing medications.

11. **Follow-up care.** Anyone taking medication requires ongoing care to assess effectiveness and appropriateness of medications. Many medications require invasive and noninvasive testing to monitor blood levels; hematopoietic, hepatic, or renal function; or other effects on other body systems. Ongoing medical evaluation may result in dosage adjustments, change in medication, or discontinuation of medication.

12. **What not to take.** Inform patients not to take expired medications or someone else's medication. Warn them not to self-medicate with older, no-longer-used prescriptions even if the remaining supply is not expired. Tell patients to keep a current record of all medications taken and to ask health care providers if new medications are meant to replace a current medication.

As you teach, encourage the patient and the family to ask questions. Providing feedback about medication questions will increase their understanding and help you identify areas that need reinforcement. Also, ask patients to repeat what you have said and return to demonstrate application or administration techniques.

Stress the importance of concurrent therapies. Medications often are only a part of a recommended therapy. Review with the patient and family other measures that will enhance or maintain health. Always consider the cultural context in which health information is provided and plan accordingly. This might include obtaining a same-gender translator or adjusting dosing times to avoid conflict with traditional rituals.

Finally, provide written instructions in a simple and easy-to-read format. Keep in mind that most health care information is written at a 10th grade reading level, while many patients read at a 5th grade level. Tell patients to keep the written instructions, so that they can be reviewed at home, when stress levels are lower and practical difficulties in maintaining the medication plan are known.

CLASSIFICATIONS

• ANTI-ALZHEIMER'S AGENTS

PHARMACOLOGIC PROFILE

General Use

Management of Alzheimer's dementia.

General Action and Information

All agents act by increasing the amount of acetylcholine in the CNS by inhibiting cholinesterase. No agents to date can slow the progression of Alzheimer's dementia. Current agents may temporarily improve cognitive function and therefore improve quality of life.

Contraindications

Hypersensitivity. Tacrine should not be used in patients who have had previous hepatic reactions to the drug.

Precautions

Use cautiously in patients with a history of "sick sinus syndrome" or other supraventricular cardiac conduction abnormalities (may cause bradycardia). Cholingeric effects may result in adverse GI effects (nausea, vomiting, diarrhea, weight loss) and may also increase gastric acid secretion resulting in GI bleeding, especially during concurrent NSAID therapy. Other cholinergic effects may include urinary tract obstruction, seizures, or bronchospasm.

Interactions

Additive effects with other drugs having cholinergic properties. May exaggerate the effects of succinylcholine-type muscle relaxation during anesthesia. May decrease therapeutic effects of anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) throughout therapy.
- Monitor nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.

Potential Nursing Diagnoses

- Disturbed thought process (Indications).
- Imbalanced nutrition: less than body requirements.
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Patient/Family Teaching

- Instruct patient and caregiver that medication should be taken as directed.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, and weight loss occur.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

• ANTIANEMICS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of anemias.

General Action and Information

Iron (ferrous fumarate, ferrous gluconate, ferrous sulfate, iron dextran, iron sucrose, polysaccharide-iron complex, sodium ferric gluconate complex) is required for production of hemoglobin, which is necessary for oxygen transport to cells. Cyanocobalamin and hydroxocobalamin (Vitamin B_{12}) and folic acid are water-soluble vitamins that are required for red blood cell production. Darbepoetin and epoetin stimulate production of red blood cells. Nandrolone stimulates production of erythropoetin.

Contraindications

Undiagnosed anemias. Hemochromatosis, hemosiderosis, hemolytic anemia (Iron). Uncontrolled hypertension (darbepoetin, epoetin).

Precautions

Use parenteral iron (iron dextran, iron sucrose, sodium ferric gluconate complex) cautiously in patients with a history of allergy or hypersensitivity reactions.

Interactions

Oral iron can decrease the absorption of tetracyclines, fluoroquinolones, or penicillamine. Vitamin E may impair the therapeutic response to iron. Phenytoin and other anticonvulsants may decrease the absorption of folic acid. Response to Vitamin B_{12} or folic acid may be delayed by chloramphenicol. Darbepoetin and epoetin may increase the requirement for heparin during hemodialysis.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status and dietary history to determine possible causes for anemia and need for patient teaching.

Potential Nursing Diagnoses

- Activity intolerance (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Available in combination with many vitamins and minerals (see Appendix B)

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional. Explain that the best source of vitamins and minerals is a well-balanced diet with foods from the four basic food groups.

Copyright © 2008 by F.A. Davis

- Patients self-medicating with vitamin and mineral supplements should be cautioned not to exceed RDA. The effectiveness of mega doses for treatment of various medical conditions is unproven and may cause side effects.

Evaluation/Desired Outcomes

- Resolution of anemia.

• ANTIANGINALS

PHARMACOLOGIC PROFILE

General Use

Nitrates are used to treat and prevent attacks of angina. Only nitrates (sublingual, lingual spray, or intravenous) may be used in the acute treatment of attacks of angina pectoris. Calcium channel blockers and beta blockers are used prophylactically in long-term management of angina.

General Action and Information

Several different groups of medications are used in the treatment of angina pectoris. The nitrates (isosorbide dinitrate, isosorbide mononitrate, and nitroglycerin) are available as a lingual spray, sublingual tablets, parenterals, transdermal systems, and sustained-release oral dosage forms. Nitrates dilate coronary arteries and cause systemic vasodilation (decreased preload). Calcium channel blockers dilate coronary arteries (some also slow heart rate). Beta blockers decrease myocardial oxygen consumption via a decrease in heart rate. Therapy may be combined if selection is designed to minimize side effects or adverse reactions.

Contraindications

Hypersensitivity. Avoid use of beta blockers or calcium channel blockers in advanced heart block, cardiogenic shock, or untreated CHF.

Precautions

Beta blockers should be used cautiously in patients with diabetes mellitus, pulmonary disease, or hypothyroidism.

Interactions

Nitrates, calcium channel blockers, and beta blockers may cause hypotension with other antihypertensives or acute ingestion of alcohol. Verapamil, diltiazem, and beta blockers may have additive myocardial depressant effects when used with other agents that affect cardiac function. Verapamil has a number of other significant drug-drug interactions.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor blood pressure and pulse periodically throughout therapy.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Available in various dose forms. See specific drugs for information on administration.

Patient/Family Teaching

- Instruct patient on concurrent nitrate therapy and prophylactic antianginals to continue taking both medications as ordered and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional immediately if chest pain does not improve; worsens after therapy; is accompanied by diaphoresis or shortness of breath; or if severe, persistent headache occurs.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol with these medications.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

• ANTIANXIETY AGENTS

PHARMACOLOGIC PROFILE

General Use

Antianxiety agents are used in the management of various forms of anxiety, including generalized anxiety disorder (GAD). Some agents are more suitable for intermittent or short-term use (benzodiazepines) while others are more useful long-term (buspirone, doxepin, fluoxetine, paroxetine, sertraline, venlafaxine).

General Action and Information

Most agents cause generalized CNS depression. Benzodiazepines may produce tolerance with long-term use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

Copyright © 2008 by F.A. Davis

Contraindications

Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions

Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease (benzodiazepines only). Use with caution in patients who may be suicidal or who may have had previous drug addictions. Patients may be more sensitive to CNS depressant effects; dosage reduction may be required.

Interactions

Mainly for benzodiazepines; additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines may occur. Most agents should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiratory status frequently throughout IV administration.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Anxiety:** Assess degree of anxiety and level of sedation (ataxia, dizziness, slurred speech) before and periodically throughout therapy.

Potential Nursing Diagnoses

- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Patients changing to buspirone from other antianxiety agents should receive gradually decreasing doses. Buspirone will not prevent withdrawal symptoms.

Patient/Family Teaching

- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in anxiety level.

• ANTIARRHYTHMICS

PHARMACOLOGIC PROFILE

General Use

Suppression of cardiac arrhythmias.

General Action and Information

Correct cardiac arrhythmias by a variety of mechanisms, depending on the group used. The therapeutic goal is decreased symptomatology and increased hemodynamic performance. Choice of agent depends on etiology of arrhythmia and individual patient characteristics. Treatable causes of arrhythmias should be corrected before therapy is initiated (e.g., electrolyte disturbances, other drugs). Antiarrhythmics are generally classified by their effects on cardiac conduction tissue (see the following table). Adenosine, atropine, and digoxin are also used as antiarrhythmics.

MECHANISM OF ACTION OF MAJOR ANTIARRHYTHMIC DRUGS

CLASS	DRUGS	MECHANISM
I	moricizine	Shares properties of IA, IB, and IC agents
IA	quinidine, procainamide, disopyramide	Depress Na conductance, increase APD and ERP, decrease membrane responsiveness
IB	tocainide, lidocaine, phenytoin, mexiletine	Increase K conductance, decrease APD and ERP
IC	flecainide, propafenone	Profound slowing of conduction, markedly depress phase O
II	acebutolol, esmolol, propranolol	Interfere with Na conductance, depress cell membrane, decrease automaticity, and increase ERP of the AV node, block excess sympathetic activity
III	amiodarone, dofetilide, ibutilide, sotalol	Interfere with norepinephrine, increase APD and ERP
IV	diltiazem, verapamil	Increase AV nodal ERP, Ca channel blocker

APD = action-potential duration; Ca = calcium; ERP = effective refractory period; K = potassium; Na = sodium.

Contraindications

Differ greatly among various agents. See individual drugs.

Precautions

Differ greatly among agents used. Appropriate dosage adjustments should be made in elderly patients and those with renal or hepatic impairment, depending on agent chosen. Correctable causes (electrolyte abnormalities, drug toxicity) should be evaluated. See individual drugs.

Interactions

Differ greatly among agents used. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and blood pressure continuously throughout IV administration and periodically throughout oral administration.

Potential Nursing Diagnoses

- Decreased cardiac output (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Copyright © 2008 by F.A. Davis

Implementation

- Take apical pulse before administration of oral doses. Withhold dose and notify physician or other health care professional if heart rate is <50 bpm.
- Administer oral doses with a full glass of water. Most sustained-release preparations should be swallowed whole. Do not crush, break, or chew tablets or open capsules, unless specifically instructed.

Patient/Family Teaching

- Instruct patient to take oral doses around the clock, as directed, even if feeling better.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- Caution patient to avoid taking OTC medications without consulting health care professional.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Resolution of cardiac arrhythmias without detrimental side effects.

• ANTIASTHMATICS

PHARMACOLOGIC PROFILE

General Use

Management of acute and chronic episodes of reversible bronchoconstriction. Goal of therapy is to treat acute attacks (short-term control) and to decrease incidence and intensity of future attacks (long-term control). The choice of modalities depends on the continued requirement for short term control agents.

General Action and Information

Adrenergic bronchodilators and phosphodiesterase inhibitors both work by increasing intracellular levels of cyclic-3', 5'-adenosine monophsphate (cAMP); adrenergics by increasing production and phosphodiesterase inhibitors by decreasing breakdown. Increased levels of cAMP pro-

Copyright © 2008 by F.A. Davis

duce bronchodilation. Corticosteroids act by decreasing airway inflammation. Anticholinergics (ipratropium) produce bronchodilation by decreasing intracellular levels of cyclic guanosine monophosphate (cGMP). Leukotriene receptor antagonists and mast cell stabilizers decrease the release of substances that can contribute to bronchospasm.

Contraindications

Inhaled corticosteroids, long-acting adrenergic agents, and mast cell stabilizers should not be used during acute attacks of asthma.

Precautions

Adrenergic bronchodilators and anticholinergics should be used cautiously in patients with cardiovascular disease. Chronic use of systemic corticosteroids should be avoided in children or during pregnancy or lactation. Diabetic patients may experience loss of glycemic control during corticosteroid therapy. Corticosteroids should never be abruptly discontinued.

Interactions

Adrenergic bronchodilators and phosphodiesterase inhibitors may have additive CNS and cardiovascular effects with other adrenergic agents. Cimetidine increases theophylline levels and the risk of toxicity. Coritcosteroids may decrease the effectiveness of antidiabetics. Corticosteroids may cause hypokalemia which may be additive with potassium-losing diuretics and may also increase the risk of digoxin toxicity.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically throughout therapy.
- Assess cardiovascular status of patients taking adrenergic bronchodilators or anticholinergics. Monitor for ECG changes and chest pain.

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Patient/Family Teaching

- Instruct patient to take antiasthmatics as directed. Do not take more than prescribed or discontinue without discussing with health care professional.
- Advise patient to avoid smoking and other respiratory irritants.
- Instruct patient in correct use of metered-dose inhaler or other administration devices (see Appendix D).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, if symptoms worsen after treatment, or if toxic effects occur.
- Patients using inhalation medications and bronchodilators should be advised to use the bronchodilator first and allow 5 minutes to elapse before administering other medications, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.

• ANTICHOLINERGICS

PHARMACOLOGIC PROFILE

General Use

Atropine— Bradyarrhythmias. **Ipratropium—** bronchospasm (inhalation) and rhinorrhea (intranasal). **Scopolamine—** Nausea and vomiting related to motion sickness and vertigo. **Propantheline and glycopyrrolate—** Decreasing gastric secretory activity and increasing esophageal sphincter tone. Atropine and scopolamine are also used as ophthalmic mydriatics. Benztropine, biperidin, and trihexyphenidyl are used in the management of Parkinson's disease. Oxybutynin and tolterodine are used as urinary tract spasmodics.

General Action and Information

Competitively inhibit the action of acetylcholine. In addition, atropine, glycopyrrolate, propantheline, and scopolamine are antimuscarinic in that they inhibit the action of acetylcholine at sites innervated by postganglionic cholinergic nerves.

Contraindications

Hypersensitivity, narrow-angle glaucoma, severe hemorrhage, tachycardia (due to thyrotoxicosis or cardiac insufficiency), or myasthenia gravis.

Precautions

Geriatric and pediatric patients are more susceptible to adverse effects. Use cautiously in patients with urinary tract pathology; those at risk for GI obstruction; and those with chronic renal, hepatic, pulmonary, or cardiac disease.

Interactions

Additive anticholinergic effects (dry mouth, dry eyes, blurred vision, constipation) with other agents possessing anticholinergic activity, including antihistamines, antidepressants, quinidine, and disopyramide. May alter GI absorption of other drugs by inhibiting GI motility and increasing transit time. Antacids may decrease absorption of orally administered anticholinergics.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure or increase in ventricular ectopy or angina promptly.
- Monitor intake and output ratios in elderly or surgical patients; may cause urinary retention.
- Assess patient regularly for abdominal distention and auscultate for bowel sounds. Constipation may become a problem. Increasing fluids and adding bulk to the diet may help alleviate constipation.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Decreased cardiac output (Indications).
- Impaired oral mucous membrane (Side Effects).
- Constipation (Side Effects).

Implementation

- **PO:** Administer oral doses of atropine, glycopyrrolate, propantheline, or scopolamine 30 min before meals.
- Scopolamine transdermal patch should be applied at least 4 hr before travel.

Patient/Family Teaching

- Instruct patient that frequent rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Ophth:** Advise patients that ophthalmic preparations may temporarily blur vision and impair ability to judge distances. Dark glasses may be needed to protect eyes from bright light.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Decrease in nausea and vomiting related to motion sickness or vertigo.
- Dryness of mouth.
- Dilation of pupils.
- Decrease in GI motility.
- Resolution of signs and symptoms of Parkinson's disease.

• ANTICOAGULANTS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of thromboembolic disorders including deep vein thrombosis, pulmonary embolism, and atrial fibrillation with embolization. Also used in the management of MI sequentially or in combination with thrombolytics and/or antiplatelet agents.

General Action and Information

Anticoagulants are used to prevent clot extension and formation. They do not dissolve clots. The two types of anticoagulants in common use are parenteral heparins and oral warfarin. Therapy is usually initiated with heparin or a heparin-like agent because of rapid onset of action, while maintenance therapy consists of warfarin. Warfarin takes several days to produce therapeutic anticoagulation. In serious or severe thromboembolic events, heparin therapy may be preceded by thrombolytic therapy. Low doses of heparin or heparin-like compounds and fondaparinux are mostly used to prevent deep vein thrombosis after certain surgical procedures and in similar si-

Copyright © 2008 by F.A. Davis

tuations in which prolonged bedrest increases the risk of thromboembolism. Argatroban and lepirudin are used as anticoagulation in patients who have developed thrombocytopenia during heparin therapy.

Contraindications

Underlying coagulation disorders, ulcer disease, malignancy, recent surgery, or active bleeding.

Precautions

Anticoagulation should be undertaken cautiously in any patient with a potential site for bleeding. Pregnant or lactating patients should not receive warfarin. Heparin does not cross the placenta. Heparin and heparin-like agents should be used cautiously in patients receiving epidural analgesia.

Interactions

Warfarin is highly protein bound and may displace or be displaced by other highly protein-bound drugs. The resultant interactions depend on which drug is displaced. Bleeding may be potentiated by aspirin or large doses of penicillins or penicillin-like drugs, cefotetan, cefoperazone, valproic acid, or NSAIDs.

NURSING IMPLICATIONS

Assessment

- Assess patient taking anticoagulants for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools; urine; or NG aspirate).
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- **Lab Test Considerations:** Monitor prothrombin time (PT) or international normalized ratio (INR) with warfarin therapy, activated partial thromboplastin time (aPTT) with full-dose heparin therapy and hematocrit, and other clotting factors frequently during therapy.
- Monitor bleeding time throughout antiplatelet therapy. Prolonged bleeding time, which is time and dose dependent, is expected.
- **Toxicity and Overdose:** If overdose occurs or anticoagulation needs to be immediately reversed, the antidote for heparins is protamine sulfate; for warfarin, the antidote is vitamin K (phytonadione [AquaMEPHYTON]). Administration of whole blood or plasma may also be required in severe bleeding due to warfarin because of the delayed onset of vitamin K.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Inform all health care professionals caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching

- Caution patient to avoid activities leading to injury, to use a soft toothbrush and electric razor, and to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take OTC medications, especially those containing aspirin, NSAIDs, or alcohol, without advice of health care professional.

Copyright © 2008 by F.A. Davis

- Review foods high in vitamin K (see Appendix L) with patients on warfarin. Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin and greatly alternating intake of these foods will cause PT levels to fluctuate.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care professionals caring for patient of anticoagulant therapy before laboratory tests, treatment, or surgery.

Evaluation/Desired Outcomes

- Prevention of undesired clotting and its sequelae without signs of hemorrhage. Prevention of stroke, MI, and death in patients at risk.

• ANTICONVULSANTS

PHARMACOLOGIC PROFILE

General Use

Anticonvulsants are used to decrease the incidence and severity of seizures due various etiologies. Some anticonvulsants are used parenterally in the immediate treatment of seizures. It is not uncommon for patients to require more than one anticonvulsant to control seizures on a long-term basis. Many regimens are evaluated with serum level monitoring.
Several anticonvulsants are also used to treat neuropathic pain.

General Action and Information

Anticonvulsants include a variety of agents, all capable of depressing abnormal neuronal discharges in the CNS that may result in seizures. They may work by preventing the spread of seizure activity, depressing the motor cortex, raising seizure threshold, or altering levels of neurotransmitters, depending on the group. See individual drugs.

Contraindications

Previous hypersensitivity.

Precautions

Use cautiously in patients with severe hepatic or renal disease; dose adjustment may be required. Choose agents carefully in pregnant and lactating women. Fetal hydantoin syndrome may occur in offspring of patients who receive phenytoin during pregnancy.

Interactions

Barbiturates stimulate the metabolism of other drugs that are metabolized by the liver, decreasing their effectiveness. Hydantoins are highly protein-bound and may displace or be displaced by other highly protein-bound drugs. Lamotrigine, tiagabine, and topiramate are capable of interacting with several other anticonvulsants. For more specific interactions, see individual drugs.

Copyright © 2008 by F.A. Davis

Many drugs are capable of lowering seizure threshold and may decrease the effectiveness of anticonvulsants, including tricyclic antidepressants and phenothiazines.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- **Toxicity and Overdose:** Monitor serum drug levels routinely throughout anticonvulsant therapy, especially when adding or discontinuing other agents.

Potential Nursing Diagnoses

- Risk for injury (Indications, Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Administer anticonvulsants around the clock. Abrupt discontinuation may precipitate status epilepticus.
- Implement seizure precautions.

Patient/Family Teaching

- Instruct patient to take medication every day, exactly as directed.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizures.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with these medications.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

• ANTIDEPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various forms of endogenous depression, often in conjunction with psychotherapy. Other uses include: Treatment of anxiety (doxepin, fluoxetine, paroxetine, sertraline, venlafaxine); Enuresis (imipramine); Chronic pain syndromes (amitriptyline, doxepin, imipramine, nortriptyline); Smoking cessation (bupropion); Bulimia (fluoxetine); Obsessive-compulsive disorder (fluoxetine, fluvoxamine, paroxetine, sertraline); Social anxiety disorder (paroxetine, sertraline).

General Action and Information

Antidepressant activity is most likely due to preventing the reuptake of dopamine, norepinephrine, and serotonin by presynaptic neurons, resulting in accumulation of these neurotransmitters. The two major classes of antidepressants are the tricyclic antidepressants and the SSRIs. Most tricyclic agents possess significant anticholinergic and sedative properties, which explains many of their side effects (amitriptyline, amoxapine, doxepin, imipramine, nortriptyline). The SSRIs are more likely to cause insomnia (fluoxetine, fluvoxamine, paroxetine, sertraline).

Contraindications

Hypersensitivity. Should not be used in narrow-angle glaucoma. Should not be used in pregnancy or lactation or immediately after MI.

Precautions

Use cautiously in older patients and those with pre-existing cardiovascular disease. Elderly men with prostatic enlargement may be more susceptible to urinary retention. Anticholinergic side effects of tricyclic antidepressants (dry eyes, dry mouth, blurred vision, and constipation) may require dosage modification or drug discontinuation. Dosage requires slow titration; onset of therapeutic response may be 2-4 wk. May decrease seizure threshold, especially bupropion.

Interactions

Tricyclic antidepressants— May cause hypertension, tachycardia, and convulsions when used with MAO inhibitors. May prevent therapeutic response to some antihypertensives. Additive CNS depression with other CNS depressants. Sympathomimetic activity may be enhanced when used with other sympathomimetics. Additive anticholinergic effects with other drugs possessing anticholinergic properties. **MAO inhibitors—** Hypertensive crisis may occur with concurrent use of MAO inhibitors and amphetamines, methyldopa, levodopa, dopamine, epinephrine, norepinephrine, desipramine, imipramine, reserpine, vasoconstrictors, or ingestion of tyramine-containing foods. Hypertension or hypotension, coma, convulsions, and death may occur with meperidine or other opioid analgesics and MAO inhibitors. Additive hypotension with antihypertensives or spinal anesthesia and MAO inhibitors. Additive hypoglycemia with insulin or oral hypoglycemic agents and MAO inhibitors. SSRIs, bupropion, or venlafaxine should not be used in combination with or within weeks of MAO inhibitors (see individual monographs). Risk of adverse reactions may be increased by almotriptan, frovatriptan, rizatriptan, naratriptan, sumatriptan, or zolmitriptan.

NURSING IMPLICATIONS

Assessment

- Monitor mental status and affect. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Toxicity and Overdose:** Concurrent ingestion of MAO inhibitors and tyramine-containing foods may lead to hypertensive crisis. Symptoms include chest pain, severe headache, nuchal

Copyright © 2008 by F.A. Davis

rigidity, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.

Potential Nursing Diagnoses

- Ineffective coping (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Administer drugs that are sedating at bedtime to avoid excessive drowsiness during waking hours, and administer drugs that cause insomnia (fluoxetine, fluvoxamine, paroxetine, sertraline, MAO inhibitors) in the morning.

Patient/Family Teaching

- Caution patient to avoid alcohol and other CNS depressants. Patients receiving MAO inhibitors should also avoid OTC drugs and foods or beverages containing tyramine (see Appendix L) during and for at least 2 wk after therapy has been discontinued, as they may precipitate a hypertensive crisis. Health care professional should be contacted immediately if symptoms of hypertensive crisis develop.
- Inform patient that dizziness or drowsiness may occur. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen and any herbal alternative therapies before treatment or surgery. MAO inhibitor therapy usually needs to be withdrawn at least 2 wk before use of anesthetic agents.
- Emphasize the importance of participation in psychotherapy and follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Resolution of depression.
- Decrease in anxiety.
- Control of bedwetting in children over 6 yr of age.
- Management of chronic neurogenic pain.

• ANTIDIABETICS

PHARMACOLOGIC PROFILE

General Use

Insulin is used in the management of type 1 diabetes mellitus. It may also be used in type 2 diabetes mellitus when diet and/or oral medications fail to adequately control blood sugar. The choice of insulin preparation (rapid-acting, intermediate-acting, long-acting) and source (semisynthetic, human recombinant DNA) depend on the degree of control desired, daily blood glucose fluctuations, and history of previous reactions. Oral agents are used primarily in type 2 diabetes mellitus. Oral agents are used when diet therapy alone fails to control blood glucose or symptoms or when patients are not amenable to using insulin. Some oral agents may be used with insulin.

General Action and Information

Insulin, a hormone produced by the pancreas, lowers blood glucose by increasing transport of glucose into cells and promotes the conversion of glucose to glycogen. It also promotes the conversion of amino acids to proteins in muscle, stimulates triglyceride formation, and inhibits the release of free fatty acids. Sulfonylureas, nateglinide, repaglinide, and metformin lower blood glucose by stimulating endogenous insulin secretion by beta cells of the pancreas and by increasing sensitivity to insulin at intracellular receptor sites. Intact pancreatic function is required. Miglitol delays digestion of ingested carbohydrates, thus lowering blood glucose, especially after meals. It may be combined with sulfonylureas. Pioglitazone and rosiglitazone increase insulin sensitivity.

Contraindications

Insulin— Hypoglycemia. **Oral hypoglycemic agents—** Hypersensitivity (cross-sensitivity with other sulfonylureas and sulfonamides may exist). Hypoglycemia. Type 1 diabetes. Avoid use in patients with severe kidney, liver, thyroid, and other endocrine dysfunction. Should not be used in pregnancy or lactation.

Precautions

Insulin— Infection, stress, or changes in diet may alter requirements. **Oral hypoglycemic agents—** Use cautiously in geriatric patients. Dose reduction may be necessary. Infection, stress, or changes in diet may alter requirements. Use with sulfonylureas with caution in patients with a history of cardiovascular disease. Metformin may cause lactic acidosis.

Interactions

Insulin— Additive hypoglycemic effects with oral hypoglycemic agents. **Oral hypoglycemic agents—** Ingestion of alcohol may result in disulfiram-like reaction with some agents. Alcohol, corticosteroids, rifampin, glucagon, and thiazide diuretics may decrease effectiveness. Anabolic steroids, chloramphenicol, clofibrate, MAO inhibitors, most NSAIDs, salicylates, sulfonamides, and warfarin may increase hypoglycemic effect. Beta blockers may produce hypoglycemia and mask signs and symptoms.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions.
- Acarbose, miglitol, and pioglitazone do not cause hypoglycemia when taken alone but may increase the hypoglycemic effect of other hypoglycemic agents.
- Patients who have been well controlled on metformin but develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.

Copyright © 2008 by F.A. Davis

- **Lab Test Considerations:** Serum glucose and glycosylated hemoglobin should be monitored periodically throughout therapy to evaluate effectiveness of treatment.

Potential Nursing Diagnoses

- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require sliding scale insulin. Withhold oral hypoglycemic agents and reinstitute after resolution of acute episode.
- Patients switching from daily insulin dose may require gradual conversion to oral hypoglycemics.
- **Insulin:** Available in different types and strengths and from different species. Check type, species, source, dose, and expiration date with another licensed nurse. Do not interchange insulins without physician's order. Use only insulin syringes to draw up dose. Use only U100 syringes to draw up insulin lispro dose.

Patient/Family Teaching

- Explain to patient that medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water (glucose, not table sugar, if taking miglitol), and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops; if unable to eat usual diet; or if blood glucose levels are not controlled.
- Advise patient to carry sugar or a form of glucose and identification describing medication regimen at all times.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- **Insulin:** Instruct patient on proper technique for administration; include type of insulin, equipment (syringe and cartridge pens), storage, and syringe disposal. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- **Sulfonylureas:** Advise patient that concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headache, and hypoglycemia).
- **Metformin:** Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

• ANTIDIARRHEALS

PHARMACOLOGIC PROFILE

General Use

For the control and symptomatic relief of acute and chronic nonspecific diarrhea.

General Action and Information

Diphenoxylate/atropine, difenoxin/atropine, and loperamide slow intestinal motility and propulsion. Kaolin/pectin and bismuth subsalicylate affect fluid content of the stool. Bismuth subsalicylate is also used a part of the management of ulcer disease due to *Helicobacter pylori*. Polycarbophil acts as an antidiarrheal by taking on water within the bowel lumen to create a formed stool. Polycarbophil may also be used to treat constipation. Octreotide is used specifically for diarrhea associated with GI endocrine tumors.

Contraindications

Previous hypersensitivity. Severe abdominal pain of unknown cause, especially when associated with fever.

Precautions

Use cautiously in patients with severe liver disease or inflammatory bowel disease. Safety in pregnancy and lactation not established (diphenoxylate/atropine and loperamide). Octreotide may aggravate gallbladder disease.

Interactions

Kaolin may decrease absorption of digoxin. Polycarbophil decreases the absorption of tetracycline. Octreotide may alter the response to insulin or oral hypoglycemic agents.

NURSING IMPLICATIONS

Assessment

- Assess the frequency and consistency of stools and bowel sounds before and throughout therapy.
- Assess patient's fluid and electrolyte status and skin turgor for dehydration.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Diarrhea (Indications).
- Constipation (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Shake liquid preparations before administration.

Patient/Family Teaching

- Instruct patient to notify health care professional if diarrhea persists; or if fever, abdominal pain, or palpitations occur.

Evaluation/Desired Outcomes

- Decrease in diarrhea.

• ANTIEMETICS

PHARMACOLOGIC PROFILE

General Use

Phenothiazines, dolasetron, granisetron, metoclopramide, and ondansetron are used to manage nausea and vomiting of many causes, including surgery, anesthesia, and antineoplastic and radiation therapy. Palonosetron and aprepitant are used specifically with emetogenic chemotherapy. Dimenhydrinate, scopolamine, and meclizine are used almost exclusively to prevent motion sickness.

General Action and Information

Phenothiazines act on the chemoreceptor trigger zone to inhibit nausea and vomiting. Dimenhydrinate, scopolamine, and meclizine act as antiemetics mainly by diminishing motion sickness. Metoclopramide decreases nausea and vomiting by its effects on gastric emptying. Dolasetron, granisetron, palonosetron, and ondansetron block the effects of serotonin at 5-HT_3 receptor sites.

Contraindications

Previous hypersensitivity.

Precautions

Use phenothiazines cautiously in children who may have viral illnesses. Choose agents carefully in pregnant patients (no agents are approved for safe use).

Interactions

Additive CNS depression with other CNS depressants including antidepressants, antihistamines, opioid analgesics, and sedative/hypnotics. Phenothiazines may produce hypotension when used with antihypertensives, nitrates, or acute ingestion of alcohol.

NURSING IMPLICATIONS

Assessment

- Assess nausea, vomiting, bowel sounds, and abdominal pain before and following administration.

Copyright © 2008 by F.A. Davis

- Monitor hydration status and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.

Potential Nursing Diagnoses

- Deficient fluid volume (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Risk for injury (Side Effects).

Implementation

- For prophylactic administration, follow directions for specific drugs so that peak effect corresponds to time of anticipated nausea.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following myelography, as they lower seizure threshold.

Patient/Family Teaching

- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; and remove noxious stimuli from environment).
- May cause drowsiness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, nausea and vomiting.

• ANTIFUNGALS

PHARMACOLOGIC PROFILE

General Use

Treatment of fungal infections. Infections of skin or mucous membranes may be treated with topical or vaginal preparations. Deep-seated or systemic infections require oral or parenteral therapy. New parenteral formulations of amphotericin employ lipid encapsulation technology designed to decrease toxicity.

General Action and Information

Kill (fungicidal) or stop growth of (fungistatic) susceptible fungi by affecting the permeability of the fungal cell membrane or protein synthesis within the fungal cell itself.

Contraindications

Previous hypersensitivity.

Precautions

Because most systemic antifungals may have adverse effects on bone marrow function, use cautiously in patients with depressed bone marrow reserve. Amphotericin B commonly causes renal

Copyright © 2008 by F.A. Davis

impairment. Fluconazole requires dosage adjustment in the presence of renal impairment. Adverse reactions to fluconazole may be more severe in HIV-positive patients.

Interactions

Differ greatly among various agents. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of infection and assess involved areas of skin and mucous membranes before and throughout therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Available in various dosage forms. Refer to specific drugs for directions for administration.
- **Topical:** Consult physician or other health care professional for cleansing technique before applying medication. Wear gloves during application. Do not use occlusive dressings unless specified by physician or other health care professional.

Patient/Family Teaching

- Instruct patient on proper use of medication form.
- Instruct patient to continue medication as directed for full course of therapy, even if feeling better.
- Advise patient to report increased skin irritation or lack of therapeutic response to health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection. Deep-seated fungal infections may require prolonged therapy (weeks–months). Recurrent fungal infections may be a sign of serious systemic illness.

• ANTIHISTAMINES

PHARMACOLOGIC PROFILE

General Use

Relief of symptoms associated with allergies, including rhinitis, urticaria, and angioedema, and as adjunctive therapy in anaphylactic reactions. Topical and ophthalmic antihistamines may immunize systemic side effects. Some antihistamines are used to treat motion sickness (dimenhydrinate and meclizine), insomnia (diphenhydramine), Parkinson-like reactions (diphenhydramine), and other nonallergic conditions.

General Action and Information

Antihistamines block the effects of histamine at the H_1 receptor. They do not block histamine release, antibody production, or antigen-antibody reactions. Most antihistamines have anticholinergic properties and may cause constipation, dry eyes, dry mouth, and blurred vision. In addition, many antihistamines cause sedation. Some phenothiazines have strong antihistaminic properties (hydroxyzine and promethazine).

Contraindications

Hypersensitivity and angle-closure glaucoma. Should not be used in premature or newborn infants.

Precautions

Elderly patients may be more susceptible to adverse anticholinergic effects of antihistamines. Use cautiously in patients with pyloric obstruction, prostatic hypertrophy, hyperthyroidism, cardiovascular disease, or severe liver disease. Use cautiously in pregnancy and lactation.

Interactions

Additive sedation when used with other CNS depressants, including alcohol, antidepressants, opioid analgesics, and sedative/hypnotics. MAO inhibitors prolong and intensify the anticholinergic properties of antihistamines.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Monitor pulse and blood pressure before initiating and throughout IV therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis when administering for nausea and vomiting.
- **Anxiety:** Assess mental status, mood, and behavior when administering for anxiety.
- **Pruritus:** Observe the character, location, and size of affected area when administering for pruritic skin conditions.

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Risk for injury (Adverse Reactions).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.

Copyright © 2008 by F.A. Davis

- When administering concurrently with opioid analgesics (hydroxyzine, promethazine), supervise ambulation closely to prevent injury secondary to increased sedation.

Patient/Family Teaching

- Inform patient that drowsiness may occur. Avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using concurrent alcohol or CNS depressants.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Prevention or decreased severity of nausea and vomiting.
- Decrease in anxiety.
- Relief of pruritus.
- Sedation when used as a hypnotic.

doxepin 452

• ANTIHYPERTENSIVES

PHARMACOLOGIC PROFILE

General Use

Treatment of hypertension of many causes, most commonly essential hypertension. Parenteral products are used in the treatment of hypertensive emergencies. Oral treatment should be initiated as soon as possible and individualized to ensure adherence and compliance for long-term therapy. Therapy is initiated with agents having minimal side effects. When such therapy fails, more potent drugs with different side effects are added in an effort to control blood pressure while causing minimal patient discomfort.

General Action and Information

As a group, the antihypertensives are used to lower blood pressure to a normal level (<90 mm Hg diastolic) or to the lowest level tolerated. The goal of antihypertensive therapy is prevention of end-organ damage. Antihypertensives are classified into groups according to their site of action. These include peripherally-acting antiadrenergics; centrally-acting alpha-adrenergics; beta blockers; vasodilators; ACE inhibitors; angiotensin II antagonists; calcium channel blockers; and diuretics. Hypertensive emergencies may be managed with parenteral agents, such as enalaprilat or fenoldopam.

Copyright © 2008 by F.A. Davis

Contraindications
Hypersensitivity to individual agents.

Precautions
Choose agents carefully in pregnancy, during lactation, or in patients receiving digoxin. ACE inhibitors and angiotensin II antagonists should be avoided during pregnancy. Alpha-adrenergic agonists and beta blockers should be used only in patients who will comply, because abrupt discontinuation of these agents may result in rapid and excessive rise in blood pressure (rebound phenomenon). Thiazide diuretics may increase the requirement for treatment of diabetics. Vasodilators may cause tachycardia if used alone and are commonly used in combination with beta blockers. Some antihypertensives cause sodium and water retention and are usually combined with a diuretic.

Interactions
Many drugs can negate the therapeutic effectiveness of antihypertensives, including antihistamines, NSAIDs, sympathomimetic bronchodilators, decongestants, appetite suppressants, antidepressants, and MAO inhibitors. Hypokalemia from diuretics may increase the risk of digoxin toxicity. Potassium supplements and potassium-sparing diuretics may cause hyperkalemia when used with ACE inhibitors.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight.
- Monitor frequency of prescription refills to determine compliance.

Potential Nursing Diagnoses
- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation
- Many antihypertensives are available as combination products to enhance compliance (see Appendix B).

Patient/Family Teaching
- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause rebound hypertension. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, discontinuation of smoking, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercise or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications, especially cold remedies.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Patients taking ACE inhibitors or angiotensin II antagonists should notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor progress.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in blood pressure.

• ANTI-INFECTIVES

PHARMACOLOGIC PROFILE

General Use

Treatment and prophylaxis of various bacterial infections. See specific drugs for spectrum and indications. Some infections may require additional surgical intervention and supportive therapy.

Copyright © 2008 by F.A. Davis

General Action and Information

Kill (bactericidal) or inhibit the growth of (bacteriostatic) susceptible pathogenic bacteria. Not active against viruses or fungi. Anti-infectives are subdivided into categories depending on chemical similarities and antimicrobial spectrum.

Contraindications

Known hypersensitivity to individual agents. Cross-sensitivity among related agents may occur.

Precautions

Culture and susceptibility testing are desirable to optimize therapy. Dosage modification may be required in patients with hepatic or renal insufficiency. Use cautiously in pregnant and lactating women. Prolonged inappropriate use of broad spectrum anti-infective agents may lead to superinfection with fungi or resistant bacteria.

Interactions

Penicillins and aminoglycosides chemically inactivate each other and should not be physically admixed. Erythromycins may decrease hepatic metabolism of other drugs. Probenecid increases serum levels of penicillins and related compounds. Highly protein-bound anti-infectives such as sulfonamides may displace or be displaced by other highly bound drugs. See individual drugs. Extended-spectrum penicillins (ticarcillin, piperacillin) and some cephalosporins (cefoperazone, cefotetan) may increase the risk of bleeding with anticoagulants, thrombolytic agents, antiplatelet agents, or NSAIDs. Fluoroquinolone absorption is decreased by antacids, bismuth subsalicylate, iron salts, sucralfate, and zinc salts.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of infection prior to and throughout therapy.
- Determine previous hypersensitivities in patients receiving penicillins or cephalosporins.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Most anti-infectives should be administered around the clock to maintain therapeutic serum drug levels.

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock until finished completely, even if feeling better.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy to health care professional.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains pus, blood, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

• ANTINEOPLASTICS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of various solid tumors, lymphomas, and leukemias. Also used in some autoimmune disorders such as rheumatoid arthritis (cyclophosphamide, methotrexate). Often used in combinations to minimize individual toxicities and increase response. Chemotherapy may be combined with other treatment modalities such as surgery and radiation therapy. Dosages vary greatly, depending on extent of disease, other agents used, and patient's condition. Some new formulations (daunorubicin, doxorubicin) encapsulated in a lipid membrane have less toxicity with greater efficacy.

General Action and Information

Act by many different mechanisms (see the following table). Many affect DNA synthesis or function; others alter immune function or affect hormonal status of sensitive tumors. Action may not be limited to neoplastic cells.

MECHANISM OF ACTION OF VARIOUS ANTINEOPLASTICS

MECHANISM OF ACTION	AGENT	EFFECTS ON CELL CYCLE
ALKYLATING AGENTS	busulfan	Cell cycle–nonspecific
Cause cross-linking of DNA	carboplatin	
	chlorambucil	
	cisplatin	
	cyclophosphamide	
	ifosfamide	
	mechlorethamine	
	melphalan	
	procarbazine	
	temozolamide	
ANTHRACYCLINES	daunorubicin	Cell cycle–nonspecific
Interfere with DNA and RNA synthesis	doxorubicin	
	epirubicin	
	idarubicin	
ANTITUMOR ANTIBIOTIC	bleomycin	Cell cycle–nonspecific (except bleomycin)
Interfere with DNA and RNA synthesis	mitomycin	
	mitoxantrone	
ANTIMETABOLITES	cytarabine	Cell cycle–specific, work mostly in S phase (DNA synthesis)
Take the place of normal proteins	fluorouracil	
	hydroxyurea	
	methotrexate	
ENZYMES	asparaginase	Cell-cycle phase–specific
Deplete asparagine	pegaspargase	
ENZYME INHIBITORS	irinotecan	Cell-cycle phase–specific
Inhibits topoisomerase	topotecan	
Inhibits kinase	imatinib	Unknown
HORMONAL AGENTS	bicalutamide	Unknown
Alter hormonal status in tumors that are sensitive	estramustine	
	flutamide	
	leuprolide	
	megestrol	
	nilutamide	
	tamoxifen	
	testosterone (androgens)	
	triptorelin	
HORMONAL AGENTS—AROMATASE INHIBITORS	anastrazole	Unknown
Inhibit enzyme responsible for activating estrogen	letrozole	
IMMUNE MODULATORS	aldesleukin	Unknown
	alemtuzumab	
	gemtuzumab

MECHANISM OF ACTION	AGENT	EFFECTS ON CELL CYCLE
	toremifene	
	trastuzumab	
PODOPHYLLOTOXIN DERIVATIVES	etoposide	Cell-cycle phase–specific
Damages DNA before mitosis		
TAXOIDS	docetaxel	Cell-cycle phase–specific
Interupt interphase and mitosis	paclitaxel	
VINCA ALKALOIDS	vinblastine	Cell cycle–specific, work during M phase (mitosis)
Interfere with mitosis	vinCRIStine	
	vinorelbine	
MISCELLANEOUS	aldesleukin	Unknown
	altretamine	Unknown

Contraindications

Previous bone marrow depression or hypersensitivity. Contraindicated in pregnancy and lactation.

Precautions

Use cautiously in patients with active infections, decreased bone marrow reserve, radiation therapy, or other debilitating illnesses. Use cautiously in patients with childbearing potential.

Interactions

Allopurinol decreases metabolism of mercaptopurine. Toxicity from methotrexate may be increased by other nephrotoxic drugs or larger doses of aspirin or NSAIDs. Bone marrow depression is additive. See individual drugs.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor IV site carefully and ensure patency. Discontinue infusion immediately if discomfort, erythema along vein, or infiltration occurs. Tissue ulceration and necrosis may result from infiltration.
- Monitor for symptoms of gout (increased uric acid, joint pain, and edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Imbalanced nutrition: less than body requirements (Adverse Reactions).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers (see Appendix K).
- Check dose carefully. Fatalities have resulted from dosing errors.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions.
- These drugs may cause gonadal suppression; however, patient should still use birth control, as most antineoplastics are teratogenic. Advise patient to inform health care professional immediately if pregnancy is suspected.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional. Antineoplastics may decrease antibody response and increase risk of adverse reactions.
- Advise patient of need for medical follow-up and frequent lab tests.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic status in patients with leukemia.

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of parkinsonism of various causes: degenerative, toxic, infective, neoplastic, or drug-induced.

General Action and Information

Drugs used in the treatment of the parkinsonian syndrome and other dyskinesias are aimed at restoring the natural balance of two major neurotransmitters in the CNS: acetylcholine and dopamine. The imbalance is a deficiency in dopamine that results in excessive cholinergic activity. Drugs used are either anticholinergics (benztropine, biperiden, and trihexyphenidyl) or dopaminergic agonists (bromocriptine, levodopa). Pramipexole and ropinerole are two new nonergot dopamine agonists. Entacapone inhibits the enzyme that breaks down levodopa, thereby enhancing its effects.

Contraindications

Anticholinergics should be avoided in patients with angle-closure glaucoma.

Precautions

Use cautiously in patients with severe cardiac disease, pyloric obstruction, or prostatic enlargement.

Interactions

Pyridoxine, MAO inhibitors, benzodiazepines, phenytoin, phenothiazines, and haloperidol may antagonize the effects of levodopa. Agents that antagonize dopamine (phenothiazines, metoclopramide) may decrease effectiveness of dopamine agonists.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (akinesia, rigidity, tremors, pill rolling, mask facies, shuffling gait, muscle spasms, twisting motions, and drooling) before and throughout course of therapy. On-off phenomenon may cause symptoms to appear or improve suddenly.
- Monitor blood pressure frequently during therapy. Instruct patient to remain supine during and for several hours after first dose of bromocriptine, as severe hypotension may occur.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Impaired physical mobility (Indications).
- Risk for injury (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- In the carbidopa/levodopa combination, the number following the drug name represents the milligram of each respective drug.

Patient/Family Teaching

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to medication is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also notify the dentist if dryness interferes with use of dentures.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages. Patients receiving levodopa should avoid multivitamins. Vitamin B_6 (pyridoxine) may interfere with levodopa's action.
- Caution patient that decreased perspiration may occur. Overheating may occur during hot weather. Patients should remain indoors in an air-conditioned environment during hot weather.
- Advise patient to increase activity, bulk, and fluid in diet to minimize constipating effects of medication.
- Advise patient to notify health care professional if confusion, rash, urinary retention, severe constipation, visual changes, or worsening of parkinsonian symptoms occur.

Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms.
- Resolution of drug-induced extrapyramidal symptoms.

Antiparkinson agents included in *Davis's Drug Guide for Nurses*

anticholinergics
benztropine 218
biperiden 32
trihexyphenidyl 1295

antiviral
amantadine 135

catechol-O-methyltransferase inhibitors
entacapone 475
tolcapone 1188

dopamine agonists
apomorphine 186
bromocriptine 1272
carbidopa/levodopa 743

pramipexole 1000
ropinirole 1081
rotigotine transdermal system 1084

monoamine oxidase type B inhibitors
selegiline 1098

• ANTIPLATELET AGENTS

PHARMACOLOGIC PROFILE

General Use

Antiplatelet agents are used to treat and prevent thromboembolic events such as stroke and MI. Dipyridamole is commonly used after cardiac surgery.

Copyright © 2008 by F.A. Davis

General Action and Information

Inhibit platelet aggregation, prolongs bleeding time, and are used to prevent MI or stroke (aspirin, clopidogrel, dipyridamole, ticlopidine). Eptifibatide and tirofiban are used in the management of various acute coronary syndromes. These agents have been used concurrently/sequentially with anticoagulants and thrombolytics.

Contraindications

Hypersensitivity, ulcer disease, active bleeding, and recent surgery.

Precautions

Use cautiously in patients at risk for bleeding (trauma, surgery). History of GI bleeding or ulcer disease. Safety not established in pregnancy, lactation, or children.

Interactions

Concurrent use with NSAIDs, heparin, thrombolytics, or warfarin may increase the risk of bleeding.

NURSING IMPLICATIONS

Assessment

- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Assess patient taking antiplatelet agents for symptoms of stroke, peripheral vascular disease, or MI periodically throughout therapy.
- **Lab Test Considerations:** Monitor bleeding time throughout antiplatelet therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Use an infusion pump with continuous infusions to ensure accurate dosage.

Patient/Family Teaching

- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

Antiplatelet agents included in *Davis's Drug Guide for Nurses*

glycoprotein IIb/IIIa inhibitors
eptifibatide 490
tirofiban 1185

platelet adhesion inhibitors
dipyridamole 428

platelet aggregation inhibitors
cilostazol 309, 1326
clopidogrel 324

• ANTIPSYCHOTICS

PHARMACOLOGIC PROFILE

General Use

Treatment of acute and chronic psychoses, particularly when accompanied by increased psychomotor activity. Use of clozapine is limited to schizophrenia unresponsive to conventional therapy. Selected agents are also used as antihistamines or antiemetics. Chlorpromazine is also used in the treatment of intractable hiccups.

General Action and Information

Block dopamine receptors in the brain; also alter dopamine release and turnover. Peripheral effects include anticholinergic properties and alpha-adrenergic blockade. Most antipsychotics are phenothiazines except for haloperidol, which is a butyrophenone, and clozapine, which is a miscellaneous compound. Newer "atypical" agents such as olanzapine, quetiapine, and risperidone may have fewer adverse reactions. Phenothiazines differ in their ability to produce sedation (greatest with chlorpromazine and thioridazine), extrapyramidal reactions (greatest with prochlorperazine and trifluoperazine), and anticholinergic effects (greatest with chlorpromazine).

Contraindications

Hypersensitivity. Cross-sensitivity may exist among phenothiazines. Should not be used in angle-closure glaucoma. Should not be used in patients who have CNS depression.

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with symptomatic cardiac disease. Avoid exposure to extremes in temperature. Use cautiously in severely ill or debilitated patients, diabetic patients, and patients with respiratory insufficiency, prostatic hypertrophy, or intestinal obstruction. May lower seizure threshold. Clozapine may cause agranulocytosis. Most agents are capable of causing neuroleptic malignant syndrome. Should not be used routinely for anxiety or agitation not related to psychoses.

Interactions

Additive hypotension with acute ingestion of alcohol, antihypertensives, or nitrates. Antacids may decrease absorption. Phenobarbital may increase metabolism and decrease effectiveness. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, or sedative/hypnotics. Lithium may decrease blood levels and effectiveness of phenothiazines. May decrease the therapeutic response to levodopa. May increase the risk of agranulocytosis with antithyroid agents.

NURSING IMPLICATIONS

Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically throughout therapy.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate before and frequently during the period of dosage adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Monitor patient for onset of *akathisia*—restlessness or desire to keep moving—and extrapyramidal side effects; *parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonia*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs—every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Parkinsonian effects are more common in geriatric patients and dystonias are more common in younger patients. Notify health care professional if these symptoms occur, as reduction in dosage or discontinuation

Copyright © 2008 by F.A. Davis

of medication may be necessary. Trihexyphenidyl or diphenhydramine may be used to control these symptoms.
- Monitor for *tardive dyskinesia*—uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue. Notify health care professional immediately if these symptoms occur; these side effects may be irreversible.
- Monitor for development of *neuroleptic malignant syndrome*—fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control. Notify health care professional immediately if these symptoms occur.

Potential Nursing Diagnoses

- Disturbed thought process (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects.
- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following myelography, as they lower the seizure threshold.
- **PO:** Administer with **food, milk,** or a full glass of **water** to minimize gastric irritation.
- Dilute most concentrates in 120 ml of distilled or acidified tap water or **fruit juice** just before administration.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to skip doses or double up on missed doses. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, as these drugs impair body temperature regulation.
- Advise patient that increasing activity, bulk, and fluids in the diet helps minimize the constipating effects of this medication.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior. Relief of nausea and vomiting. Relief of intractable hiccups.

quetiapine 1043, 1327
risperidone 1070
ziprasidone 1257

• ANTIPYRETICS

PHARMACOLOGIC PROFILE

General Use

Used to lower fever of many causes (infection, inflammation, and neoplasms).

General Action and Information

Antipyretics lower fever by affecting thermoregulation in the CNS and by inhibiting the action of prostaglandins peripherally. Many antipyretics affect platelet function; of these, aspirin has the most profound effect as compared with other salicylates, ibuprofen, or ketoprofen.

Contraindications

Avoid aspirin, ibuprofen, or ketoprofen in patients with bleeding disorders (risk of bleeding is less with other salicylates). Aspirin and other salicylates should be avoided in children and adolescents.

Precautions

Use aspirin, ibuprofen, or ketoprofen cautiously in patients with ulcer disease. Avoid chronic use of large doses of acetaminophen.

Interactions

Large doses of aspirin may displace other highly protein-bound drugs. Additive GI irritation with aspirin, ibuprofen, ketoprofen, and other NSAIDs or corticosteroids. Aspirin, ibuprofen, ketoprofen, or naproxen may increase the risk of bleeding with other agents affecting hemostasis (anticoagulants, thrombolytic agents, antineoplastics, and certain anti-infectives).

NURSING IMPLICATIONS

Assessment

- Assess fever; note presence of associated symptoms (diaphoresis, tachycardia, and malaise).

Potential Nursing Diagnoses

- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Administration with food or antacids may minimize GI irritation (aspirin, ibuprofen, ketoprofen, naproxen).
- Available in oral and rectal dosage forms and in combination with other drugs.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Advise patient to consult health care professional if fever is not relieved by routine doses or if greater than 39.5°C (103°F) or lasts longer than 3 days.
- Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.

Evaluation/Desired Outcomes

- Reduction of fever.

Antipyretics included in *Davis's Drug Guide for Nurses*

acetaminophen 107
aspirin 1087
choline and magnesium salicylates 1087
choline salicylate 1087
ibuprofen, oral 654
ketoprofen 714
magnesium salicylate 1087
naproxen 864
salsalate 1087
sodium salicylate 1087

• ANTIRETROVIRALS

PHARMACOLOGIC PROFILE

General Use

The goal of antiretroviral therapy in the management of HIV infection is to improve CD4 cell counts and decrease viral load. If accomplished, this generally results in slowed progression of the disease, improved quality of life, and decreased opportunistic infections. Perinatal use of agents also prevents transmission of the virus to the fetus. Post-exposure prophylaxis with antiretrovirals is also recommended.

General Action and Information

Because of the rapid emergence of resistance and toxicities of individual agents, HIV infection is almost always managed by a combination of agents. Selections and doses are based on individual toxicities, underlying organ system disease, concurrent drug therapy, and severity of illness. Various combinations are used; up to 4 agents may be used simultaneously. More than 100 agents are currently being tested in addition to those already approved by the FDA.

Contraindications

Hypersensitivity. Because of highly varying toxicities among agents, see individual monographs for more specific information.

Precautions

Many agents require modification for renal impairment. Protease inhibitors may cause hyperglycemia and should be used cautiously in patients with diabetes. Hemophiliacs may also be at risk of bleeding when taking protease inhibitors. See individual monographs for specific information.

Interactions

There are many significant and potentially serious drug-drug interactions among the antiretrovirals. They are affected by drugs that alter metabolism; some agents themselves affect metabolism. See individual agents.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections throughout therapy.

Copyright © 2008 by F.A. Davis

- **Lab Test Considerations:** Monitor viral load and CD4 counts prior to and periodically during therapy.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Administer doses around the clock.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock, even if sleep is interrupted. Emphasize the importance of complying with therapy, not taking more than prescribed amount, and not discontinuing without consulting health care professional. Missed doses should be taken as soon as remembered unless almost time for next dose; patient should not double doses. Inform patient that long-term effects are unknown at this time.
- Instruct patient that antiretrovirals should not be shared with others.
- Inform patient that antiretroviral therapy does not cure HIV and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patient to avoid taking any Rx, OTC, or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in viral load and increase in CD4 counts in patients with HIV.

• ANTIRHEUMATICS

PHARMACOLOGIC PROFILE

General Use

Antirheumatics are used to manage symptoms of rheumatoid arthritis (pain, swelling) and in more severe cases to slow down joint destruction and preserve joint function. NSAIDs, aspirin, and other salicylates are used to manage symptoms such as pain and swelling, allowing continued motility and improved quality of life. Corticosteroids are reserved for more advanced swelling and discomfort, primarily because of their increased side effects, especially with chronic use. They can be used to control acute flares of disease. Neither NSAIDs nor corticosteroids prevent disease progression or joint destruction. Disease-modifying antirheumatics drugs (DMARDs, sometimes called slow-acting agents) slow the progression of rheumatoid arthritis and delay joint destruction. DMARDs are reserved for severe cases because of their toxicity. Several months of therapy may be required before benefit is noted and maintained. Serious and frequent adverse reactions may require discontinuation of therapy, despite initial benefit.

General Action and Information

Both NSAIDs and corticosteroids have potent anti-inflammatory properties. DMARDs work by a variety of mechanisms. See individual agents, but most work by suppressing the auto-immune response thought to be responsible for joint destruction.

Contraindications

Hypersensitivity. Patients who are allergic to aspirin should not receive other NSAIDs. Corticosteroids should not be used in patients with active untreated infections.

Precautions

NSAIDs and corticosteroids should be used cautiously in patients with a history of GI bleeding. Corticosteroids should be used with caution in diabetic patients. Many DMARDs have immunosuppressive properties and should be avoided in patients for whom immunosuppression poses a serious risk, including patients with active infections, underlying malignancy, and uncontrolled diabetes mellitus.

Interactions

NSAIDs may diminish the response to diuretics and antihypertensives. Corticosteroids may augment hypokalemia from other medications and increase the risk of digoxin toxicity. DMARDs increase the risk of serious immunosuppression with other immunosuppressants.

NURSING IMPLICATIONS

Assessment

- Assess patient monthly for pain, swelling, and range of motion.

Potential Nursing Diagnoses

- Chronic pain (Indications).
- Deficient knowledge, related to disease processes and medication regimen.

Implementation

- Most agents require regular administration to obtain maximum effects.

Patient/Family Teaching

- Instruct patient to contact health care professional if no improvement is noticed within a few days.

Evaluation/Desired Outcomes

- Improvement in signs and symptoms of rheumatoid arthritis.

• ANTITUBERCULARS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment and prevention of tuberculosis. Combinations are used in the treatment of active disease tuberculosis to rapidly decrease the infectious state and delay or prevent the emergence of resistant strains. In selected situations, intermittent (twice weekly) regimens may be employed. Streptomycin is also used as an antitubercular. Rifampin is used in the prevention of meningococcal meningitis and *Haemophilus influenzae* type b disease.

General Action and Information

Kill (tuberculocidal) or inhibit the growth of (tuberculostatic) mycobacteria responsible for causing tuberculosis. Combination therapy with two or more agents is required, unless used as prophylaxis (isoniazid alone).

Contraindications

Hypersensitivity. Severe liver disease.

Precautions

Use cautiously in patients with a history of liver disease or in elderly or debilitated patients. Ethambutol requires ophthalmologic follow-up. Safety in pregnancy and lactation not established, although selected agents have been used without adverse effects on the fetus. Compliance is required for optimal response.

Interactions

Isoniazid inhibits the metabolism of phenytoin. Rifampin significantly decreases saquinavir levels (combination should be avoided).

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically throughout therapy.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Most medications can be administered with food or antacids if GI irritation occurs.

Patient/Family Teaching

- Advise patient of the importance of continuing therapy even after symptoms have subsided.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.
- Inform patients taking rifampin that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of tuberculosis. Negative sputum cultures.

Antituberculars included in *Davis's Drug Guide for Nurses*

ethambutol 517
isoniazid 705
pyrazinamide 1036
rifampin 1066
rifapentine 1291

• ANTIULCER AGENTS

PHARMACOLOGIC PROFILE

General Use

Treatment and prophylaxis of peptic ulcer and gastric hypersecretory conditions such as Zollinger-Ellison syndrome. Histamine H_2-receptor antagonists (blockers) and proton pump inhibitors are also used in the management of GERD.

General Action and Information

Because a great majority of peptic ulcer disease may be traced to GI infection with the organism *Helicobacter pylori*, eradication of the organism decreases symptomatology and recurrence. Anti-infectives with significant activity against the organism include amoxicillin, clarithromycin, metronidazole, and tetracycline. Bismuth also has anti-infective activity against *H. pylori*. Regimens usually include: a histamine H_2-receptor antagonist or a proton pump inhibitor and 2 anti-infectives with or without bismuth subsalicylate for 1-14 days.

Other medications used in the management of gastric/duodenal ulcer disease are aimed at neutralizing gastric acid (antacids), decreasing acid secretion (histamine H_2 antagonists, proton pump inhibitors, misoprostol), or protecting the ulcer surface from further damage (misoprostol, sucralfate). Histamine H_2-receptor antagonists competitively inhibit the action of histamine at the H_2 receptor, located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. Misoprostol decreases gastric acid secretion and increases production of protective mucus. Proton pump inhibitors prevent the transport of hydrogen ions into the gastric lumen.

Contraindications

Hypersensitivity.
Pregnancy.

Copyright © 2008 by F.A. Davis

Precautions

Most histamine H_2 antagonists require dose reduction in renal impairment and in elderly patients. Magnesium-containing antacids should be used cautiously in patients with renal impairment. Misoprostol should be used cautiously in women with childbearing potential.

Interactions

Calcium- and magnesium-containing antacids decrease the absorption of tetracycline and fluoroquinolones. Cimetidine inhibits the ability of the liver to metabolize several drugs, increasing the risk of toxicity from warfarin, tricyclic antidepressants, theophylline, metoprolol, phenytoin, propranolol, and lidocaine. Omeprazole decreases metabolism of phenytoin, diazepam, and warfarin. All agents that increase gastric pH will decrease the absorption of ketoconazole.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Antacids:** Assess for heartburn and indigestion as well as the location, duration, character, and precipitating factors of gastric pain.
- **Histamine H_2 Antagonists:** Assess elderly and severely ill patients for confusion routinely. Notify health care professional promptly should this occur.
- **Misoprostol:** Assess women of childbearing age for pregnancy. Medication is usually begun on 2nd or 3rd day of menstrual period following a negative serum pregnancy test within 2 wk of beginning therapy.
- **Lab Test Considerations:** Histamine H_2 antagonists antagonize the effects of pentagastrin and histamine during gastric acid secretion test. Avoid administration during the 24 hr preceding the test.
- May cause false-negative results in skin tests using allergen extracts. These drugs should be discontinued 24 hr prior to the test.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- **Antacids:** Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of antacids and other oral medications by at least 1 hr.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage to stomach. Liquid and powder dosage forms are considered to be more effective than chewable tablets.
- Chewable tablets must be chewed thoroughly before swallowing. Follow with half a glass of water.
- Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- **Misoprostol:** Administer with meals and at bedtime to reduce the severity of diarrhea.
- **Proton pump inhibitors:** Administer before meals, preferably in the morning. Capsules should be swallowed whole; do not open, crush, or chew.
- May be administered concurrently with antacids.
- **Sucralfate:** Administer on an empty stomach 1 hr before meals and at bedtime. Do not crush or chew tablets. Shake suspension well prior to administration. If nasogastric administration is required, consult pharmacist, as protein-binding properties of sucralfate have resulted in formation of a bezoar when administered with enteral feedings and other medications.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. If a dose is missed, it should be taken as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin, NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools to health care professional promptly.
- Inform patient that cessation of smoking may help prevent the recurrence of duodenal ulcers.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk or if problem is recurring. Advise patient to consult health care professional if relief is not obtained or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Misoprostol:** Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol may cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- **Sucralfate:** Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing.
- Advise patient that an increase in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.

Evaluation/Desired Outcomes

- Decrease in GI pain and irritation. Prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy with histamine H_2 antagonists is continued for at least 6 wk after initial episode. Decreased symptoms of GERD. Increase in the pH of gastric secretions (antacids). Prevention of gastric ulcers in patients receiving chronic NSAID therapy (misoprostol only).

• ANTIVIRALS

PHARMACOLOGIC PROFILE

General Use

Acyclovir, famciclovir, and valacyclovir are used in the management of herpes virus infections. Acyclovir also is used in the management of chickenpox. Oseltamivir and zanamivir are used pri-

Copyright © 2008 by F.A. Davis

marily in the prevention of influenza A viral infections. Cidofovir, ganciclovir, valganciclovir, and foscarnet are used in the treatment of cytomegalovirus (CMV) retinitis. Vidarabine is used only to treat ophthalmic viral infections. Penciclovir and docosanol are used in the treatment and prevention of oral-facial herpes simplex.

General Action and Information

Most agents inhibit viral replication.

Contraindications

Previous hypersensitivity.

Precautions

All except zanamivir require dose adjustment in renal impairment. Acyclovir may cause renal impairment. Acyclovir may cause CNS toxicity. Foscarnet increases risk of seizures.

Interactions

Acyclovir may have additive CNS and nephrotoxicity with drugs causing similar adverse reactions.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of infection before and throughout therapy.
- **Ophth:** Assess eye lesions before and daily during therapy.
- **Topical:** Assess lesions before and daily during therapy.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Most systemic antiviral agents should be administered around the clock to maintain therapeutic serum drug levels.

Patient/Family Teaching

- Instruct patient to continue taking medication around the clock for full course of therapy, even if feeling better.
- Advise patient that antivirals and antiretrovirals do not prevent transmission to others. Precautions should be taken to prevent spread of virus.
- Instruct patient in correct technique for topical or ophthalmic preparations.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of viral infection. Length of time for complete resolution depends on organism and site of infection.

Antivirals included in *Davis's Drug Guide for Nurses*

acyclovir 111
amantadine 135
cidofovir 308
docosanol 441
entecavir 476
famciclovir 529
foscarnet 582
ganciclovir 594
imiquimod 669
lamivudine 723, 1325
oseltamivir 916
penciclovir 957
ribavirin 1062
valacyclovir 1209
valganciclovir 1210
zanamivir 1251

Copyright © 2008 by F.A. Davis

• BETA BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Management of hypertension, angina pectoris, tachyarrhythmias, hypertrophic subaortic stenosis, migraine headache (prophylaxis), MI (prevention), glaucoma (ophthalmic use), CHF (carvedilol and sustained-release metoprolol only) and hyperthyroidism (management of symptoms only).

General Action and Information

Beta blockers compete with adrenergic (sympathetic) neurotransmitters (epinephrine and norepinephrine) for adrenergic receptor sites. $Beta_1$-adrenergic receptor sites are located chiefly in the heart where stimulation results in increased heart rate, contractility, and AV conduction. $Beta_2$-adrenergic receptors are found mainly in bronchial and vascular smooth muscle and the uterus. Stimulation of $beta_2$-adrenergic receptors produces vasodilation, bronchodilation, and uterine relaxation. Blockade of these receptors antagonizes the effects of the neurotransmitters. Beta blockers may be relatively selective for $beta_1$-adrenergic receptors (acebutolol, atenolol, betaxolol, esmolol, and metoprolol) or nonselective (carteolol, carvedilol, labetalol, levobunolol, nadolol, penbutolol, pindolol, propranolol, sotalol, and timolol) blocking both $beta_1$- and $beta_2$-adrenergic receptors. Carvedilol and labetalol have additional alpha-adrenergic blocking properties. Acebutolol, carvedilol, penbutolol, and pindolol possess intrinsic sympathomimetic action (ISA) that may result in less bradycardia than other agents. Ophthalmic beta blockers decrease production of aqueous humor.

Contraindications

Uncompensated CHF (most beta blockers), acute bronchospasm, some forms of valvular heart disease, bradyarrhythmias, and heart block.

Precautions

Use cautiously in pregnant and lactating women (may cause fetal bradycardia and hyopoglycemia). Use cautiously in any form of lung disease or underlying compensated CHF (most agents). Use with caution in diabetics and patients with severe liver disease. Beta blockers should not be abruptly discontinued in patients with cardiovascular disease.

Interactions

May cause additive myocardial depression and bradycardia when used with other agents having these effects (digoxin and some antiarrhythmics). May antagonize the therapeutic effects of bronchodilators. May alter the requirements for insulin or hypoglyemic agents in diabetics. Cimetidine may decrease the metabolism and increase the effects of some beta blockers.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Migraine prophylaxis:** Assess frequency and severity of migraine headaches periodically throughout therapy.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).

Copyright © 2008 by F.A. Davis

- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- Take apical pulse prior to administering. If heart rate is <50 bpm or if arrhythmias occur, hold medication and notify health care professional.
- Many beta blockers are available in combination products to enhance compliance (see Appendix B).

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes to health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Caution patient that these medications may cause increased sensitivity to cold.
- Diabetics should monitor blood glucose closely, especially if weakness, malaise, irritability, or fatigue occurs.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Ophth:** Instruct patient in correct technique for administration of ophthalmic preparations.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Control of arrhythmias.
- Prevention of myocardial reinfarction.
- Prevention of migraine headaches.
- Decrease in tremors.
- Lowering of intraocular pressure.

• BONE RESORPTION INHIBITORS

PHARMACOLOGIC PROFILE

General Use

Bone resorption inhibitors are primarily used to treat and prevent osteoporosis in postmenopausal women. Other uses include treatment of osteoporosis due to other causes, including corticosteroid therapy, treatment of Paget's disease of the bone, and management of hypercalcemia.

General Action and Information

Biphosphonates (alendronate, etidronate, risedronate, and tiludronate) inhibit resorption of bone by inhibiting hydroxyapatite crystal dissolution and osteoclast activity. Raloxifene binds to estrogen receptors, producing estrogen-like effects on bone including decreased bone resorption and decreased bone turnover.

Contraindications

Hypersensitivity. Biphosphonates should not be used in patients with hypocalcemia. Raloxifene should not be used in women with childbearing potential or a history of thromboembolic disease.

Precautions

Use cautiously in patients with renal impairment; some agents should be avoided in moderate to severe renal impairment.

Interactions

Calcium supplements decrease absorption of biphosphonates. Tilundronate's effects may be altered by aspirin or other NSAIDs. Aspirin may increase GI adverse reactions with alendronate. Cholestyramine decreases absorption of raloxifene (concurrent use is contraindicated).

NURSING IMPLICATIONS

Assessment

- Assess patients for low bone density before and periodically during therapy.
- Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- **Lab Test Considerations:** Monitor serum calcium in patients with osteoporosis. Monitor alkaline phosphatase in patients with Paget's disease.

Potential Nursing Diagnoses

- Risk for injury (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis.

Evaluation/Desired Outcomes

- Prevention of, or decrease in, the progression of osteoporosis in postmenopausal women. Decrease in the progression of Paget's disease.

• BRONCHODILATORS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of reversible airway obstruction due to asthma or COPD. Recently revised recommendations for management of asthma recommend that rapid-acting inhaled beta-agonist bronchodilators (not salmeterol) be reserved as acute relievers of bronchospasm; repeated or chronic use indicates the need for additional long-term control agents, including inhaled corticosteroids, mast cell stabilizers, and long-acting bronchodilators (oral theophylline or beta-agonists) and leukotriene modifiers (montelukast, zafirlukast).

General Action and Information

Beta-adrenergic agonists (albuterol, epinephrine, isoproterenol, metaproterenol, pirbuterol, and terbutaline) produce bronchodilation by stimulating the production of cyclic adenosine monophosphate (cAMP). Newer agents (albuterol, metaproterenol, pirbuterol, and terbutaline) are relatively selective for pulmonary ($beta_2$) receptors, whereas older agents produce cardiac stimulation ($beta_2$-adrenergic effects) in addition to bronchodilation. Onset of action allows use in management of acute attacks except for salmeterol, which has delayed onset. Phosphodiesterase inhibitors (aminophylline and theophylline) inhibit the breakdown of cAMP. Ipratropium is an anticholinergic compound that produces bronchodilation by blocking the action of acetylcholine in the respiratory tract. Montelukast, zafirlukast, and zileuton are leukotriene modifiers. Leukotrienes are components of slow-reacting substance of anaphylaxis A (SRS-A), which may be a cause of bronchospasm.

Contraindications

Hypersensitivity to agents, preservatives (bisulfites), or propellants used in their formulation. Avoid use in uncontrolled cardiac arrhythmias.

Precautions

Use cautiously in patients with diabetes, cardiovascular disease, or hyperthyroidism.

Interactions

Therapeutic effectiveness may be antagonized by concurrent use of beta blockers. Additive sympathomimetic effects with other adrenergic (sympathetic) drugs, including vasopressors and decongestants. Cardiovascular effects may be potentiated by antidepressants and MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure, pulse, respiration, lung sounds, and character of secretions before and throughout therapy.
- Patients with a history of cardiovascular problems should be monitored for ECG changes and chest pain.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Activity intolerance (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Administer around the clock to maintain therapeutic plasma levels.

Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals.
- Encourage the patient to drink adequate liquids (2000 ml/day minimum) to decrease the viscosity of the airway secretions.
- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional and to minimize intake of xanthine-containing foods or beverages (colas, coffee, and chocolate), as these may increase side effects and cause arrhythmias.
- Caution patient to avoid smoking and other respiratory irritants.
- Instruct patient on proper use of metered-dose inhaler (see Appendix D).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Patients using other inhalation medications and bronchodilators should be advised to use bronchodilator first and allow 5 min to elapse before administering the other medication, unless otherwise directed by health care professional.

Evaluation/Desired Outcomes

- Decreased bronchospasm. Increased ease of breathing.

• CALCIUM CHANNEL BLOCKERS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of hypertension (amlodipine, diltiazem, felodipine, isradipine, nicardipine, nifedipine, nisoldipine, verapamil) or in the treatment and prophylaxis of angina pectoris or coronary artery spasm (amlodipine, diltiazem, felodipine, nicardipine, verapamil). Verapamil and diltiazem are also used as antiarrhythmics. Nimodipine is used to prevent neurologic damage due to certain types of cerebral vasospasm.

General Action and Information

Block calcium entry into cells of vascular smooth muscle and myocardium. Dilate coronary arteries in both normal and ischemic myocardium and inhibit coronary artery spasm. Diltiazem and

Copyright © 2008 by F.A. Davis

verapamil decrease AV conduction. Nimodipine has a relatively selective effect on cerebral blood vessels.

Contraindications

Hypersensitivity. Contraindicated in bradycardia, 2nd- or 3rd-degree heart block, or uncompensated CHF (verapamil).

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with liver disease or uncontrolled arrhythmias.

Interactions

Additive myocardial depression with beta blockers and disopyramide (diltiazem and verapamil). Effectiveness may be decreased by phenobarbital or phenytoin and increased by propranolol or cimetidine. Verapamil and diltiazem may increase serum digoxin levels and cause toxicity.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Arrhythmias:** ECG should be monitored continuously during IV therapy and periodically during long-term therapy with verapamil.
- **Cerebral vasospasm:** Assess patient's neurological status (level of consciousness, movement) before and periodically during therapy with nimodipine.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Acute pain (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- May be administered without regard to meals.
- Do not open, crush, or chew sustained-release capsules.

Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Instruct patient on the importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Copyright © 2008 by F.A. Davis

- **Angina:** Instruct patients on concurrent nitrate therapy to continue taking both medications as directed and using SL nitroglycerin as needed for anginal attacks. Advise patient to contact health care professional if chest pain worsens or does not improve after therapy, or is accompanied by diaphoresis or shortness of breath, or if severe, persistent headache occurs. Caution patient to discuss exercise precautions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of supraventricular tachyarrhythmias.
- Improvement in neurological deficits due to vasospasm following subarachnoid hemorrhage.

• CENTRAL NERVOUS SYSTEM STIMULANTS

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of narcolepsy and as adjunctive treatment in the management of ADHD.

General Action and Information

Produce CNS stimulation by increasing levels of neurotransmitters in the CNS. Produce CNS and respiratory stimulation, dilated pupils, increased motor activity and mental alertness, and a diminished sense of fatigue. In children with ADHD these agents decrease restlessness and increase attention span.

Contraindications

Hypersensitivity. Should not be used in pregnant or lactating women. Should not be used in hyperexcitable states. Avoid using in patients with psychotic personalities or suicidal/homicidal tendencies. Contraindicated in glaucoma and severe cardiovascular disease.

Precautions

Use cautiously in patients with a history of cardiovascular disease, hypertension, diabetes mellitus, or in elderly or debilitated patients. Continual use may result in psychological dependence or addiction.

Interactions

Additive sympathomimetic (adrenergic effects). Use with MAO inhibitors can result in hypertensive crises. Alkalinizing the urine (sodium bicarbonate, acetazolamide) decreases excretion and enhances effects of amphetamines. Acidification of the urine (ammonium chloride, large doses

Copyright © 2008 by F.A. Davis

of ascorbic acid) decreases effect of amphetamines. Phenothiazines may also decrease effects. Methylphenidate may decrease the metabolism and increase effects of other drugs (warfarin, anticonvulsants, tricyclic antidepressants).

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy.
- Monitor weight biweekly and inform health care professional of significant loss.
- Monitor height periodically in children; inform health care professional if growth inhibition occurs.
- May produce false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess attention span, impulse control, and interactions with others in children. Therapy may be interrupted at intervals to determine if symptoms are sufficient to warrant continued therapy.
- **Narcolepsy:** Observe and document frequency of episodes.

Potential Nursing Diagnoses

- Disturbed thought process (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Patient/Family Teaching

- Instruct patient not to alter dose without consulting health care professional. These medications have high dependence and abuse potential. Abrupt cessation with high doses may cause extreme fatigue and mental depression.
- Advise patient to avoid intake of large amounts of caffeine.
- Medication may impair judgment. Caution patient to avoid driving or other activities requiring judgment until response to medication is known.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence.

Evaluation/Desired Outcomes

- Decreased frequency of narcoleptic episodes.
- Improved attention span and social interactions.

dexmethylphenidate 398
dextroamphetamine 401, 1325
methylphenidate 808, 1325
modafinil 837

• CORTICOSTEROIDS

PHARMACOLOGIC PROFILE

General Use

Used in replacement doses (20 mg of hydrocortisone or equivalent) systemically to treat adrenocortical insufficiency. Larger doses are usually used for their antiinflammatory, immunosuppressive, or antineoplastic activity. Used adjunctively in many other situations, including hypercalcemia and autoimmune diseases. Topical corticosteroids are used in a variety of inflammatory and

Copyright © 2008 by F.A. Davis

allergic conditions. Inhalant corticosteroids are used in the chronic management of reversible airway disease (asthma); intranasal and ophthalmic corticosteroids are used in the management of chronic allergic and inflammatory conditions.

General Action and Information

Produce profound and varied metabolic effects, in addition to modifying the normal immune response and suppressing inflammation. Available in a variety of dosage forms, including oral, injectable, topical, and inhalation. Prolonged used of large amounts of topical or inhaled agent may result in systemic absorption and/or adrenal suppression.

Contraindications

Serious infections (except for certain forms of meningitis). Do not administer live vaccines to patients on larger doses.

Precautions

Prolonged treatment will result in adrenal suppression. Do not discontinue abruptly. Additional doses may be needed during stress (surgery and infection). Safety in pregnancy and lactation not established. Long-term use in children will result in decreased growth. May mask signs of infection. Use lowest dose possible for shortest time possible. Alternate-day therapy is preferable during long-term treatment.

Interactions

Additive hypokalemia with amphotericin B and potassium-losing diuretics. Hypokalemia may increase the risk of digoxin toxicity. May increase requirements for insulin or oral hypoglycemic agents. Phenytoin, phenobarbital, and rifampin stimulate metabolism and may decrease effectiveness. Oral contraceptives may block metabolism. Cholestyramine and colestipol may decrease absorption.

NURSING IMPLICATIONS

Assessment

- These drugs are indicated for many conditions. Assess involved systems prior to and periodically throughout course of therapy.
- Assess patient for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) prior to and periodically throughout course of therapy.
- Children should have periodic evaluations of growth.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Disturbed body image (Side Effects).

Implementation

- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- **PO:** Administer with meals to minimize gastric irritation.

Patient/Family Teaching

- Emphasize need to take medication exactly as directed. Review symptoms of adrenal insufficiency that may occur when stopping the medication and that may be life-threatening.
- Encourage patients on long-term therapy to eat a diet high in protein, calcium, and potassium and low in sodium and carbohydrates.
- These drugs cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections. Advise patient to consult health care professional before receiving any vaccinations.

Copyright © 2008 by F.A. Davis

- Discuss possible effects on body image. Explore coping mechanisms.
- Advise patient to carry identification in the event of an emergency in which patient cannot relate medical history.

Evaluation/Desired Outcomes

- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and organ transplants.
- Replacement therapy in adrenal insufficiency.
- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

• DIURETICS

PHARMACOLOGIC PROFILE

General Use

Thiazide diuretics and loop diuretics are used alone or in combination in the treatment of hypertension or edema due to CHF or other causes. Potassium-sparing diuretics have weak diuretic and antihypertensive properties and are used mainly to conserve potassium in patients receiving thiazide or loop diuretics. Osmotic diuretics are often used in the management of cerebral edema.

Copyright © 2008 by F.A. Davis

General Action and Information

Enhance the selective excretion of various electrolytes and water by affecting renal mechanisms for tubular secretion and reabsorption. Groups commonly used are thiazide diuretics and thiazide-like diuretics (chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, and metolazone), loop diuretics (bumetanide, furosemide, and torsemide), potassium-sparing diuretics (amiloride, spironolactone, and triamterene), and osmotic diuretics (mannitol). Mechanisms vary, depending on agent.

Contraindications

Hypersensitivity. Thiazide diuretics may exhibit cross-sensitivity with other sulfonamides.

Precautions

Use with caution in patients with renal or hepatic disease. Safety in pregnancy and lactation not established.

Interactions

Additive hypokalemia with corticosteroids, amphotericin B, piperacillin, or ticarcillin. Hypokalemia enhances digitalis glycoside toxicity. Potassium-losing diuretics decrease lithium excretion and may cause toxicity. Additive hypotension with other antihypertensives or nitrates. Potassium-sparing diuretics may cause hyperkalemia when used with potassium supplements or ACE inhibitors.

NURSING IMPLICATIONS

Assessment

- Assess fluid status throughout therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes.
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Notify health care professional promptly if these signs of electrolyte imbalance occur.
- **Hypertension:** Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving osmotic diuretics to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum uric acid levels before and periodically throughout course of therapy.
- Thiazide diuretics may cause increased serum cholesterol, low-density lipoprotein (LDL), and triglyceride concentrations.

Potential Nursing Diagnoses

- Excess fluid volume (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Administer oral diuretics in the morning to prevent disruption of sleep cycle.
- Many diuretics are available in combination with antihypertensives or potassium-sparing diuretics.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patients on antihypertensive regimen to continue taking medication, even if feeling better. Medication controls, but does not cure, hypertension.

Copyright © 2008 by F.A. Davis

- Caution patient to make position changes slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding dietary potassium guidelines.
- Instruct patient to monitor weight weekly and report significant changes.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, or numbness or tingling of extremities occurs.
- Emphasize the importance of routine follow-up.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, regular exercise, restricted sodium intake, stress reduction, moderation of alcohol consumption, and cessation of smoking).
- Instruct patients with hypertension in the correct technique for monitoring weekly blood pressure.

Evaluation/Desired Outcomes

- Decreased blood pressure.
- Increased urine output.
- Decreased edema.
- Reduced intracranial pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

• HORMONES

PHARMACOLOGIC PROFILE

General Use

Used in the treatment of deficiency states including diabetes (insulin), diabetes insipidus (desmopressin), hypothyroidism (thyroid hormones), and menopause (estrogens or estrogens/progestins). Estrogenic and progestational hormones are used as contraceptive agents in various combinations and sequences. Hormones may be used to treat hormonally sensitive tumors (androgens, estrogens) and in other selected situations. See individual drugs.

Copyright © 2008 by F.A. Davis

General Action and Information

Natural or synthetic substances that have a specific effect on target tissue. Differ greatly in their effects, depending on individual agent and function of target tissue.

Contraindications

Differ greatly among individual agents; see individual entries.

Precautions

Differ greatly among individual agents; see individual entries.

Interactions

Differ greatly among individual agents; see individual entries.

NURSING IMPLICATIONS

Assessment

- Monitor patient for symptoms of hormonal excess or insufficiency.
- **Sex Hormones:** Blood pressure and hepatic function tests should be monitored periodically throughout therapy.

Potential Nursing Diagnoses

- Sexual dysfunction (Indications).
- Disturbed body image (Indications, Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- **Sex Hormones:** During hospitalization, continue to administer according to schedule followed prior to hospitalization.

Patient/Family Teaching

- Explain dose schedule (and withdrawal bleeding with female sex hormones).
- Emphasize the importance of follow-up exams to monitor effectiveness of therapy and to ensure proper development of children and early detection of possible side effects.
- **Female Sex Hormones:** Advise patient to report signs and symptoms of fluid retention, thromboembolic disorders, mental depression, or hepatic dysfunction to health care professional.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of hormone imbalance including menopause symptoms and contraception.
- Correction of fluid and electrolyte imbalances.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Slowed progression of postmenopausal osteoporosis.

• IMMUNOSUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Azathioprine, basiliximab, cyclosporine, daclizumab, mycophenolate, sirolimus, and tacrolimus are used with corticosteroids in the prevention of transplantation rejection reactions. Muromonab-CD3 is used to manage rejection reactions not controlled by other agents. Azathioprine, cyclophosphamide, and methotrexate are used in the management of selected autoimmune diseases (nephrotic syndrome of childhood and severe rheumatoid arthritis).

General Action and Information

Inhibit cell-mediated immune responses by different mechanisms. In addition to azathioprine and cyclosporine, which are used primarily for their immunomodulating properties, cyclophosphamide and methotrexate are used to suppress the immune responses in certain disease states (nephrotic syndrome of childhood and severe rheumatoid arthritis). Muromonab-CD3 is a recombinant immunoglobulin antibody that alters T-cell function. Basiliximab and daclizumab are monoclonal antibodies.

Copyright © 2008 by F.A. Davis

Contraindications

Hypersensitivity to drug or vehicle.

Precautions

Use cautiously in patients with infections. Safety in pregnancy and lactation not established.

Interactions

Allopurinol inhibits the metabolism of azathioprine. Drugs that alter liver-metabolizing processes may change the effect of cyclosporine. The risk to toxicity of methotrexate may be increased by other nephrotoxic drugs, large doses of aspirin, or NSAIDs. Muromonab-CD3 has additive immunosuppressive properties; concurrent immunosuppressive doses should be decreased or eliminated.

NURSING IMPLICATIONS

Assessment

- Monitor for infection (vital signs, sputum, urine, stool, WBC). Notify physician or other health care professional immediately if symptoms occur.
- **Organ Transplant:** Assess for symptoms of organ rejection throughout therapy.
- **Lab Test Consideration:** Monitor CBC and differential throughout therapy.

Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Protect transplant patients from staff and visitors who may carry infection.
- Maintain protective isolation as indicated.

Patient/Family Teaching

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to avoid contact with contagious persons and those who have recently taken oral polio virus vaccine. Patients should not receive vaccinations without first consulting with health care professional.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention or reversal of rejection of organ transplants or decrease in symptoms of autoimmune disorders.

• LAXATIVES

PHARMACOLOGIC PROFILE

General Use

Used to treat or prevent constipation or to prepare the bowel for radiologic or endoscopic procedures.

General Action and Information

Induce one or more bowel movements per day. Groups include stimulants (bisacodyl, sennosides), saline laxatives (magnesium salts and phosphates), stool softeners (docusate), bulk-forming agents (polycarbophil and psyllium), and osmotic cathartics (lactulose, polyethylene glycol/electrolyte). Increasing fluid intake, exercising, and adding more dietary fiber are also useful in the management of chronic constipation.

Contraindications

Hypersensitivity. Contraindicated in persistent abdominal pain, nausea, or vomiting of unknown cause, especially if accompanied by fever or other signs of an acute abdomen.

Precautions

Excessive or prolonged use may lead to dependence. Should not be used in children unless advised by a physician or other health care professional.

Interactions

Theoretically may decrease the absorption of other orally administered drugs by decreasing transit time.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

- Constipation (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Many laxatives may be administered at bedtime for morning results.
- Taking oral doses on an empty stomach will usually produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.
- Stool softeners and bulk laxatives may take several days for results.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to a minimum of 1500–2000 ml/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation: increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that laxatives should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- A soft, formed bowel movement.
- Evacuation of the colon.

Laxatives included in *Davis's Drug Guide for Nurses*

bulk-forming agents
polycarbophil 1289
psyllium 1035

osmotics

• LIPID-LOWERING AGENTS

PHARMACOLOGIC PROFILE

General Use

Used as a part of a total plan including diet and exercise to reduce blood lipids in an effort to reduce the morbidity and mortality of atherosclerotic cardiovascular disease and its sequelae.

General Action and Information

HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin) inhibit an enzyme involved in cholesterol synthesis. Bile acid sequestrants (cholestyramine, colestipol, colesevelam) bind cholesterol in the GI tract. Fenofibrate, niacin, and gemfibrozil act by other mechanisms (see individual monographs).

Contraindications

Hypersensitivity.

Precautions

Safety in pregnancy, lactation, and children not established. See individual drugs. Dietary therapy should be given a 2–3 mo trial before drug therapy is initiated.

Interactions

Bile acid sequestrants (cholestyramine and colestipol) may bind lipid-soluble vitamins (A, D, E, and K) and other concurrently administered drugs in the GI tract. The risk of myopathy from HMG-CoA reductase inhibitors is increased by niacin, erythromycin, gemfibrozil, and cyclosporine.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially in regard to **fat** and alcohol consumption.
- **Lab Test Considerations:** Serum cholesterol and triglyceride levels should be evaluated before initiating and periodically throughout therapy. Medication should be discontinued if paradoxical increase in cholesterol level occurs.
- Liver function tests should be assessed before and periodically throughout therapy. May cause an increase in levels.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

Implementation

- See specific medications to determine timing of doses in relation to meals.

Patient/Family Teaching

- Advise patient that these medications should be used in conjunction with diet restrictions (**fat, cholesterol, carbohydrates,** and alcohol), exercise, and cessation of smoking.

Evaluation/Desired Outcomes

- Decreased serum triglyceride and LDL **cholesterol** levels and improved HDL cholesterol ratios. Therapy is usually discontinued if the clinical response is not evident after 3 mo of therapy.

• MINERALS/ELECTROLYTES/PH MODIFIERS

PHARMACOLOGIC PROFILE

General Use

Prevention and treatment of deficiencies or excesses of electrolytes and maintenance of optimal acid/base balance for homeostasis. Acidifiers and alkalinizers are also used to promote urinary excretion of substances that accumulate in certain disease states (kidney stones, uric acid).

General Action and Information

Electrolytes and minerals are necessary for many body processes. Maintenance of electrolyte levels within normal limits is required for many physiological processes such as cardiac, nerve, and muscle function; bone growth and stability; and a number of other activities. Minerals and electrolytes may also serve as catalysts in many enzymatic reactions. Acid/base balance allows for normal transfer of substances at the cellular and intracellular level.

Contraindications

Contraindicated in situations in which replacement would cause excess or when risk factors for retention are present.

Precautions

Use cautiously in disease states in which electrolyte imbalances are common such as significant hepatic or renal disease, adrenal or pituitary disorders.

Copyright © 2008 by F.A. Davis

Interactions

Depend on individual agents. Alkalinizers and acidifiers can alter the excretion of drugs for which elimination is pH dependent. See specific entries.

NURSING IMPLICATIONS

Assessment

- Observe patient carefully for evidence of electrolyte excess or insufficiency. Monitor lab values before and periodically throughout therapy.

Potential Nursing Diagnoses

- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

Implementation

- **Potassium Chloride:** Do not administer potassium chloride undiluted.

Patient/Family Teaching

- Review diet modifications with patients with chronic electrolyte disturbances.

Evaluation/Desired Outcomes

- Return to normal serum electrolyte concentrations and resolution of clinical symptoms of electrolyte imbalance.
- Changes in pH or composition of urine, which prevent formation of renal calculi.

• NATURAL/HERBAL PRODUCTS

PHARMACOLOGIC PROFILE

General Use

These remedies are used for a wide variety of conditions. Prescriptions are not required and consumers have the choice of many products.

General Action and Information

Use of these agents is based on historical and sometimes anecdotal evidence. The FDA has little control over these agents, so currently there is little standardization among products.

Contraindications

Hypersensitivity. Most products are plant extracts that may contain a variety of impurities.

Precautions

Elderly, pediatric, and pregnant or lactating patients should be aware that these agents carry many of the same risks as prescription medications. Patients with serious chronic medical conditions should consult their health care professional before use.

Interactions

These agents have the ability to interact with prescription medications and may prevent or augment a desired therapeutic outcome. St. John's wort and kava-kava have the greatest risk for serious interactions.

NURSING IMPLICATIONS

Assessment

- Assess the condition for which the patient is taking the product.

Potential Nursing Diagnoses

- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Patient/Family Teaching

- Discuss with patient the reason for using the product. Encourage patient to choose products with USP label, if possible, to guarantee content and purity of medication.
- Inform patient of known side effects and interactions with other medications.

Evaluation/Desired Outcomes

- Improvement in condition for which medication was taken.

Natural/Herbal Products included in *Davis's Drug Guide for Nurses*

arnica 1297
black cohosh 1298

• NONOPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use

Used to control mild to moderate pain and/or fever. Phenazopyridine is used only to treat urinary tract pain, and capsaicin is used topically for a variety of painful syndromes.

General Action and Information

Most nonopioid analgesics inhibit prostaglandin synthesis peripherally for analgesic effect and centrally for antipyretic effect. Tramadol is a centrally acting agent.

Contraindications

Hypersensitivity and cross-sensitivity among NSAIDs may occur.

Precautions

Use cautiously in patients with severe hepatic or renal disease, chronic alcohol use/abuse, or malnutrition. Tramadol has CNS depressant properties.

Interactions

Long-term use of acetaminophen with NSAIDs may increase the risk of adverse renal effects. Prolonged high-dose acetaminophen may increase the risk of bleeding with warfarin. Hepatotoxicity may be additive with other hepatotoxic agents, including alcohol. NSAIDs increase the risk of bleeding with warfarin, thrombolytic agents, antiplatelet agents, some cephalosporins, and valproates (effect is greatest with aspirin). NSAIDs may also decrease the effectiveness of diuretics and antihypertensives. The risk of CNS depression with tramadol is increased by concurrent use of other CNS depressants, including alcohol, antihistamines, sedative/hypnotics, and some antidepressants.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Hepatic, hematologic, and renal function should be evaluated periodically throughout prolonged high-dose therapy. Aspirin and most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- **PO:** Administer salicylates and NSAIDs after meals or with food or an antacid to minimize gastric irritation.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take salicylates and NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patients on long-term therapy to inform health care professional of medication regimen prior to surgery. Aspirin, salicylates, and NSAIDs may need to be withheld prior to surgery.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Reduction of fever.

• NONSTEROIDAL ANTI-INFLAMMATORY AGENTS

PHARMACOLOGIC PROFILE

General Use

NSAIDs are used to control mild to moderate pain, fever, and various inflammatory conditions, such as rheumatoid arthritis and osteoarthritis. Ophthalmic NSAIDs are used to decrease postoperative ocular inflammation, to inhibit perioperative miosis, and to decrease inflammation due to allergies.

General Action and Information

NSAIDs have analgesic, antipyretic, and anti-inflammatory properties. Analgesic and anti-inflammatory effects are due to inhibition of prostaglandin synthesis. Antipyretic action is due to vasodilation and inhibition of prostaglandin synthesis in the CNS. COX-2 inhibitors (celecoxib) may cause less GI bleeding.

Contraindications

Hypersensitivity to aspirin is a contraindication for the whole group of NSAIDs. Cross-sensitivity may occur.

Copyright © 2008 by F.A. Davis

Precautions

Use cautiously in patients with a history of bleeding disorders, GI bleeding, and severe hepatic, renal, or cardiovascular disease. Safe use in pregnancy is not established and, in general, should be avoided during the second half of pregnancy.

Interactions

NSAIDs prolong bleeding time and potentiate the effect of warfarin, thrombolytic agents, some cephalosporins, antiplatelet agents, and valproates. Prolonged use with aspirin may result in increased GI side effects and decreased effectiveness. NSAIDs may also decrease response to diuretics or antihypertensive therapy. Ibuprofen negates the cardioprotective benefits of low-dose aspirin. COX-2 inhibitors do not negate the cardioprotective effect of low-dose aspirin.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged PT. Monitor periodically in prolonged high-dose therapy to assess for GI blood loss.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- **PO:** Administer NSAIDs after meals or with food or an antacid to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patient on long-term therapy to inform health care professional of medication regimen prior to surgery. NSAIDs may need to be withheld prior to surgery.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Reduction of fever.

• OPIOID ANALGESICS

PHARMACOLOGIC PROFILE

General Use

Management of moderate to severe pain. Fentanyl is also used as a general anesthetic adjunct.

General Action and Information

Opioids bind to opiate receptors in the CNS, where they act as agonists of endogenously occurring opioid peptides (eukephalins and endorphins). The result is alteration to the perception of and response to pain.

Contraindications

Hypersensitivity to individual agents.

Precautions

Use cautiously in patients with undiagnosed abdominal pain, head trauma or pathology, liver disease, or history of addiction to opioids. Use smaller doses initially in the elderly and those with respiratory diseases. Prolonged use may result in tolerance and the need for larger doses to relieve pain. Psychological or physical dependence may occur.

Interactions

Increases the CNS depressant properties of other drugs, including alcohol, antihistamines, antidepressants, sedative/hypnotics, phenothiazines, and MAO inhibitors. Use of partial-antagonist opioid analgesics (buprenorphine, butorphanol, nalbuphine, and pentazocine) may precipitate opioid withdrawal in physically dependent patients. Use with MAO inhibitors or procarbazine may result in severe paradoxical reactions (especially with meperidine). Nalbuphine or pentazocine may decrease the analgesic effects of other concurrently administered opioid analgesics.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and at peak following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring higher doses of opioid agonist-antagonists should be converted to an opioid agonist.
- Opioid agonist-antagonists are not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient

Copyright © 2008 by F.A. Davis

to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.

- Assess prior analgesic history. Antagonistic properties of agonist-antagonists may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with chronic therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, stool softeners, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Monitor intake and output ratios. If significant discrepancies occur, assess for urinary retention and inform physician or other health care professional.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Disturbed sensory perception (auditory, visual) (Side Effects).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Do not confuse morphine with hydromorphone or meperidine; errors have resulted in fatalities.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decreased severity of pain without a significant alteration in level of consciousness or respiratory status.

• SEDATIVE/HYPNOTICS

PHARMACOLOGIC PROFILE

General Use

Sedatives are used to provide sedation, usually prior to procedures. Hypnotics are used to manage insomnia. Selected agents are useful as anticonvulsants (clorazepate, diazepam, phenobarbital), skeletal muscle relaxants (diazepam), adjuncts in the management of alcohol withdrawal syndrome (chlordiazepoxide, diazepam, oxazepam), as adjuncts in general anesthesia (droperidol) or amnestics (midazolam, diazepam).

General Action and Information

Cause generalized CNS depression. May produce tolerance with chronic use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

Contraindications

Hypersensitivity. Should not be used in comatose patients nor in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

Precautions

Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease. Use with caution in patients who may be suicidal or who may have had previous drug addictions. Hypnotic use should be short-term. Geriatric patients may be more sensitive to CNS depressant effects; dosage reduction may be required.

Interactions

Additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines. Barbiturates induce hepatic drug-metabolizing enzymes and can decrease the effectiveness of drugs metabolized by the liver, including oral contraceptives. Should not be used with MAO inhibitors.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiratory status frequently throughout IV administration. Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Insomnia:** Assess sleep patterns before and periodically throughout course of therapy.
- **Seizures:** Observe and record intensity, duration, and characteristics of seizure activity. Institute seizure precautions.

Copyright © 2008 by F.A. Davis

- **Muscle Spasms:** Assess muscle spasms, associated pain, and limitation of movement before and throughout therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.

Potential Nursing Diagnoses

- Imsomnia (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Supervise ambulation and transfer of patients following administration of hypnotic doses. Remove cigarettes. Side rails should be raised and call bell within reach at all times. Keep bed in low position.

Patient/Family Teaching

- Discuss the importance of preparing the environment for sleep (dark room, quiet, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not increase dose. Gradual withdrawal may be required to prevent reactions following prolonged therapy.
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Improvement in sleep patterns.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness.
- More rational ideation when used for alcohol withdrawal.

• SKELETAL MUSCLE RELAXANTS

PHARMACOLOGIC PROFILE

General Use

Two major uses are spasticity associated with spinal cord diseases or lesions (baclofen and dantrolene) or adjunctive therapy in the symptomatic relief of acute painful musculoskeletal conditions (cyclobenzaprine, diazepam, and methocarbamol). IV dantrolene is also used to treat and prevent malignant hyperthermia.

General Action and Information

Act either centrally (baclofen, carisoprodol, cyclobenzaprine, diazepam, and methocarbamol) or directly (dantrolene).

Contraindications

Baclofen and oral dantrolene should not be used in patients in whom spasticity is used to maintain posture and balance.

Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with a history of previous liver disease.

Interactions

Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, and sedative/hypnotics.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Impaired physical mobility (Indications).
- Risk for injury (Side Effects).

Implementation

- Provide safety measures as indicated. Supervise ambulation and transfer of patients.

Patient/Family Teaching

- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with these medications.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain.
- Decreased muscle spasticity.
- Increased range of motion.
- Prevention or decrease in temperature and skeletal rigidity in malignant hyperthermia.

baclofen 213
carisoprodol 268
chlorzoxazone 305
cyclobenzaprine 360, 1325
diazepam 404
metaxalone 792
methocarbamol 799
orphenadrine 915

direct-acting
dantrolene 374

• THROMBOLYTICS

PHARMACOLOGIC PROFILE

General Use

Acute management of coronary thrombosis (MI). Streptokinase and urokinase are used in the management of massive pulmonary emboli, deep vein thrombosis, and arterial thromboembolism. Alteplase is used in the management of acute ischemic stroke.

General Action and Information

Converts plasminogen to plasmin, which then degrades fibrin in clots. Alteplase, reteplase, and urokinase directly activate plasminogen. Streptokinase binds with plasminogen to form activator complexes, which then convert plasminogen to plasmin. Results in lysis of thrombi in coronary arteries, pulmonary emboli, or deep vein thrombosis, or clearing of clots in cannulae/catheters.

Contraindications

Hypersensitivity. Cross-sensitivity with streptokinase may occur. Contraindicated in active internal bleeding, history of cerebrovascular accident, recent CNS trauma or surgery, neoplasm, or arteriovenous malformation. Severe uncontrolled hypertension and known bleeding tendencies.

Precautions

Recent (within 10 days) major surgery, trauma, GI or GU bleeding. Severe hepatic or renal disease. Subacute bacterial endocarditis or acute pericarditis. Use cautiously in geriatric patients. Safety not established in pregnancy, lactation, or children.

Interactions

Concurrent use with aspirin, NSAIDs, warfarin, heparins, ticlopidine, or dipyridamole may increase the risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may also be increased by concurrent use with cefotetan, cefoperazone, and valproic acid.

NURSING IMPLICATIONS

Assessment

- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor blood pressure.
- Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy. Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (decreased neurologic status; abdominal pain with coffee-ground emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify physician immediately.
- Inquire about previous reaction to streptokinase therapy. Assess patient for hypersensitivity reaction (rash, dyspnea, fever, changes in facial color, swelling around the eyes, wheezing). If

Copyright © 2008 by F.A. Davis

these occur, inform physician promptly. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Inquire about recent streptococcal infection. Streptokinase may be less effective if administered between 5 days and 6 mo of a streptococcal infection.
- Assess neurologic status throughout therapy.
- Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Coronary Thrombosis:** Monitor ECG continuously. Notify physician if significant arrhythmias occur. IV lidocaine or procainamide (Pronestyl) may be ordered prophylactically. Cardiac enzymes should be monitored. Radionuclide myocardial scanning and/or coronary angiography may be ordered 7–10 days following therapy to monitor effectiveness of therapy.
- Monitor heart sounds and breath sounds frequently. Inform physician if signs of CHF occur (rales/crackles, dyspnea, S3 heart sound, jugular venous distention, relieved CVP).
- **Pulmonary Embolism:** Monitor pulse, blood pressure, hemodynamics, and respiratory status (rate, degree of dyspnea, arterial blood gases).
- **Deep Vein Thrombosis/Acute Arterial Occlusion:** Observe extremities and palpate pulses of affected extremities every hour. Notify physician immediately if circulatory impairment occurs. Computed tomography, impedance plethysmography, quantitative Doppler effect determination, and/or angiography or venography may be used to determine restoration of blood flow and duration of therapy; however, repeated venograms are not recommended.
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3 hr of onset.
- **Lab Test Considerations:** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP/fdp) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time may be evaluated prior to and frequently throughout therapy. Bleeding time may be assessed prior to therapy if patient has received platelet aggregation inhibitors. Obtain type and cross match and have blood available at all times in case of hemorrhage. Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.
- **Toxicity and Overdose:** If local bleeding occurs, apply pressure to site. If severe or internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran, as it has antiplatelet activity. Aminocaproic acid (Amicar) may be used as an antidote.

Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- This medication should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines prior to therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Systemic anticoagulation with heparin is usually begun several hours after the completion of thrombolytic therapy.

Copyright © 2008 by F.A. Davis

- Acetaminophen may be ordered to control fever.

Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.

Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow.
- Prevention of neurologic sequelae in acute ischemic stroke.
- Cannula or catheter patency.

Thrombolytics included in *Davis's Drug Guide for Nurses*

alteplase 1164
reteplase 1164
streptokinase 1164
tenecteplase 1164
urokinase 1164

• VACCINES/IMMUNIZING AGENTS

PHARMACOLOGIC PROFILE

General Use

Immune globulins provide passive immunization to infectious diseases by providing antibodies. Immunization with vaccines and toxoids containing bacterial or viral antigenic material results in endogenous production of antibodies.

General Action and Information

Immunity from immune globulins is rapid, but short-lived (up to 3 months). Active immunization with vaccine or toxoids produces prolonged immunity (years).

Contraindications

Hypersensitivity to product, preservatives, or other additives. Some products contain thimerisol, neomycin, and/or **egg protein.**

Precautions

Severe bleeding problems (IM injections).

Interactions

Decreased antibody response to vaccine/toxoids and increased risk of adverse reactions in patients receiving concurrent antineoplastic, immunosuppressive, or radiation therapy.

NURSING IMPLICATIONS

Assessment

- Assess previous immunization history and history of hypersensitivity.

Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Measles, mumps, and rubella vaccine, trivalent oral polio virus vaccine, and diptheria toxoid, tetanus toxoid, and pertussis vaccine may be given concurrently.
- Administer each immunization by appropriate route.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Inform patient/parent of potential and reportable side effects of immunization. Health care professional should be notified if patient develops fever over 39.4°C (103°F); difficulty breathing; hives; itching; swelling of the eyes, face, or inside of nose; sudden severe tiredness or weakness; or convulsions occur.
- Review next scheduled immunization with parent. Emphasize the importance of keeping a record of immunizations and dates given.

Evaluation/Desired Outcomes

- Prevention of diseases through active immunity.

Vaccines/immunizing agents included in *Davis's Drug Guide for Nurses*

immune globulins

botulism immune globulin 1272
cytomegalovirus immune globulin 1276
Rh_0(D) immune globulin standard dose IM 1060
Rh_0(D) globulin IV 98
Rh_0(D) globulin microdose IM 98

miscellaneous

quadravalent human papillomavirus (types 6, 11, 16, 18) recombinant vaccine 98
zoster vaccine, live 1265

• VASCULAR HEADACHE SUPPRESSANTS

PHARMACOLOGIC PROFILE

General Use

Used for acute treatment of vascular headaches (migraine, cluster headaches, migraine variants). Other agents such as some beta blockers and some calcum channel blockers are used for suppression of frequently occurring vascular headaches.

General Action and Information

Ergot derivatives (ergotamine, dihydroergotamine) directly stimulate alpha-adrenergic and serotonergic receptors, producing vascular smooth muscle vasoconstriction. Almotriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan produce vasoconstriction by acting as serotonin ($5\text{-}HT_1$) agonists.

Contraindications

Avoid using these agents in patients with ischemic cardiovascular disease.

Precautions

Use cautiously in patients with a history of or risk for cardiovascular disease.

Interactions

Avoid concurrent use of ergot derivative agents with serotonin agonist agents; see also individual agents.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack and frequency of attacks.

Potential Nursing Diagnoses

- Acute pain (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Copyright © 2008 by F.A. Davis

Implementation

- Medication should be administered at the first sign of a headache.

Patient/Family Teaching

- Inform patient that medication should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient that lying down in a darkened room following medication administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches.

Evaluation/Desired Outcomes

- Relief of migraine attack.

sumatriptan 1129
zolmitriptan 1261

miscellaneous
divalproex sodium 1212
valproate sodium 1212
valproic acid 1212
verapamil 1224

• VITAMINS

PHARMACOLOGIC PROFILE

General Use

Used in the prevention and treatment of vitamin deficiencies and as supplements in various metabolic disorders.

General Action and Information

Serve as components of enzyme systems that catalyze numerous varied metabolic reactions. Necessary for homeostasis. Water-soluble vitamins (B-vitamins and vitamin C) rarely cause toxicity. Fat-soluble vitamins (vitamins D and E) may accumulate and cause toxicity.

Contraindications

Hypersensitivity to additives, preservatives, or colorants.

Precautions

Dose should be adjusted to avoid toxicity, especially for fat-soluble vitamins.

Interactions

Pyridoxine in large amounts may interfere with the effectiveness of levodopa. Cholestyramine, colestipol, and mineral oil decrease absorption of fat-soluble vitamins.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin deficiency before and periodically throughout therapy.

Copyright © 2008 by F.A. Davis

- Assess nutritional status through 24-hr diet recall. Determine frequency of consumption of vitamin-rich foods.

Potential Nursing Diagnoses

- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching).

Implementation

- Because of infrequency of single vitamin deficiencies, combinations are commonly administered.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of physician or other health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDAs. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects and toxicity.

Evaluation/Desired Outcomes

- Prevention of or decrease in the symptoms of vitamin deficiencies.

Vitamins included in *Davis's Drug Guide for Nurses*

fat-soluble vitamins
calcitriol 1236
doxercalciferol 1236
ergocalciferol 1236

pyridoxine 1039
riboflavin 1291
thiamine 1160
hydroxocobalamin 1233

• WEIGHT CONTROL AGENTS

PHARMACOLOGIC PROFILE

General Use

These agents are used in the management of exogenous obesity as part of a regimen including a reduced-calorie diet. They are especially useful in the presence of other risk factors including hypertension, diabetes or dyslipidemias.

General Action and Information

Phentermine and sibutramine are anorexiants that are designed to decrease appetite via their action in the CNS. Orlistat is a lipase inhibitor that decreases absorption of dietary fat.

Contraindications

None of these agents should be used during pregnancy or lactation. Phentermine and sibutramine should not be used in patients with severe hepatic or renal disease, uncontrolled hypertension, known CHF, or cardiovascular disease. Orlistat should not be used in patients with chronic malabsorption.

Copyright © 2008 by F.A. Davis

Precautions

Phentermine and sibutramine should be used cautiously in patients with a history of seizures, or angle-closure glaucoma and in geriatric patients.

Interactions

Phentermine and sibutramine may have additive, adverse effects with CNS stimulants, some vascular headache suppressants, MAO inhibitors, and some opioids (concurrent use should be avoided). Orlistat reduces absorption of some fat-soluble vitamins and beta-carotene.

NURSING IMPLICATIONS

Assessment

- Monitor weight and dietary intake prior to and periodically during therapy. Adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

Potential Nursing Diagnoses

- Disturbed body image (Indications).
- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

Patient/Family Teaching

- Advise patient that regular physical activity, approved by healthcare professional, should be used in conjunction with medication and diet.

Evaluation/Desired Outcomes

- Slow, consistent weight loss when combined with a reduced-calorie diet.

Weight control agents included in *Davis's Drug Guide for Nurses*

PEDIATRIC INTRAVENOUS MEDICATION QUICK REFERENCE CHART

Risk of fluid overload in infants and children is always a consideration when administering IV medications. The following table provides maximum concentrations—the smallest amount of fluid necessary for diluting specific medications—and the maximum rate at which the medications can be given.

Drug	Maximum Concentration	Maximum Rate
acetazolamide	100 mg/ml	500 mg/min
acyclovir	10 mg/ml	Give over 1 hr
adenosine	3 mg/ml	Give over 1-2 sec
allopurinol	6 mg/ml	Give over 15-20 min
amikacin	10 mg/ml	Give over 30 min
aminocaproic acid	20 mg/ml	Give over 1 hr
aminophylline	25 mg/ml	25 mg/min
amphotericin B	0.1 mg/ml (peripherally) 0.5 mg/ml (centrally)	Give over 2-6 hr
amphotericin B liposomal	2 mg/ml	Give over 2 hr
ampicillin	100 mg/ml	10 mg/kg/min
ampicillin/sulbactam	45 mg/ml	Give over 15-30 min
atropine	1 mg/ml	Give over 1 min
azithromycin	2 mg/ml	Give over 1 hr
bumetanide	0.25 mg/ml	Give over 1-2 min
calcitriol	2 mcg/ml	Give over 15 sec
calcium chloride	100 mg/ml	100 mg/min
calcium gluconate	100 mg/ml	100 mg/min
cefazolin	138 mg/ml (IVP) 20 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-60 min
cefepime	160 mg/ml	Give over 30 min
cefotaxime	< 200 mg/ml (IVP) 60 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-30 min
cefoxitin	180 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 15-40 min
ceftazidime	200 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-30 min
ceftriaxone	40 mg/ml	Give over 10-30 min
cefuroxime	100 mg/ml (IVP) 30 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 15-60 min
chlorpromazine	1 mg/ml	0.5 mg/min
ciprofloxacin	2 mg/ml	Give over 60 min
clindamycin	18 mg/ml	30 mg/min
cyclosporine	2.5 mg/ml	Give over 2-8 hr
dexamethasone	10 mg/ml	Doses <10 mg: Give over 1-4 min Doses >10 mg: Give over 10-20 min
diazepam	5 mg/ml	2 mg/min
diazoxide	15 mg/ml	Give over 30-60 min
digoxin	100 mcg/ml	Give over 5 min
diphenhydramine	50 mg/ml	25 mg/min
doxycycline	1 mg/ml	Give over 1 hr
enalaprilat	1.25 mg/ml	Give over 5 min
erythromycin	5 mg/ml	Give over 20-120 min
famotidine	4 mg/ml	Give over 2-10 min
fentanyl	50 mcg/ml	Give over 1-3 min
fluconazole	2 mg/ml	Give over 1-2 hr
flumazenil	0.1 mg/ml	Give over 15-30 sec
fosphenytoin	25 mg/ml	3 mg/kg/min
furosemide	10 mg/ml	0.5 mg/kg/min
ganciclovir	10 mg/ml	Give over 1 hr
gentamicin	40 mg/ml	Give over 30 min
glycopyrrolate	0.2 mg/ml	Give over 5-10 sec
granisetron	50 mcg/ml	Give over 2-60 min
hydralazine	20 mg/ml	5 mg/min or 0.2 mg/kg/min

Copyright © 2008 by F.A. Davis

Drug	Maximum Concentration	Maximum Rate
hydrocortisone	50 mg/ml (IVP) 5 mg/ml (Intermittent infusion)	Give over 1-10 min Give over 20-30 min
imipenem/cilastatin	7 mg/ml	Give over 20-60 min
inamrinone	5 mg/ml	Give over 2-3 min
indomethacin	1 mg/ml	Give over 20-35 min
kanamycin	6 mg/ml	Give over 30-60 min
ketamine	50 mg/ml (IVP) 2 mg/ml (Intermittent infusion)	2 mg/min or 0.5 mg/kg/min 2 mg/min or 0.5 mg/kg/min
ketorolac	30 mg/ml	Give over 1-5 min
labetalol	5 mg/ml	2 mg/min
levocarnitine	200 mg/ml	Give over 2-3 min
levothyroxine	100 mcg/ml	Give over 2-3 min
lorazepam	4 mg/ml	2 mg/min or 0.05 mg/kg over 2-5 min
magnesium sulfate	60 mg/ml	1 mEq/kg/hr (125 mg/kg/hr)
meperidine	10 mg/ml	Give over 5 min
meropenem	50 mg/ml	Give over 15-30 min
methylprednisolone	125 mg/ml (IVP) 2.5 mg/ml (Intermittent infusion)	Give over 1-30 min Give over 20-60 min
metoclopramide	5 mg/ml	Give over 1-2 min
metronidazole	8 mg/ml	Give over 1 hr
midazolam	5 mg/ml	Give over 20-30 sec (5 min in neonates)
milrinone	1 mg/ml	Give over 10 min
morphine	5 mg/ml	Give over 4-5 min
nafcillin	100 mg/ml	Give over 15-60 min
naloxone	1 mg/ml	Give over 30 sec
ondansetron	2 mg/ml	Give over 2-15 min
oxacillin	100 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 10 min Give over 15-30 min
pancuronium	2 mg/ml	Give over seconds
penicillin g	50,000 units/ml (neonates/infants) 500,000 units/ml (children)	Give over 15-30 min
pentamidine	2.5 mg/ml	Give over 1-2 hr
pentobarbital	50 mg/ml	Give over 10-30 min
phenobarbital	130 mg/ml	2 mg/kg/min
phenytoin	50 mg/ml	3 mg/kg/min
phytonadione	10 mg/ml	Give over 15-30 min
piperacillin	200 mg/ml (IVP) 20 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 20-60 min
piperacillin/tazobactam	20 mg/ml	Give over 30 min
potassium chloride	80 mEq/L (peripherally) 200 mEq/L (centrally)	1 mEq/kg/hr
promethazine	25 mg/ml	< 25 mg/min
propranolol	1 mg/ml	Give over 10-15 min
protamine	10 mg/ml	5 mg/min
ranitidine	2.5 mg/ml	10 mg/min
rifampin	6 mg/ml	Give over 30 min
tacrolimus	0.02 mg/ml	Give over 4-24 hr
terbutaline	1 mg/ml	Give over 5-10 min
ticarcillin	100 mg/ml	Give over 10-120 min
ticarcillin/clavulanate	100 mg/ml	Give over 10-60 min
tobramycin	40 mg/ml	Give over 30 min
trimethoprim/sulfamethoxazole	1 ml drug per 10 ml diluent	Give over 1-1.5 hr
valproate sodium	50 mg/ml	2-6 mg/kg/min
vancomycin	5 mg/ml	Give over 60 min
vasopressin	1 unit/ml	Give over 5-30 min
verapamil	2.5 mg/ml	Give over 30-60 sec
zidovudine	4 mg/ml	Give over 30-60 min

BEERS CRITERIA

The Beers criteria for potentially inappropriate medication use in adults 65 years and older in the United States is a compilation of drugs and drug classes found to increase the risk of adverse events in older adults. Frequently, older adults are more sensitive to the medications or their side effects. The potential for adverse events can be minimized by prescribing safer alternatives or prescribing at the lowest effective dose.

alprazolam (Xanax)	fluoxetine (Prozac)
amiodarone (Cordarone)	flurazepam (Dalmane)
amitriptyline (Elavil)	guanadrel (Hylorel)
amphetamines	halazepam (Paxipam)
anorexic agents	halazepam (Paxipam)
barbiturates	hydroxyzine (Vistaril, Atarax)
belladonna alkaloids (Donnatal)	hyoscyamine (Levsin, Levsinex)
bisacodyl (Dulcolax)	meperidine (Demerol)
carisoprodol (Soma)	meprobamate (Miltown, Equanil)
cascara sagrada	mesoridazine (Serentil)
castor oil (Neoloid)	metaxalone (Skelaxin)
chlordiazepoxide (Librium, Mitran)	methocarbamol (Robaxin)
chlordiazepoxide-amitriptyline (Limbitrol)	methyldopa (Aldomet)
chlorpheniramine (Chlor-Trimeton)	methyldopa-hydrochlorothiazide (Aldoril)
chlorpropamide (Diabinese)	methyltestosterone (Android, Virilon, Testrad)
chlorzoxazone (Paraflex)	mineral oil
cimetidine (Tagamet)	naproxen (Naprosyn, Avaprox, Aleve)
clidinium-chlordiazepoxide (Librax)	nifedipine (Procardia, Adalat)
clonidine (Catapres)	nitrofurantoin (Microdantin)
clorazepate (Tranxene)	orphenadrine (Norflex)
cyclandelate (Cyclospasmol)	oxaprozin (Daypro)
cyclobenzaprine (Flexeril)	oxazepam (Serax)
cyproheptadine (Periactin)	oxybutynin (Ditropan)
dessicated thyroid	pentazocine (Talwin)
dexchlorpheniramine (Polaramine)	perphenazine-amitriptyline (Triavil)
diazepam (Valium)	piroxicam (Feldene)
dicyclomine (Bentyl)	promethazine (Phenergan)
digoxin (Lanoxin)	propantheline (Pro-Banthine)
diphenhydramine (Benadryl)	propoxyphene (Darvon) and combination products
dipyridamole (Persantine)	quazepam (Doral)
disopyramide (Norpace, Norpace CR)	reserpine (Serpalan, Serpasil)
doxazosin (Cardura)	temazepam (Restoril)
doxepin (Sinequan)	thioridazine (Mellaril)
ergot mesyloids (Hydergine)	ticlopidine (Ticlid)
estrogens	triazolam (Halcion)
ethacrynic acid (Edecrin)	trimethobenzamide (Tigan)
ferrous sulfate (iron, Feosol)	tripelennamine

DRUGS ASSOCIATED WITH INCREASED RISK OF FALLS IN THE ELDERLY

Many factors are associated with falls in the elderly, including frailty, disease, vision, polypharmacy, and certain medications. Below is a list of drugs associated with falls. Assess geriatric patients on these medications for fall risk, and implement fall reduction strategies.

ACE Inhibitors

benazepril (Lotensin)
captopril (Capoten, Zestril)
cilazapril (Inhibace)
enalapril (Vasotec)
fosinopril (Monopril)
lisinopril (Prinivil)
perindopril (Coversyl)
quinapril (Accupril)
ramipril (Altace)

Angiotensin II Receptor Antagonists

candesartan (Atacand)
eprosartan (Teveten)
irbesartan (Avapro)
losartan (Cozaar)
telmisartan (Micardis)
valsartan (Diovan)

Anti-Alzheimer's Agents

donepezil (Aricept)
galantamine (Reminyl)
rivastigmine (Exelon)

Anticonvulsants

carbamazepine (Tegretol)
gabapentin (Neurontin)
lamotrigine (Lamictal)
phenobarbital (Luminal)
phenytoin (Dilantin)
topiramate (Topamax)
valproate (Depakene)
vigabatrin (Sabril)

Antidepressants

amitriptyline (Elavil)
bupropion (Wellbutrin)
citalopram (Celexa)
clomipramine (Anafranil)
desipramine (Norpramin)
doxepin (Sinequan)
fluoxetine (Prozac)
fluvoxamine (Luvox)
imipramine (Tofranil)
mirtazapine (Remeron)
moclobemide (Manerix)
nortriptyline (Aventyl)
paroxetine (Paxil)
sertraline (Zoloft)
trazodone (Desyrel)
venlafaxine (Effexor)

Antihistamines/Antinauseants

dimenhydrinate (Dramamine, Gravol)
diphenhydramine (Benadryl)
meclizine (Bonamine)
metoclopramide (Maxeran, Reglan)
prochlorperazine (Compazine, Stemetil)
promethazine (Phenergan)
scopolamine patch (Transderm Scop, Transderm V)

Antiparkinsonian Agents

amantadine (Symmetrel)
bromocriptine (Parlodel)
entacapone (Comtan)
levodopa/benserazide (Prolopa)
levodopa/carbidopa (Sinemet)
pramipexole (Mirapex)
selegiline (Eldepryl)

Antipsychotics (Atypical)

clozapine (Clozaril)
olanzapine (Zyprexa)
quetiapine (Seroquel)

Antipsychotics (Neuroleptics)

chlorpromazine (Largactil, Thorazine)
haloperidol (Haldol)
hydroxyzine (Atarax)
lithium loxapine (Loxapac)
methotrimeprazine (Nozinan)
perphenazine (Trilafon)
prochlorperazine (Compazine, Stemetil)
risperidone (Risperdal)
thioridazine (Mellaril)
trifluoperazine (Stelazine)

Benzodiazepines (Intermediate Acting)

alprazolam (Xanax)
lorazepam (Ativan)
nitrazepam (Mogadon)
oxazepam (Serax)
temazepam (Restoril)

Benzodiazepines (Long Acting)

chlordiazepoxide (Librium)
clonazepam (Klonopin, Rivotril)
diazepam (Valium)
flurazepam (Dalmane)

Benzodiazepines (Short Acting)

midazolam (Versed)
triazolam (Halcion)

Beta Blockers

acebutolol (Sectral)
atenolol (Tenormin)
bisoprolol (Monocor)
carvedilol (Coreg)
labetalol (Normodyne, Trandate)
metoprolol (Lopressor)
propranolol (Inderal)
sotalol (Betapace, Sotacor)
timolol (Blocadren)

Calcium Channel Blockers

amlodipine (Norvasc)
diltiazem (Cardizem)
felodipine (Plendil)
nifedipine (Adalat)
verapamil (Calan, Isoptin)

Diuretics

amiloride/HCTZ (Moduretic)
furosemide (Lasix)
hydrochlorothiazide
triamterene/HCTZ (Dyazide)

Opioid Analgesics

acetaminophen-Codeine (Tylenol #1, #2, #3)
codeine
fentanyl (Sublimaze, Duragesic)
hydromorphone (Dilaudid, Hydromorph Contin)
meperidine (Demerol)
morphine (MOS, MS Contin, M-Eslon, Roxanol)
oxycodone (Percocet/Percodan, OxyContin)
pentazocine (Talwin)

Over the Counter (OTC) Medications

allergy medicines
analgesics
antiemetics
cold remedies
cough preparations
muscle relaxants
sleeping pills

Vasodilators

hydralazine (Apresoline)
isosorbide (Isordil)
nitroglycerin (Nitro-Dur)
terazosin (Hytrin)

LOOK-ALIKE, SOUND-ALIKE (LASA) DRUG NAMES

The Joint Commission established a National Patient Safety Goal that requires accredited organizations to identify a list of look-alike or sound-alike drugs used in their organization and, at a minimum, to review the list annually and take action to prevent errors involving the use of these drugs. Organizations must list at least 10 drug combinations from the Joint Commission's list of LASA drugs.

The following are drug pairs that the Joint Commission and others have rated as most problematic. Names in ALL CAPITALS are brand names; those in lowercase are generic names.

ABELCET	amphotericin B
acetazolamide	acetohexamide
acetohexamide	acetohexamide
AMARYL	REMINYL
AMBISOME	amphotericin B
amphotericin B	ABELCET
amphotericin B	AMBISOME
AVANDIA	COUMADIN
AVINZA	EVISTA
carboplatin	cisplatin
CELEXA	CEREBYX
CELEXA	CELEBREX
CELEBREX	CELEXA
CEREBYX	CELEXA
cisplatin	carboplatin
COUMADIN	AVANDIA
daunorubicin	idarubicin
daunorubicin	daunorubicin citrate liposomal
DIABETA	ZEBET A
doxorubicin hydrochloride	doxorubicin liposomal
ephedrine	epinephrine
EVISTA	AVINZA
fentanyl	sufentanil
folic acid	folinic acid (leucovorin calcium)
folinic acid (leucovorin calcium)	folic acid
heparin	HESPAN
HESPAN	heparin
HUMALOG	HUMULIN
HUMALOG MIX	HUMULIN
HUMULIN	HUMALOG
HUMULIN	HUMALOG MIX
hydromorphone	morphine
idarubicin	daunorubicin
LAMICTAL	LAMISIL
LAMISIL	LAMICTAL
LANTUS	LENTE
LENTE	LANTUS
leucovorin calcium	LEUKERAN
LEUKERAN	leucovorin calcium
morphine	hydromorphone
morphine oral liquid **concentrate**	morphine **non-concentrated** oral liquid
NOVOLIN	NOVOLOG MIX
NOVOLOG MIX	NOVOLIN
REMINYL	AMARYL
RETROVIR	ritonavir
ritonavir	RETROVIR
SEROQUEL	SERZONE
SERZONE	SEROQUEL
sufentanil	fentanyl
TAXOL	TAXOTERE
TAXOTERE	TAXOL
tiagabine	tizanidine
tizanidine	tiagabine
vinblastine	vincristine
vincristine	vinblastine
WELLBUTRIN SR	WELLBUTRIN XL
WELLBUTRIN XL	WELLBUTRIN SR
ZANTAC	ZYRTEC
ZEBET A	DIABETA
ZYPREXA	ZYRTEC
ZYRTEC	ZYPREXA
ZYRTEC	ZANTAC

HIGH ALERT MEDICATIONS

High alert medications are those drugs that have the highest potential for harm when prescribed or administered inappropriately. Below is a complete list of high alert medications found in *Davis's Drug Guide for Nurses*. The list may change based on new research; refer to *Medication Errors: Improving Practices and Patient Safety* on page 8 for additional information.

aldesleukin	DOXOrubicin hydrochloride	magnesium sulfate (IV, parenteral)
alemtuzumab	DOXOrubicin hydrochloride liposome	
altretamine		meperidine
amiodarone	epinephrine	methadone
arsenic trioxide	epirubicin	methotrexate
asparaginase	eptifibatide	metoprolol
bleomycin	esmolol	midazolam
buprenorphine	etoposides	milrinone
busulfan	fentanyl (oral, transmucosal)	morphine
butorphanol	fentanyl (parenteral)	nalbuphine
calcium salts	fentanyl (transdermal)	nesiritide
capecitabine	fluorouracil	oxycodone compound
carboplatin	fondaparinux	oxymorphone
carmustine	gemcitabine	pancuronium
chloralhydrate	gemtuzumab ozogamicin	pentazocine
chlorambucil	heparin	potassium phosphates
cisplatin	heparins (low molecular weight)	potassium supplements
codeine	hydrocodone	pramlintide
colchicine	hydromorphone	propranolol
cyclophosphamide	hypoglycemic agents, oral	sodium chloride
cytarabine	imatinib	thrombolytic agents
DAUNOrubicin citrate liposome	insulin mixtures	tirofiban
DAUNOrubicin hydrochloride	insulins (short-acting)	topotecan
decitabine	insulins (intermediate-acting)	trastuzumab
digoxin	insulins (long-acting)	vinBLAStine
DOBUTamine	insulins (rapid-acting)	vinCRIStine
docetaxel	labetalol	vinorelbine
DOPamine	lidocaine	warfarin

TALL MAN LETTERING CHANGES

The Food and Drug Administration has asked manufacturers to update the appearance of 33 look-alike drug names. The changes involve using capital letters ("Tall Man") to minimize medication errors resulting from look-alike confusion.

Acetohexamide Acetazolamide	AcetoHEXAMIDE AcetaZOLAMIDE
Bupropion Buspirone	BuPROPion BusPIRone
Chlorpromazine Chlorpropamide	ChlorproMAZINE ChlorproPAMIDE
Clomiphene Clomipramine	ClomiPHENE ClomiPRAMINE
Cyclosporine Cycloserine	CycloSPORINE CycloSERINE
Daunorubicin Doxorubicin	DAUNOrubicin DOXOrubicin
Dimenhydrinate Diphenhydramine	DimenhyDRINATE DiphenhydrAMINE
Dobutamine Dopamine	DOBUTamine DOPamine
Glipizide Glyburide	GlipiZIDE GlyBURIDE
Hydralazine Hydroxyzine	HydrALAZINE HydrOXYzine
Medroxyprogesterone Methylprednisolone Methyltestosterone	MedroxyPROGESTERone MethylPREDNISolone MethylTESTOSTERone
Nicardipine Nifedipine	NiCARdipine NIFEdipine
Prednisone Prednisolone	PrediSONE PrednisoLONE
Sulfadiazine Sulfisoxazole	SulfADIAZINE SulfiSOXAZOLE
Tolazamide Tolbutamide	TOLAZamide TOLBUTamide
Vinblastine Vincristine	VinBLAStine VinCRIStine

A

abacavir (ah-back-ah-veer)
Ziagen

Classification
Therapeutic: antiretrovirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

Pregnancy Category C

Indications
Management of HIV infection (AIDS) in combination with other antiretrovirals (not with lamivudine and/or tenofovir).

Action
Converted inside cells to carbovir triphosphate, its active metabolite. Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase, which in turn terminates viral DNA growth.
Therapeutic Effects: Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics
Absorption: Rapidly and extensively (83%) absorbed.
Distribution: Distributes into extravascular space and readily distributes into erythrocytes.
Metabolism and Excretion: Mostly metabolized by the liver; 1.2% excreted unchanged in urine.
Half-life: 1.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity (rechallenge may be fatal); Lactation: Breastfeeding not recommended for HIV-infected patients.
Use Cautiously in: OB: Safety not established; Pedi: Safety not established in children <3 mo.

Adverse Reactions/Side Effects
CNS: headache, insomnia. **GI:** HEPATOTOXICITY, diarrhea, nausea, vomiting, anorexia. **Derm:** rashes. **F and E:** LACTIC ACIDOSIS. **Misc:** HYPERSENSITIVITY REACTIONS.

Interactions
Drug-Drug: Alcohol increases blood levels. May increase **methadone** metabolism in some patients; slight increase in **methadone** dosing may be needed.

Route/Dosage
PO (Adults): 300 mg twice daily.
PO (Children 3 mo–16 yr): 8 mg/kg twice daily (not to exceed 300 mg twice daily).

Availability
Tablets: 300 mg. **Oral solution (strawberry/banana flavor):** 20 mg/ml in 240-ml bottles. ***In combination with:*** lamivudine and zidovudine (Trizivir). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hypersensitivity reactions (fever; rash; gastrointestinal—nausea, vomiting, diarrhea, abdominal pain; constitutional—malaise, fatigue, achiness; respiratory—dyspnea, cough, pharyngitis). May also cause elevated liver function tests, increased creatine phosphokinase or creatinine, and lymphopenia. Discontinue abacavir at the first sign of hypersensitivity reaction. Do not restart abacavir following reaction; more severe symptoms may occur within hours and may include life-threatening hypotension and death. Symptoms usually resolve upon discontinuation.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum glucose and triglyceride levels.

Potential Nursing Diagnoses
Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation
- **PO:** May be administered with or without food. Oral solution may be stored at room temperature or refrigerated; do not freeze.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Emphasize the importance of taking abacavir as directed. Must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient not to share abacavir with others.
- Inform patient that abacavir does not cure AIDS or prevent associated or opportunistic infections. Abacavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom, and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of abacavir are unknown at this time.
- Advise patient of potential for hypersensitivity reactions that may result in death. Instruct patient to discontinue abacavir and notify health care professional immediately if symptoms of hypersensitivity occur. Medication guide for patients should be dispensed with prescription. Advise patient to read it thoroughly with each refill. A warning card summarizing symptoms of abacavir hypersensitivity should be provided with each prescription; instruct patient to carry card at all times.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS, and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

acarbose (aye-**kar**-bose)
Precose

Classification
Therapeutic: antidiabetics
Pharmacologic: alpha-glucosidase inhibitors

Pregnancy Category B

Indications

Management of type 1 diabetes in conjunction with dietary therapy; may be used with insulin or other hypoglycemic agents.

Action

Lowers blood glucose by inhibiting the enzyme alpha-glucosidase in the GI tract. Delays and reduces glucose absorption. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients, especially postprandial hyperglycemia.

Pharmacokinetics

Absorption: <2% systemically absorbed; action is primarily local (in the GI tract).
Distribution: Unknown.
Metabolism and Excretion: Minimal amounts absorbed are excreted by the kidneys.
Half-life: 2 hr.

TIME/ACTION PROFILE (effect on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Diabetic ketoacidosis; Cirrhosis; Serum creatinine >2 mg/dl; OB, Lactation, Pedi: Safety not established.
Use Cautiously in: Presence of fever, infection, trauma, stress (may cause hyperglycemia, requiring alternative therapy).

Adverse Reactions/Side Effects

GI: abdominal pain, diarrhea, flatulence, ↑ transaminases.

Interactions

Drug-Drug: Thiazide diuretics and **loop diuretics**, **corticosteroids**, **phenothiazines**, **thyroid preparations**, **estrogens (conjugated)**, **progestins**, **hormonal contraceptives**, **phenytoin**, **niacin**, **sympathomimetics**, **calcium channel blockers**, and **isoniazid** may ↑ glucose levels in diabetic patients and lead to ↓ control of blood glucose. Effects are ↓ by **intestinal adsorbents**, including **activated charcoal** and **digestive enzyme preparations (amylase, pancreatin)**; avoid concurrent use. ↑ effects of **sulfonylurea hypoglycemic agents**. May ↓ absorption of **digoxin**; may require dosage adjustment.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): 25 mg 3 times daily; may be increased q 4–8 wk as needed/tolerated (range 50–100 mg 3 times daily; not to exceed 50 mg 3

Copyright © 2008 by F.A. Davis

times daily in patients ≤60 kg or 100 mg 3 times daily in patients >60 kg).

Availability

Tablets: 25 mg, 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemia (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety) when taking concurrently with other oral hypoglycemic agents.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.
- Monitor AST and ALT every 3 mo for the 1st yr and then periodically. Elevated levels may require dosage reduction or discontinuation of acarbose. Elevations occur more commonly in patients taking more than 300 mg/day and in female patients. Levels usually return to normal without other evidence of liver injury after discontinuation.
- ***Toxicity and Overdose:*** Symptoms of overdose are transient increase in flatulence, diarrhea, and abdominal discomfort. Acarbose alone does not cause hypoglycemia; however, other concurrently administered hypoglycemic agents may produce hypoglycemia requiring treatment.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Does not cause hypoglycemia when taken while fasting, but may increase hypoglycemic effect of other hypoglycemic agents.
- **PO:** Administer with first bite of each meal 3 times/day.

Patient/Family Teaching

- Instruct patient to take acarbose at same time each day. If a dose is missed and the meal is completed without taking the dose, skip missed dose and take next dose with the next meal. Do not double doses.
- Explain to patient that acarbose controls hyperglycemia but does not cure diabetes. Therapy is longterm.
- Review signs of hypoglycemia and hyperglycemia (blurred vision; drowsiness; dry mouth; flushed, dry skin; fruit-like breath odor; increased urination; ketones in urine; loss of appetite; stomachache; nausea or vomiting; tiredness; rapid, deep breathing; unusual thirst; unconsciousness) with patient. If hypoglycemia occurs, advise patient to take a form of oral glucose (e.g., glucose tablets, liquid gel glucose) rather than sugar (absorption of sugar is blocked by acarbose) and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and urine ketones. Monitor closely during periods of stress or illness. Notify health care professional if significant changes occur.
- Caution patient to avoid using other medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of oral glucose and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up examinations.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

acebutolol

(a-se-**byoo**-toe-lole)
Monitan, Sectral

Classification
Therapeutic: antiarrhythmics (class II), antihypertensives
Pharmacologic: beta blockers

Pregnancy Category B

Copyright © 2008 by F.A. Davis

Indications

Treatment of hypertension (single agent or with other antihypertensives). Treatment of ventricular tachyarrhythmias. **Unlabeled uses:** Prophylaxis of MI, treatment of angina pectoris, management of anxiety, tremors, thyrotoxicosis, mitral valve prolapse, idiopathic hypertrophic subaortic stenosis.

Action

Blocks stimulation of $beta_1$–(myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, or uterine) receptor sites. Mild intrinsic sympathomimetic activity (ISA). **Therapeutic Effects:** Decreased heart rate. Decreased AV conduction. Decreased blood pressure.

Pharmacokinetics

Absorption: Well absorbed following oral administration but rapidly undergoes metabolism.
Distribution: Minimal penetration of the CNS. Crosses the placenta and enters breast milk in small amounts.
Metabolism and Excretion: Mostly metabolized to diacetolol, which is also a beta blocker.
Half-life: 3–4 hr (8–13 hr for diacetolol).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (effect on BP)	1–1.5 hr	2–8 hr	12–24 hr
PO (antiarrhythmic)	1 hr	4–6 hr	up to 10 hr

Contraindications/Precautions

Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block; Obstructive airway disease including asthma.
Use Cautiously in: Renal or hepatic impairment (dosage reduction recommended if CCr <50 ml/min/1.73 m^2); Geri: Increased sensitivity; Thyrotoxicosis (may mask symptoms); Diabetes mellitus (may mask symptoms of hypoglycemia); History of severe allergic reactions (intensity of reactions may be increased); OB, Lactation, Pedi: Safety not established; neonatal bradycardia, hypotension, hypoglycemia, and respiratory depression may occur rarely.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, diminished libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Concurrent use with **digoxin** may increase bradycardia.
Antihypertensives, acute ingestion of **alcohol**, or **nitrates** may cause additive hypotension. Use with **epinephrine** may result in unopposed alpha-adrenergic stimulation. Concurrent use with **thyroid preparations** may decrease effectiveness. Concurrent use with **insulin** may result in prolonged hypoglycemia. May decrease effectiveness of **theophylline**.

Route/Dosage

PO (Adults): 400–800 mg/day—single dose or twice daily (up to 1200 mg/day or 800 mg/day in geriatric patients).

Renal Impairment

PO (Adults): If CCr <50 ml/min/1.73 m^2, use 50% of normal dose. If CCr <25 ml/min/1.73 m^2, use 25% of normal dose.

Availability (generic available)

Capsules: 200 mg, 400 mg. **Tablets:** ♣100 mg, ♣200 mg, ♣400 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased serum alkaline phosphatase, LDH, AST, and ALT levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Copyright © 2008 by F.A. Davis

Noncompliance, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered with food or on an empty stomach.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. If a dose is missed, it should be taken as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Diabetic patients should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. May mask tachycardia and blood pressure changes as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Acebutolol controls, but does not cure, hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Control of arrhythmias without appearance of detrimental side effects.

acetaminophen

(a-seet-a-**min**-oh-fen)

Abenol, Acephen, Aceta, Aminofen, Apacet, APAP, Apo-Acetaminophen, Aspirin Free Anacin, Aspirin Free Pain Relief, Children's Pain Reliever, Dapacin, Feverall, Extra Strength Dynafed E.X., Extra Strength Dynafed (Billups, P.J.), Genapap, Genebs, Halenol, Infant's Pain Reliever, Liquiprin, Mapap, Maranox, Meda, Neopap, Novo-Gesic, Oraphen-PD, Panadol, paracetamol, Redutemp, Ridenol, Silapap, Tapanol, Tempra, Tylenol, Uni-Ace

Classification

Therapeutic: antipyretics, nonopioid analgesics

Pregnancy Category B

Indications

Mild pain. Fever.

Action

Inhibits the synthesis of prostaglandins that may serve as mediators of pain and fever, primarily in the CNS. Has no significant anti-inflammatory properties or GI toxicity. **Therapeutic Effects:** Analgesia. Antipyresis.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rectal absorption is variable.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations.
Metabolism and Excretion: 85–95% metabolized by the liver. Metabolites may be toxic in overdose situation. Metabolites excreted by the kidneys.
Half-life: Neonates: 2–5 hr. Adults: 1–3 hr.

TIME/ACTION PROFILE (analgesia and antipyresis)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–1 hr	1–3 hr	3–8 hr†
Rect	0.5–1 hr	1–3 hr	3–4 hr

†Depends on dose

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.
Use Cautiously in: Hepatic disease/renal disease (lower chronic doses recommended); Chronic alcohol use/abuse; Malnutrition.

Adverse Reactions/Side Effects

GI: HEPATIC FAILURE, HEPATOTOXICITY (overdose). **GU:** renal failure (high doses/chronic use). **Hemat:** neutropenia, pancytopenia, leukopenia. **Derm:** rash, urticaria.

Interactions

Drug-Drug: Chronic high-dose acetaminophen (>2 g/day) may ↑ risk of bleeding with **warfarin** (PT should be monitored regularly and INR should not exceed 4). Hepatotoxicity is additive with other **hepatotoxic substances**, including **alcohol**. Concurrent use of **sulfinpyrazone**, **isoniazid**, **rifampin**, **rifabutin**, **phenytoin**, **barbiturates**, and **carbamazepine** may ↑ the risk of acetaminophen-induced liver damage (limit self-medication); these agents will also ↓ therapeutic effects of acetaminophen. Concurrent **NSAIDs** ↑ the risk of adverse renal effects (avoid chronic concurrent use). **Propranolol** ↓ metabolism and may ↑ effects. May ↓ effects of **lamotrigine** and **zidovudine**.

Route/Dosage

Children ≤12 yr should not receive >5 doses/24 hr without notifying physician or other health care professional.

PO (Adults and Children >12 yr): 325–650 mg q 4–6 hr or 1 g 3–4 times daily or 1300 mg q 8 hr (not to exceed 4 g or 2.5 g/24 hr in patients with hepatic/renal impairment).
PO (Children 1–12 yr): 10–15 mg/kg/dose q 4–6 hr as needed (not to exceed 5 doses/24 hr).
PO (Infants): 10–15 mg/kg/dose q 4–6 hr as needed (not to exceed 5 doses/24 hr).
PO (Neonates): 10–15 mg/kg/dose q 6–8 hr as needed.
Rect (Adults and Children >12 yr): 325–650 mg q 4–6 hr as needed or 1 g 3–4 times/day (not to exceed 4 g/24 hr).
Rect (Children 1–12 yr): 10–20 mg/kg/dose q 4–6 hr as needed.
Rect (Infants): 10–20 mg/kg/dose q 4–6 hr as needed.
Rect (Neonates): 10–15 mg/kg/dose q 6–8 hr as needed.

Availability (generic available)

Chewable tablets (fruit, bubblegum, or grape flavor): 80 mg[OTC], 160 mg[OTC]. **Tablets:** 160 mg[OTC], 325 mg[OTC], 500 mg[OTC], 650 mg[OTC]. **Caplets:** 325 mg[OTC], 500 mg[OTC]. **Solution (berry, fruit, and grape flavor):** 100 mg/ml[OTC]. **Liquid (mint):** 160 mg/5 ml[OTC], 500 mg/15 ml[OTC]. **Elixir (grape and cherry flavor):** 160 mg/5 ml[OTC]. **Drops:** 100 mg/ml[OTC]. **Suspension:** 100 mg/ml[OTC], 160 mg/5 ml[OTC]. **Syrup:** 160 mg/5 ml[OTC]. **Suppositories:** 80 mg[OTC], 120 mg[OTC], 325 mg[OTC], 650 mg[OTC]. ***In combination with:*** many other medications. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess overall health status and alcohol usage before administering acetaminophen. Patients who are malnourished or chronically abuse alcohol are at higher risk of developing hepatotoxicity with chronic use of usual doses of this drug.
- Assess amount, frequency, and type of drugs taken in patients self-medicating, especially with OTC drugs. Prolonged use of acetaminophen increases the risk of adverse renal effects. For short-term use, combined doses of acetaminophen and salicylates should not exceed the recommended dose of either drug given alone.
- **Pain:** Assess type, location, and intensity prior to and 30–60 min following administration.

Copyright © 2008 by F.A. Davis

- **Fever:** Assess fever; note presence of associated signs (diaphoresis, tachycardia, and malaise).
- ***Lab Test Considerations:*** Evaluate hepatic, hematologic, and renal function periodically during prolonged, high-dose therapy.
- May alter results of blood glucose monitoring. May cause falsely ↓ values when measured with glucose oxidase/peroxidase method, but probably not with hexokinase/G6PD method. May also cause falsely ↑ values with certain instruments; see manufacturer's instruction manual.
- Increased serum bilirubin, LDH, AST, ALT, and prothrombin time may indicate hepatotoxicity.
- ***Toxicity and Overdose:*** If overdose occurs, **acetylcysteine** (Acetadote) is the antidote.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for imbalanced body temperature (Indications)

Implementation

- When combined with opioids do not exceed the maximum recommended daily dose of acetaminophen.
- **PO:** Administer with a full glass of water.
- May be taken with food or on an empty stomach.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to take more than the recommended amount. Chronic excessive use of >4 g/day (2 g in chronic alcoholics) may lead to hepatotoxicity, renal or cardiac damage. Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Advise patient to avoid alcohol (3 or more glasses per day increase the risk of liver damage) if taking more than an occasional 1–2 doses and to avoid taking concurrently with salicylates or NSAIDs for more than a few days, unless directed by health care professional.
- Pedi: Advise parents or caregivers to check concentrations of liquid preparations. Errors have resulted in serious liver damage. Have parents or caregivers determine the correct formulation and dose for their child (based on the child's age/weight), and demonstrate how to measure it using an appropriate measuring device.
- Inform patients with diabetes that acetaminophen may alter results of blood glucose monitoring. Advise patient to notify health care professional if changes are noted.
- Caution patient to check labels on all OTC products. Advise patients to avoid taking more than one product containing acetaminophen at a time to prevent toxicity.
- Advise patient to consult health care professional if discomfort or fever is not relieved by routine doses of this drug or if fever is greater than 39.5°C (103°F) or lasts longer than 3 days.

Evaluation/Desired Outcomes

- Relief of mild pain.
- Reduction of fever.

acetaZOLAMIDE

(a-set-a-**zole**-a-mide)
Acetazolam, AK-Zol, Apo-Acetazolamide, Dazamide, Diamox, Diamox Sequels, Storzolamide

Classification
Therapeutic: anticonvulsants, antiglaucoma agents, diuretics, ocular hypotensive agents
Pharmacologic: carbonic anhydrase inhibitors

Pregnancy Category C

Indications

Lowering of intraocular pressure in the treatment of glaucoma. Management of acute altitude sickness. **Unlabeled uses:** Diuretic. Adjunct to the treatment of refractory seizures. Reduce cerebrospinal fluid production in hydrocephalus. Prevention of renal calculi composed of uric acid or cystine.

Action

Inhibition of carbonic anhydrase in the eye results in decreased secretion of aqueous humor.

Copyright © 2008 by F.A. Davis

Inhibition of renal carbonic anhydrase, resulting in self-limiting urinary excretion of sodium, potassium, bicarbonate, and water. CNS inhibition of carbonic anhydrase and resultant diuresis may decrease abnormal neuronal firing. Alkaline diuresis prevents precipitation of uric acid or cystine in the urinary tract. **Therapeutic Effects:** Lowering of intraocular pressure. Control of some types of seizures. Prevention and treatment of acute altitude sickness. Prevention of uric acid or cystine renal calculi.

Pharmacokinetics

Absorption: Dose dependent; erratic with doses >10 mg/kg/day.
Distribution: Crosses the placenta and blood-brain barrier; enters breast milk.
Protein Binding: 95%.
Metabolism and Excretion: Excreted mostly unchanged in urine.
Half-life: 2.4–5.8 hr.

TIME/ACTION PROFILE (lowering of intraocular pressure)

ROUTE	ONSET	PEAK	DURATION
PO	1–1.5 hr	2–4 hr	8–12 hr
PO-ER	2 hr	8–18 hr	18–24 hr
IV	2 min	15 min	4–5 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity or cross-sensitivity with sulfonamides may occur; Hepatic disease or insufficiency; Concurrent use with ophthalmic carbonic anhydrase inhibitors (brinzolamide, dorzolamide) is not recommended; OB: Avoid during first trimester of pregnancy.
Use Cautiously in: Chronic respiratory disease; Electrolyte abnormalities; Gout; Renal disease (dosage reduction necessary for ClCr <50 ml/min); Diabetes mellitus; OB: Use with caution during second or third trimester of pregnancy; Lactation: Safety not established.

Adverse Reactions/Side Effects

CNS: depression, tiredness, weakness, drowsiness. **EENT:** transient nearsightedness. **GI:** anorexia, metallic taste, nausea, vomiting, melena. **GU:** crystalluria, renal calculi. **Derm:** STEVENS-JOHNSON SYNDROME, rashes. **Endo:** hyperglycemia. **F and E:** hyperchloremic acidosis, hypokalemia, growth retardation (in children receiving chronic therapy). **Hemat:** APLASTIC ANEMIA, HEMOLYTIC ANEMIA, LEUKOPENIA. **Metab:** weight loss, hyperuricemia. **Neuro:** paresthesias. **Misc:** allergic reactions including ANAPHLYAXIS.

Interactions

Drug-Drug: Excretion of **barbiturates**, **aspirin**, and **lithium** is ↑ and may lead to ↓ effectiveness. Excretion of **amphetamine**, **quinidine**, **procainamide**, and possibly **tricyclic antidepressants** is ↓ and may lead to toxicity. May ↑ **cyclosporine** levels.

Route/Dosage

PO (Adults): *Glaucoma (open angle)*—250–1000 mg/day in 1–4 divided doses (up to 250 mg q 4 hr) or 500-mg extended-release capsules twice daily. *Epilepsy*—4–16 mg/kg/day in 1–4 divided doses (maximum 30 mg/kg/day or 1 g/day). *Altitude sickness*—250 mg 2–4 times daily started 24–48 hr before ascent, continued for 48 hr or longer to control symptoms. *Antiurolithic*—250 mg at bedtime. *Edema*—250–375 mg/day. *Urine alkalinization*—5 mg/kg/dose repeated 2–3 times over 24 hrs.
PO (Children): *Glaucoma*—8–30 mg/kg (300–900 mg/m²/day) in 3 divided doses (usual range 10–15 mg/kg/day). *Edema*—5 mg/kg/dose once daily. *Epilepsy*—4–16 mg/kg/day in 1–4 divided doses (maximum 30 mg/kg/day or 1 g/day).
PO (Neonates): *Hydrocephalus*—5 mg/kg/dose q 6 hrs increased by 25 mg/kg/day up to a maximum of 100 mg/kg/day.
IV (Adults): *Glaucoma (closed angle)*—250–500 mg, may repeat in 2–4 hr to a maximum of 1 g/day. *Edema*—250–375 mg/day.
IV (Children): *Glaucoma*—5–10 mg/kg q 6 hr, not to exceed 1 g/day. *Edema*—5 mg/kg/dose once daily.
IV (Neonates): *Hydrocephalus*—5 mg/kg/dose q 6 hrs increased by 25 mg/kg/day up to a maximum of 100 mg/kg/day.

Availability

Tablets: 125 mg, 250 mg. **Extended-release capsules:** 500 mg. **Injection:** 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Observe for signs of hypokalemia (muscle weakness, malaise, fatigue, ECG changes, vomiting).
- Assess for allergy to sulfonamides.
- **Intraocular Pressure:** Assess for eye discomfort or decrease in visual acuity.
- **Seizures:** Monitor neurologic status in patients receiving acetazolamide for seizures. Initiate seizure precautions.

Copyright © 2008 by F.A. Davis

- **Altitude Sickness:** Monitor for decrease in severity of symptoms (headache, nausea, vomiting, fatigue, dizziness, drowsiness, shortness of breath). Notify health care professional immediately if neurologic symptoms worsen or if patient becomes more dyspneic and rales or crackles develop.
- ***Lab Test Considerations:*** Serum electrolytes, complete blood counts, and platelet counts should be evaluated initially and periodically throughout prolonged therapy. May cause ↓ potassium, bicarbonate, WBCs, and RBCs. May cause ↑ serum chloride.
- May cause ↑ in serum and urine glucose; monitor serum and urine glucose carefully in diabetic patients.
- May cause false-positive results for urine protein and 17-hydroxysteroid tests.
- May cause ↑ blood ammonia, bilirubin, uric acid, urine urobilinogen, and calcium. May ↓ urine citrate.

Potential Nursing Diagnoses

Disturbed sensory perception (visual) (Indications)

Implementation

- Do not confuse acetazolamide with acetohexamide.
- Encourage fluids to 2000–3000 ml/day, unless contraindicated, to prevent crystalluria and stone formation.
- A potassium supplement without chloride should be administered concurrently with acetazolamide.
- **PO:** Give with food to minimize GI irritation. Tablets may be crushed and mixed with fruit-flavored syrup to minimize bitter taste for patients with difficulty swallowing. Extended-release capsules may be opened and sprinkled on soft food, but do not crush, chew, or swallow contents dry. Extended-release capsules are only indicated for glaucoma and altitude sickness; do not use for epilepsy or diuresis.
- **IM:** Extremely painful; avoid if possible.
- **Direct IV:** Dilute 500 mg of acetazolamide in at least 5 ml of sterile water for injection for a concentration of 100 mg/ml. Use reconstituted solution within 24 hr. ***Rate:*** Not to exceed 500 mg/min.
- **Intermittent Infusion:** Further dilute in D5W, D10W, 0.45% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's solution, or combinations of dextrose and saline or dextrose and Ringer's solution. ***Rate:*** Infuse over 4–8 hr.
- **Additive Compatibility:** cimetidine, ranitidine.
- **Additive Incompatibility:** multiple parenteral multivitamins.

Patient/Family Teaching

- Instruct patient to take as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Patients on anticonvulsant therapy may need to gradually withdraw medication.
- Advise patient to report numbness or tingling of extremities, weakness, rash, sore throat, unusual bleeding or bruising, or fever to health care professional. If hematopoietic reactions, fever, rash, or renal problems occur, carbonic anhydrase inhibitor therapy should be discontinued.
- May occasionally cause drowsiness. Caution patient to avoid driving and other activities that require alertness until response to the drug is known.
- Caution patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- **Intraocular Pressure:** Advise patient of the need for periodic ophthalmologic exams; loss of vision may be gradual and painless.

Evaluation/Desired Outcomes

- Decrease in intraocular pressure when used for glaucoma. If therapy is not effective or patient is unable to tolerate one carbonic anhydrase inhibitor, using another may be effective and more tolerable.
- Decrease in the frequency of seizures.
- Prevention of altitude sickness.
- Prevention of uric acid or cystine stones in the urinary tract.

acyclovir (ay-**sye**-kloe-veer)
Avirax, Zovirax

Classification
Therapeutic: antivirals
Pharmacologic: purine analogues

Pregnancy Category B (PO, IV), C (topical)

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Indications

PO: Recurrent genital herpes infections. Localized cutaneous herpes zoster infections (shingles) and chickenpox (varicella). **IV:** Severe initial episodes of genital herpes in nonimmunosuppressed patients. Mucosal or cutaneous herpes simplex infections or herpes zoster infections (shingles) in immunosuppressed patients. Herpes simplex encephalitis. **Topical:** *Cream*—Recurrent herpes labialis (cold sores). *Ointment*—Treatment of limited non–life-threatening herpes simplex infections in immunocompromised patients (systemic treatment is preferred).

Action

Interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibition of viral replication, decreased viral shedding, and reduced time for healing of lesions.

Pharmacokinetics

Absorption: Despite poor absorption (15–30%), therapeutic blood levels are achieved.
Distribution: Widely distributed. CSF concentrations are 50% of plasma. Crosses placenta; enters breast milk.
Protein Binding: <30%.
Metabolism and Excretion: >90% eliminated unchanged by kidneys; remainder metabolized by liver.
Half-life: Neonates: 4 hr; Children 1–12 yr: 2–3 hr; Adults: 2–3.5 hr (↑ in renal failure).

TIME/ACTION PROFILE (antiviral blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–2.5 hr	4 hr
IV	prompt	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to acyclovir or valacyclovir.
Use Cautiously in: Pre-existing serious neurologic, hepatic, pulmonary, or fluid and electrolyte abnormalities; Renal impairment (dose alteration recommended if CCr <50 ml/min); Geriatric patients (due to age related ↓ in renal function); Obese patients (dose should be based on ideal body weight); Patients with hypoxia; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, hallucinations, trembling. **GI:** diarrhea, nausea, vomiting, elevated liver enzymes, hyperbilirubinemia, abdominal pain, anorexia. **GU:** RENAL FAILURE, crystalluria, hematuria. **Derm:** acne, hives, skin rashes, unusual sweating, Stevens-Johnson syndrome. **Endo:** changes in menstrual cycle. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME (high doses in immunosuppressed patients). **Local:** pain, phlebitis, local irritation. **MS:** joint pain. **Misc:** polydipsia.

Interactions

Drug-Drug: Probenecid ↑ blood levels of acyclovir. ↑ blood levels and risk of toxicity from **theophylline**; dose adjustment may be necessary. ↓ blood levels and may ↓ effectiveness of **valproic acid** or **hydantoins**. Concurrent use of other **nephrotoxic drugs** ↑ risk of adverse renal effects. **Zidovudine** and IT **methotrexate** may ↑ risk of CNS side effects.

Route/Dosage

Initial Genital Herpes

PO (Adults and Children): 200 mg q 4 hr while awake (5 times/day) for 7–10 days or 400 mg q 8 hr for 7–10 days; maximum dose in children: 80 mg/kg/day in 3–5 divided doses.
IV (Adults and Children): 5 mg/kg q 8 hr or 750 mg/m²/day divided q 8 hr for 5–7 days.

Chronic Suppressive Therapy for Recurrent Genital Herpes

PO (Adults and Children): 400 mg twice daily or 200 mg 3–5 times/day for up to 12 mo. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Intermittent Therapy for Recurrent Genital Herpes

PO (Adults and Children): 200 mg q 4 hr while awake (5 times/day) or 400 mg q 8 hr or 800 mg q 12 hr for 5 days, start at first sign of symptoms. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

Acute Treatment of Herpes Zoster in Immunosuppressed Patients

PO (Adults): 800 mg q 4 hr while awake (5 times/day) for 7–10 days. *Prophylaxis*—400 mg 5 times/day.
PO (Children): 250–600 mg/m²/dose 4–5 times/day.

Herpes Zoster in Immunocompetent Patients

PO (Adults and Children): 4000 mg/day in 5 divided doses for 5–7 days, maximum dose in children: 80 mg/kg/day in 5 divided doses.

Copyright © 2008 by F.A. Davis

Chickenpox

PO (Adults and Children): 20 mg/kg (not to exceed 800 mg/dose) qid for 5 days. Start within 24 hr of rash onset.

Mucosal and Cutaneous Herpes Simplex Infections in Immunosuppressed Patients

IV (Adults and Children >12 yr): 5 mg/kg q 8 hr for 7 days.
IV (Children <12 yr): 10 mg/kg q 8 hr for 7 days.
Topical (Adults): 0.5 in. ribbon of 5% *ointment* for every 4-square-in. area q 3 hr (6 times/day) for 7 days.

Herpes Simplex Encephalitis

IV (Adults): 10 mg/kg q 8 hr for 14–21 days.
IV (Children 3 mo–12 yr): 10 mg/kg q 8 hr for 14–21 days.
IV (Children birth–3 mo): 20 mg/kg q 8 hr for 14–21 days.
IV (Neonates, premature): 10 mg/kg q 12 hr for 14–21 days.

Varicella Zoster Infections in Immunosuppressed Patients

IV (Adults): 10 mg/kg q 8 hr for 7–10 days.
IV (Children <12 yr): 10 mg/kg q 8 hr for 7–10 days.

Renal Impairment

PO, IV (Adults and Children): *CCr >50 ml/min/1.73 m²*—no dosage adjustment needed; *CCr 25–50 ml/min/1.73 m²*—administer normal dose q 12 hr; *CCr 10–25 ml/min/1.73 m²*—administer normal dose q 24 hr; *CCr 0–10 ml/min/1.73 m²*—50% of dose q 24 hr.
IV (Neonates): *SCr 0.8–1.1 mg/dl:* Administer 20 mg/kg/dose q 12 hr; *SCr 1.2–1.5 mg/dl:* Administer 20 mg/kg/dose q 24 hr; *SCr >1.5 mg/dl:* Administer 10 mg/kg/dose q 24 hr.

Herpes labialis

Topical (Adults and Children >12 yr): Apply 5 times/day for 4 days; start at first symptoms.

Availability (generic available)

Capsules: 200 mg. **Cost:** *Generic*—$12.99/30. **Tablets:** 400 mg, 800 mg. **Cost:** *Generic*—400 mg $14.50/30, 800 mg $24.99/30. **Suspension (banana flavor):** 200 mg/5 ml. **Cost:** $123.97/473 ml. **Powder for injection:** 500 mg/vial, 1000 mg/vial. **Solution for injection:** 25 mg/ml in 20-ml and 40-ml vials, 50 mg/ml in 10-ml and 20-ml vials. **Cream:** 5% in 2-g and 5-g tubes. **Cost:** $51.36/2-g tube, $115.99/5-g tube. **Ointment:** 5% in 15-g tubes. **Cost:** $129.99/15-g tube.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.
- Monitor neurologic status in patients with herpes encephalitis.
- ***Lab Test Considerations:*** Monitor BUN, serum creatinine, and CCr before and during therapy. ↑ BUN and serum creatinine levels or ↓ CCr may indicate renal failure.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Patient/Family Teaching)

Implementation

- Acyclovir treatment should be started as soon as possible after herpes simplex symptoms appear and within 24 hr of a herpes zoster outbreak.
- **PO:** Acyclovir may be administered with food or on an empty stomach, with a full glass of water.
- Shake oral suspension well before administration.

IV Administration

- **IV:** Maintain adequate hydration (2000–3000 ml/day), especially during first 2 hr after IV infusion, to prevent crystalluria.
- Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Acyclovir injectable should not be administered topically, IM, subcut, PO, or in the eye.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute 500-mg or 1-g vial with 10 ml or 20 ml, respectively, of sterile water for injection. Do not reconstitute with bacteriostatic water with benzyl alcohol or parabens. Shake well to dissolve completely. Further dilute in at least 100 ml of D5W, 0.9% NaCl, dextrose/saline combinations or LR. ***Concentration:*** 7 mg/ml. Patients requiring fluid restriction: 10 mg/ml. ***Rate:*** Administer via infusion pump over 1 hr to minimize renal tubular damage. Use reconstituted solution within 12 hr. Once diluted for infusion, the solution should be used within 24 hr. Refrigeration results in

Copyright © 2008 by F.A. Davis

precipitation, which dissolves at room temperature.

- **Y-Site Compatibility:** allopurinol, amikacin, amphotericin B cholesteryl sulfate, ampicillin, anidulafungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, dexamethasone sodium phosphate, dimenhydrinate, diphenhydramine, docetaxel, doxorubicin liposome, doxycycline, erythromycin lactobionate, etoposide phosphate, famotidine, filgrastim, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, lansoprazole, linezolid, lorazepam, magnesium sulfate, melphalan, methylprednisolone sodium succinate, metoclopramide, metronidazole, milrinone, multivitamin infusion, nafcillin, oxacillin, paclitaxel, pemetrexed, penicillin G potassium, pentobarbital, perphenazine, piperacillin, potassium chloride, propofol, ranitidine, remifentanil, sodium bicarbonate, teniposide, theophylline, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, zidovudine.
- **Y-Site Incompatibility:** amifostine, aztreonam, cefepime, dobutamine, dopamine, fludarabine, foscarnet, gemcitabine, idarubicin, levofloxacin, ondansetron, piperacillin/tazobactam, sargramostim, tacrolimus, vinorelbine.
- **Additive Compatibility:** fluconazole.
- **Additive Incompatibility:** blood products, pantoprazole, protein-containing solutions.
- **Topical:** Apply to skin lesions only; do not use in the eye.

Patient/Family Teaching

- Advise patient to take medication as directed for the full course of therapy. Take missed doses as soon as possible but not just before next dose is due; do not double doses. Acyclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.
- Inform patient that acyclovir is not a cure. The virus lies dormant in the ganglia, and acyclovir will not prevent the spread of infection to others.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- Patient should consult health care professional if symptoms are not relieved after 7 days of topical therapy or if oral acyclovir does not decrease the frequency and severity of recurrences. Immunocompromised patients may require a longer time, usually 2 weeks, for crusting over of lesions.
- Instruct women with genital herpes to have yearly Papanicolaou smears because they may be more likely to develop cervical cancer.
- **Topical:** Instruct patient to apply ointment in sufficient quantity to cover all lesions every 3 hr, 6 times/day for 7 days. 0.5-in. ribbon of ointment covers approximately 4 square in. Use a finger cot or glove when applying to prevent inoculation of other areas or spread to other people. Keep affected areas clean and dry. Loose-fitting clothing should be worn to prevent irritation.
- Avoid drug contact in or around eyes. Report any unexplained eye symptoms to health care professional immediately; ocular herpetic infection can lead to blindness.

Evaluation/Desired Outcomes

- Crusting over and healing of skin lesions.
- Decrease in frequency and severity of recurrences.
- Acceleration of complete healing and cessation of pain in herpes zoster.
- Decrease in intensity of chickenpox.

adalimumab (a-da-li-**mu**-mab)
Humira

Classification
Therapeutic: antirheumatics
Pharmacologic: DMARDs, monoclonal antibodies

Pregnancy Category B

Indications

Treatment of moderately to severely active rheumatoid arthritis in patients who have responded inadequately to other DMARDs; may be used with methotrexate or other DMARDs. Psoriatic arthritis. Active ankylosing spondylitis. Crohn's disease.

Action

Neutralizes and prevents the action of tumor necrosis factor (TNF), resulting in anti-inflamma-

Copyright © 2008 by F.A. Davis

tory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, and ankylosing spondylitis. Reduced signs and symptoms of Crohn's disease.

Pharmacokinetics

Absorption: 64% absorbed after subcut administration.
Distribution: Synovial fluid concentrations are 31–96% of serum.
Metabolism and Excretion: Unknown.
Half-life: 14 days (range 10–20 days).

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
Subcut	8–26 wk	131 hr*	2 wk†

*Blood level
†Following discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of anakinra; Active infection (including chronic or localized); Lactation: Potential for serious side effects in the infant; discontinue drug or provide formula.
Use Cautiously in: History of recurrent infection or underlying illness/treatment predisposing to infection; Patients residing, or who have resided, where tuberculosis or histoplasmosis is endemic; Pre-existing or recent onset CNS demyelinating disorders; History of lymphoma; Geri: ↑ risk of infection/malignancy; OB: Use only if clearly needed; Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: headache. **CV:** hypertension. **GI:** abdominal pain, nausea. **GU:** hematuria. **Derm:** rash. **Hemat:** neutropenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** hypercholesterolemia, hyperlipidemia. **MS:** back pain. **Misc:** allergic reactions including ANAPHYLAXIS, INFECTIONS (including reactivation tuberculosis).

Interactions

Drug-Drug: Concurrent use with **anakinra** or other **TNF blocking agents** ↑ risk of serious infections and is contraindicated. **Live vaccinations** should not be given concurrently.

Route/Dosage

Rheumatoid Arthritis, Ankylosing Spondylitis, and Psoriatic Arthritis

Subcut (Adults): 40-mg every other week; patients not receiving concurrent methotrexate may receive additional benefit by increasing dose to 40-mg once weekly.

Crohn's Disease

Subcut (Adults): 160 mg initially on Day 1 (given as four 40-mg injections in one day or as two 40-mg injections given in two consecutive days), followed by 80 mg 2 wks later on Day 15. Two wks later (Day 29) begin maintenance dose of 40 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents may be continued during therapy.

Availability

Solution for subcut injection (pre-filled syringes): 40 mg/0.8 ml. **Pen:** Single use prefilled glass syringe containing 40 mg (0.8 mL).

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Adalimumab is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe re-

Copyright © 2008 by F.A. Davis

action. Discontinue adalimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with adalimumab.
- ***Lab Test Considerations:*** May cause agranulocytosis, granulocytopenia, leukopenia, pancytopenia, and polycythemia.

Potential Nursing Diagnoses
Acute pain (Indications)
Risk for infection (Side Effects)

Implementation
- Administer a tuberculin skin test prior to administration of adalimumab. Patients with active latent TB should be treated for TB prior to therapy.
- Administer initial injection under supervision of a health care professional.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- Other DMARDs should be continued during adalimumab therapy.
- **Subcut:** Administer at a 45° angle in upper thighs or abdomen, avoiding the 2 inches around the navel. Put pressure on injection site for 10 sec, do not rub. Rotate injection sites; avoid areas that are tender, bruised, hard, or red.

Patient/Family Teaching
- Instruct patient on the correct technique for administering adalimumab. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container.
- Advise patient to use calendar stickers provided to by manufacturer to assist in remembering when dose is due. If a dose is missed, instruct patient to administer as soon as possible, then take next dose according to regular schedule. If more than prescribed dose is taken, caution patient to consult health care professional or the HUMIRA Patient Resource Center at 1-800-4HUMIRA (448-6472).
- Caution patient to notify health care professional immediately if signs of infection, severe rash, swollen face, or difficulty breathing occurs while taking adalimumab.
- Advise patient to consult health care professional before taking other Rx or OTC medications or herbal products.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Pen:** Clean area for injection with alcohol swab. Hold pen with gray cap pointing up. Check solution through window; if discolored, cloudy, or contains flakes, discard solution. Turn pen over and point cap down to make sure solution reaches fill line; if not, do not use and contact pharmacist. Remove gray cap exposing the needle and the plum cap exposing the button; removing the plum cap activates the pen. Pinch skin and place pen, with window visible, against skin at a 90° angle and press button until a click is heard. Hold pen in place until all solution is injected (10 seconds) and yellow marker is visible in window and has stopped moving. Continue to pinch skin throughout injection. Remove needle and press with a gauze pad or cotton ball for 10 seconds. Do not rub injection site. Dispose of pen into a puncture-resistant container.

Evaluation/Desired Outcomes
- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased signs and symptoms and maintenance of remission in patients with Crohn's disease.

adenosine (a-**den**-oh-seen)
Adenocard, Adenoscan

Classification
Therapeutic: antiarrhythmics

Pregnancy Category C

Indications
Conversion of paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm when vagal maneuvers are unsuccessful. As a diagnostic agent (with noninvasive techniques) to assess myocardial perfusion defects occur-

Copyright © 2008 by F.A. Davis

ring as a consequence of coronary artery disease.

Action

Restores normal sinus rhythm by interrupting re-entrant pathways in the AV node. Slows conduction time through the AV node. Also produces coronary artery vasodilation. **Therapeutic Effects:** Restoration of normal sinus rhythm.

Pharmacokinetics

Absorption: Following IV administration, absorption is complete.
Distribution: Taken up by erythrocytes and vascular endothelium.
Metabolism and Excretion: Rapidly converted to inosine and adenosine monophosphate.
Half-life: <10 sec.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; 2nd- or 3rd-degree AV block or sick sinus syndrome, unless a functional artificial pacemaker is present.
Use Cautiously in: Patients with a history of asthma (may induce bronchospasm); Unstable angina; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

CNS: apprehension, dizziness, headache, head pressure, light-headedness. **EENT:** blurred vision, throat tightness. **Resp:** shortness of breath, chest pressure, hyperventilation. **CV:** facial flushing, transient arrhythmias, chest pain, hypotension, palpitations. **GI:** metallic taste, nausea. **Derm:** burning sensation, facial flushing, sweating. **MS:** neck and back pain. **Neuro:** numbness, tingling. **Misc:** heaviness in arms, pressure sensation in groin.

Interactions

Drug-Drug: Carbamazepine may ↑ risk of progressive heart block. **Dipyridamole** ↑ effects of adenosine (dosage reduction of adenosine recommended). Effects of adenosine ↑ by **theophylline** or **caffeine** (larger doses of adenosine may be required). Concurrent use with **digoxin** may ↑ risk of ventricular fibrillation.

Route/Dosage

IV (Adults and Children >50 kg): *Antiarrhythmic*—6 mg by rapid IV bolus; if no results, repeat 1–2 min later as 12-mg rapid bolus. This dose may be repeated (single dose not to exceed 12 mg). *Diagnostic use*—140 mcg/kg/min for 6 min (0.84 mg/kg total).
IV (Children <50 kg): *Antiarrhythmic*—0.05–0.1 mg/kg as a rapid bolus, may repeat in 1–2 min; if response is inadequate, may increase by 0.05–0.1 mg/kg until sinus rhythm is established or maximum dose of 0.3 mg/kg is used.

Availability (generic available)

Injection: 6 mg/2-ml vial (Adenocard), 3 mg/1 ml in 30-ml vial (Adenoscan).

NURSING IMPLICATIONS

Assessment

- Monitor heart rate frequently (every 15–30 sec) and ECG continuously during therapy. A short, transient period of 1st-, 2nd-, or 3rd-degree heart block or asystole may occur following injection; usually resolves quickly due to short duration of adenosine. Once conversion to normal sinus rhythm is achieved, transient arrhythmias (premature ventricular contractions, atrial premature contractions, sinus tachycardia, sinus bradycardia, skipped beats, AV nodal block) may occur, but generally last a few seconds.
- Monitor blood pressure during therapy.
- Assess respiratory status (breath sounds, rate) following administration. Patients with history of asthma may experience bronchospasm.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- Do not confuse adenosine (Adenocard) with adenosine phosphate.

IV Administration

- **IV:** Crystals may occur if adenosine is refrigerated. Warm to room temperature to dissolve crystals. Solution must be clear before use. Do not administer solutions that are discolored or contain particulate matter. Discard unused portions.
- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 3 mg/ml. ***Rate:*** Adminis-

Copyright © 2008 by F.A. Davis

ter over 1–2 seconds via peripheral IV as proximal as possible to trunk. Slow administration may cause increased heart rate in response to vasodilation. Follow each dose with 20 ml rapid saline flush to ensure injection reaches systemic circulation.

- **Intermittent Infusion:** (for use in diagnostic testing) ***Diluent:*** Administer 30-ml vial undiluted. ***Concentration:*** 3 mg/ml. ***Rate:*** Administer at a rate of 140 mcg/kg/min over 6 min for a total dose of 0.84 mg/kg. Thallium-201 should be injected as close to the venous access as possible at the midpoint (after 3 min) of the infusion.
- **Y-Site Compatibility:** abciximab, Thallium-201.

Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension. Doses >12 mg decrease blood pressure by decreasing peripheral vascular resistance.
- Instruct patient to report facial flushing, shortness of breath, or dizziness.

Evaluation/Desired Outcomes

- Conversion of supraventricular tachycardia to normal sinus rhythm.
- Diagnosis of myocardial perfusion defects.

albumin (human)

(al-**byoo**-min)
Albuminar, Albutein, Buminate, normal human serum albumin, Plasbumin

Classification
Therapeutic: volume expanders
Pharmacologic: blood products, colloids

Pregnancy Category C

Indications

Expansion of plasma volume and maintenance of cardiac output in situations associated with fluid volume deficit, including shock, hemorrhage, and burns. Temporary replacement of albumin in diseases associated with low levels of plasma proteins, such as nephrotic syndrome or end-stage liver disease, resulting in relief or reduction of associated edema.

Action

Provides colloidal oncotic pressure, which serves to mobilize fluid from extravascular tissues back into the intravascular space. Requires concurrent administration of appropriate crystalloid. **Therapeutic Effects:** Increase in intravascular fluid volume.

Pharmacokinetics

Absorption: Following IV administration, absorption is essentially complete.
Distribution: Confined to the intravascular space, unless capillary permeability is increased.
Metabolism and Excretion: Probably degraded by the liver.
Half-life: 2–3 wk.

TIME/ACTION PROFILE (oncotic effect)

ROUTE	ONSET	PEAK	DURATION
IV	15–30 min	unknown	24 hrs

Contraindications/Precautions

Contraindicated in: Allergic reactions to albumin; Severe anemia; CHF; Normal or increased intravascular volume.
Use Cautiously in: Severe hepatic or renal disease; Dehydration (additional fluids may be required); Patients requiring sodium restriction; Preterm neonates (infuse slowly due to increased risk of intravascular hemorrhage).

Adverse Reactions/Side Effects

CNS: headache. **CV:** PULMONARY EDEMA, fluid overload, hypertension, hypotension, tachycardia. **GI:** increased salivation, nausea, vomiting. **Derm:** rash, urticaria. **MS:** back pain. **Misc:** chills, fever, flushing.

Interactions

Drug-Drug: None significant.

Route/Dosage

Dose is highly individualized and depends on condition being treated.

Hypovolemic shock—5% Albumin

IV (Adults): 25 g (500 ml), may be repeated within 30 min.
IV (Children): 0.5–1 g/kg/dose (10–20 mL/kg/dose) may repeat as needed (maximum 6 g/kg/day).
IV (Infants and Neonates): 0.25–0.5 g/kg/dose (5–10 ml/kg/dose).

Hypoproteinemia—25% Albumin

IV (Adults): 50–75 g.
IV (Children, Infants, and Neonates): 0.5–1 g/kg/dose, may repeat every 1–2 days; doses up to 1.5 g/kg/day have been added to hyperalimentation solutions and given over 24 hrs.

Copyright © 2008 by F.A. Davis

Nephrotic Syndrome—25% Albumin

IV (Adults): 12.5–50 g/day in 3–4 divided doses.

IV (Children and Infants): 0.25–1 g/kg/dose.

Availability

Injection: 5% (50 mg/mL), 25% (250 mg/mL).

NURSING IMPLICATIONS

Assessment

- Monitor vital signs, CVP, and intake and output before and frequently throughout therapy. If fever, tachycardia, or hypotension occurs, stop infusion and notify physician immediately. Antihistamines may be required to suppress this hypersensitivity response. Hypotension may also result from infusing too rapidly. May be given without regard to patient's blood group.
- Assess for signs of vascular overload (elevated CVP, rales/crackles, dyspnea, hypertension, jugular venous distention) during and after administration.
- **Surgical Patients:** Assess for increased bleeding after administration caused by increased blood pressure and circulating blood volume. Albumin does not contain clotting factors.
- ***Lab Test Considerations:*** Serum albumin levels should increase with albumin therapy.
- Monitor serum sodium levels; may cause ↑ concentrations.
- Infusions of normal serum albumin may cause false ↑ of alkaline phosphatase levels.
- Hemorrhage: Monitor hemoglobin and hematocrit levels. These values may ↓ because of hemodilution.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Deficient fluid volume (Indications)
Excess fluid volume (Side Effects)

Implementation

- Follow manufacturer's recommendations for administration. Administer through a large-gauge (at least 20-gauge) needle or catheter. Record lot number in patient record.
- Solution should be clear amber; 25% albumin solution is equal to 5 times the osmotic value of plasma. Do not administer solutions that are discolored or contain particulate matter. Each liter of both 5% and 25% albumin contains 130–160 mEq of sodium and is thus no longer labeled "salt-poor" albumin.
- Administration of large quantities of normal serum albumin may need to be supplemented with whole blood to prevent anemia. If more than 1000 ml of 5% normal serum albumin is given or if hemorrhage has occurred, the administration of whole blood or packed RBCs may be needed. Hydration status should be monitored and maintained with additional fluids.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Administer 5% normal serum albumin undiluted. Normal serum albumin 25% may be administered undiluted or diluted in 0.9% NaCl, D5W, or sodium lactate injection; do not dilute in sterile water (may result in hypotonic-associated hemolysis which may be fatal). Infusion must be completed within 4 hr. ***Concentration:*** 5%: 50 mg/ml undiluted. 25%: 250 mg/ml undiluted. ***Rate:*** Rate of administration is determined by concentration of solution, blood volume, indication, and patient response (usual rate over 30–60 min). In patients with normal blood volume, rate of 5% and 25% solutions should not exceed 2–4 ml/min and 1 ml/min, respectively for both adults and children.
- **Hypovolemia:** 5% or 25% normal serum albumin may be administered as rapidly as tolerated and repeated in 15–30 min if necessary.
- **Burns:** Rate after the first 24 hr should be set to maintain a plasma albumin level of 2.5 g/100 ml or a total serum protein level of 5.2 g/100 ml.
- **Hypoproteinemia:** Normal serum albumin 25% is the preferred solution because of the increased concentration of protein. The rate should not exceed 2–3 ml/min of 25% or 5–10 ml/min of 5% solution to prevent circulatory overload and pulmonary edema. This treatment provides a temporary rise in plasma protein until the hypoproteinemia is corrected.
- **Y-Site Compatibility:** diltiazem, lorazepam.
- **Y-Site Incompatibility:** fat emulsion, midazolam, vancomycin, verapamil.

Copyright © 2008 by F.A. Davis

- **Solution Compatibility:** 0.9% NaCl, D5W, D5/0.9% NaCl, D5/0.45% NaCl, sodium lactate 1/6M, D5/LR, and LR.

Patient/Family Teaching

- Explain the purpose of this solution to the patient.
- Instruct patient to report signs and symptoms of hypersensitivity reaction.

Evaluation/Desired Outcomes

- Increase in blood pressure and blood volume when used to treat shock and burns.
- Increased urinary output reflects the mobilization of fluid from extravascular tissues.
- Elevated serum plasma protein in patients with hypoproteinemia.

albuterol (al-**byoo**-ter-ole)

Airet, Apo-Salvent, Gen-Salbutamol, Novo-Salmol, Proventil, Proventil HFA, salbutamol, Ventodisk, Ventolin, Ventolin HFA, Ventolin nebules, Ventolin rotacaps

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

Pregnancy Category C

Indications

Used as a bronchodilator to control and prevent reversible airway obstruction caused by asthma or COPD. **Inhaln:** Used as a quick-relief agent for acute bronchospasm and for prevention of exercise-induced bronchospasm. **PO:** Used as a long-term control agent in patients with chronic/persistent bronchospasm.

Action

Binds to beta$_2$-adrenergic receptors in airway smooth muscle, leading to activation of adenyl cyclase and increased levels of cyclic-3′, 5′-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes smooth muscle airways. Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta$_2$ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Well absorbed after oral administration but rapidly undergoes extensive metabolism.
Distribution: Small amounts appear in breast milk.
Metabolism and Excretion: Extensively metabolized by the liver and other tissues.
Half-life: Oral 2.7–5 hr; Inhalation: 3.8 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	2–3 hr	4–6 hr or more
PO–ER	30 min	2–3 hr	12 hr
Inhaln	5–15 min	60–90 min	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines; Hypersensitivity to fluorocarbons (some inhalers).
Use Cautiously in: Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; Seizure disorders; Excess inhaler use may lead to tolerance and paradoxical bronchospasm; OB, Lactation, Pedi: Safety not established for pregnant women near term, breastfeeding women, and children <2 yr; Geri: Increased risk adverse reactions; may require dosage reduction.

Adverse Reactions/Side Effects

CNS: nervousness, restlessness, tremor, headache, insomnia (Pedi: occurs more frequently in young children than adults), hyperactivity in children. **CV:** chest pain, palpitations, angina, arrhythmias, hypertension. **GI:** nausea, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use with other **adrenergic agents** will have ↑ adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. May decrease serum **digoxin** levels. Cardiovascular effects are potentiated in patients receiving **tricyclic antidepressants**. Risk of hypokalemia ↑ concurrent use of **potassium-losing diuretics**. Hypokalemia ↑ the risk of **digoxin** toxicity.
Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

PO (Adults and Children ≥12 yr): 2–4 mg 3–4 times daily (not to exceed 32 mg/day) or 4–8 mg of extended-release tablets twice daily.

Copyright © 2008 by F.A. Davis

PO (Geriatric Patients): Initial dose should not exceed 2 mg 3–4 times daily, may be increased carefully (up to 32 mg/day).
PO (Children 6–12 yr): 2 mg 3–4 times daily or 0.3–0.6 mg/kg/day as extended-release tablets divided twice daily; may be carefully increased as needed (not to exceed 8 mg/day).
PO (Children 2–6 yr): 0.1 mg/kg 3 times daily (not to exceed 2 mg 3 times daily initially); may be carefully increased to 0.2 mg/kg 3 times daily (not to exceed 4 mg 3 times daily).
Inhaln (Adults and Children ≥4 yr): *Via metered-dose inhaler*—2 inhalations q 4–6 hr or 2 inhalations 15 min before exercise (90 mcg/spray); some patients may respond to 1 inhalation. *NIH Guidelines for acute asthma exacerbation: Children*—4–8 puffs q 20 min for 3 doses then q 1–4 hr; *Adults*—4–8 puffs q 20 min for up to 4 hr then q 1–4 hr prn.
Inhaln (Adults and Children >12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—2.5–5 mg q 20 min for 3 doses then 2.5–10 mg q 1–4 hr prn; *Continuous nebulization*—10–15 mg/hr.
Inhaln (Children 2–12 yr): *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—0.15 mg/kg/dose (minimum dose 2.5 mg) q 20 min for 3 doses then 0.15–0.3 mg/kg (not to exceed 10 mg) q 1–4 hr prn *or* 1.25 mg 3–4 times daily for children 10–15 kg *or* 2.5 mg 3–4 times daily for children >15 kg; *Continuous nebulization*—0.5–3 mg/kg/hr.
Inhaln (Adults and Children ≥4 yr): *Via Rotahaler inhalation device*—200 mcg (as Ventolin Rotacaps) q 4–6 hr (up to 400 mcg q 4–6 hr). May also be given 15 min before exercise.

Availability (generic available)

Tablets: 2 mg, 4 mg. **Cost:** *Generic*—2 mg $62.96/270, 4 mg $49.49/270. **Extended-release tablets:** 4 mg, 8 mg. **Cost:** 4 mg $265.43/180, 8 mg $488.93/180. **Oral syrup (strawberry-flavored):** 2 mg/5 ml. **Cost:** *Generic*—$11.42/480 ml. **Metered-dose aerosol:** 90 mcg/inhalation in 6.7-g, 8.5-g, 17-g, and 18-g canisters (200 metered inhalations), ✱100 mcg/spray. **Cost:** *Proair HFA*—$35.99/8.5-g canister; *Proventil HFA*—$45.99/6.7-g canister; *Ventolin HFA*—$37.99/18-g canister. **Inhalation solution:** 0.63 mg/3 ml, 1.25 mg/3 ml, 0.83 mg/ml in vials and 3 ml unit dose, ✱1 mg/ml, ✱2 mg/ml, 5 mg/ml. **Cost:** *Generic*—5 mg/ml $15.99/20 ml, 0.63 mg/ml $8.99/3 ml, 0.83 mg/ml $18.99/3 ml (25 vials). **Powder for inhalation (Ventodisk):** ✱200 mcg, ✱400 mcg. ***In combination with:*** ipratropium (Combivent, DuoNeb). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy to determine effectiveness of medication.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify physician or other health care professional immediately.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or higher-than-recommended doses.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Do not confuse Salbutamol (albuterol) with Salmeterol.
- **PO:** Administer oral medication with meals to minimize gastric irritation.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.
  Inhaln: Shake inhaler well, and allow at least 1 min between inhalations of aerosol medication. Prime the inhaler before first use by releasing 4 test sprays into the air away from the face. Pedi: Use spacer for children <8 years of age.
- For nebulization or IPPB, the 0.5-, 0.83-, 1-, and 2-mg/ml solutions do not require dilution before administration. The 5 mg/ml (0.5%) solution must be diluted with 1–2.5 ml of 0.9% NaCl for inhalation. Diluted solutions are stable for 24 hr at room temperature or 48 hr if refrigerated.
- For nebulizer, compressed air or oxygen flow should be 6–10 L/min; a single treatment of 3 ml lasts about 10 min.
- IPPB usually lasts 5–20 min.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take albuterol as directed. If on a scheduled dosing regimen, take missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses or increase the dose or frequency of doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm (more likely with first dose from new cannister), or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Instruct patient to prime unit with 4 sprays before using and to discard cannister after 200 sprays. Actuators should not be changed among products.
- Inform patient that these products contain hydrofluoralkane (HFA) and the propellant and are described as non-CFC or CFC-free (contain no chlorofluorocarbons).
- Advise patient to consult health care professional before taking any OTC medications, natural/herbal products, or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Inform patient that albuterol may cause an unusual or bad taste.
- **Inhaln:** Instruct patient in the proper use of the metered-dose inhaler, Rotahaler, or nebulizer (see Appendix D).
- Advise patients to use albuterol first if using other inhalation medications and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Instruct patient to notify health care professional if no response to the usual dose of albuterol or if contents of one canister are used in less than 2 wk.
- Pedi: Caution adolescents and their parents about overuse of inhalers, which can cause heart damage and life-threatening arrhythmias.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

alclometasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

HIGH ALERT

alemtuzumab

(a-lem-**too**-zoo-mab)
Campath

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Treatment of B-cell chronic lymphocytic leukemia in patients who have been treated with alkylating agents and in which fludarabine therapy has failed.

Action

Binds to the CD52 antigen found on the surface of B- and T-lymphocytes and other white blood cells; resulting in lysis. **Therapeutic Effects:** Lysis of leukemic cells with eventual improvement in hematologic parameters.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Binds to CD52 receptors.
Metabolism and Excretion: Unknown.
Half-life: 12 days.

TIME/ACTION PROFILE (hematologic parameters)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	2–4 mos‡	7–11 mos‡‡

‡Median time to response
‡‡Duration of response

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Systemic infections; Underlying immunodeficiency, including HIV infection; Lactation: Discontinue breast-feeding during and for 3 mos following last dose of alemtuzumab.
Use Cautiously in: Patients with ischemic heart disease or in patients on antihypertensive medications; Women and men with reproduction potential should use contraception during treatment and for 6 mos after therapy; OB: Should be administered only if clearly needed.

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: depression, dizziness, drowsiness, fatigue, headache, weakness. **Resp:** bronchospasm, cough, dyspnea. **CV:** hypertension, hypotension, tachycardia. **GI:** abdominal pain, anorexia, constipation, stomatitis. **Derm:** rash, sweating. **F and E:** edema. **Hemat:** NEUTROPENIA, PANCYTOPENIA/MARROW HYPOPLASIA, anemia, lymphopenia, thrombocytopenia. **MS:** back pain, skeletal pain. **Misc:** infusion-related events, infection, sepsis.

Interactions

Drug-Drug: Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to and increase the risk of adverse reactions to **live-virus vaccines**.

Route/Dosage

IV (Adults): 3 mg/day initially, as tolerated increase dose to 10 mg/day and then 30 mg/day given three times weekly for up to 12 weeks; single doses should not exceed 30 mg or more than 90 mg/wk.

Availability

Solution for injection (requires further dilution): 30 mg/3 ml in single-use ampules.

NURSING IMPLICATIONS

Assessment

- Monitor for infusion reactions (hypotension, rigors, fever, shortness of breath, bronchospasm, chills, rash). Premedicate with an oral antihistamine and acetaminophen 30 min prior to initial dose, dose increases, and as clinically indicated. Monitor blood pressure and hypotensive symptoms in patients with ischemic heart disease with extra care. Antihistamines, acetaminophen, antiemetics, meperidine, corticosteroids, and incremental dose escalation have been used to prevent and treat infusion-related reactions. Initiate therapy at lowest dose and increase gradually. If therapy is interrupted for 7 or more days, reinstitute with gradual dose escalation.
- ***Lab Test Considerations:*** Obtain CBC and platelet counts weekly during therapy and more frequently if worsening anemia, neutropenia, or thrombocytopenia is observed. For first occurrence of ANC<250 cells/mm^3 and/or platelet count <25,000 cells/mm^3, withhold alemtuzumab therapy. When ANC >500 cells/mm^3 and platelet count is >50,000 cells/mm^3, resume at same dose. If delay of 7 days or more occurred initiate therapy at 3 mg and escalate to 10 mg and then to 30 mg as tolerated. For second occurrence of ANC <250 cells/mm^3 and/or platelet count <25,000 cells/mm^3, withhold alemtuzumab. When ANC >500 cells/mm^3 and platelet count >50,000 cells/mm^3, resume therapy at 10 mg. If delay is 7 days or more, initiate therapy at 3 mg and escalate to 10 mg only. For third occurrence of ANC <250 cells/mm^3 and/or platelet count <25,000 cells/mm^3, discontinue alemtuzumab therapy permanently. For a decrease of ANC and/or platelet count of 50% of baseline value in patients initiating therapy with a baseline ANC of <500 cells/mm^3 and/or a baseline platelet count of 25,000 cells/mm^3, withhold therapy. When baseline levels return, resume therapy. If delay is 7 days or more, initiate therapy at 3 mg and escalate to 10 mg and 30 mg as tolerated.
- Assess CD4 counts after treatment until recovery to ≥200 cells cells/mm^3.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Risk for injury (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Alemtuzumab should only be administered under the supervision of a physician experienced in the use antineoplastic therapy.
- Administer via IV only. Inspect solution for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored.

IV Administration

- Withdraw necessary amount from ampule into syringe. Filter with a sterile low-protein binding, non-fiber releasing 5 micron filter prior to dilution.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 100 ml of 0.9% NaCl or D5W. Gently invert bag to mix. Dispose of syringe and unused drug product according to institutional

Copyright © 2008 by F.A. Davis

guidelines. Use within 8 hr of dilution. Store at room temperature or in refrigerator. Protect solution from light. ***Rate:*** Administer over 2 hr.

- **Y-Site Incompatibility:** No data is available regarding mixing with other solutions and medications. Do not add to or infuse simultaneously with other solutions or medications.

Patient/Family Teaching

- Inform patient and family of purpose of alemtuzumab.
- Caution patient to avoid immunizations with a live virus due to immunosuppression.

Evaluation/Desired Outcomes

- Improvement in hematologic parameters in patients with B-cell chronic lymphocytic leukemia.

alendronate (a-**len**-drone-ate)
Fosamax

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Pregnancy Category C

Indications

Treatment and prevention of postmenopausal osteoporosis. Treatment of osteoporosis in men. Treatment of Paget's disease of the bone. Treatment of corticosteroid-induced osteoporosis in patients (men and women) who are receiving ≥7.5 mg of prednisone/day (or equivalent) with evidence of decreased bone mineral density.

Action

Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures. Decreased progression of Paget's disease.

Pharmacokinetics

Absorption: Poorly absorbed (0.6–0.8%) after oral administration.
Distribution: Transiently distributes to soft tissue, then distributes to bone.
Metabolism and Excretion: Excreted in urine.
Half-life: 10 yr (reflects release of drug from skeleton).

TIME/ACTION PROFILE (inhibition of bone resorption)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	3 wk–7 mo†

†After discontinuation of alendronate

Contraindications/Precautions

Contraindicated in: Renal insufficiency (CCr <35 ml/min); OB, Lactation: Safety not established.
Use Cautiously in: Patients with active GI pathology (dysphagia, esophageal disease, gastritis, duodenitis, ulcers); Pre-existing hypocalcemia or vitamin D deficiency.

Adverse Reactions/Side Effects

CNS: headache. **EENT:** blurred vision, conjunctivitis, eye pain/inflammation. **GI:** abdominal distention, abdominal pain, acid regurgitation, constipation, diarrhea, dyspepsia, dysphagia, esophageal ulcer, flatulence, gastritis, nausea, taste perversion, vomiting. **Derm:** erythema, photosensitivity, rash. **MS:** musculoskeletal pain.

Interactions

Drug-Drug: Calcium supplements, **antacids**, and **other oral medications** ↓ the absorption of alendronate. Doses >10 mg/day ↑ risk of adverse GI events when used with **NSAIDs**. IV **ranitidine** ↑ blood levels.
Drug-Food: Food significantly ↓ absorption. **Caffeine (coffee, tea, cola)**, **mineral water**, and **orange juice** also ↓ absorption.

Route/Dosage

PO (Adults): *Treatment of osteoporosis*—10 mg once daily or 70 mg once weekly. *Prevention of osteoporosis*—5 mg once daily or 35 mg once weekly. *Paget's disease*—40 mg once daily for 6 mo. Re-treatment may be considered for patients who relapse. *Treatment of corticosteroid-induced osteoporosis in men and premenopausal women*—5 mg once daily. *Treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen*—10 mg once daily.

Availability

Tablets: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. **Cost:** 5 mg $248.19/90, 10 mg $240.97/90, 35 mg $235.97/12, 40 mg $177.89/30, 70 mg $239.96/12. **Oral solution (raspberry flavor):** 70 mg/75 ml. **Cost:** $27.99/75 ml. ***In combination with:*** Cholecalciferol (Fosamax plus D) See Appendix B.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- ***Lab Test Considerations:*** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient elevations of calcium and phosphate.
- **Paget's Disease:** Monitor alkaline phosphatase before and periodically during therapy. Alendronate is indicated for patients with alkaline phosphatase twice the upper limit of normal.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- Do not confuse Fosamax (alendronate) with Flomax (tamsulosin).
- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food.

Patient/Family Teaching

- Instruct patient on the importance of taking exactly as directed, first thing in the morning, 30 min before other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Alendronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a weekly dose is missed, take the morning after remembered and resume the following week on the chosen day. Do not take 2 tablets on the same day. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to discontinue alendronate and notify health care provider if pain or difficulty swallowing, retrosternal pain, or new/worsening heartburn occur.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if blurred vision, eye pain or inflammation occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she is breastfeeding.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women.
- Treatment of osteoporosis in men.
- Decrease in the progression of Paget's disease.
- Treatment of corticosteroid-induced osteoporosis.

alfuzosin (al-**fyoo**-zo-sin)
Uroxatral

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category B

Indications

Management of symptomatic benign prostatic hyperplasia (BPH).

Action

Selectively blocks alpha$_1$-adrenergic receptors in the lower urinary tract to relax smooth muscle in the bladder neck and prostate. **Therapeutic Effects:** Increased urine flow and decreased symptoms of BPH.

Pharmacokinetics

Absorption: 49% absorbed following oral administration; food enhances absorption.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); 69% eliminated in feces, 24% in urine.

Copyright © 2008 by F.A. Davis

Half-life: 10 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO-ER	within hr	8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate to severe hepatic impairment; Potent inhibitors of the CYP3A4 enzyme system; Concurrent use of other alpha-adrenergic blocking agents; Severe renal impairment; OB, Pedi: No indications for women and children.

Use Cautiously in: Congenital or acquired QTc prolongation or concurrent use of other drugs known to prolong QTc; Mild hepatic impairment; Geri: Consider age-related changes in body mass, cardiac, renal and hepatic function when prescribing.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **Resp:** bronchitis, sinusitis, pharyngitis. **CV:** postural hypotension. **GI:** abdominal pain, constipation, dyspepsia, nausea. **GU:** erectile dysfunction.

Interactions

Drug-Drug: Ketoconazole, **itraconazole**, and **ritonavir** ↓ metabolism and significantly ↑ levels and effects (concurrent use in contraindicated). Levels are also ↑ by **cimetidine**, **atenolol**, and **diltiazem**. Alfuzosin ↑ levels and may ↑ effects of **atenolol** and **diltiazem** (monitor blood pressure and heart rate). ↑ risk of hypotension with **antihypertensives**, **nitrates**, and acute ingestion of **alcohol**.

Route/Dosage

PO (Adults): 10 mg once daily.

Availability

Extended-release tablets: 10 mg. **Cost:** $229.96/90.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess patient for orthostatic reaction and syncope. Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically thereafter. May occur within a few hrs after initial doses and occasionally thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer with food at the same meal each day. Tablets must be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication with the same meal each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery.
- Advise patient to notify health care professional if frequent dizziness or fainting occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- Geri: Assess risk for falls; implement fall prevention program and instruct patient and family in preventing falls at home.

Evaluation/Desired Outcomes

- Decreased symptoms of benign prostatic hyperplasia.

aliskiren (a-**lis**-ki-ren)
Tekturna

Classification
Therapeutic: antihypertensives
Pharmacologic: renin inhibitors

Pregnancy Category C

Indications

Treatment of hypertension (alone or with other agents).

Copyright © 2008 by F.A. Davis

Action
Inhibition of renin results in decreased formation of angiotensin II, a powerful vasoconstrictor. **Therapeutic Effects:** Decreased blood pressure.

Pharmacokinetics
Absorption: Poorly absorbed (bioavailability 2.5%).
Distribution: Unknown.
Metabolism and Excretion: 2% excreted unchanged in urine, remainder is probably metabolized (CYP3A4 enzyme system).
Half-life: 24 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Known or suspected pregnancy (may cause fetal injury or death).
Use Cautiously in: Salt or volume depletion (correct before use); Severe renal impairment; Pedi: Safe use not established.

Adverse Reactions/Side Effects
Resp: cough. **GI:** abdominal pain, diarrhea (↑ in females and elderly), dyspepsia, reflux. **Misc:** ANGIOEDEMA.

Interactions
Drug-Drug: Blood levels are ↓ by **irbesartan**. Blood levels are ↑ by **atorvastatin** and **ketoconazole**. ↓ blood levels and may ↓ effects of **furosemide**. Antihypertensive effects may be ↑ by other **antihypertensives**, **diuretics**, and **nitrates**. ↑ risk of hyperkalemia with **ACE inhibitors** in diabetic patients.
Drug-Food: High fat meals significantly ↓ absorption.

Route/Dosage
PO (Adults): 150 mg/day initially; may be increased to 300 mg/day.

Availability
Tablets: 150 mg, 300 mg.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes. If an excessive fall in BP occurs, place patient in a supine position and administer IV 0.9% NaCl, if necessary. A transient hypotensive response does not contraindicate further therapy.
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause minor ↑ in BUN, serum creatinine, potassium, uric acid, and creatine kinase.
- May cause small ↓ in hemoglobin and hematocrit.

Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

Implementation
- Correct volume or sodium depletion prior to initiating therapy.
- **PO:** Administer at the same time each day without regard to meals.

Patient/Family Teaching
- Instruct patient to take aliskiren as directed at the same time each day, even if feeling better. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses. Do not share medication with others, even with same condition; may be harmful.
- May cause dizziness. Caution patient to lie down and notify health care professional. Also, avoid driving and other activities requiring alertness until response to aliskiren is known.
- Advise patient to report signs and symptoms of angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty swallowing or breathing) to health care professional immediately.
- Instruct patient to notify health care professional prior to taking other Rx, OTC, or herbal products.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding. If pregnancy is detected, discontinue aliskiren as soon as possible.

Evaluation/Desired Outcomes
- Decrease in blood pressure without appearance of side effects. Antihypertensive effect is 90% attained by 2 wks.

Copyright © 2008 by F.A. Davis

allopurinol (al-oh-**pure**-i-nole)
Alloprim, Apo-Allopurinol, Lopurin, Purinol, Zyloprim

Classification
Therapeutic: antigout agents, antihyperuricemics
Pharmacologic: xanthine oxidase inhibitors

Pregnancy Category C

Indications
PO: Prevention of attack of gouty arthritis and nephropathy. **PO, IV:** Treatment of secondary hyperuricemia, which may occur during treatment of tumors or leukemias.

Action
Inhibits the production of uric acid by inhibiting the action of xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels.

Pharmacokinetics
Absorption: Well absorbed (80%) following oral administration.
Distribution: Widely distributed in tissue and breast milk.
Protein Binding: <1%.
Metabolism and Excretion: Metabolized to oxypurinol, an active compound with a long half-life. 12% excreted unchanged, 76% excreted as oxypurinol.
Half-life: 1–3 hr (oxypurinol 18–30 hr).

TIME/ACTION PROFILE (hypouricemic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	1–2 days	1–2 wk	1–3 wk

†Duration after discontinuation of allopurinol

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Acute attacks of gout; Renal insufficiency (dose reduction required if CCr <20 ml/min); Dehydration (adequate hydration necessary); OB, Lactation: Rarely used; Geri: Begin at lower end of dosage range.

Adverse Reactions/Side Effects
CV: hypotension, flushing, hypertension, bradycardia, and heart failure (reported with IV administration).
CNS: drowsiness. **GI:** diarrhea, hepatitis, nausea, vomiting. **GU:** renal failure, hematuria.
Derm: rash (discontinue drug at first sign of rash), urticaria. **Hemat:** bone marrow depression. **Misc:** hypersensitivity reactions.

Interactions
Drug-Drug: Use with **mercaptopurine** and **azathioprine** ↑ bone marrow depressant properties—doses of these drugs should be ↓. Use with **ampicillin** or **amoxicillin** ↑ risk of rash. Use with **oral hypoglycemic agents** and **warfarin** ↑ effects of these drugs. Use with **thiazide diuretics** or **ACE inhibitors** ↑ risk of hypersensitivity reactions. Large doses of allopurinol may ↑ risk of **theophylline** toxicity. May ↑ **cyclosporine** levels.

Route/Dosage
Management of Gout
PO (Adults and Children >10 yr): *Initially*—100 mg/day; increase at weekly intervals based on serum uric acid (not to exceed 800 mg/day). Doses >300 mg/day should be given in divided doses. *Maintenance dose*—100–200 mg 2–3 times daily. Doses of ≤300 mg may be given as a single daily dose.

Management of Secondary Hyperuricemia
PO (Adults and Children >10 yr): 600–800 mg/day in 2–3 divided doses starting 1–2 days before chemotherapy or radiation.
PO (Children 6–10 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 300 mg daily in 2–3 divided doses.
PO (Children <6 yr): 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 150 mg daily in 3 divided doses.
IV (Adults and Children >10 yr): 200–400 mg/m²/day (up to 600 mg/day) as a single daily dose or in divided doses q 8–24 hr.
IV (Children <10 yr): 200 mg/m²/day initially as a single daily dose or in divided doses q 8–24 hr (maximum dose 600 mg/day).

Renal Impairment
(Adults and Children): *CCr >50 ml/min*—No dosage change; *CCr 10–50 ml/min*—Reduce dosage to 50% of recommended; *CCr <10 ml/min*—Reduce dosage to 30% of recommended.

Availability (generic available)
Tablets: 100 mg, 300 mg. **Cost:** *Generic*—100 mg $12.99/100, 300 mg $22.99/100. **Injection:** 500 mg/vial.

NURSING IMPLICATIONS

Assessment
- Monitor intake and output ratios. Decreased kidney function can cause drug accumulation

Copyright © 2008 by F.A. Davis

and toxic effects. Ensure that patient maintains adequate fluid intake (minimum 2500–3000 ml/day) to minimize risk of kidney stone formation.

- Assess patient for rash or more severe hypersensitivity reactions. Discontinue allopurinol immediately if rash occurs. Therapy should be discontinued permanently if reaction is severe. Therapy may be reinstated after a mild reaction has subsided, at a lower dose (50 mg/day with very gradual titration). If skin rash recurs, discontinue permanently.
- **Gout:** Monitor for joint pain and swelling. Addition of colchicine or NSAIDs may be necessary for acute attacks. Prophylactic doses of colchicine or an NSAID should be administered concurrently during the first 3–6 mo of therapy because of an increased frequency of acute attacks of gouty arthritis during early therapy.
- ***Lab Test Considerations:*** Serum and urine uric acid levels usually begin to ↓ 2–3 days after initiation of oral therapy.
- Monitor blood glucose in patients receiving oral hypoglycemic agents. May cause hypoglycemia.
- Monitor hematologic, renal, and liver function tests before and periodically during therapy, especially during the first few months. May cause ↑ serum alkaline phosphatase, bilirubin, AST, and ALT levels. ↓ CBC and platelets may indicate bone marrow depression. ↑ BUN, serum creatinine, and CCr may indicate nephrotoxicity. These are usually reversed with discontinuation of therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** May be administered after milk or meals to minimize gastric irritation; give with plenty of fluid. May be crushed and given with fluid or mixed with food for patients who have difficulty swallowing.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 500 mg vial with 25 ml of sterile water for injection. Solution should be clear and almost colorless with only slight opalescence. Dilute to desired concentration with 0.9% NaCl or D5W. Administer within 10 hr of reconstitution; do not refrigerate. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** Not >6 mg/ml. ***Rate:*** Infusion should be initiated 24–48 hr before start of chemotherapy known to cause tumor cell lysis. Rate of infusion depends on volume of infusate (100–300 mg doses may be infused over 30 minutes). May be administered as a single infusion or equally divided infusions at 6-, 8-, or 12-hr intervals.
- **Y-Site Compatibility:** acyclovir, aminophylline, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cisplatin, cyclophosphamide, dactinomycin, dexamethasone sodium phosphate, doxorubicin liposome, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, lorazepam, mannitol, mesna, methotrexate, metronidazole, mitoxandrone, morphine, piperacillin, potassium chloride, ranitidine, teniposide, thiotepa, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** amikacin, amphotericin B, carmustine, cefotaxime, chlorpromazine, cimetidine, clindamycin, cytarabine, dacarbazine, daunorubicin, diphenhydramine, doxorubicin, doxycycline, droperidol, floxuridine, gentamicin, haloperidol, idarubicin, imipenem/cilastatin, mechlorethamine, meperidine, methylprednisolone sodium succinate, metoclopramide, minocycline, nalbuphine, ondansetron, prochlorperazine, promethazine, sodium bicarbonate, streptozocin, tobramycin, vinorelbine.

Patient/Family Teaching

- Instruct patient to take allopurinol as directed. Take missed doses as soon as remembered. If dosing schedule is once daily, do not take if remembered the next day. If dosing schedule is more than once a day, take up to 300 mg for the next dose.
- Instruct patient to continue taking allopurinol along with an NSAID or colchicine during an acute attack of gout. Allopurinol helps prevent, but does not relieve, acute gout attacks.

Copyright © 2008 by F.A. Davis

- Alkaline diet may be ordered. Urinary acidification with large doses of vitamin C or other acids may increase kidney stone formation (see Appendix L). Advise patient of need for increased fluid intake.
- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to report skin rash, blood in urine, or influenza symptoms (chills, fever, muscle aches and pains, nausea, or vomiting) to health care professional immediately; skin rash may indicate hypersensitivity.
- Advise patient that large amounts of alcohol increase uric acid concentrations and may decrease the effectiveness of allopurinol.
- Emphasize the importance of follow-up exams to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Decreased serum and urinary uric acid levels. May take 2–6 wk to observe clinical improvement in patients treated for gout.

almotriptan (al-moe-**trip**-tan)
Axert

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Pregnancy Category C

Indications
Acute treatment of migraine headache.

Action
Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropetides and resultant decrease in migraine headache.

Pharmacokinetics
Absorption: Well absorbed following oral administration (70%).
Distribution: Unknown.
Metabolism and Excretion: 40% excreted unchanged in urine; 27% metabolized by monoamine oxidase-A (MAO-A); 12% metabolized by cytochrome P450 hepatic enzymes (3A4 and 2D6); 13% excreted in feces as unchanged and metabolized drug.
Half-life: 3–4 hr.

TIME/ACTION PROFILE (Blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes; History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy.
Use Cautiously in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision; Impaired hepatic or renal function; OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: drowsiness, headache. **CV:** CORONARY ARTERY VASOSPASM, MI, myocardial ischemia, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA. **GI:** dry mouth, nausea. **Neuro:** paresthesia.

Interactions
Drug-Drug: Concurrent use with **MAO-A inhibitors** increases blood levels and the risk of adverse reactions (concurrent use or use within 2 wk or MAO inhibitor is contraindicated). Concurrent use with other **5-HT_1 agonists** or **ergot-type compounds (dihydroergotamine)** may result in additive vasoactive properties (avoid use within 24 hr of each other). Concurrent use with **SSRI antidepressants** may result in weakness, hyperreflexia, and incoordination. Blood levels and effects may be increased by **ketoconazole**, **itraconazole**, **ritonavir**, and **erythromycin** (inhibitors of CYP3A4 enzymes).

Route/Dosage
PO (Adults): 6.25–12.5 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Copyright © 2008 by F.A. Davis

Hepatic/Renal Impairment

PO (Adults): 6.25 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

Availability

Tablets: 6.25 mg, 12.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets should be swallowed whole with liquid.

Patient/Family Teaching

- Inform patient that almotriptan should only be used during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer almotriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 2 doses in any 24-hr period.
- If first dose does not relieve headache, additional almotriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take almotriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following almotriptan administration may further help relieve headache.
- Caution patient not to use almotriptan if she is pregnant, suspects she is pregnant, plans to become pregnant, or is breastfeeding. Adequate contraception should be used during therapy.
- Advise patient to notify health care professional prior to next dose of almotriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during almotriptan use.
- Instruct patient to consult health care professional before taking other prescription or OTC or herbal/alternative preparations.

Evaluation/Desired Outcomes

- Relief of migraine attack.

alprazolam (al-**pray**-zoe-lam)

Apo-Alpraz, Novo-Alprazol, Niravam, Nu-Alpraz, Xanax, Xanax XR

Classification

Therapeutic: antianxiety agents
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications

Treatment of Generalized Anxiety Disorder (GAD). Panic Disorder. Management of anxiety associated with depression. **Unlabeled uses:** Management of symptoms of premenstrual syndrome (PMS). Insomnia, irritable bowel syndrome (IBS) and other somatic symptoms associated with anxiety. Used as an adjunct with acute mania, acute psychosis.

Action

Acts at many levels in the CNS to produce anxiolytic effect. May produce CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics

Absorption: Well absorbed (90%) from the GI tract; absorption is slower with extended-release tablets.
Distribution: Widely distributed, crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation is minimal.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Metabolized by the liver (CYP3A4 enzyme system) to an active compound that is subsequently rapidly metabolized.
Half-life: 12–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma, obstructive sleep apnea, pulmonary disease; Pregnancy and lactation; Concurrent itraconazole or ketoconazole; OB, Lactation: Use in pregnancy or lactation may cause CNS depression, flaccidity, feeding difficulties, and seizures in infant.
Use Cautiously in: Renal Impairment, Hepatic dysfunction (↓ dose required); Concurrent use with nefazodone, fluvoxamine, cimetidine, fluoxetine, hormonal contraceptives, propoxyphene, diltiazem, isoniazid, erythromycin, clarithromycin, grapefruit juice (↓ dose may be necessary); History of suicide attempt or alcohol/drug dependence, debilitated patients (↓ dose required); Pedi: Safety and efficacy not established. Decreased dosage and frequent monitoring required; Geri: Elderly patients have increased sensitivity to benzodiazepines. Appears on Beers list and is associated with increased risk of falls (↓ dose required) and excessive CNS effects.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, confusion, hangover, headache, mental depression, paradoxical excitation. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Alcohol, **antidepressants**, other **benzodiazepines**, **antihistamines**, and **opioid analgesics**—concurrent use results in ↑ CNS depression. **Hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **metoprolol**, **propoxyphene**, **propranolol**, **valproic acid**, **CYP3A4 inhibitors (erythromycin**, **ketoconazole**, **itraconazole**, **fluvoxamine**, **cimetidine**, **nefazodone)** ↓ metabolism of alprazolam, ↑ blood levels and ↑ its actions (dose adjustments may be necessary). May ↓ efficacy of **levodopa**. **CYP3A4 inducers (rifampin**, **carbamazepine**, or **barbiturates)** ↑ metabolism and ↓ effects of alprazolam. Sedative effects may be ↓ by **theophylline**. **Cigarette smoking** ↓ blood levels and effects.
Drug-Natural Products: Kava kava, valerian, or chamomile can ↑ CNS depression.
Drug-Food: Concurrent ingestion of **grapefruit juice** ↑ blood levels.

Route/Dosage

Anxiety

PO (Adults): 0.25–0.5 mg 2–3 times daily (not >4 mg/day; begin with 0.25 mg 2–3 times daily in geriatric/debilitated patients).

Panic Attacks

PO (Adults): 0.5 mg 3 times daily; may be increased by 1 mg or less every 3–4 days as needed (not >10 mg/day). *Extended–release tablets (Xanax XR)*—0.5–1 mg once daily in the morning, may be increased every 3–4 days by not more than 1 mg/day; up to 10 mg/day (usual range 3–6 mg/day).

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** 0.25 mg $98.21/100, 0.5 mg $122.35/100, 1 mg $163.25/100, 2 mg $277.56/100. **Extended-release tablets:** 0.5 mg, 1 mg, 2 mg, 3 mg. **Orally disintegrating tablets (orange):** 0.25 mg, 0.5 mg, 1 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess patient for drowsiness, light-headedness, and dizziness. These symptoms usually disappear as therapy progresses. Dose should be reduced if these symptoms persist.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Risk is greater in patients taking >4 mg/day. Restrict the amount of drug available to patient. Assess regularly for continued need for treatment.
- ***Lab Test Considerations:*** Monitor CBC and liver and renal function periodically dur-

Copyright © 2008 by F.A. Davis

ing long-term therapy. May cause ↓ hematocrit and neutropenia.

- ***Toxicity and Overdose:*** Flumazenil is the antidote for alprazolam toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.)

Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Side Effects)
Risk for falls (Side Effects)

Implementation

- Do not confuse Xanax (alprazolam) with Zantac (ranitidine).
- If early morning anxiety or anxiety between doses occurs, the same total daily dose should be divided into more frequent intervals.
- **PO:** May be administered with food if GI upset occurs. Administer greatest dose at bedtime to avoid daytime sedation.
- Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Do not crush, break, or chew extended-release tablets.
- Taper by 0.5 mg q 3 days to prevent withdrawal. Some patients may require longer tapering period (months).
- For *orally disintegrating tablets:* Remove tablet from bottle with dry hands just prior to taking medication. Place tablet on tongue. Tablet will dissolve with saliva; may also be taken with water. Remove cotton from bottle and reseal tightly to prevent moisture from entering bottle. If only ½ tablet taken, discard unused portion immediately; may not remain stable.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip or double up on missed doses. If a dose is missed, take within 1 hr; otherwise, skip the dose and return to regular schedule. If medication is less effective after a few weeks, check with health care professional; do not increase dose. Abrupt withdrawal may cause sweating, vomiting, muscle cramps, tremors, and seizures.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Advise patient to avoid the use of alcohol or other CNS depressants concurrently with alprazolam. Instruct patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with this medication.
- Inform patient that benzodiazepines are usually prescribed for short-term use and do not cure underlying problems.
- Teach other methods to decrease anxiety (exercise, support group, relaxation techniques).
- Advise patient to not share medication with anyone.

Evaluation/Desired Outcomes

- Decreased sense of anxiety without CNS side effects.
- Decreased frequency and severity of panic attacks.
- Decreased symptoms of premenstrual syndrome.

alteplase, See THROMBOLYTIC AGENTS.

aluminum hydroxide

AlternaGEL, Alu-Cap, Alugel, Aluminet, Alu-Tab, Amphojel, Basalgel, Dialume

Classification

Therapeutic: antiulcer agents, hypophosphatemics
Pharmacologic: antacids, phosphate binders

Pregnancy Category UK

Indications

Lowering of phosphate levels in patients with chronic renal failure. Adjunctive therapy in the treatment of peptic, duodenal, and gastric ulcers. Hyperacidity, indigestion, reflux esophagitis.

Action

Binds phosphate in the GI tract. Neutralizes gastric acid and inactivates pepsin. **Therapeutic**

Copyright © 2008 by F.A. Davis

Effects: Lowering of serum phosphate levels. Healing of ulcers and decreased pain associated with ulcers or gastric hyperacidity. Constipation limits use alone in the treatment of ulcer disease. Frequently found in combination with magnesium-containing compounds.

Pharmacokinetics

Absorption: With chronic use, small amounts of aluminum are systemically absorbed.
Distribution: If absorbed, aluminum distributes widely, crosses the placenta, and enters breast milk. Concentrates in the CNS with chronic use.
Metabolism and Excretion: Mostly excreted in feces. Small amounts absorbed are excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO†	hr–days	days–wk	days
PO‡	15–30 min	30 min	30 min–3 hr

†Hypophosphatemic effect
‡Antacid effect

Contraindications/Precautions

Contraindicated in: Severe abdominal pain of unknown cause.
Use Cautiously in: Hypercalcemia; Hypophosphatemia; OB: Generally considered safe; chronic high-dose therapy should be avoided.

Adverse Reactions/Side Effects

GI: constipation. **F and E:** hypophosphatemia.

Interactions

Drug-Drug: Absorption of **tetracyclines**, **chlorpromazine**, **iron salts**, **isoniazid**, **digoxin**, or **fluoroquinolones** may be decreased. **Salicylate** blood levels may be decreased. **Quinidine**, **mexiletine**, and **amphetamine** levels may be increased if enough antacid is ingested such that urine pH is increased.

Route/Dosage

Hypophosphatemia

PO (Adults): 1.9–4.8 g (30–40 ml of regular suspension or 15–20 ml of concentrated suspension) 3–4 times daily.
PO (Children): 50–150 mg/kg/24 hr in 4–6 divided doses; titrate to normal serum phosphate levels.

Antacid

PO (Adults): 500–1500 mg (5–30 ml) 3–6 times daily.

Availability (generic available)

Capsules: 475 mg[OTC], 500 mg[OTC]. **Tablets:** 300 mg[OTC], 500 mg[OTC], 600 mg[OTC]. **Suspension:** 320 mg/5 ml[OTC], 450 mg/5 ml[OTC], 600 mg/5 ml[OTC], 675 mg/5 ml[OTC]. ***In combination with:*** magnesium carbonate, calcium carbonate, simethicone, and mineral oil. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, character, and precipitating factors of gastric pain.
- ***Lab Test Considerations:*** Monitor serum phosphate and calcium levels periodically during chronic use of aluminum hydroxide.
- May cause increased serum gastrin and decreased serum phosphate concentrations.
- In treatment of severe ulcer disease, guaiac stools, and emesis, monitor pH of gastric secretions.

Potential Nursing Diagnoses

Acute pain (Indications)
Constipation (Side Effects)

Implementation

- Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of aluminum hydroxide and oral medications by at least 1–2 hr.
- Tablets must be chewed thoroughly before swallowing to prevent their entering small intestine in undissolved form. Follow with a glass of water.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage into stomach.
- Liquid dosage forms are considered more effective than tablets.
- **Hypophosphatemic:** For phosphate lowering, follow dose with full glass of water or fruit juice.
- **Antacid:** May be given in conjunction with magnesium-containing antacids to minimize constipation, except in patients with renal failure. Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- For treatment of peptic ulcer, aluminum hydroxide may be administered every 1–2 hr while the patient is awake or diluted with 2–3

Copyright © 2008 by F.A. Davis

parts water and administered intragastrically every 30 min for 12 or more hr per day. Physician may order NG tube clamped after administration.
- For reflux esophagitis, administer 15 ml 20–40 min after meals and at bedtime.

Patient/Family Teaching
- Instruct patient to take aluminum hydroxide exactly as directed. If on a regular dosing schedule and a dose is missed, take as soon as remembered if not almost time for next dose; do not double doses.
- Advise patient not to take aluminum hydroxide within 1–2 hr of other medications without consulting health care professional.
- Advise patients to check label for sodium content. Patients with CHF or hypertension, or those on sodium restriction, should use low-sodium preparations.
- Inform patients of potential for constipation from aluminum hydroxide.
- **Hypophosphatemia:** Patients taking aluminum hydroxide for hyperphosphatemia should be taught the importance of a low-phosphate diet.
- **Antacid:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if taking other medications, if relief is not obtained, or if symptoms of gastric bleeding (black tarry stools, coffee-ground emesis) occur.

Evaluation/Desired Outcomes
- Decrease in serum phosphate levels.
- Decrease in GI pain and irritation.
- Increase in the pH of gastric secretions. In treatment of peptic ulcer, antacid therapy should be continued for at least 4–6 wk after symptoms have disappeared because there is no correlation between disappearance of symptoms and healing of ulcers.

amantadine (a-**man**-ta-deen)
Symmetrel

Classification
Therapeutic: antiparkinson agents, antivirals

Pregnancy Category C

Indications
Symptomatic initial and adjunct treatment of Parkinson's disease. Prophylaxis and treatment of influenza A viral infections.

Action
Potentiates the action of dopamine in the CNS. Prevents penetration of influenza A virus into host cell. **Therapeutic Effects:** Relief of Parkinson's symptoms. Prevention and decreased symptoms of influenza A viral infection.

Pharmacokinetics
Absorption: Well absorbed from the GI tract.
Distribution: Distributed to various body tissues and fluids. Crosses blood-brain barrier and enters breast milk.
Metabolism and Excretion: Excreted unchanged in the urine.
Half-life: 10–28 hr.

TIME/ACTION PROFILE (antiparkinson effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 48 hr	up to 2 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Seizure disorders; Liver disease; Psychiatric problems; Congestive heart failure; Renal impairment (dosage reduction/increased dosing interval required if CCr ≤50 ml/min); May increase susceptibility to rubella infections; OB, Lactation: Safety not established; Geri: Increased sensitivity to adverse effects.

Adverse Reactions/Side Effects
CNS: ataxia, dizziness, insomnia, anxiety, confusion, depression, drowsiness, psychosis, seizures. **GI:** nausea, vomiting, anorexia, constipation. **EENT:** blurred vision, dry mouth. **Resp:** dyspnea. **CV:** hypotension, CHF, edema. **GU:** urinary retention. **Derm:** mottling, livedo reticularis, rashes. **Hemat:** leukopenia, neutropenia.

Interactions
Drug-Drug: Concurrent use of **antihistamines**, **phenothiazines**, **quinidine**, **disopyramide**, and **tricyclic antidepressants** may increase anticholinergic effects (dry mouth, blurred vision, constipation). Increased risk of adverse CNS reactions with **alcohol**. Increased

Copyright © 2008 by F.A. Davis

risk of CNS stimulation with other **CNS stimulants**.

Route/Dosage

Parkinson's Disease

PO (Adults): 100 mg 1–2 times daily (up to 400 mg/day).

Influenza A Viral Infection

PO (Adults and Children >12 yr): *Treatment*—200 mg/day as a single dose or 100 mg bid (not >100 mg/day in geriatric patients); *Prophylaxis*—100 mg/day in 1–2 divided doses.

PO (Children 10–12 yr): 100 mg q 12 hr *or* 5 mg/kg/day in 1–2 divided doses; not to exceed 200 mg/day.

PO (Children 1–9 yr): 5 mg/kg/day in 1–2 divided doses; not to exceed 150 mg/day.

Renal Impairment

PO (Adults): *CCr 30–50 ml/min*—200 mg on the first day, then 100 mg once daily; *CCr 15–29 ml/min*—200 mg on the first day, then 100 mg every other day; *<15 ml/min or hemodialysis patients*—200 mg once every 7 days.

Availability (generic available)

Liquid-filled capsules: 100 mg. **Tablets:** 100 mg. **Syrup (raspberry flavor):** 50 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure periodically. Assess patient for drug-induced orthostatic hypotension.
- Monitor vital signs and mental status periodically during first few days of dosage adjustment in patients receiving >200 mg daily; side effects are more likely.
- Assess for CHF (peripheral edema, weight gain, dyspnea, rales/crackles, jugular venous distention), especially in patients on chronic therapy or with a history of CHF.
- Assess patient for the appearance of a diffuse red mottling of the skin (livedo reticularis), especially in the lower extremities or on exposure to cold. Disappears with continued therapy but may not completely resolve until 2–12 wk after therapy has been discontinued.
- Geri: Monitor intake and output closely in geriatric patients. May cause urinary retention. Report significant discrepancy or bladder distention.
- **Parkinson's Disease:** Assess akinesia, rigidity, tremors, and gait disturbances before and throughout therapy.
- **Influenza Prophylaxis or Treatment:** Monitor respiratory status (rate, breath sounds, sputum) and temperature periodically. Supportive treatment is indicated if symptoms occur.
- ***Toxicity and Overdose:*** Symptoms of toxicity include CNS stimulation (confusion, mood changes, tremors, seizures, arrhythmias, and hypotension). There is no specific antidote, although physostigmine has been used to reverse CNS effects.

Potential Nursing Diagnoses

Impaired physical mobility
Risk for infection (Indications)

Implementation

- Do not confuse amantadine with rimantidine or ranitidine.
- **PO:** Do not administer last dose of medication near bedtime; may produce insomnia in some patients.
- Administering amantadine in divided doses may decrease CNS side effects.
- The contents of capsules may be mixed with food or fluids if the patient has difficulty swallowing.
- **Antiviral Prophylaxis:** Treatment should be started in anticipation of contact or as soon as possible after exposure and continue for at least 10 days following exposure. Infectious period is just before onset of symptoms to up to 1 wk after. If vaccine is unavailable or contraindicated, may be administered up to 90 days to protect from repeated exposures.
- May be used with inactivated influenza A virus vaccine until protective antibody response develops. Administer for 2–3 wk after vaccine has been given.
- **Antiviral Treatment:** Administer as soon as possible after onset of symptoms and continue for 24–48 hr after symptoms disappear.

Patient/Family Teaching

- Advise patient to take medication around the clock as directed and not to skip doses or double up on missed doses. If a dose is missed, do not take within 4 hr of the next dose.
- May cause dizziness or blurred vision. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.

Copyright © 2008 by F.A. Davis

- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Consult health care professional if dry mouth persists for >2 wk.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages.
- Instruct patient to notify health care professional if confusion, mood changes, difficulty with urination, edema and shortness of breath, or worsening of Parkinson's disease symptoms occurs.
- **Antiviral:** Instruct patient and family to notify health care professional if influenza symptoms occur when amantadine is used as prophylaxis or if symptoms do not improve in a few days when product is used for treatment.
- **Parkinson's Disease:** Advise patient that up to 2 wk of therapy may be needed for full benefit of medication. Notify health care professional if medication gradually loses its effectiveness. Amantadine should be tapered gradually; abrupt withdrawal may precipitate a parkinsonian crisis.

Evaluation/Desired Outcomes

- Decrease in akinesia and rigidity. Full therapeutic effects may require 2 wk of therapy.
- Absence or reduction of influenza A symptoms.

amcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

amifostine (a-mi-fos-teen)
Ethyol

Classification
Therapeutic: cytoprotective agents

Pregnancy Category C

Indications

Reduces renal toxicity from cisplatin. Reduces the incidence of moderate to severe xerostomia from postoperative radiation for head and neck cancer in which the radiation port includes a large portion of the parotid glands.

Action

Converted by alkaline phosphatase in tissue to a free thiol compound that binds and detoxifies damaging metabolites of cisplatin and reactive oxygen species generated by radiation. **Therapeutic Effects:** Decreased renal damage from cisplatin. Decreased severity of xerostomia following radiation for head and neck cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Rapidly cleared from plasma; converted to cytoprotective compounds by alkaline phosphatase in tissues.
Half-life: 8 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Known sensitivity to aminothiol compounds; Hypotension or dehydration; Lactation: Use an alternative to breast milk; Concurrent antineoplastic therapy for other tumors (especially malignancies of germ cell origin).
Use Cautiously in: OB, Pedi: Safety not established; Geri: Geriatric patients or patients with cardiovascular disease have increased risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: dizziness, somnolence. **EENT:** sneezing. **CV:** hypotension. **GI:** hiccups, nausea, vomiting. **Derm:** flushing. **F and E:** hypocalcemia. **Misc:** allergic reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, TOXODERMA, ERYTHEMA MULTIFORMA, EXFOLIATIVE DERMATITIS (↑ when used as a radioprotectant), chills.

Interactions

Drug-Drug: Concurrent use of **antihypertensives** ↑ risk of hypotension.

Route/Dosage

Reduction of Renal Damage with Cisplatin

IV (Adults): 910 mg/m^2 once daily, within 30 min before chemotherapy; if full dose is poorly

Copyright © 2008 by F.A. Davis

tolerated, subsequent doses should be decreased to 740 mg/m².

Reduction of Xerostomia from Radiation

IV (Adults): 200 mg/m² once daily, as a 3-minute infusion starting 15–30 min before standard fraction radiation therapy.

Availability

Powder for injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure before and every 5 min during infusion. Discontinue antihypertensives 24 hr prior to treatment. If significant hypotension requiring interruption of therapy occurs, place patient in Trendelenburg position and administer an infusion of 0.9% NaCl using a separate IV line. If blood pressure returns to normal in 5 min and patient is asymptomatic, infusion may be resumed so that full dose may be given.
- Assess fluid status before administration. Correct dehydration before instituting therapy. Nausea and vomiting are frequent and may be severe. Prophylactic antiemetics including dexamethasone 20 mg IV and a serotonin-antagonist antiemetic (ondansetron, dolasetron, granisetron, palonosetron) should be administered before and during infusion. Monitor fluid status closely.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- **Xerostomia:** Assess patient for dry mouth and mouth sores periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum calcium concentrations before and periodically during therapy. May cause hypocalcemia. Calcium supplements may be necessary.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute with 9.7 ml of sterile 0.9% NaCl. Dilute further with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 5 hr at room temperature or 24 hr if refrigerated. ***Concentration:*** Adults: dilute dose to a final volume of 50 ml; Children: 5–40 mg/ml. ***Rate:*** *For renal toxicity:* Administer over 15 min within 30 min before chemotherapy administration. Longer infusion times are not as well tolerated. *For xerostomia:* Administer over 3 min starting 15–30 min prior to radiation therapy.
- **Y-Site Compatibility:** amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gentamicin, gemcitabine, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone, morphine, nalbuphine, ondansetron, pemetrexed, piperacillin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, trimetrexate, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amphotericin B, cefoperazone, chlorpromazine, cisplatin, ganciclovir, prochlorperazine.
- **Additive Incompatibility:** Do not mix with other solutions or medications.

Patient/Family Teaching

- Explain the purpose of amifostine infusion to patient.
- Inform patient that amifostine may cause hypotension, nausea, vomiting, flushing, chills, dizziness, somnolence, hiccups, and sneezing.

Evaluation/Desired Outcomes

- Prevention of renal toxicity associated with repeated administration of cisplatin in patients with ovarian cancer.

Copyright © 2008 by F.A. Davis

- Decreased severity of xerostomia from radiation treatment of head and neck cancer.

amikacin, See AMINOGLYCOSIDES.

amiloride, See DIURETICS (POTASSIUM-SPARING).

aminocaproic acid

(a-mee-noe-ka-**pro**-ik)
Amicar, epsilon aminocaproic acid

Classification
Therapeutic: hemostatic agents
Pharmacologic: fibrinolysis inhibitors

Pregnancy Category C

Indications
Management of acute, life-threatening hemorrhage due to systemic hyperfibrinolysis or urinary fibrinolysis. **Unlabeled uses:** Prevention of recurrent subarachnoid hemorrhage. Prevention of bleeding following oral surgery in hemophiliacs. Management of severe hemorrhage caused by thrombolytic agents.

Action
Inhibits activation of plasminogen. **Therapeutic Effects:** Inhibition of fibrinolysis. Stabilization of clot formation.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Mostly eliminated unchanged by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	N/A
IV	unknown	2 hr	N/A

Contraindications/Precautions
Contraindicated in: Active intravascular clotting.
Use Cautiously in: Upper urinary tract bleeding; Cardiac, renal, or liver disease (dosage reduction may be required); Disseminated intravascular coagulation (should be used concurrently with heparin); OB, Lactation: Safety not established; Pedi: Do not use products containing benzyl alcohol with neonates.

Adverse Reactions/Side Effects
CNS: dizziness, malaise. **EENT:** nasal stuffiness, tinnitus. **CV:** arrhythmias, hypotension (IV only). **GI:** anorexia, bloating, cramping, diarrhea, nausea. **GU:** diuresis, renal failure. **MS:** myopathy.

Interactions
Drug-Drug: Concurrent use with **estrogens, conjugated** may result in a hypercoagulable state. Concurrent use with **clotting factors** may ↑ risk of thromboses.

Route/Dosage

Acute Bleeding Syndromes due to Elevated Fibrinolytic Activity
PO (Adults): 5 g 1st hr, followed by 1–1.25 g q hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
IV (Adults): 4–5 g over 1st hr, followed by 1 g/hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
PO, IV (Children): 100 mg/kg or 3 g/m^2 over 1st hr, followed by continuous infusion of 33.3 mg/kg/hr; or 1 g/m^2/hr (total dosage not >18 g/m^2/24 hr).

Subarachnoid Hemorrhage
PO (Adults): *To follow IV*—3 g q 2 hr (36 g/day). If no surgery is performed, continue for 21 days after bleeding stops, then decrease to 2 g q 2 hr (24 g/day) for 3 days, then 1 g q 2 hr (12 g/day) for 3 days.
IV (Adults): 36 g/day for 10 days followed by PO.

Prevention of Bleeding Following Oral Surgery in Hemophiliacs
PO (Adults): 75 mg/kg (up to 6 g) immediately after procedure, then q 6 hr for 7–10 days; syrup may also be used as an oral rinse of 1.25 g (5 ml) 4 times a day for 7–10 days.
IV, PO (Children): *Also for epistaxis*—50–100 mg/kg/dose administered IV every 6 hr for 2–3 days starting 4 hr before the procedure. After completion of IV therapy, aminocaproic acid

Copyright © 2008 by F.A. Davis

should be given as 50–100 mg/kg/dose orally every 6 hr for 5–7 days.

Availability

Tablets: 500 mg. **Syrup (raspberry flavor):** 1.25 g/5 ml. **Injection:** 250 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiratory status as indicated by severity of bleeding.
- Monitor for overt bleeding every 15–30 min.
- Monitor neurologic status (pupils, level of consciousness, motor activity) in patients with subarachnoid hemorrhage.
- Monitor intake and output ratios frequently; notify physician if significant discrepancies occur.
- Assess for thromboembolic complications (especially in patients with history). Notify physician of positive Homans' sign, leg pain and edema, hemoptysis, dyspnea, or chest pain.
- ***Lab Test Considerations:*** Monitor platelet count and clotting factors prior to and periodically throughout therapy in patients with systemic fibrinolysis.
- ↑ CPK, AST, and serum aldolase may indicate myopathy.
- May ↑ serum potassium.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse Amicar (aminocaproic acid) with Amikin (amikacin).
- **PO:** Syrup may be used as an oral rinse, swished for 30 sec 4 times/day for 7–10 days for the control of bleeding during dental and oral surgery in hemophilic patients. Small amounts may be swallowed, except during 1st and 2nd trimesters of pregnancy. Syrup may be applied with an applicator in children or unconscious patients.

IV Administration

- **IV:** Stabilize IV catheter to minimize thrombophlebitis. Monitor site closely.
- **Intermittent Infusion:** ***Diluent:*** Do not administer undiluted. Dilute initial 4–5 g dose in 250 ml of sterile water for injection, 0.9% NaCl, D5W, or LR. Do not dilute with sterile water in patients with subarachnoid hemorrhage. ***Concentration:*** 20 mg/ml. ***Rate:*** Single doses: Administer over 1 hr. Rapid infusion rate may cause hypotension, bradycardia, or other arrhythmias.
- **Continuous Infusion:** Administer IV solution using infusion pump to ensure accurate dose. Administer via slow IV infusion. ***Rate:*** Initial dose may be followed by a continuous infusion of 1–1.25 g/hr in adults or 33.3 mg/kg/hr in children.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Instruct patient to notify the nurse immediately if bleeding recurs or if thromboembolic symptoms develop.
- **IV:** Caution patient to make position changes slowly to avoid orthostatic hypotension.

Evaluation/Desired Outcomes

- Cessation of bleeding.
- Prevention of rebleeding in subarachnoid hemorrhage without occurrence of undesired clotting.

AMINOGLYCOSIDES

amikacin (am-i-**kay**-sin)
Amikin

gentamicin† (jen-ta-**mye**-sin)
Cidomycin, Garamycin, G-Mycin, Jenamicin

kanamycin (kan-a-**mye**-sin)
Kantrex

neomycin (neo-oh-**mye**-sin)
Neo-Fradin

streptomycin (strep-toe-**mye**-sin)

tobramycin† (toe-bra-**mye**-sin)
Nebcin, TOBI

Classification
Therapeutic: anti-infectives
Pharmacologic: aminoglycosides

Pregnancy Category C (gentamicin, topical use of others), D (amikacin, kanamycin, neomycin, streptomycin, tobramycin)

†See Appendix C for ophthalmic use

Indications

Amikacin, gentamicin, kanamycin, and tobramycin: Treatment of serious gram-negative

Copyright © 2008 by F.A. Davis

bacillary infections and infections caused by staphylococci when penicillins or other less toxic drugs are contraindicated. **Streptomycin:** In combination with other agents in the management of active tuberculosis. **Neomycin:** Used orally to prepare the GI tract for surgery, to decrease the number of ammonia-producing bacteria in the gut as part of the management of hepatic encephalopathy, and to treat diarrhea caused by *Escherichia coli*. **Tobramycin by inhalation:** Management of *Pseudomonas aeruginosa* in cystic fibrosis patients. **Gentamicin, streptomycin:** In combination with other agents in the management of serious enterococcal infections. **Gentamicin IV:** Prevention of infective endocarditis. **Gentamicin (topical), tobramycin (ophthalmic):** Treatment of localized infections caused by susceptible organisms. **Unlabeled uses:** Amikacin: In combination with other agents in the management of *Mycobacterium avium* complex infections.

Action

Inhibits protein synthesis in bacteria at level of 30S ribosome. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Most aminoglycosides notable for activity against *P. aeruginosa*, *Klebsiella pneumoniae*, *E. coli*, *Proteus*, *Serratia*, *Acinetobacter*, *Staphylococcus aureus*. In treatment of enterococcal infections, synergy with a penicillin is required. Streptomycin and amikacin also active against *Mycobacterium*.

Pharmacokinetics

Absorption: Well absorbed after IM administration. IV administration results in complete bioavailability. Some absorption follows administration by other routes. Minimal systemic absorption with neomycin (may accumulate in patients with renal failure).
Distribution: Widely distributed throughout extracellular fluid; cross the placenta; small amounts enter breast milk. Poor penetration into CSF (↑ when meninges are inflammed).
Metabolism and Excretion: Excretion is >90% renal.
Half-life: 2–4 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO (neomycin)	rapid	1–4 hr	N/A
IM	rapid	30–90 min	6–24 hr
IV	rapid	15–30 min†	6–24 hr

*All parenterally administered aminoglycosides
†Postdistribution peak occurs 30 min after the end of a 30-min infusion and 15 min after the end of a 1-hr infusion

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminoglycosides; Most parenteral products contain bisulfites and should be avoided in patients with known intolerance; Products containing benzyl alcohol should be avoided in neonates; Intestinal obstruction (neomycin only).
Use Cautiously in: Renal impairment (dose adjustments necessary; blood level monitoring useful in preventing ototoxicity and nephrotoxicity); Hearing impairment; Neuromuscular diseases such as myasthenia gravis; Obese patients (dose should be based on ideal body weight); OB: Tobramycin and streptomycin may cause congenital deafness; Lactation: Safety not established; Pedi: Neonates have increased risk of neuromuscular blockade; cautious use due to difficulty in assessing auditory and vestibular function and immature renal function; Geri: Cautious use in geriatric patients due to difficulty in assessing auditory and vestibular function and age-related renal impairment.

Adverse Reactions/Side Effects

CNS: ataxia, vertigo. **EENT:** ototoxicity (vestibular and cochlear). **GU:** nephrotoxicity. **GI:** *Neomycin*— diarrhea, nausea, vomiting. **F and E:** hypomagnesemia. **MS:** muscle paralysis (high parenteral doses). **Neuro:** ↑ neuromuscular blockade. **Resp:** apnea. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Inactivated by **penicillins** and **cephalosporins** when coadministered to patients with renal insufficiency. Possible respiratory paralysis after **inhalation anesthetics** or **neuromuscular blocking agents**. ↑ incidence of ototoxicity with **loop diuretics**. ↑ incidence of nephrotoxicity with other **nephrotoxic drugs**. Neomycin may ↑ anticoagulant effects of **warfarin**. Neomycin may ↓ absorption of **digoxin** and **methotrexate**.

Route/Dosage

Amikacin

IM, IV (Adults and Children): 5 mg/kg q 8 hr or 7.5 mg/kg q 12 hr (not to exceed 1.5 g/day).

Copyright © 2008 by F.A. Davis

M. avium complex—7.5–15 mg/kg/day divided q 12–24 hr.
IM, IV (Neonates): *Loading dose* –10 mg/kg; *Maintenance dose*—7.5 mg/kg q 12 hr.

Renal Impairment
IM, IV (Adults): *Loading dose* –7.5 mg/kg, further dosing based on blood level monitoring and renal function assessment.

Gentamicin

Many regimens are used; most involve dosing adjusted on the basis of blood level monitoring and assessment of renal function.
IM, IV (Adults): 1–2 mg/kg q 8 hr (up to 6 mg/kg/day in 3 divided doses); *Once-daily dosing (unlabeled)*—4–7 mg/kg q 24 hr.
IM, IV (Children >5 yr): 2–2.5 mg/kg/dose q 8 hr. *Once daily*—5–7.5 mg/kg/dose q 24 hr. *Cystic fibrosis*—2.5–3.3 mg/kg/dose q 6–8 hr. *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
IM, IV (Children 1 mo-5 yr): 2.5 mg/kg/dose q 8 hr. *Once daily*—5–7.5 mg/kg/dose q 24 hr. *Cystic fibrosis*—2.5–3.3 mg/kg/dose q 6–8 hr. *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
IM, IV (Neonates full term and/or >1 wk): *Weight <1200 g*—2.5 mg/kg/dose q 18–24 hr. *Weight 1200–2000 g*—2.5 mg/kg/dose q 8–12 hr. *Weight >2000 g*—2.5 mg/kg/dose q 8 hr. *ECMO*—2.5 mg/kg/dose q 18 hr, subsequent doses based on serum concentrations. *Once daily*—3.5–5 mg/kg/dose q 24 hr.
IM, IV (Neonates premature and/or ≤1 wk): *Weight <1000 g*—3.5 mg/kg/dose q 24 hr. *Weight 1000–1200 g*—2.5 mg/kg/dose q 18–24 hr. *Weight >1200 g*—2.5 mg/kg/dose q 12 hr. *Once daily*—3.5–4 mg/kg/dose q 24 hr.
IT (Adults): 4–8 mg/day.
IT (Infants >3 months and Children): 1–2 mg/day.
IT (Neonates): 1 mg/day.
Topical (Adults and Children >1 month): Apply cream or ointment 3–4 times daily.

Renal Impairment
IM, IV (Adults): Initial dose of 2 mg/kg. Subsequent doses/intervals based on blood level monitoring and renal function assessment.

Kanamycin

IM, IV (Adults and Children and Infants): 5 mg/kg q 8 hr *or* 7.5 mg/kg q 12 hr (not to exceed 15 mg/kg/day).
Inhaln (Adults): 250 mg 2–4 times daily.

Renal Impairment
IM, IV (Adults): 7.5 mg/kg; further dosing and intervals determined by blood level monitoring and assessment of renal function.

Neomycin

PO (Adults): *Preoperative intestinal antisepsis*—1 g q hr for 4 doses, then 1 g q 4 hr for 5 doses *or* 1 g at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—1–3 g q 6 hr for 5–6 days; may be followed by 4 g/day chronically.
PO (Children): *Preoperative intestinal antisepsis*—15 mg/kg q 4 hr for 2 days *or* 25 mg/kg at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—12.5–25 mg/kg q 6 hr for 5–6 days (maximum dose = 12 g/day).

Streptomycin

IM (Adults): *Tuberculosis*—1 g/day initially, decreased to 1 g 2–3 times weekly; *Other infections*—250 mg–1 g q 6 hr *or* 500 mg–2 g q 12 hr.
IM (Children): *Tuberculosis*—20 mg/kg/day (not to exceed 1 g/day); *Other infections*—5–10 mg/kg q 6 hr *or* 10–20 mg/kg q 12 hr.

Renal Impairment
IM (Adults): 1 g initially, further dosing determined by blood level monitoring and assessment of renal function.

Tobramycin

IM, IV (Adults): 1–2 mg/kg q 8 hr *or* 4–6.6 mg/kg/day q 24 hr.
IM, IV (Adults): 3–6 mg/kg/day in 3 divided doses, or 4–6.6 mg/kg once daily.
IM, IV (Children >5 yr): 6–7.5 mg/kg/day divided q 8 hr, up to 13 mg/kg/day divided q 6–8 hr in cystic fibrosis patients (dosing interval may vary from q 6 hr–q 24 hr, depending on clinical situation).
IM, IV (Children 1 month-5 yr): 7.5 mg/kg/day divided q 8 hr, up to 13 mg/kg/day divided q 6–8 hr in cystic fibrosis.
IM, IV (Neonates): *Preterm <1000 g*—3.5 mg/kg/dose q 24 hr. *0–4 weeks, <1200 g*—2.5 mg/kg/dose q 18 hr. *Postnatal age <7 days*—2.5 mg/kg/dose q 12 hr. *Postnatal age >7 days,1200–2000 g*—2.5 mg/kg/dose q 8–12 hr. *Postnatal age >7 days, >2000 g*—2.5 mg/kg/dose q 8 hr.
Inhaln (Adults and Children): Standard dose: 40–80 mg 2–3 times/day; High dose: 300 mg twice daily for 28 days, then off for 28 days, then repeat cycle.

Copyright © 2008 by F.A. Davis

Ophth (Adults and Children >2 months): Apply 0.5" ribbon into the affected eye 2–3 times/day; for severe infections, apply q 3–4 hr.

Renal Impairment

IM, IV (Adults): 1 mg/kg initially, further dosing determined by blood level monitoring and assessment of renal function.

Availability

Amikacin

Injection: 50 mg/ml, 62.5 mg/ml, 250 mg/ml.

Gentamicin

Injection: 10 mg/ml, 40 mg/ml. **Premixed injection:** 40 mg/50 ml, 60 mg/50 ml, 60 mg/100 ml, 70 mg/50 ml, 80 mg/50 ml, 80 mg/100 ml, 90 mg/100 ml, 100 mg/50 ml, 100 mg/100 ml, 120 mg/100 ml. **Topical cream:** 0.1%. **Topical ointment:** 0.1%.

Kanamycin

Injection: 37.5 mg/ml, 250 mg/ml, 333.3 mg/ml.

Neomycin

Oral solution: 125 mg/5 ml. **Tablets:** 500 mg. ***In combination with:*** other topical antibiotics or anti-inflammatory agents for skin, ear, and eye infections. See Appendix B.

Streptomycin

Injection: 🍁500 mg/ml, 1 g.

Tobramycin

Injection: 10 mg/ml, 40 mg/ml, 1.2-g vial. **Nebulizer solution:** 300 mg/5 ml in 5-ml ampules. **Ophthalmic solution:** 3 mg/ml in 5-ml container. **Ophthalmic ointment:** 3 mg/g in 3.5-g tube.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Evaluate eighth cranial nerve function by audiometry before and throughout therapy. Hearing loss is usually in the high-frequency range. Prompt recognition and intervention are essential in preventing permanent damage. Also monitor for vestibular dysfunction (vertigo, ataxia, nausea, vomiting). Eighth cranial nerve dysfunction is associated with persistently elevated peak aminoglycoside levels. Discontinue aminoglycosides if tinnitus or subjective hearing loss occurs.
- Monitor intake and output and daily weight to assess hydration status and renal function.
- Assess patient for signs of superinfection (fever, upper respiratory infection, vaginal itching or discharge, increasing malaise, diarrhea). Report to physician or other health care professional.
- **Hepatic Encephalopathy:** Monitor neurologic status. Before administering oral medication, assess patient's ability to swallow.
- ***Lab Test Considerations:*** Monitor renal function by urinalysis, specific gravity, BUN, creatinine, and CCr before and during therapy.
- May cause ↑ BUN, AST, ALT, serum alkaline phosphatase, bilirubin, creatinine, and LDH concentrations.
- May cause ↓ serum calcium, magnesium, potassium, and sodium concentrations (streptomycin and tobramycin).
- ***Toxicity and Overdose:*** Monitor blood levels periodically during therapy. Timing of blood levels is important in interpreting results. Draw blood for peak levels 1 hr after IM injection and 30 min after a 30-min IV infusion is completed. Draw trough levels just before next dose. Peak level for **amikacin** and **kanamycin** is 20–30 mcg/ml; trough level should be <10 mcg/ml. Peak level for **gentamicin** and **tobramycin** should not exceed 10 mcg/ml; trough level should not exceed 2 mcg/ml. Peak level for **streptomycin** should not exceed 25 mcg/ml.

Potential Nursing Diagnoses

Risk for infection (Indications)
Disturbed sensory perception (auditory) (Side Effects)

Implementation

- Do not confuse Amikin (amikacin) with Amicar (aminocaproic acid).
- Keep patient well hydrated (1500–2000 ml/day) during therapy.
- **Preoperative Bowel Prep:** Neomycin is usually used in conjunction with erythromycin, a low-residue diet, and a cathartic or enema.

Copyright © 2008 by F.A. Davis

- **PO:** Neomycin may be administered without regard to meals.
- **IM:** IM administration should be deep into a well-developed muscle. Alternate injection sites.

Amikacin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution may be pale yellow without decreased potency. Stable for 24 hr at room temperature. ***Concentration:*** 10 mg/ml. ***Rate:*** Infuse over 30–60 min for adults and children and over 1–2 hr in infants.
- **Syringe Incompatibility:** heparin, pantoprazole.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amiodarone, amsacrine, anidulafungin, aztreonam, bivalirudin, cefepime, ceftazidime, cisatracurium, cyclophosphamide, dexamethasone sodium phosphate, dexmedetomidate, diltiazem, docetaxel, enalaprilat, esmolol, etoposide, fenoldopam, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gemcitabine, granisetron, hydromorphone, idarubicin, labetalol, lansoprazole, levofloxacin, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, midazolam, milrinone, morphine, nicardipine, ondansetron, paclitaxel, pemetrexed, perphenazine, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine, warfarin, zidovudine.
- **Y-Site Incompatibility:** allopurinol sodium, amophotericin B cholesteryl sulfate, azithromycin, hetastarch, propofol. If aminoglycosides and penicillins or cephalosporins must be administered concurrently, administer in separate sites, at least 1 hr apart.
- **Additive Incompatibility:** Manufacturer does not recommend admixing.

Gentamicin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each dose with D5W, 0.9% NaCl, or LR. Also available in commercially mixed piggyback injections. Do not use solutions that are discolored or that contain a precipitate. ***Concentration:*** 10 mg/ml. ***Rate:*** Infuse slowly over 30 min–2 hr.
- **Syringe Incompatibility:** ampicillin, heparin, pantoprazole.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amiodarone, amsacrine, atracurium, aztreonam, bivalirudin, cefepime, ceftazidime, ciprofloxacin, cisatracurium, cyclophosphamide, cytarabine, daptomycin, dexmedetomidate, diltiazem, docetaxel, doxapram, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, fenoldopam, fluconazole, fludarabine, foscarnet, gemcitabine, granisetron, hydromorphone, insulin, labetalol, lansoprazle, levofloxacin, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, meropenem, midazolam, milrinone, morphine, multivitamins, nicardipine, ondansetron, paclitaxel, pancuronium, perphenazine, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vecuronium, vinorelbine, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, azithromycin, drotrecogin, furosemide, heparin, idarubicin, indomethacin, pemetrexed, propofol, warfarin.
- **Additive Compatibility:** atracurium, aztreonam, bleomycin, cimetidine, ciprofloxacin, metronidazole, ofloxacin, ranitidine.
- **Additive Incompatibility:** amphotericin B, heparin.

Kanamycin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each 500 mg in 100–200 ml or each 1 g in 200–400 ml of D5W, D10W, D5/0.9% NaCl, 0.9% NaCl, or LR. Dilute in a proportionately smaller volume for pediatric patients. Darkening of solution does not alter potency. ***Concentration:*** 2.5–5 mg/ml. ***Rate:*** Infuse slowly over 30–60 min.
- **Syringe Incompatibility:** heparin.
- **Y-Site Compatibility:** cyclophosphamide, furosemide, hydromorphone, magnesium sulfate, meperidine, morphine, perphenazine, potassium chloride, vitamin B complex with C.
- **Additive Incompatibility:** Manufacturer does not recommend admixing with other antibacterial agents.

Tobramycin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each dose in 50–100 ml of D5W, D10W, D5/

Copyright © 2008 by F.A. Davis

0.9% NaCl, 0.9% NaCl, Ringer's, or LR. Stable for 24 hr at room temperature, 96 hr if refrigerated. Also available in commercially mixed piggyback injections. ***Concentration:*** 10 mg/ml. ***Rate:*** Infuse slowly over 30–60 min in both adult and pediatric patients.

- **Syringe Incompatibility:** clindamycin, heparin, pantoprazole.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amiodarone, amsacrine, aztreonam, bivalirudin, cefepime, ceftazidime, ciprofloxacin, cisatracurium, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, fenoldopam, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gemcitabine, granisetron, hydromorphone, insulin, labetalol, linezolid, magnesium sulfate, melphalan, meperidine, midazolam, milrinone, morphine, nicardipine, perphenazine, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, azithromycin, drotrecogin, heparin, hetastarch, indomethacin, lansoprazole, pemetrexed, propofol, sargramostim.
- **Additive Incompatibility:** Manufacturer recommends administering separately; do not admix.
- **Topical:** Cleanse skin before application. Wear gloves during application.

Patient/Family Teaching

- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, hearing loss, rash, dizziness, or difficulty urinating.
- Advise patient of the importance of drinking plenty of liquids.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- **PO:** Instruct patient to take neomycin as directed for full course of therapy. Take missed doses as soon as possible if not almost time for next dose; do not take double doses.
- Caution patient that neomycin may cause nausea, vomiting, or diarrhea.
- **Topical:** Instruct patient to wash affected skin gently and pat dry. Apply a thin film of ointment. Apply occlusive dressing only if directed by health care professional. Patient should assess skin and inform health care professional if skin irritation develops or infection worsens.
- **Inhaln:** Instruct patient to take inhalation twice daily as close to 12 hr apart as possible; not <6 hr apart. Administer over 10–15 min period using a hand-held PARI LC PLUS reusable nebulizer with a *DeVilbiss Pulmo-Aide* compressor. Do not mix with dornase alpha in nebulizer. Instruct patient on multiple therapies to take others first and use tobramycin last. Tobramycin-induced bronchospasm may be reduced if tobramycin is administered after bronchodilators. Instruct patient to sit or stand upright during inhalation and breathe normally through mouthpiece of nebulizer. Nose clips may help patient breath through mouth.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. If no response is seen within 3–5 days, new cultures should be taken.
- Prevention of infection in intestinal surgery (neomycin).
- Improved neurologic status in hepatic encephalopathy (neomycin).
- Endocarditis prophylaxis (gentamicin).

aminophylline, See BRONCHODILATORS (XANTHINES).

HIGH ALERT

amiodarone

(am-ee-**oh**-da-rone)
Cordarone, Pacerone

Classification
Therapeutic: antiarrhythmics (class III)

Pregnancy Category D

Indications

Life-threatening ventricular arrhythmias unresponsive to less toxic agents. **Unlabeled uses: PO:** Management of supraventricular tachyarrhythmias. **IV:** As part of the Advanced Cardiac Life Support (ACLS) and Pediatric Advanced Life Support (PALS) guidelines for the management

Copyright © 2008 by F.A. Davis

of ventricular fibrillation/pulseless ventricular tachycardia after cardiopulmonary resuscitation and defibrillation have failed; also for other life-threatening tachyarrhythmias.

Action

Prolongs action potential and refractory period. Inhibits adrenergic stimulation. Slows the sinus rate, increases PR and QT intervals, and decreases peripheral vascular resistance (vasodilation). **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability. Slowly and variably absorbed from the GI tract (35–65%).
Distribution: Distributed to and accumulates slowly in body tissues. Reaches high levels in fat, muscle, liver, lungs, and spleen. Crosses the placenta and enters breast milk.
Protein Binding: 96% bound to plasma proteins.
Metabolism and Excretion: Metabolized by the liver, excreted into bile. Minimal renal excretion. One metabolite has antiarrhythmic activity.
Half-life: 13–107 days.

TIME/ACTION PROFILE (suppression of ventricular arrhythmias)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 days (up to 2–3 mos)	3–7 hr	wks–mos
IV	2 hr	3–7 hr	unknown

Contraindications/Precautions

Contraindicated in: Patients with cardiogenic shock; Severe sinus node dysfunction; 2nd- and 3rd-degree AV block; Bradycardia (has caused syncope unless a pacemaker is in place); Hypersensitivity to amiodarone or iodine; OB: Can cause fetal hypo- or hyperthyroidism; Lactation: Enters breast milk and can cause harm to the neonate; use an alternative to breast milk; Pedi: Safety not established; products containing benzyl alcohol should not be used in neonates.
Use Cautiously in: History of CHF; Thyroid disorders; Corneal refractive laser surgery; Severe pulmonary or liver disease; Geri: Appears on Beers list. Potential to affect QT interval and cause torsades de pointes. Initiate therapy at the low end of the dosing range due to decreased hepatic, renal, or cardiac function; comorbid disease; or other drug therapy.

Adverse Reactions/Side Effects

CNS: confusional states, disorientation, hallucinations, dizziness, fatigue, malaise, headache, insomnia. **EENT:** corneal microdeposits, abnormal sense of smell, dry eyes, optic neuritis, optic neuropathy, photophobia. **Resp:** ADULT RESPIRATORY DISTRESS SYNDROME (ARDS), PULMONARY FIBROSIS, PULMONARY TOXICITY. **CV:** CHF, WORSENING OF ARRHYTHMIAS, bradycardia, hypotension. **GI:** LIVER FUNCTION ABNORMALITIES, anorexia, constipation, nausea, vomiting, abdominal pain, abnormal sense of taste. **GU:** decreased libido, epididymitis. **Derm:** TOXIC EPIDERMAL NECROLYSIS (rare), photosensitivity, blue discoloration. **Endo:** hypothyroidism, hyperthyroidism. **Neuro:** ataxia, involuntary movement, paresthesia, peripheral neuropathy, poor coordination, tremor.

Interactions

Drug-Drug: Increased risk of QT prolongations with **fluoroquinolones**, **macrolides**, and **azole antifungals** (undertake concurrent use with caution). ↑ blood levels and may lead to toxicity from **digoxin** (↓ dose of digoxin by 50%). ↑ blood levels and may lead to toxicity from other **class I antiarrhythmics** (**quinidine**, **procainamide**, **mexiletine**, **lidocaine**, or **flecainide**— ↓ doses of other drugs by 30–50%). ↑ blood levels of **cyclosporine**, **dextromethorphan**, **methotrexate**, **phenytoin**, and **theophylline**. **Phenytoin** ↓ amiodarone blood levels. ↑ activity of **warfarin** (↓ dose of warfarin by 33–50%). ↑ risk of bradyarrhythmias, sinus arrest, or AV heart block with **beta blockers** or **calcium channel blockers**. **Cholestyramine** may ↓ amiodarone blood levels. **Cimetidine** and **ritonavir** ↑ amiodarone blood levels. Risk of myocardial depression is ↑ by **volatile anesthetics**.
Drug-Natural Products: St. John's wort induces enzymes that metabolize amiodarone; may ↓ levels and effectiveness. Avoid concurrent use.
Drug-Food: Grapefruit juice inhibits enzymes in the GI tract that metabolize amiodarone resulting in ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

Ventricular Arrhythmias

PO (Adults): 800–1600-mg/day in 1–2 doses for 1–3 wk, then 600–800 mg/day in 1–2 doses for 1 mo, then 400 mg/day maintenance dose.
PO (Children): 10 mg/kg/day (800 mg/1.72 m^2/day) for 10 days or until response or adverse

Copyright © 2008 by F.A. Davis

reaction occurs, then 5 mg/kg/day (400 mg/1.72 m^2/day) for several weeks, then decreased to 2.5 mg/kg/day (200 mg/1.72 m^2/day) or lowest effective maintenance dose.

IV (Adults): 150 mg over 10 min, followed by 360 mg over the next 6 hr and then 540 mg over the next 18 hr. Continue infusion at 0.5 mg/min until oral therapy is initiated. If arrhythmia recurs, a small loading infusion of 150 mg over 10 min should be given; in addition, the rate of the maintenance infusion may be increased. *Conversion to initial oral therapy*—If duration of IV infusion was <1 wk, oral dose should be 800–1600 mg/day; if IV infusion was 1–3 wk, oral dose should be 600–800 mg/day; if IV infusion was >3 wk, oral dose should be 400 mg/day. *ACLS guidelines for pulseless VFib/VTach*—300 mg IV push, may repeat once after 3–5 min with 150 mg IV push (maximum cumulative dose 2.2 g/24 hr; unlabeled).

IV: Intraosseous **(Children and infants):** *PALS guidelines for pulseless VFib/VTach* 5 mg/kg as a bolus; *perfusion tachycardia*—5 mg/kg loading dose over 20–60 min (maximum of 15 mg/kg/day; unlabeled).

Supraventricular Tachycardia

PO (Adults): 600–800 mg/day for 1 wk or until desired response occurs or side effects develop, then decrease to 400 mg/day for 3 wk, then maintenance dose of 200–400 mg/day.

PO (Children): 10 mg/kg/day (800 mg/1.72 m^2/day) for 10 days or until response or side effects occur, then 5 mg/kg/day (400 mg/1.72 m^2/day) for several weeks, then decreased to 2.5 mg/kg/day (200 mg/1.72 m^2/day) or lowest effective maintenance dose.

Availability (generic available)

Tablets: 200 mg, 400 mg. **Cost:** 200 mg $235.39/60. **Injection:** 50 mg/ml in 3-, 9-, and 18-ml vials. **Cost:** 50 mg $1057.13/10 ampules.

NURSING IMPLICATIONS

Assessment

- Monitor ECG continuously during IV therapy or initiation of oral therapy. Monitor heart rate and rhythm throughout therapy; PR prolongation, slight QRS widening, T-wave amplitude reduction with T-wave widening and bifurcation, and U waves may occur. QT prolongation may be associated with worsening of arrhythmias and should be monitored closely during IV therapy. Report bradycardia or increase in arrhythmias promptly; patients receiving IV therapy may require slowing rate, discontinuing infusion, or inserting a temporary pacemaker.
- Assess for signs of pulmonary toxicity (rales/crackles, decreased breath sounds, pleuritic friction rub, fatigue, dyspnea, cough, wheezing, pleuritic pain, fever, hemoptysis, hypoxia). Chest x-ray and pulmonary function tests are recommended before therapy. Monitor chest x-ray every 3–6 mo during therapy to detect diffuse interstitial changes or alveolar infiltrates. Bronchoscopy or gallium radionuclide scan may also be used for diagnosis. Usually reversible after withdrawal, but fatalities have occurred.
- **IV:** Assess for signs and symptoms of ARDS throughout therapy. Report dyspnea, tachypnea, or rales/crackles promptly. Bilateral, diffuse pulmonary infiltrates are seen on chest x-ray.
- Monitor blood pressure frequently. Hypotension usually occurs during first several hours of therapy and is related to rate of infusion. If hypotension occurs, slow rate.
- **PO:** Assess for neurotoxicity (ataxia, proximal muscle weakness, tingling or numbness in fingers or toes, uncontrolled movements, tremors); common during initial therapy, but may occur within 1 wk to several months of initiation of therapy and may persist for more than 1 yr after withdrawal. Dose reduction is recommended. Assist patient during ambulation to prevent falls.
- Ophthalmic exams should be performed before and regularly during therapy and whenever visual changes (photophobia, halos around lights, decreased acuity) occur. May cause permanent loss of vision.
- Assess for signs of thyroid dysfunction, especially during initial therapy. Lethargy; weight gain; edema of the hands, feet, and periorbital region; and cool, pale skin suggest hypothyroidism and may require decrease in dose or discontinuation of therapy and thyroid supplementation. Tachycardia; weight loss; nervousness; sensitivity to heat; insomnia; and warm, flushed, moist skin suggest hyperthyroidism and may require discontinuation of therapy and treatment with antithyroid agents.

Copyright © 2008 by F.A. Davis

- ***Lab Test Considerations:*** Monitor liver and thyroid functions before and periodically throughout therapy. Drug effects persist long after discontinuation. Thyroid function abnormalities are common, but clinical thyroid dysfunction is uncommon.
- Monitor AST, ALT, and alkaline phosphatase at regular intervals during therapy, especially in patients receiving high maintenance dose. If liver function studies are 3 times normal or double in patients with elevated baseline levels or if hepatomegaly occurs, dose should be reduced.
- May cause asymptomatic elevations in ANA titer concentrations.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired gas exchange (Side Effects)

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous; fatalities have occurred from medication errors involving amiodarone. Before administering, have second practitioner check original order, dose calculations, and infusion pump settings. Patients should be hospitalized and monitored closely during IV therapy and initiation of oral therapy. IV therapy should be administered only by physicians experienced in treating life-threatening arrhythmias. Do not confuse amiodarone with inamrinone, formerly called amrinone.
- Hypokalemia and hypomagnesemia may decrease effectiveness or cause additional arrhythmias; correct before therapy.
- Monitor closely when converting from IV to oral therapy, especially in geriatric patients.
- **PO:** May be administered with meals and in divided doses if GI intolerance occurs or if daily dose exceeds 1000 mg.

IV Administration

- **IV:** Administer via volumetric pump; drop size may be reduced, causing altered dosing with drop counter infusion sets.
- Administer through an in-line filter.
- Infusions exceeding 2 hr must be administered in glass or polyolefin bottles to prevent adsorption. However, polyvinyl chloride (PVC) tubing must be used during administration because concentrations and infusion rate recommendations have been based on PVC tubing.
- **Direct IV:** ***Diluent:*** Administer undiluted. May also be diluted in 20–30 ml of D5W or 0.9% NaCl. ***Concentration:*** 50 mg/ml. ***Rate:*** Administer IV push.
- **Intermittent Infusion:** ***Diluent:*** Dilute 150 mg of amiodarone in 100 ml of D5W. Infusion stable for 2 hr in PVC bag. ***Concentration:*** 1.5 mg/ml. ***Rate:*** Infuse over 10 min. Do not administer IV push.
- **Continuous Infusion:** ***Diluent:*** Dilute 900 mg (18 ml) of amiodarone in 500 ml of D5W. Infusion stable for 24 hr in glass or polyolefin bottle. ***Concentration:*** Solution above: 1.8 mg/ml. Concentration may range from 1–6 mg/ml (concentrations >2 mg/ml must be administered via central venous catheter). ***Rate:*** Infuse at a rate of 1 mg/min for the first 6 hr, then decrease infusion rate to 0.5 mg/min and continue until oral therapy initiated.
- **Y-Site Compatibility:** amikacin, amphotericin B, atracurium, atropine, bumetanide, calcium chloride, calcium gluconate, caspofungin, ceftizoxime, ceftriaxone, cefuroxime, ciprofloxacin, clindamycin, daptomycin, dexmedetomidine, diltiazem, dobutamine, dopamine, doxycycline, epinephrine, eptifibatide, erythromycin lactobionate, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, insulin, isoproterenol, labetalol, lepirudin, lidocaine, linezolid, lorazepam, methylprednisolone, metronidazole, midazolam, milrinone, morphine, nesiritide, nitroglycerin, norepinephrine, palonosetron, penicillin G potassium, phenylephrine, potassium chloride, procainamide, quinupristin/dalfopristin, rifampin, tacrolimus, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, voriconazole.
- **Y-Site Incompatibility:** aminophylline, bivalirudin, ceftazidime, digoxin, ertapenem, heparin, imipenem-cilastatin, levofloxacin, micafungin, piperacillin/tazobactam, potassium phosphates, sodium bicarbonate.
- **Additive Incompatibility:** aminophylline, heparin, sodium bicarbonate.

Patient/Family Teaching

- Instruct patient to take amiodarone as directed. Patient should read the *Medication Guide* prior to first dose and with each Rx refill. If a dose is missed, do not take at all. Consult health care professional if more than two doses are missed.
- Advise patient to avoid drinking grapefruit juice during therapy.

Copyright © 2008 by F.A. Davis

- Inform patient that side effects may not appear until several days, weeks, or years after initiation of therapy and may persist for several months after withdrawal.
- Teach patients to monitor pulse daily and report abnormalities.
- Advise patients that photosensitivity reactions may occur through window glass, thin clothing, and sunscreens. Protective clothing and sunblock are recommended during and for 4 months after therapy. If photosensitivity occurs, dosage reduction may be useful.
- Inform patients that bluish discoloration of the face, neck, and arms is a possible side effect of this drug after prolonged use. This is usually reversible and will fade over several months. Notify health care professional if this occurs.
- Instruct male patients to notify health care professional if signs of epididymitis (pain and swelling in scrotum) occur. May require reduction in dose.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams, including chest x-ray and pulmonary function tests every 3–6 mo and ophthalmic exams after 6 mo of therapy, and then annually.

Evaluation/Desired Outcomes

- Cessation of life-threatening ventricular arrhythmias. Adverse effects may take up to 4 months to resolve.

amitriptyline

(a-mee-**trip**-ti-leen)

Apo-Amitriptyline, Elavil, Levate, Novotriptyn

Classification

Therapeutic: antidepressants

Pharmacologic: tricyclic antidepressants

Pregnancy Category C

Indications

Depression. **Unlabeled uses:** Anxiety, insomnia, treatment-resistant depression. Chronic pain syndromes (i.e., fibromyalgia, neuropathic pain/chronic pain, headache, low back pain).

Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed.
Protein Binding: 95% bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by the liver. Some metabolites have antidepressant activity. Undergoes enterohepatic recirculation and secretion into gastric juices. Probably crosses the placenta and enters breast milk.
Half-life: 10–50 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk (up to 30 days)	2–6 wk	days–wks
IM	2–3 wk	2–6 wk	days–wks

Contraindications/Precautions

Contraindicated in: Angle-closure glaucoma; Known history of QTc prolongation, recent MI, heart failure.
Use Cautiously in: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (increased risk of urinary retention); History of seizures (threshold may be ↓); OB: Use only if clearly needed and maternal benefits outweigh risk to fetus Lactation: May cause sedation in infant; Pedi: Safety not established in children <12 yr; Geri: Appears on Beers list. Geriatric patients are at increased risk of adverse reactions including falls secondary to sedative and anticholinergic effects.

Adverse Reactions/Side Effects

CNS: lethargy, sedation. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, hepatitis, paralytic ileus, increased appetite, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Amitriptyline is metabolized in the liver by the cytochrome P450 2D6 enzyme, and its action may be affected by drugs that compete for metabolism by this enzyme, including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** including **propafenone**, and **flecainide**; when these drugs are used concurrently with amitriptyline, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of amitriptyline. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk before starting amitriptyline). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before starting amitriptyline). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Concurrent use with **levodopa** may result in delayed or ↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins** (**rifampin**, **rifapentine**, and **rifabutin**). Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other agents having **anticholinergic** properties. **Phenothiazines** or **oral contraceptives** ↑ levels and may cause toxicity. **Nicotine** may ↑ metabolism and alter effects.

Drug-Natural Products: St. John's wort may decrease serum concentrations and efficacy. Concomitant use of **kava kava**, **valerian**, or **chamomile** can increase CNS depression. Increased anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 75 mg/day in divided doses; may be increased up to 150 mg/day *or* 50–100 mg at bedtime, may increase by 25–50 mg up to 150 mg (in hospitalized patients, may initiate with 100 mg/day, increasing total daily dose up to 300 mg).

PO (Geriatric Patients and Adolescents): 10 mg tid and 20 mg at bedtime *or* 25 mg at bedtime initially, slowly increased to 100 mg/day as a single bedtime dose or divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*—10 mg $13.32/100, 25 mg $12.22/100, 50 mg $14.20/100, 75 mg $12.21/100, 100 mg $12.21/100, 150 mg $24.42/100. **Syrup:** 10 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically throughout treatment.
- Assess fasting glucose and cholesterol levels in overweight/obese individuals.
- Monitor blood pressure and pulse before and during initial therapy. Notify physician or other health care professional of decreases in blood pressure (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored before and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Pain:** Assess intensity, quality, and location of pain periodically during therapy. May require several weeks for effects to be seen. Use pain scale to monitor effectiveness of medication. Assess for sexual dysfunction (decreased libido; erectile dysfunction). Geri: Geriatric patients started on amitriptyline may be at an increased risk for falls; start with low dose and monitor closely. Assess for anticholinergic effects (weakness and sedation).
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose before and periodically during therapy. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Chronic pain (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Elavil (amitriptyline) with Oruvail (ketoprofen).

Copyright © 2008 by F.A. Davis

- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May give entire dose at bedtime. Sedative effect may be apparent before antidepressant effect is noted. May require tapering to avoid withdrawal effects.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls and advise patient to make position changes slowly. Institute fall precautions. Advise patient to make position changes slowly. Refer as appropriate for nutrition/weight management and medical management.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Alert patient that medication may turn urine blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. Medication should be discontinued as long as possible before surgery.
- Therapy for depression is usually prolonged and should be continued for at least 3 months to prevent relapse. Emphasize the importance of follow-up exams to monitor effectiveness, side effects, and improve coping skills. Advise patient and family that treatment is not a cure and symptoms can recur after discontinuation of medication. Refer patient to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

amlodipine (am-**loe**-di-peen)
Norvasc

Classification
Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications

Alone or with other agents in the management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed after oral administration (64–90%).
Distribution: Probably crosses the placenta.
Protein Binding: 95–98%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 30–50 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–9	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Blood pressure <90 mm Hg.
Use Cautiously in: Severe hepatic impairment (dosage reduction recommended); Aortic stenosis; History of CHF; OB, Lactation, Pedi: Safety not established; Geri: Dose reduction recommended; increased risk of hypotension.

Adverse Reactions/Side Effects

CNS: headache, dizziness, fatigue. **CV:** peripheral edema, angina, bradycardia, hypotension, palpitations. **GI:** gingival hyperplasia, nausea. **Derm:** flushing.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **nonsteroidal anti-inflammatory agents**. May ↑ risk of neurotoxicity with **lithium**.
Drug-Food: Grapefruit juice ↑ serum levels and effect.

Route/Dosage

PO (Adults): 5–10 mg once daily; *antihypertensive in fragile or small patients or patients already receiving other antihypertensives*—initiate at 2.5 mg/day, increase as required/tolerated (up to 10 mg/day) as an antihypertensive therapy with 2.5 mg/day in patients with hepatic insufficiency.
PO (Geriatric Patients): *Antihypertensive*—Initiate therapy at 2.5 mg/day, increase as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, increase as required/tolerated (up to 10 mg/day).

Hepatic Impairment

PO (Adults): *Antihypertensive*—Initiate therapy at 2.5 mg/day, increase as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, increase as required/tolerated (up to 10 mg/day).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $99.97/90, 5 mg $105.97/90, 10 mg $135.96/90. ***In combination with:*** atorvastatin (Caduet), benazepril (Lotrel), olmesartan (Azor), and valsartan (Exforge). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Acute pain (Indications)

Implementation

- **PO:** May be administered without regard to meals.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.

Copyright © 2008 by F.A. Davis

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, if it occurs with diaphoresis, if shortness of breath occurs, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

amoxicillin (a-mox-i-**sil**-in)

Amoxil, Apo-Amoxi, DisperMox, Novamoxin, Nu-Amoxi, Trimox, Wymox

Classification

Therapeutic: anti-infectives, antiulcer agents

Pharmacologic: aminopenicillins

Pregnancy Category B

Indications

Treatment of: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections. Endocarditis prophylaxis. Postexposure inhalational anthrax prophylaxis. Management of ulcer disease due to *Helicobacter pylori*. **Unlabeled uses:** Lyme disease in children <8 years.

Action

Binds to bacterial cell wall, causing cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillins. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *Neisseria gonorrhoeae*, *Shigella*, *Chlamydia trachomatis*, *Salmonella*, *Borrelia burgdorferi*, *H. pylori*.

Pharmacokinetics

Absorption: Well absorbed from duodenum (75–90%). More resistant to acid inactivation than other penicillins.
Distribution: Diffuses readily into most body tissues and fluids. CSF penetration increased when meninges are inflamed. Crosses placenta; enters breast milk in small amounts.
Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.
Half-life: Neonates: 3.7 hr; Infants and Children: 1–2 hr; Adults: 0.7–1.4 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins; Tablets for oral suspension (Disper-Mox) contain aspartame; avoid in patients with phenylketonuria.

Use Cautiously in: Severe renal insufficiency (↓ dose if CCr <30 ml/min); Infectious mononucleosis, acute lymphocytic leukemia, or cytomegalovirus infection (↑ risk of rash); Patients with a history of cephalosporin allergy; OB, Lactation: Has been used safely in pregnant and breastfeeding women.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, elevated liver enzymes. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS, SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ effect of **warfarin**. May ↓ effectiveness of **oral contraceptives**. **Allopurinol** may ↑ frequency of rash.

Route/Dosage

Most Infections

PO (Adults): 250–500 mg q 8 hr *or* 500–875 mg q 12 hr (not to exceed 2–3 g/day).

PO (Children >3 mo): 25–50 mg/kg/day in divided doses q 8 hr *or* 25–50 mg/kg/day individual doses q 12 hr. *Acute otitis media due to highly resistant strains of S. pneumoniae*: 80–90 mg/kg/day divided q 12 hr. *Postexposure inhalational anthrax prophylaxis:* <40 kg: 45 mg/kg/day in divided doses q 8 hr; >40 kg: 500 mg q 8 hr.

PO (Infants ≤3 mo and neonates): 20–30 mg/kg/day in divided doses q 12 hr.

H. Pylori

PO (Adults): *Triple therapy*—1000 mg amoxicillin twice daily with lansoprazole 30 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* 1000 mg amoxicillin twice daily with omeprazole 20 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* amoxicillin 1000 mg twice daily with esomeprazole 40 mg daily and clarithromycin 500 mg twice daily for 10 days. *Dual therapy*—1000 mg amoxicillin three times daily with lansoprazole 30 mg three times daily for 14 days.

Endocarditis Prophylaxis

PO (Adults): 2 g 1 hr prior to procedure.

PO (Children): 50 mg/kg 1 hr prior to procedure (not to exceed adult dose).

Gonorrhea

PO (Adults and Children ≥40 kg): single 3 g dose.

PO (Children >2 yr and <40 kg): 50 mg/kg with probenecid 25 mg/kg as a single dose.

Renal Impairment

PO (Adults CCr 10–30 ml/min): 250–500 mg q 12 hr.

Renal Impairment

PO (Adults CCr <10 ml/min): 250–500 mg q 24 hr.

Availability (generic available)

Chewable tablets (cherry, banana, peppermint flavors): 125 mg, 200 mg, 250 mg, 400 mg. **Cost:** *Generic*—125 mg $17.13/30, 200 mg $16.99/20, 250 mg $13.99/30, 400 mg $16.36/30. **Tablets:** 500 mg, 875 mg. **Cost:** *Generic*—500 mg $12.80/21, 875 mg $24.99/30. **Capsules:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg $7.99/30, 500 mg $7.99/30. **Suspension (pediatric drops) (bubblegum flavor):** 50 mg/ml in 30-ml bottles. **Cost:** *Generic*—$7.99/30 ml. **Suspension (strawberry [125 mg/5 ml] and bubblegum [200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml] flavors):** 125 mg/5 ml, 200 mg/5 ml, 250 mg/5 ml, 400 mg/5 ml. **Cost:** *Generic*—125 mg/5 ml $11.25/100 ml, 200 mg/5 ml $16.92/100 ml, 250 mg/5 ml $7.99/150 ml, 400 mg/5 ml $17.47/100 ml. **Tablets for oral suspension (strawberry):** 200 mg, 400 mg. ***In combination with:*** clarithromycin and lansoprazole in a compliance package (Prevpac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.

Copyright © 2008 by F.A. Davis

- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify the physician or other health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- May cause false-positive direct Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock. May be given without regard to meals or with meals to decrease GI side effects. Capsule contents may be emptied and swallowed with liquids. Chewable tablets should be crushed or chewed before swallowing with liquids.
- Shake oral suspension before administering. Suspension may be given straight or mixed in formula, milk, fruit juice, water, or ginger ale. Administer immediately after mixing. Discard refrigerated reconstituted suspension after 10 days.
- Mix each *tablet for oral suspension (DisperMox)* in 2 tsp of water. Patient should drink entire mixture, rinse container with a small amount of water and drink to make sure entire dose is taken. Do not chew or swallow tablet. Tablets will not dissolve in mouth. Use only water to dissolve tablets, other liquids are not recommended. Store tablets at room temperature.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Review use and preparation of *tablets for oral suspension (DisperMox)*.
- Instruct female patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception during therapy with amoxicillin and until next menstrual period.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Instruct the patient to notify health care professional if symptoms do not improve.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Eradication of *H. pylori* with resolution of ulcer symptoms.

amoxicillin/clavulanate

(a-mox-i-**sill**-in/klav-yoo-**lan**-ate)
Augmentin, Augmentin ES, Augmentin XR, ♣Clavulin

Classification
Therapeutic: anti-infectives
Pharmacologic: aminopenicillins/beta lactamase inhibitors

Pregnancy Category B

Indications

Treatment of a variety of infections including: Skin and skin structure infections, Otitis media,

Copyright © 2008 by F.A. Davis

Sinusitis, Respiratory tract infections, Genitourinary tract infections.

Action

Binds to bacterial cell wall, causing cell death; spectrum of amoxicillin is broader than penicillin. Clavulanate resists action of beta-lactamase, an enzyme produced by bacteria that is capable of inactivating some penicillins. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *Neisseria gonorrhoeae*, *S. aureus*, *Klebsiella pneumoniae*, *Shigella*, *Salmonella*, *Moraxella catarrhalis*.

Pharmacokinetics

Absorption: Well absorbed from the duodenum (75–90%). More resistant to acid inactivation than other penicillins.
Distribution: Diffuses readily into most body tissues and fluids. Does not readily enter brain/CSF; CSF penetration is increased in the presence of inflamed meninges. Crosses the placenta and enters breast milk in small amounts.
Metabolism and Excretion: 70% excreted unchanged in the urine; 30% metabolized by the liver.
Half-life: 1–1.3 hr.

TIME/ACTION PROFILE (peak blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–2 hr	8—12 hrhr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins; Hypersensitivity to clavulanate; Suspension and chewable tablets contain aspartame and should be avoided in phenylketonurics; History of amoxicillin/clavulanate-associated cholestatic jaundice.
Use Cautiously in: Severe renal insufficiency (dose reduction necessary); Infectious mononucleosis (increased incidence of rash); Hepatic impairment (dose cautiously, monitor liver function).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, hepatic dysfunction, nausea, vomiting. **GU:** vaginal candidiasis. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May potentiate the effect of **warfarin**. Concurrent **allopurinol** therapy ↑ risk of rash. May decrease the effectiveness of **hormonal contraceptives**.
Drug-Food: Clavulanate absorption is decreased by a **high fat** meal.

Route/Dosage

Most Infections (Dosing based on amoxicillin component)

PO (Adults and Children >40 kg): 250 mg q 8 hr or 500 mg q 12 hr.

Serious Infections and Respiratory Tract Infections

PO (Adults and Children >40 kg): 875 mg q 12 hr *or* 500 mg q 8 hr; *Acute bacterial sinusitis*—2000 mg q 12 hr for 10 days as extended release (XR) product; *Community-acquired pneumonia*—2000 mg every 12 hr for 7–10 days as extended release (XR) product.

Recurrent/persistent acute otitis media due to Multidrug-resistant *S. pneumonia, H. influenzae,* or *M. catarrhalis*

PO (Children <40 kg): 80–90 mg/kg/day in divided doses q 12 hr for 10 days (as ES formulation only).

Renal Impairment

PO (Adults): *CCr 10–30 ml/min*—250–500 mg q 12 hr (do not use 875 mg tablet); *CCr <10 ml/min*—250–500 mg q 24 hr.

Otitis Media, Sinusitis, Lower Respiratory Tract Infections, Serious Infections

PO (Children ≥3 mo): *200 mg/5 ml or 400 mg/5 ml suspension*—45 mg/kg/day divided q 12 hr; *125 mg/5 ml or 250 mg/5 ml suspension*—40 mg/kg/day divided q 8 hr.

Less Serious Infections

PO (Children ≥3 mo): *200 mg/5 ml or 400 mg/5 ml suspension*—25 mg/kg/day divided q 12 hr *or* 20 mg/kg/day divided q 8 hr (as 125 mg/5 ml or 250 mg/5 ml suspension).
PO (Children <3 mo): 15 mg/kg q 12 hr (125 mg/ml suspension recommended).

Availability (generic available)

Tablets: 250 mg amoxicillin with 125 mg clavulanate, 500 mg amoxicillin with 125 mg clavulanate, 875 mg amoxicillin with 125 mg clavulanate. **Cost:** *Generic*—250 mg $97.19/30, 500 mg $45.99/20, 875 mg $83.99/20. **Chewable tablets (125 mg and 250 mg are lemon-**

Copyright © 2008 by F.A. Davis

lime flavor; 200 mg and 400 mg are cherry-banana flavor): 125 mg amoxicillin with 31.25 mg clavulanate, 200 mg amoxicillin with 28.5 mg clavulanate, 250 mg amoxicillin with 62.5 mg clavulanate, 400 mg amoxicillin with 57 mg clavulanate. **Cost:** *Generic*—125 mg $39.88/30, 200 mg $36.90/20, 250 mg $76.06/30, 400 mg $63.79/20. **Extended-release tablets (scored):** 1000 mg amoxicillin with 62.5 mg clavulanate. **Cost:** 1000 mg $101.53/28. **Suspension (125 mg/5 ml and 250 mg/5 ml are orange flavor; 200 mg/5 ml, 400 mg/5 ml and 600 mg/5 ml are orange-raspberry flavor):** 125 mg amoxicillin with 31.25 mg clavulanate/5 ml, 200 mg amoxicillin with 28.5 mg clavulanate/5 ml, 250 mg amoxicillin with 62.5 mg clavulanate/5 ml, 400 mg amoxicillin with 57 mg clavulanate/5 ml, 600 mg amoxicillin with 42.9 mg clavulanate/5 ml (ES formulation). **Cost:** *Generic*—125 mg $27.11/100 ml, 200 mg $40.85/100 ml, 250 mg $51.77/100 ml, 400 mg $69.21/100 ml, 600 mg $35.99/75 ml.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify the physician or other health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations. Elderly men and patients receiving prolonged treatment are at ↑ risk for hepatic dysfunction.
- May cause false-positive direct Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock. Administer at the start of a meal to enhance absorption and to decrease GI side effects. Do not administer with high fat meals; clavulanate absorption is decreased. XR tablet is scored and can be broken for ease of administration. Capsule contents may be emptied and swallowed with liquids. Chewable tablets should be crushed or chewed before swallowing with liquids. Shake oral suspension before administering. Refrigerated reconstituted suspension should be discarded after 10 days.
- Two 250-mg tablets are not bioequivalent to one 500-mg tablet; 250-mg tablets and 250-mg chewable tablets are also not interchangeable. Two 500-mg tablets are not interchangeable with one 1000-mg XR tablet; amounts of clavulanic acid and durations of action are different. Augmentin ES-600 (600 mg/5-ml) does not contain the same amount of clavulanic acid as any of the other Augmentin suspensions. Suspensions are not interchangeable.
- Pedi: Do not administer 250-mg chewable tablets to children <40 kg due to clavulanate content. Children <3 months should receive the 125-mg/5-ml oral solution.

Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Instruct female patients taking oral contraceptives to use an alternate or additional method of contraception during therapy and until next menstrual period.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal

Copyright © 2008 by F.A. Davis

cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Instruct the patient to notify health care professional if symptoms do not improve or if nausea or diarrhea persists when drug is administered with food.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

amphetamine mixtures
(am-**fet**-a-meen)
Amphetamine Salt, Adderall, Adderall XR

Classification
Therapeutic: central nervous system stimulants

Schedule II

Pregnancy Category C

Indications
Narcolepsy. ADHD.

Action
Causes release of norepinephrine from nerve endings. Pharmacologic effects are: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation). **Therapeutic Effects:** Increased motor activity, mental alertness, and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed in body tissues, with high concentrations in the brain and CSF. Crosses placenta and enters breast milk.
Metabolism and Excretion: Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.
Half-life: Children 6–12 yrs: 9–11 hr; Adults: 10–13 hr (depends on urine pH).

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	tablet: 0.5–1 hr	tablet: 3 hr capsule: 7 hr	4–6 hr

Contraindications/Precautions
Contraindicated in: Hyperexcitable states including hyperthyroidism; Psychotic personalities; Suicidal or homicidal tendencies; Chemical dependence; Glaucoma; Structural cardiac abnormalities (may increase the risk of sudden death); OB, Pedi: Potentially embryotoxic.
Use Cautiously in: Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); History of substance abuse (misuse may result in serious cardiovascular events/sudden death); Hypertension; Diabetes mellitus; Tourette's syndrome (may exacerbate tics); Geri: Geriatric or debilitated patients may be more susceptible to side effects.

Adverse Reactions/Side Effects
CNS: hyperactivity, insomnia, irritability, restlessness, tremor, dizziness, headache. **CV:** palpitations, tachycardia, cardiomyopathy (increased with prolonged use, high doses), hypertension, hypotension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, increased libido. **Derm:** urticaria. **Endo:** growth inhibition (with long term use in children). **Misc:** psychological dependence.

Interactions
Drug-Drug: Use with **MAO inhibitors** or **meperidine** can result in hypertensive crisis. ↑ adrenergic effects with other **adrenergics** or **thyroid preparations**. **Drugs that alkalinize urine (sodium bicarbonate, acetazolamide)** ↓ excretion, ↑ effects. **Drugs that acidify urine (ammonium chloride,** large doses of **ascorbic acid)** ↑ excretion, ↓ effects. ↑ risk of hypertension and bradycardia with **beta blockers**. ↑ risk of arrhythmias with **digoxin**. **Tricyclic antidepressants** may ↑ effect of amphetamine but may ↑ risk of arrhythmias, hypertension, or hyperpyrexia.
Drug-Natural Products: Use with **St. John's wort may increase serious side effects (avoid concurrent use).**
Drug-Food: Foods that alkalinize the urine (fruit juices) can ↑ effect of amphetamine.

Copyright © 2008 by F.A. Davis

Route/Dosage

Dose is expressed in total amphetamine content (amphetamine + dextroamphetamine).

Narcolepsy

PO (Adults and Children ≥12 yr): 10–60 mg/day in divided doses; start with 10 mg/day, increase by 10 mg/day at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr.
PO (Children 6–12 yr): 5 mg once daily; may increase by 5 mg/day at weekly intervals to a maximum of 60 mg/day.

ADHD

PO (Children ≥6 yr): 5 mg/day 1–2 times daily; increase daily dose by 5 mg at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr. If starting therapy with extended release capsules, start with 10 mg once daily and increase by 10 mg/day at weekly intervals (up to 40 mg/day).
PO (Adults): 20 mg/day initially (as extended-release product).
PO (Children 3–5 yr): 2.5 mg/day in the morning; increase daily dose by 2.5 mg at weekly intervals not to exceed 40 mg/day.

Availability (generic available)

Amount is expressed in total amphetamine content (amphetamine + dextroamphetamine.
Tablets: 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg. **Extended-release capsules:** 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiration before and periodically during therapy.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- **ADHD:** Monitor weight biweekly and inform physician of significant loss. Pedi: Monitor height periodically in children; inform physician of growth inhibition.
- Assess attention span, impulse control, motor and vocal tics, and interactions with others in children with ADHDs.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- ***Lab Test Considerations:*** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

Implementation

- **PO:** Use the lowest effective dose.
- May be taken without regard to food.
- Extended-release capsules may be swallowed whole or opened and sprinkled on applesauce; swallow contents without chewing. Applesauce should be swallowed immediately; do not store. Do not divide contents of capsule; entire contents of capsule should be taken.
- **ADHD:** Pedi: When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer months or may be given on each of the 5 school days, with medication-free weekends and holidays.

Patient/Family Teaching

- Instruct patient to take medication at least 6 hr before bedtime to avoid sleep disturbances. Missed doses should be taken as soon as remembered up to 6 hr before bedtime. With extended release capsule, avoid afternoon doses to prevent insomnia. Do not double doses. Advise patient and parents to read the Medication Guide prior to starting therapy and with each Rx refill. Instruct patient not to alter dose without consulting physician. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to limit caffeine intake.
- May impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence. Pedi: Children should be given a drug-free holiday each year to reassess symptoms and treatment. Doses will change as children age due to pharmacoki-

Copyright © 2008 by F.A. Davis

netic changes such as slower hepatic metabolism.
- Advise patient to notify physician if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe. Pedi: If reduced appetite and weight loss are a problem, advise parents to provide high calorie meals when drug levels are low (at breakfast and or bedtime).

Evaluation/Desired Outcomes
- Improved attention span.
- Decrease in narcoleptic symptoms.

amphotericin B deoxycholate
(am-foe-**ter**-i-sin)
Fungizone
amphotericin B cholesteryl sulfate
Amphotec
amphotericin B lipid complex
Abelcet
amphotericin B liposome
AmBisome

Classification
Therapeutic: antifungals

Pregnancy Category B

Indications
IV: Treatment of progressive, potentially fatal fungal infections. The cholesteryl sulfate, lipid complex, and liposome formulations should be considered for patients who are intolerant (e.g., renal dysfunction) or refractory to amphotericin B dexycholate. **Amphotericin B liposome:** Management of suspected fungal infections in febrile neutropenic patients: Treatment of visceral leishmaniasis, Treatment of crytococcal meningitis in HIV patients.

Action
Binds to fungal cell membrane, allowing leakage of cellular contents. Toxicity (especially acute infusion reactions and nephrotoxicity) is less with lipid formulations. **Therapeutic Effects:** Can be fungistatic or fungicidal (depends on concentration achieved and susceptibility of organism). **Spectrum:** Active against: Aspergillosis, Blastomycosis, Candidiasis, Coccidioidomycosis, Cryptococcosis, Histoplasmosis, Leishmaniasis (liposomal formulation only), Mucormycosis.

Pharmacokinetics
Absorption: Not absorbed orally.
Distribution: Extensively distributed to body tissues and fluids. Poor penetration into CSF.
Metabolism and Excretion: Elimination is very prolonged. Detectable in urine up to 7 wk after discontinuation.
Half-life: Biphasic—initial phase, 24–48 hr; terminal phase, 15 days. *Cholesteryl sulfate*—28 hr. *Lipid complex*—174 hr. *Liposomal*—100–153 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation: Potential for distribution into breast milk and toxicity in infant; discontinue nursing.
Use Cautiously in: Renal impairment or electrolyte abnormalities; Patients receiving concurrent leukocyte transfusions (increased risk of pulmonary toxicity); OB: Has been used safely.

Adverse Reactions/Side Effects
CNS: anxiety, confusion, headache, insomnia. **Resp:** dyspnea, hypoxia, wheezing. **CV:** chest pain, hypotension, tachycardia, edema, hypertension. **GI:** diarrhea, hyperbilirubinemia, liver enzyme elevation, nausea, vomiting, abdominal pain. **GU:** nephrotoxicity, hematuria. **F and E:** hyperglycemia, hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** pruritis, rashes. **Local:** phlebitis. **MS:** arthralgia, myalgia. **Misc:** HYPERSENSITIVITY REACTIONS, chills, fever, acute infusion reactions.

Interactions
Drug-Drug: Increased risk of renal toxicity, bronchospasm, and hypotension with **antineoplastics**. Concurrent use with **corticosteroids** ↑ risk of hypokalemia. Concurrent use with **zidovudine** may increase the risk of myelotoxicity and nephrotoxicity. Combined use with **flucytosine** ↑ antifungal activity but may ↑ the risk of toxicity from flucytosine. Combined use with **azole antifungals** may induce fungal resistance. Increased risk of nephrotoxicity with other **nephrotoxic agents** such as **aminoglycosides**, **cyclosporine**, or **tacrolimus**.

Copyright © 2008 by F.A. Davis

Hypokalemia from amphotericin ↑ the risk of **digoxin** toxicity. Hypokalemia may enhance the curariform effects of **neuromuscular blocking agents**.

Route/Dosage

Specific dosage and duration of therapy depend on nature of infection being treated.

Amphotericin Deoxycholate

IV (Adults): Give test dose of 1 mg. If test dose tolerated, initiate therapy with 0.25 mg/kg/day (doses up to 1.5 mg/kg/day may be used, depending on type of infection) (alternate-day dosing may also be used); *Bladder irrigation*—Instill 50 mcg/ml solution into bladder daily for 5–10 days.
IV (Infants and Children): Give test dose of 0.1 mg/kg (maximum dose 1 mg) or may administer initial dose of 0.25–1 mg/kg/day over 6 hr (without test dose) (some infections may require 1.5 mg/kg/day; alternate-day dosing may be used).
IT (Adults): 25–300 mcg q 48–72 hr, ↑ to 500 mcg—1 mg as tolerated (maximum total dose = 15 mg).
IT (Children): 25–100 mcg q 48–72 hr; ↑ to 500 mcg as tolerated.

Amphotericin B Cholesteryl Sulfate (Amphotec)

IV (Adults and Children): 3–4 mg/kg q 24 hr (no test dose needed).

Amphotericin B Lipid Complex (Abelcet)

IV (Adults and Children): 5 mg/kg q 24 hr (no test dose needed).

Amphotericin B Liposome (AmBisome)

IV (Adults and Children): *Empiric therapy*—3 mg/kg q 24 hr; *Documented infections*—3–5 mg/kg q 24 hr; *Visceral leishmaniasis (immunocompetent patients)*—3 mg/kg q 24 hr on days 1–5, then 3 mg/kg q 24 hr on days 14 and 21; *Visceral leishmaniasis (immunosuppressed patients)*—4 mg/kg q 24 hr on days 1–5, then 4 mg/kg q 24 hr on days 10, 17, 24, 31, and 38; *Cryptococcal meningitis in HIV patients*—6 mg/kg q 24 hr.

Availability

Amphotericin Deoxycholate

Powder for injection: 50 mg/vial.

Amphotericin B Cholesteryl Sulfate

Powder for injection: 50 mg/vial, 100 mg/vial.

Amphotericin B Lipid Complex

Suspension for injection: 100 mg/20-ml vial.

Amphotericin B Liposome

Powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient closely during test dose and the first 1–2 hr of each dose for fever, chills, headache, anorexia, nausea, or vomiting. Premedicating with antipyretics, corticosteroids, antihistamines, meperidine, and antiemetics may decrease these reactions. Febrile reaction usually subsides within 4 hr after the infusion is completed.
- Assess injection site frequently for thrombophlebitis or leakage. Drug is very irritating to tissues.
- Monitor vital signs every 15 min during test dose and every 30 min for 2–4 hr after administration. Meperidine and dantrolene have been used to prevent and treat rigors. Assess respiratory status (lung sounds, dyspnea) daily. Notify physician of changes. If respiratory distress occurs, discontinue infusion immediately; anaphylaxis may occur. Equipment for cardiopulmonary resuscitation should be readily available.
- Monitor intake and output and weigh daily. Adequate hydration (2000–3000 ml/day) and maintaining sodium balance may minimize nephrotoxicity.
- ***Lab Test Considerations:*** Monitor CBC, BUN and serum creatinine, and potassium and magnesium levels daily. If BUN and serum creatinine ↑ significantly, may need to discontinue or consider switching to cholesteryl sulfate, lipid complex, or liposomal formulation.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse amphotericin B cholesteryl sulfate (Amphotec) with amphotericin deoxycholate, amphotericin B lipid complex (Abelcet), or amphotericin B liposome (AmBisome); they are not interchangeable.

Copyright © 2008 by F.A. Davis

- This drug should be administered IV only to hospitalized patients or those under close supervision. Diagnosis should be confirmed before administration.

Amphotericin B Deoxycholate

IV Administration

- Test dose: ***Diluent:*** Reconstitute 50-mg vial with 10 ml of sterile water for injection to achieve a concentration of 5 mg/ml. Reconstituted vial stable for 24 hr at room temperature or 1 wk if refrigerated. Further dilute with 500 ml of D5W. May be diluted in 250 ml of D5W if being administered via a central venous catheter. Protect infusion from light. Infusion stable for 24 hr at room temperature or 2 days if refrigerated. To obtain test dose, withdraw 1 mg (10 ml) from 500 ml infusion and further dilute with D5W to a total volume of 20 ml. ***Concentration:*** 0.05 mg/ml. ***Rate:*** Infuse over 10–30 min to determine patient tolerance. Pedi: Infuse over 30–60 min.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute and dilute 50-mg vial as per the directions above. ***Concentration:*** Final concentration of infusion should not exceed 0.1 mg/ml for peripheral infusion or 0.25 mg/ml for central line administration. ***Rate:*** Infuse slowly over 4–6 hr.
- **Y-Site Compatibility:** amiodarone, diltiazem, hydromorphone, lorazepam, tacrolimus.
- **Y-Site Incompatibility:** acyclovir, amikacin, ampicillin, ampicillin/sulbactam, anidulafungin, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefepime, ceftizoxime, chloramphenicol, cimetidine, clindamycin, daptomycin, dexamethasone sodium phosphate, diazepam, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, filgrastim, fluconazole, ganciclovir, gentamicin, granisetron, haloperidol, hydralazine, hydrocortisone sodium succinate, hydroxyzine, isoproterenol, ketorolac, labetalol, lansoprazole, levofloxacin, lidocaine, linezolid, meperidine, meropenem, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, morphine, nafcillin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, phenytoin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, sodium bicarbonate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil, voriconazole.
- **Solution Incompatibility:** LR injection, saline solutions.

Amphotericin B Cholesteryl Sulfate

IV Administration

- Test Dose: ***Diluent:*** Reconstitute 50-mg vial with 10 ml and 100-mg vial with 20 ml of sterile water for injection to achieve a concentration of 5 mg/ml. Reconstituted vials are stable for 24 hr if refrigerated. Further dilute with D5W to achieve concentration below. Do not use other diluents. Infusion stable for 24 hr if refrigerated. Protect from light. To obtain test dose, withdraw 10 ml from final preparation. ***Concentration:*** Final concentration of infusion should be approximately 0.6 mg/ml (range 0.16–0.83 mg/ml). ***Rate:*** Infuse over 15–30 min.
- **Intermittent Infusion:** ***Diluent:*** Prepare infusion according to directions above. ***Concentration:*** Final concentration of infusion should be approximately 0.6 mg/ml (range 0.16–0.83 mg/ml). ***Rate:*** Infuse at a rate of 1 mg/kg/hr. If patient tolerates infusion without adverse reactions, infusion time may be shortened to a minimum of 2 hr. If reactions occur or patient cannot tolerate volume, infusion time may be extended. Rapid infusions may cause hypotension, hypokalemia, arrhythmias, and shock.
- **Y-Site Compatibility:** acyclovir, aminophylline, cefoxitin, ceftizoxime, clindamycin, dexamethasone sodium phosphate, fentanyl, furosemide, ganciclovir, granisetron, hydrocortisone, lorazepam, methylprednisolone, nitroglycerin, trimethoprim/sulfamethoxazole.
- **Y-Site Incompatibility:** amikacin, ampicillin, ampicillin/sulbactam, aztreonam, calcium chloride, calcium gluconate, cefazolin, cefepime, ceftazidime, ceftriaxone, cimetidine, cisatracurium, cyclosporine, diazepam, digoxin, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, esmolol, famotidine, fluconazole, gentamicin, haloperidol, heparin, hydromorphone, hydroxyzine, imipenem/cilastatin, labetalol, lidocaine, magnesium sulfate, meperidine, metoclopramide, metoprolol, metronidazole, midazolam, morphine, ondansetron, pheny-

Copyright © 2008 by F.A. Davis

toin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine, sodium bicarbonate, ticarcillin-clavulanate, tobramycin, vancomycin, vecuronium, verapamil.

- **Solution Incompatibility:** saline solutions.

Amphotericin B Lipid Complex

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Shake vial gently until yellow sediment at bottom has dissolved. Withdraw dose from required number of vials with 18-gauge needle. Replace needle from syringe filled with amphotericin B lipid complex with 5-micron filter needle. Each filter needle may be used to filter the contents of no more than 4 vials. Insert filter needle of syringe into IV bag of D5W and empty contents of syringe into bag. Protect from light. Infusion is stable for 6 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** Final concentration of infusion should be 1 mg/ml; a concentration of 2 mg/ml can be used for pediatric patients or patients who cannot tolerate large volumes of fluid. ***Rate:*** Do not use an in-line filter. Infuse at a rate of 2.5 mg/kg/hr via infusion pump. If infusion exceeds 2 hr, mix contents by shaking infusion bag every 2 hr. If administering through an existing line, flush line with D5W before infusion or use a separate line.
- **Y-Site Compatibility:** anidulafungin, ertapenem.
- **Y-Site Incompatibility:** daptomycin, tigecycline, tirofiban.
- **Solution Incompatibility:** saline solutions.

Amphotericin B Liposome

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 50-mg vial with 12 ml of sterile water for injection to achieve concentration of 4 mg/ml. Immediately shake vial vigorously for at least 30 seconds until all particulate matter is completely dispersed. Reconstituted vials are stable for 24 hr if refrigerated. Withdraw appropriate volume for dilution into a syringe. Attach the 5-micron filter to the syringe and inject syringe contents into an appropriate volume of D5W. Infusion should be administered within 6 hr of dilution. ***Concentration:*** Final concentration of infusion should be 1–2 mg/ml; a lower concentration (0.2–0.5 mg/ml) may be used for infants and small children. ***Rate:*** Infuse over 2 hr. Infusion time may be shortened to 1 hr if patient tolerates infusion without any adverse reactions. If discomfort occurs during infusion, duration of infusion may be increased. May be administered through an in-line filter with pore diameter of at least 1 micron. If administering through an existing line, flush line with D5W before infusion or use a separate line.
- **Y-Site Compatibility:** acyclovir, anidulafungin, atropine, azithromycin, bumetanide, cefazolin, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, clindamycin, daptomycin, dexamethasone sodium phosphate, diphenhydramine, enalaprilat, epinephrine, ertapenem, esmolol, famotidine, fenoldopam, fentanyl, furosemide, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, isoproterenol, ketorolac, lidocaine, linezolid, methylprednisolone sodium succinate, metoprolol, milrinone, nitroglycerin, nitroprusside, palonosetron, pantoprazole, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, ranitidine, tacrolimus, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, voriconazole.
- **Y-Site Incompatibility:** amikacin, ampicillin, ampicillin/sulbactam, aztreonam, calcium chloride, calcium gluconate, caspofungin, cefepime, cefotaxime, ceftazidime, ciprofloxacin, cyclosporine, diazepam, digoxin, diltiazem, dobutamine, dolasetron, dopamine, doxycycline, droperidol, erythromycin, gentamicin, hydroxyzine, imipenem/cilastatin, labetalol, lorazepam, magnesium sulfate, meperidine, meropenem, metoclopramide, metronidazole, midazolam, morphine, nicardipine, ondansetron, phenytoin, potassium phosphate, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, sodium bicarbonate, tobramycin, vancomycin, verapamil.
- **Solution Incompatibility:** Do not dilute or admix with saline solutions, other medications, or solutions containing a bacteriostatic agent.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Explain need for long duration of IV or topical therapy.
- **IV:** Inform patient of potential side effects and discomfort at IV site. Advise patient to notify health care professional if side effects occur.
- **Home Care Issue:** Instruct family or caregiver on dilution, rate, and administration of drug and proper care of IV equipment.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Several weeks to months of therapy may be required to prevent relapse.

ampicillin (am-pi-**sil**-in)

Ampicin, Apo-Ampi, Marcillin, Nu-Ampi, Novo-Ampicillin, Omnipen, Penbritin, Principen, Polycillin, Totacillin

Classification

Therapeutic: anti-infectives
Pharmacologic: aminopenicillins

Pregnancy Category B

Indications

Treatment of the following infections: Skin and skin structure infections, Soft-tissue infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia. Endocarditis prophylaxis. **Unlabeled uses:** Prevention of infection in certain high-risk patients undergoing cesarean section.

Action

Binds to bacterial cell wall, resulting in cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillin. **Spectrum:** Active against: Streptococci, nonpenicillinase-producing staphylococci, *Listeria*, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter*, *Klebsiella*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Salmonella*.

Pharmacokinetics

Absorption: Moderately absorbed from the duodenum (30–50%).
Distribution: Diffuses readily into body tissues and fluids. CSF penetration is increased in the presence of inflamed meninges. Crosses the placenta; enters breast milk in small amounts.
Metabolism and Excretion: Variably metabolized by the liver (12–50%). Renal excretion is variable (25–60% after oral dosing; 50–85% after IM administration).
Half-life: Neonates: 1.7–4 hr; Children and Adults: 1–1.5 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.5–2 hr	4–6 hr
IM	rapid	1 hr	4–6 hr
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins.
Use Cautiously in: Severe renal insufficiency (dosage reduction required if CCr <10 ml/min); Infectious mononucleosis, acute lymphocytic leukemia or cytomegalovirus infection (increased incidence of rash); Patients allergic to cephalosporins; OB: Has been used during pregnancy; Lactation: Is distributed into breast milk. Can cause rash, diarrhea, and sensitization in the infant.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid decreases renal excretion and increases blood levels of ampicillin—therapy may be combined for this purpose. Large doses may increase the risk of bleeding with **warfarin**. Incidence of rash increases with concurrent **allopurinol** therapy. May decrease the effectiveness of oral **hormonal contraceptives**.

Route/Dosage

Respiratory and Soft-Tissue Infections

PO (Adults and Children ≥20 kg): 250–500 mg q 6 hr.
PO (Children <20 kg): 50–100 mg/kg/day in divided doses q 6–8 hr (not to exceed 2–3 g/day).
IM, IV (Adults and Children ≥40 kg): 500 mg to 3 g q 6 hr (not to exceed 14 g/day).

Copyright © 2008 by F.A. Davis

IM, IV (Children <40 kg): 100–200 mg/kg/day in divided doses q 6–8 hr (not to exceed 12 g/day).

Bacterial Meningitis Caused by *H. influenzae, Streptococcus pneumoniae*, Group B streptococcus or *N. meningitidis* or Septicemia

IM, IV (Adults): 500 mg to 3 g q 6 hr (not to exceed 14 g/day).
IM, IV (Children >1 mo): 200–400 mg/kg/day in divided doses q 6 hr (not to exceed 12 g/day).
IM, IV (Neonates ≤7 days): 200 mg/kg/day divided q 8 hr.
IM, IV (Neonates >7 days): 300 mg/kg/day divided q 6 hr.

GI/GU Infections Other Than *N. gonorrhoeae*

PO (Adults and Children >20 kg): 250–500 mg q 6 hr (larger doses for more serious/chronic infections).
PO (Children ≤20 kg): 50–100 mg/kg/day in divided doses q 6 hr.

N. gonorrhoeae

PO (Adults): 3 g with 1 g probenecid.
IM, IV (Adults and Children ≥40 kg): 500 mg q 6 hr.
IM, IV (Children <40 kg): 100–200 mg/kg/day in divided doses q 6–8 hr.

Urethritis Caused by *N. gonorrhoeae* in Men

IM, IV (Adults and Children ≥40 kg): 500 mg, repeated 8–12 hr later; additional doses may be necessary for more complicated infections (prostatitis, epididymitis).

Prevention of Bacterial Endocarditis

IM, IV (Adults): 2 g 30 min before procedure (gentamicin may be added for high-risk patients); additional 1 g may be given 6 hr later for high-risk patients.
IM, IV (Children): 50 mg/kg (not to exceed 2 g) 30 min before procedure (gentamicin may be added for high-risk patients); additional 25 mg/kg may be given 6 hr later for high-risk patients.

Renal Impairment

(Adults and Children): CCr ≤10 ml/min—Increase dosing interval to q 12 hr.

Availability

Capsules: 250 mg, 500 mg. **Suspension (wild cherry flavor):** 125 mg/5 ml, 250 mg/5 ml. **Powder for injection:** 125 mg, 250 mg, 500 mg[Rx], 1 g, 2 g, 10 g.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Assess skin for "ampicillin rash," a nonallergic, dull red, macular or maculopapular, mildly pruritic rash.
- ***Lab Test Considerations:*** May cause increased AST and ALT.
- May cause transient decreases in estradiol, total conjugated estriol, estriol-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive direct Coombs' test result.
- May cause a false-positive urinary glucose.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse with omnipen with imipenem.
- Reserve IM or IV route for moderately severe or severe infections or patients unable to take oral medication. Change to PO as soon as possible.
- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals with a full glass of water. Capsules may be opened and mixed with water. Reconstituted oral suspensions retain potency for 7 days at room temperature and 14 days if re-

Copyright © 2008 by F.A. Davis

frigerated. Combination with probenecid should be used immediately after reconstitution.

- **IM:** Reconstitute for IM or IV use by adding sterile water for injection 0.9–1.2 ml to the 125-mg vial, 0.9–1.9 ml to the 250-mg vial, 1.2–1.8 ml to the 500-mg vial, 2.4–7.4 ml to the 1-g vial, and 6.8 ml to the 2-g vial.

IV Administration

- **Direct IV:** ***Diluent:*** Add 5 ml of sterile water for injection to each 125-, 250-, or 500-mg vial or at least 7.4–10 ml of diluent to each 1- or 2-g vial. Solution should be used within 1 hr of reconstitution. ***Rate:*** Doses of 125–500 mg may be given over 3–5 min (not to exceed 100 mg/min). Rapid administration may cause seizures.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute vials as per the directions above. Further dilute in 50 ml or more of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Administer within 4 hr (more stable in NaCl). ***Concentration:*** Final concentration of infusion should not exceed 30 mg/ml. ***Rate:*** Infuse over 10–15 min.
- **Y-Site Compatibility:** acyclovir, anidulafungin, bivalirudin, daptomycin, filgrastim, granisetron, heparin, levofloxacin, linezolid, milrinone, palonosetron, pantoprazole, propofol, tacrolimus, voriconazole.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B, caspofungin, diazepam, diphenhydramine, dobutamine, dopamine, doxycycline, fenoldopam, fluconazole, ganciclovir, haloperidol, hydroxyzine, lansoprazole, lorazepam, midazolam, nafcillin, nicardipine, nitroprusside, ondansetron, penicillin G potassium, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole, verapamil.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication can be dangerous. Pedi: Instruct parents and caregivers not to save or use this medication for other infections.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Advise patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception while taking ampicillin and until next menstrual period.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.
- Instruct the patient to notify health care professional if symptoms do not improve.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Lactation: Small amounts of ampicillin in breast milk can cause sensitization and alter intestinal flora of the infant. Instruct patient to monitor infant for reactions and discuss with health care provider possible need to temporarily avoid breastfeeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.

ampicillin/sulbactam

(am-pi-**sil**-in/sul-**bak**-tam)
Unasyn

Classification
Therapeutic: anti-infectives
Pharmacologic: aminopenicillins/beta lactamase inhibitors

Pregnancy Category B

Indications

Treatment of the following infections: Skin and skin structure infections, soft-tissue infections, Otitis media, Intra-abdominal infections, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia.

Action

Binds to bacterial cell wall, resulting in cell death; spectrum is broader than that of penicillin. Addition of sulbactam increases resistance

Copyright © 2008 by F.A. Davis

to beta-lactamases, enzymes produced by bacteria that may inactivate ampicillin. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Salmonella*, *Bacteroides fragilis*, *Moraxella catarrhalis*. Use should be reserved for infections caused by beta-lactamase–producing strains.

Pharmacokinetics

Absorption: Well absorbed from IM sites.
Distribution: Ampicillin diffuses readily into bile, blister and tissue fluids. Poor CSF penetration unless meninges are inflamed. Crosses the placenta; enters breast milk in small amounts.
Metabolism and Excretion: Ampicillin is variably metabolized by the liver (12–50%). Renal excretion is also variable. Sulbactam is eliminated unchanged in urine.
Protein Binding: *Ampicillin*—28%; *sulbactam*—38%.
Half-life: *Ampicillin*—1–1.8 hr; *sulbactam*—1–1.3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1 hr	6–8 hr
IV	immediate	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins or sulbactam.
Use Cautiously in: Severe renal insufficiency (dosage reduction required if CCr <30 ml/min); Epstein-Barr virus infection, acute lymphocytic leukemia, or cytomegalovirus infection (increased incidence of rash).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Local:** pain at IM site, pain at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection, elevated liver enzymes.

Interactions

Drug-Drug: Probenecid decreases renal excretion and increases blood levels of ampicillin—therapy may be combined for this purpose. May potentiate the effect of **warfarin**. Concurrent **allopurinol** therapy (increased incidence of rash). May decrease the effectiveness of **hormonal contraceptives**.

Route/Dosage

Dosage based on ampicillin component.
IM, IV (Adults and Children ≥40 kg): 1–2 g ampicillin q 6–8 hr (not to exceed 12 g ampicillin/day).
IM, IV (Children ≥1 yr): 100–200 mg ampicillin/kg/day divided q 6 hr; *Meningitis*—200–400 mg ampicillin/kg/day divided every 6 hr; maximum dose: 8 g ampicillin/day.
IM, IV (Infants >1 month): 100–150 mg ampicillin/kg/day divided q 6 hr.

Renal Impairment

IM, IV (Adults, Children, and Infants): *CCr 15–29 ml/min*—Administer q 12 hr; *CCr 5–14*—Administer q 24 hr.

Availability

Powder for injection: 1.5 g (1 g ampicillin with 500 mg sulbactam), 3 g (2 g ampicillin with 1 g sulbactam), 15 g (10 g ampicillin with 5 g sulbactam).

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBCs) at beginning and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of, and reactions to, penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause increased AST, ALT, LDH, bilirubin, alkaline phosphatase, BUN, and creatinine.

Copyright © 2008 by F.A. Davis

- May cause decreased hemoglobin, hematocrit, RBC, WBC, neutrophils, and lymphocytes.
- May cause transient decreases in estradiol, total conjugated estriol, estriol-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive Coombs' test result.

Potential Nursing Diagnosis
Risk for infection (Indications, Side Effects)

Implementation
- **IM:** Reconstitute for IM use by adding 3.2 ml of sterile water or 0.5% or 2% lidocaine HCl to the 1.5-g vial or 6.4 ml to the 3-g vial. Administer within 1 hr of preparation, deep IM into well-developed muscle.

IV Administration
- **Direct IV:** ***Diluent:*** Reconstitute 1.5-g vial with 3.2 ml of sterile water for injection and the 3-g vial with 6.4 ml. ***Concentration:*** 375 mg ampicillin/sulbactam per ml. ***Rate:*** Administer over at least 10–15 min within 1 hr of reconstitution. More rapid administration may cause seizures.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute vials as per the directions above. Further dilute in 50–100 ml of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Stability of solution varies from 2–8 hr at room temperature or 3–72 hr if refrigerated, depending on concentration and diluent. ***Concentration:*** Final concentration of infusion should be 3–45 mg of ampicillin/sulbactam per ml. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** anidulafungin, bivalirudin, daptomycin, fenoldopam, filgrastim, fluconazole, granisetron, hydromorphone, levofloxacin, linezolid, palonosetron, pantoprazole, tacrolimus, tirofiban, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B cholesteryl sulfate, caspofungin, cefotaxime, cefoxitin, ciprofloxacin, diazepam, dobutamine, doxycycline, ganciclovir, haloperidol, hydralazine, hydroxyzine, lansoprazole, lorazepam, methylprednisolone sodium succinate, midazolam, nicardipine, ondansetron, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole, verapamil. If aminoglycosides and penicillins must be given concurrently, administer in separate sites at least 1 hr apart.

Patient/Family Teaching
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Advise patients taking oral contraceptives to use an alternative or additional nonhormonal method of contraception while taking ampicillin/sulbactam and until next menstrual period.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes
- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

anakinra (a-na-**kin**-ra)
Kineret

Classification
Therapeutic: antirheumatics (DMARD)
Pharmacologic: interleukin antagonists

Pregnancy Category B

Indications
Reduction of the signs and symptoms of moderately to severely active rheumatoid arthritis in patients who have failed other DMARDs (may be used in combination with other DMARDs other than tumor necrosis factor [TNF] blocking agents).

Action
Blocks the destructive effects of interleukin-1 on cartilage and bone resorption by inhibiting its binding at specific tissue receptor sites. **Therapeutic Effects:** Slowed progression of rheumatoid arthritis.

Pharmacokinetics
Absorption: Well absorbed (95%) following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 4–6 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (clinical response)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 12 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Active infections; Hypersensitivity; Hypersensitivity to other *Escherichia coli*-derived products.

Use Cautiously in: Other chronic debilitating illness; Underlying immunosuppression; Renal impairment; OB, Lactation, Pedi: Safety not established; Geri: May be more sensitive to toxicity due to age-related decline in renal function; increased incidence of infection in geriatric population.

Exercise Extreme Caution in: Concurrent use of TNF blocking agents such as etanercept (higher risk of serious infections).

Adverse Reactions/Side Effects

CNS: headache. **GI:** diarrhea, nausea. **Hemat:** neutropenia. **Local:** injection site reactions. **Misc:** INFECTIONS, hypersensitivity reactions (rare).

Interactions

Drug-Drug: ↑ risk of serious infection with **TNF blocking agents**, such as **etanercept**. May ↓ antibody response to and increase the risk of adverse reactions from **vaccines**; avoid concurrent administration of **live vaccines**.

Route/Dosage

Subcut (Adults ≥18 yr): 100 mg/day.

Availability

Solution for injection: 100 mg/ml in 1-ml prefilled glass syringes.

NURSING IMPLICATIONS

Assessment

- Assess patient's range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- Assess for signs and symptoms of infection (fever, elevated WBC) prior to and periodically during therapy. Anakinra should not be instituted in patients with active infections and should be discontinued if patient develops a serious infection.
- Observe patient for hypersensitivity reactions (urticaria, dyspnea, hypotension). Discontinue anakinra if severe reaction occurs. Medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction.
- ***Lab Test Considerations:*** Monitor neutrophil count prior to and during therapy, then monthly for 3 mo and quarterly thereafter for up to 1 yr.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

Implementation

- Administration of higher than recommended doses did not result in higher responses.
- **Subcut:** Administer 1 dose/day. Do not administer solutions that are discolored or contain particulate matter. Provided in single-use 1-ml prefilled glass syringes.

Patient/Family Teaching

- Inform patient of the signs and symptoms of hypersensitivity reactions and other adverse reactions. Advise patient of appropriate actions if reactions occur.
- Advise patients not to receive live vaccines during therapy with anakinra without consulting health care professional.
- **Home Care Issues:** Instruct patient and family on preparation and correct technique for administration of injection and care and disposal of equipment. Caution patients and caregivers not to reuse needles, syringes, or drug product.

Evaluation/Desired Outcomes

- Reduction of signs and symptoms and slowed progression of moderate to severe active rheumatoid arthritis.

anastrazole (a-nass-stra-zole)
Arimidex

Classification
Therapeutic: antineoplastics
Pharmacologic: aromatase inhibitors

Pregnancy Category D

Indications

Postmenopausal hormone receptor-positive or unknown, locally advanced, or metastatic breast cancer. Advanced postmenopausal breast can-

Copyright © 2008 by F.A. Davis

cer in with disease progression despite tamoxifen therapy.

Action
Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen. **Therapeutic Effects:** Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer.

Pharmacokinetics
Absorption: 83–85% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 85% metabolized by the liver; 11% excreted renally.
Half-life: 50 hr.

TIME/ACTION PROFILE (lowering of serum estradiol)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	14 days	6 days†

†Following cessation of therapy

Contraindications/Precautions
Contraindicated in: OB: Potential harm to fetus or spontaneous abortion.
Use Cautiously in: Women with childbearing potential; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: headache, weakness, dizziness. **EENT:** pharyngitis. **Resp:** dyspnea, increased cough. **CV:** peripheral edema. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dry mouth, vomiting. **GU:** pelvic pain, vaginal bleeding, vaginal dryness. **Derm:** rash, including mucocutaneous disorders, sweating. **Metab:** weight gain. **MS:** back pain, bone pain. **Neuro:** paresthesia. **Misc:** allergic reactions including ANGIOEDEMA, URTICARIA, and ANAPHYLAXIS, hot flashes, pain.

Interactions
Drug-Drug: None significant.

Route/Dosage
PO (Adults): 1 mg daily.

Availability
Tablets: 1 mg. **Cost:** $795.94/90.

NURSING IMPLICATIONS

Assessment
- Assess patient for pain and other side effects periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ GTT, AST, ALT, alkaline phosphatase, total cholesterol, and LDL cholesterol levels.

Potential Nursing Diagnoses
Acute pain (Side Effects)

Implementation
- **PO:** Take medication consistently with regard to food.

Patient/Family Teaching
- Instruct patient to take medication as directed.
- Inform patient of potential for adverse reactions and advise her to notify health care professional if side effects are problematic.
- Advise patient that vaginal bleeding may occur during first few weeks after changing over from other hormonal therapy. Continued bleeding should be evaluated.
- Teach patient to report increase in pain so treatment can be initiated.

Evaluation/Desired Outcomes
- Slowing of disease progression in women with advanced breast cancer.

ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS

benazepril (ben-**aye**-ze-pril)
Lotensin

captopril (**kap**-toe-pril)
Capoten

enalapril/enalaprilat
(e-**nal**-a-pril/e-**nal**-a-pril-at)

ramipril (ra-**mi**-pril)
Altace

trandolapril (tran-**doe**-la-pril)
Mavik

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

Pregnancy Category C (first trimester), D (second and third trimesters)

Indications

Alone or with other agents in the management of hypertension. **Captopril, enalapril, fosinopril, lisinopril, quinapril, ramipril, trandolapril:** Management of CHF. **Captopril, lisinopril, ramipril, trandolapril:** Reduction of risk of death or development of CHF following MI. **Enalapril:** Slowed progression of left ventricular dysfunction into overt heart failure. **Ramipril:** Reduction of the risk of MI, stroke, and death from cardiovascular disease in patients at risk (>55 years old with a history of CAD, stroke, peripheral vascular disease, or diabetes with another cardiovascular risk factor). **Captopril:** Decreased progression of diabetic nephropathy. **Perindopril:** Reduction of risk of death from cardiovascular causes or non-fatal MI in patients with stable CAD.

Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also increase plasma renin levels and reduce aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients. Improved symptoms in patients with CHF (selected agents only). Decreased development of overt heart failure (enalapril only). Improved survival and reduced development of overt CHF after MI (selected agents only). Decreased risk of death from cardiovascular causes or MI in patients with stable CAD (perindopril only). Decreased risk of MI, stroke, or death from cardiovascular causes in high-risk patients (ramipril only). Decreased progression of diabetic nephropathy (captopril only).

Pharmacokinetics

Absorption: *Benazepril*—37% absorbed after oral administration. *Captopril*—60–75% absorbed after oral administration (↓ by food). *Enalapril*—55–75% absorbed after oral administration. *Enalaprilat*—IV administration results in complete bioavailability. *Fosinopril*—36% absorbed after oral administration. *Lisinopril*—25% absorbed after oral administration (much variability). *Moexipril*—13% bioavailability as moexiprilat after oral administration (↓ by food). *Perindopril*—25% bioavailability as perindoprilat after oral administration. *Quinapril*—60% absorbed after oral administration (high-fat meal may ↓ absorption). *Ramipril*—50–60% absorbed after oral administration. *Trandolapril*—70% bioavailability as trandolaprilat after oral administration.

Distribution: All ACE inhibitors cross the placenta. *Benazepril, captopril, enalapril, fosinopril, quinapril,* and *trandolapril*—Enter breast milk. *Lisinopril*—Minimal penetration of CNS. *Ramipril*—Probably does not enter breast milk. *Trandolapril*—Enters breast milk.

Protein Binding: *Benazepril*—95%, *Fosinopril*—99.4%, *Moexipril*—90%, *Quinapril*—97%.

Metabolism and Excretion: *Benazepril*—Converted by the liver to benazeprilat, the active metabolite. 20% excreted by kidneys; 11–12% nonrenal (biliary elimination). *Captopril*—50% metabolized by the liver to inactive compounds, 50% excreted unchanged by the kidneys. *Enalapril, enalaprilat*—Enalapril is converted by the liver to enalaprilat, the active metabolite; primarily eliminated by the kidneys. *Fosinopril*—Converted by the liver and GI mucosa to fosinoprilat, the active metabolite—50% excreted in urine, 50% in feces. *Lisinopril*—100% eliminated by the kidneys. *Moexipril*—Converted by liver and GI mucosa to moexiprilat, the active metabolite; 13% excreted in urine, 53% in feces. *Perindopril*—Converted by the liver to perindoprilat, the active metabolite; primarily excreted in urine. *Quinapril*—Converted by the liver, GI mucosa, and tissue to quinaprilat, the active metabolite: 96% eliminated by the kidneys. *Ramipril*—Converted by the liver to ramiprilat, the active metabolite; 60% excreted in urine, 40% in feces. *Trandolapril*—Converted by the liver to trandolaprilat, the active metabolite; 33% excreted in urine, 66% in feces.

Half-life: *Benazeprilat*—10–11 hr. *Captopril*—2 hr (increased in renal impairment). *Enalapril*—2 hr (increased in renal impairment). *Enalaprilat*—35–38 hr (increased in

Copyright © 2008 by F.A. Davis

renal impairment). *Fosinoprilat*—12 hr. *Lisinopril*—12 hr (increased in renal impairment). *Moexiprilat*—2–9 hr (increased in renal impairment). *Perindoprilat*—3–10 hr (increased in renal impairment). *Quinaprilat*—3 hr (increased in renal impairment). *Ramiprilat*—13–17 hr (increased in renal impairment). *Trandolaprilat*—10 hr (increased in renal impairment).

TIME/ACTION PROFILE (effect on blood pressure—single dose†)

ROUTE	ONSET	PEAK	DURATION
Benazepril	within 1 hr	2–4 hr	24 hr
Captopril	15–60 min	60–90 min	6–12 hr
Enalapril PO	1 hr	4–8 hr	12–24 hr
Enalapril IV	15 min	1–4 hr	4–6 hr
Fosinopril	within 1 hr	2–6 hr	24 hr
Lisinopril	1 hr	6 hr	24 hr
Moexipril	within 1 hr	3–6 hr	up to 24 hr
Perindoprilat	within 1–2 hr	3–7 hr	up to 24 hr
Quinapril	within 1 hr	2–4 hr	up to 24 hr
Ramipril	within 1–2 hr	3–6 hr	24 hr
Trandolapril	within 1–2 hr	4–10 hr	up to 24 hr

†Full effects may not be noted for several weeks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use of ACE inhibitors; OB: Can cause injury or death of fetus; Lactation: Certain ACE inhibitors appear in breast milk; discontinue drug or use formula.

Use Cautiously in: Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; Black patients with hypertension (monotherapy less effective, may require additional therapy; higher risk of angioedema); Women of childbearing potential; Surgery/anesthesia (hypotension may be exaggerated); Pedi: Safety not established for most agents; benazepril, fosinopril, and lisinopril may be used in children ≥6 yr (captopril and enalapril may be used in children of all ages); Geri: Initial dosage reduction recommended for most agents due to age-related decline in renal function.

Exercise Extreme Caution in: Family history of angioedema.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp:** cough, dyspnea. **CV:** hypotension, chest pain, edema, tachycardia. **Endo:** hyperuricemia. **GI:** taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, proteinuria, renal dysfunction, renal failure. **Derm:** flushing, pruritis, rashes. **F and E:** hyperkalemia. **Hemat:** AGRANULOCYTOSIS, neutropenia (captopril only). **MS:** back pain, muscle cramps, myalgia. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Excessive hypotension may occur with concurrent use of **diuretics** and other **antihypertensives**. ↑ risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, **potassium-containing salt substitutes**, or **angiotensin II receptor antagonists**. Antihypertensive response may be ↓ by **NSAIDs**. Absorption of fosinopril may be ↓ by **antacids** (separate administration by 1–2 hr). ↑ levels and may ↑ risk of **lithium** toxicity. Quinapril may ↓ absorption of **tetracycline**, **doxycycline**, and **fluoroquinolones** (because of magnesium in tablets).

Drug-Food: Food significantly ↓ absorption of captopril and moexipril (administer drugs 1 hr before meals).

Route/Dosage

Benazepril

PO (Adults): 10 mg once daily; increase gradually to maintenance dose of 20–40 mg/day in 1–2 divided doses (begin with 5 mg/day in patients receiving diuretics).

PO (Children ≥6 yr): 0.2 mg/kg once daily; may be titrated up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment

PO (Adults): *CCr <30 ml/min*—Initiate therapy with 5 mg once daily.

Renal Impairment

PO (Children ≥6 yr): *CCr <30 ml/min*—Contraindicated.

Captopril

PO (Adults): *Hypertension*—12.5–25 mg 2–3 times daily, may be increased at 1–2 wk intervals up to 150 mg 3 times daily (begin with 6.25–12.5 mg 2–3 times daily in patients receiving diuretics) (maximum dose = 450 mg/day). *CHF*—25 mg 3 times daily (6.25–12.5 mg 3 times daily in patients who have been vigorously diuresed); titrated up to target dose of 50 mg 3 times daily. *Post-MI*—6.25-mg test dose, followed by 12.5 mg 3 times daily, may be increased up to 50 mg 3 times daily. *Diabetic nephropathy*—25 mg 3 times daily.

Copyright © 2008 by F.A. Davis

PO (Children): *CHF*—0.3 mg/kg–0.5 mg/kg/dose 3 times daily, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses; *Older Children:* 6.25–12.5 mg/dose q 12–24 hr, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses.
PO (Infants): *CHF*—0.15–0.3 mg/kg/dose; titrate up to a maximum of 6 mg/kg/day in 1–4 divided doses.
PO (Neonates): *CHF*—0.05–0.1 mg/kg/dose q 8–24 hr; may increase as needed up to 0.5 mg/kg q 6–24 hr; *Premature neonates:* 0.01 mg/kg/dose q 8–12 hr.

Renal Impairment
PO (Adults): *CCr 10–50 ml/min*—Administer 75% of dose; *CCr <10 ml/min*—Administer 50% of dose.

Enalapril/Enalaprilat

PO (Adults): *Hypertension*—2.5–5 mg once daily, increase as required up to 40 mg/day in 1–2 divided doses (initiate therapy at 2.5 mg once daily in patients receiving diuretics). *CHF*—2.5 mg 1–2 times daily, titrated up to target dose of 10 mg twice daily; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L). *Asymptomatic left ventricular dysfunction*—2.5 mg twice daily, titrated up to a target dose of 10 mg twice daily.
PO (Children and Neonates): *Hypertension*—0.1 mg/kg/day q 12–24 hr (once a day in neonates); may be slowly titrated up to a maximum of 0.5 mg/kg/day.
IV (Adults): *Hypertension*—0.625–1.25 mg (0.625 mg if receiving diuretics) q 6 hr; can be titrated up to 5 mg q 6 hr.
IV (Children and Neonates): *Hypertension*—5–10 mcg/kg/dose given q 8–24 hr.

Renal Impairment
PO, IV (Adults): *Hypertension CCr 10–50 ml/min*—Administer 75% of dose; *CCr <10 ml/min*—Administer 50% of dose.

Renal Impairment
PO, IV (Children and Neonates): *CCr <30 ml/min*—Contraindicated.

Fosinopril

PO (Adults): *Hypertension*—10 mg once daily, may be increased as required up to 80 mg/day. *CHF*—10 mg once daily (5 mg once daily in patients who have been vigorously diuresed); may be increased over several weeks up to 40 mg/day.
PO (Children ≥6 yr and >50 kg): *Hypertension*—5–10 mg once daily.

Lisinopril

PO (Adults): *Hypertension*—10 mg once daily, can be increased up to 20–40 mg/day (initiate therapy at 5 mg/day in patients receiving diuretics). *CHF*—5 mg once daily; may be titrated every 2 wk up to 40 mg/day; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L). *Post-MI*—5 mg once daily for 2 days, then 10 mg daily.
PO (Children ≥6 yr): *Hypertension*—0.07 mg/kg once daily (up to 5 mg/day), may be titrated every 1–2 wk up to 0.6 mg/kg/day (or 40 mg/day).

Renal Impairment
PO (Adults): *CCr 10–30 ml/min*—Begin with 5 mg once daily; may be slowly titrated up to 40 mg/day; *CCr <10ml/min*—Begin with 2.5 mg once daily; may be slowly titrated up to 40 mg/day.

Renal Impairment
(Children ≥6 yr): *CCr <30 ml/min*—Contraindicated.

Moexipril

PO (Adults): 7.5 mg once daily, may be increased up to 30 mg/day in 1–2 divided doses (begin with 3.75 mg/day in patients receiving diuretics).

Renal Impairment
PO (Adults): *CCr ≤40 ml/min*—Initiate therapy at 3.75 mg once daily, may be titrated upward carefully to 15 mg/day.

Perindopril

PO (Adults): *Hypertension*—4 mg once daily, may be slowly titrated up to 16 mg/day in 1–2 divided doses (should not exceed 8 mg/day in elderly patients) (begin with 2–4 mg/day in 1–2 divided doses in patients receiving diuretics); *Stable CAD*—4 mg once daily for 2 weeks; may be increased, if tolerated, to 8 mg once daily; for elderly patients, begin with 2 mg once daily for 1 week (may be increased, if tolerated, to 4 mg once daily for 1 week, then, increase as tolerated to 8 mg once daily).

Copyright © 2008 by F.A. Davis

Renal Impairment
PO (Adults): *CCr 30–60 ml/min*—2 mg/day initially; may be slowly titrated up to 8 mg/day in 1–2 divided doses.

Quinapril

PO (Adults): *Hypertension*—10–20 mg once daily initially, may be titrated q 2 wk up to 80 mg/day in 1–2 divided doses (initiate therapy at 5 mg/day in patients receiving diuretics). *CHF*—5 mg twice daily initially; may be titrated at weekly intervals up to 20 mg twice daily.

Renal Impairment
PO (Adults): *CCr >60 ml/min*—Initiate therapy at 10 mg/day; *CCr 30–60 ml/min*—Initiate therapy at 5 mg/day; *CCr 10–30 ml/min*—Initiate therapy at 2.5 mg/day.

Ramipril

PO (Adults): *Hypertension*—2.5 mg once daily; may be increased slowly up to 20 mg/day in 1–2 divided doses (initiate therapy at 1.25 mg/day in patients receiving diuretics). *CHF post-MI*—1.25–2.5 mg twice daily initially; may be increased slowly up to 5 mg twice daily. *Reduction in risk of MI, stroke, and death from cardiovascular causes*—2.5 mg once daily for 1 wk, then 5 mg once daily for 3 wk, then increased as tolerated to 10 mg once daily (can also be given in 2 divided doses).

Renal Impairment
PO (Adults): *CCr <40 ml/min*—Initiate therapy at 1.25 mg once daily; may be slowly titrated up to 5 mg/day in 1–2 divided doses.

Trandolapril

PO (Adults): *Hypertension*—1 mg once daily (2 mg once daily in black patients); *CHF post-MI*—Initiate therapy at 1 mg once daily, titrate up to 4 mg once daily if possible.

Renal Impairment
PO (Adults): *CCr <30 ml/min*—Initiate therapy at 0.5 mg once daily; may be slowly titrated upward (maximum dose = 4 mg/day).

Hepatic Impairment
PO (Adults): Initiate therapy at 0.5 mg once daily; may be slowly titrated upward (maximum dose = 4 mg/day).

Availability

Benazepril

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. ***In combination with:*** amlodipine (Lotrel) and hydrochlorothiazide (Lotensin HCT). See Appendix B.

Captopril

Tablets: 12.5 mg, 25 mg, 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide (Capozide). See Appendix B.

Enalapril

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg. ***In combination with:*** felodipine (Lexxel), hydrochlorothiazide (Vaseretic). See Appendix B.

Enalaprilat

Injection: 1.25 mg/ml.

Fosinopril

Tablets: 10 mg, 20 mg, 40 mg. ***In combination with:*** hydrochlorothiazide (Monopril-HCT). See Appendix B.

Lisinopril

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. ***In combination with:*** hydrochlorothiazide (Prinzide, Zestoretic). See Appendix B.

Moexipril

Tablets: 7.5 mg, 15 mg. ***In combination with:*** hydrochlorothiazide (Uniretic).

Perindopril

Tablets: 2 mg, 4 mg, 8 mg.

Quinapril

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. ***In combination with:*** hydrochlorothiazide (Accuretic, Quinaretic). See Appendix B.

Ramipril

Capsules: 1.25 mg, 2.5 mg, 5 mg, 10 mg. **Cost:** 1.25 mg $133.41/90, 2.5 mg $165.97/90, 5 mg $175.98/90, 10 mg $195.97/90.

Trandolapril

Tablets: 1 mg, 2 mg, 4 mg. ***In combination with:*** verapamil (Tarka). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (dyspnea, facial swelling).
- **CHF:** Monitor weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor BUN, creatinine, and electrolyte levels periodically.

Copyright © 2008 by F.A. Davis

Serum potassium, BUN, and creatinine may be ↑, whereas sodium levels may be ↓. If ↑ BUN or serum creatinine concentrations occur, dose reduction or withdrawal may be required.

- Monitor CBC periodically during therapy. Certain drugs may rarely cause slight ↓ in hemoglobin and hematocrit, leukopenia, and eosinophilia.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.
- Assess urine protein prior to and periodically during therapy for up to 1 yr in patients with renal impairment or in those receiving >150 mg/day of captopril. If excessive or ↑ proteinuria occurs, re-evaluate ACE inhibitor therapy.
- *Captopril:* May cause positive ANA titer.
- *Captopril:* May cause false-positive test results for urine acetone.
- *Captopril:* Monitor CBC with differential prior to initiation of therapy, every 2 wk for the first 3 mo, and periodically for up to 1 yr in patients at risk for neutropenia (patients with renal impairment or collagen-vascular disease) or at first sign of infection. Discontinue therapy if neutrophil count is $<1000/mm^3$.

Potential Nursing Diagnoses

Decreased cardiac output (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Lotensin (benazepril) with Loniten (minoxidil) or lovastatin. Do not confuse enalapril with Eldepryl (seligiline). Do not confuse Monopril (fosinopril) with Accupril (quinapril), minoxidil, or Monoket (isosorbide mononitrate). Do not confuse Prinivil (lisinopril) with Plendil (felodipine) or Prilosec (omeprazole). Do not confuse Accupril (quinapril) with Accutane (isotretinoin). Do not confuse Altace (ramipril) with Artane (trihexyphenidyl).
- Correct volume depletion, if possible, before initiation of therapy.
- **PO:** Precipitous drop in blood pressure during first 1–3 hr after first dose may require volume expansion with normal saline but is not normally considered an indication for stopping therapy. Discontinuing diuretic therapy or cautiously increasing salt intake 2–3 days before initiation may decrease risk of hypotension. Monitor closely for at least 1 hr after blood pressure has stabilized. Resume diuretics if blood pressure is not controlled.

Benazepril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable for 30 days if refrigerated. Shake suspension before each use.

Captopril

- **PO:** Administer 1 hr before or 2 hr after meals. May be crushed if patient has difficulty swallowing. Tablets may have a sulfurous odor.
- An oral solution may be prepared by crushing a 25-mg tablet and dissolving it in 25–100 ml of water. Shake for at least 5 min and administer within 30 min.

Enalapril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension. Shake suspension before each use.

Enalaprilat

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 1.25 mg/ml. ***Rate:*** Administer over at least 5 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute in up to 50 ml of D5W, 0.9% NaCl, D5/0.9% NaCl, or D5/LR. Diluted solution is stable for 24 hr. ***Rate:*** Administer as a slow infusion over at least 5 min.
- **Y-Site Compatibility:** allopurinol, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bivalirudin, butorphanol, calcium gluconate, cefazolin, cefoperazone, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, cladribine, clindamycin, dexmedetomidine, dextran 40, dobutamine, docetaxel, dopamine, doxorubicin liposome, erythromycin lactobionate, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, meropenem, methylprednisolone sodium succinate, metronidazole, morphine, nafcillin,

Copyright © 2008 by F.A. Davis

nicardipine, nitroprusside, oxaliplatin, pemetrexed, penicillin G potassium, phenobarbital, piperacillin, piperacillin/tazobactam, potassium chloride, potassium phosphate, propofol, ranitidine, remifentanil, sodium acetate, teniposide, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinorelbine.

- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate, cefepime, lansoprazole, phenytoin.
- **Additive Compatibility:** dobutamine, dopamine, heparin, meropenem, nitroglycerin, nitroprusside, potassium chloride.

Lisinopril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable at room temperature for 4 wk. Shake suspension before each use.

Moexipril

- **PO:** Administer moexipril on an empty stomach, 1 hr before a meal.

Ramipril

- **PO:** Capsules may be opened and sprinkled on applesauce, or dissolved in 4 oz water or apple juice for patients with difficulty swallowing. Effectiveness is same as capsule. Prepared mixtures can be stored for up to 24 hrs at room temperature or up to 48 hrs if refrigerated.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible but not if almost time for next dose. Do not double doses. Warn patient not to discontinue ACE inhibitor therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes or foods containing high levels of potassium or sodium unless directed by health care professional (see Appendix L).
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension.
- Advise patient to consult health care professional before taking any OTC cough, cold, or allergy remedies, or other medications or herbal products.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient that medication may cause impairment of taste that generally resolves within 8–12 wk, even with continued therapy.
- Instruct patient to notify health care professional if rash; mouth sores; sore throat; fever; swelling of hands or feet; irregular heart beat; chest pain; dry cough; hoarseness; swelling of face, eyes, lips, or tongue; difficulty swallowing or breathing occur; or if taste impairment or skin rash persists. Persistent dry cough may occur and may not subside until medication is discontinued. Consult health care professional if cough becomes bothersome. Also notify health care professional if nausea, vomiting, or diarrhea occurs and continues.
- Emphasize the importance of follow-up examinations to monitor progress.
- OB: Advise women of childbearing age to use contraception and notify health care professional if pregnancy is planned or suspected. If pregnancy is detected, discontinue medication as soon as possible.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family on correct technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of excessive side effects.
- Decrease in signs and symptoms of CHF (some drugs may also improve survival).
- Decrease in development of overt CHF (enalapril).
- Reduction of risk of death or development of CHF following MI.
- Reduction of risk of death from cardiovascular causes and MI in patients with stable CAD (perindopril).
- Reduction of risk of MI, stroke, or death from cardiovascular causes in patients at high-risk for these events (ramipril).
- Decrease in progression of diabetic nephropathy (captopril).

ANGIOTENSIN II RECEPTOR ANTAGONISTS

candesartan (can-de-**sar**-tan)
Atacand

eprosartan (ep-roe-**sar**-tan)
Teveten

irbesartan (ir-be-**sar**-tan)
Avapro

losartan (loe-**sar**-tan)
Cozaar

olmesartan (ole-me-**sar**-tan)
Benicar

telmisartan (tel-mi-**sar**-tan)
Micardis

valsartan (val-**sar**-tan)
Diovan

Classification
Therapeutic: antihypertensives
Pharmacologic: angiotensin II receptor antagonists

Pregnancy Category C (first trimester), D (second and third trimesters)

Indications

Alone or with other agents in the management of hypertension. Treatment of diabetic nephropathy in patients with type 2 diabetes and hypertension (irbesartan and losartan only). Management of CHF (New York Heart Association class II-IV) in patients who cannot tolerate ACE inhibitors (candesartan and valsartan only) or in combination with an ACE inhibitor and beta-blocker (candesartan only). Prevention of stroke in patients with hypertension and left ventricular hypertrophy (losartan only). Reduction of risk of death from cardiovascular causes in patients with left ventricular systolic dysfunction after MI (valsartan only).

Action

Blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle and the adrenal glands. **Therapeutic Effects:** Lowering of blood pressure. Slowed progression of diabetic nephropathy (irbesartan and losartan only). Reduced cardiovascular death and hospitalizations due to CHF in patients with CHF (candesartan and valsartan only). Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction who are post-MI (valsartan only). Decreased risk of stroke in patients with hypertension and left ventricular hypertrophy (effect may be less in black patients) (losartan only).

Pharmacokinetics

Absorption: *Candesartan*—Candesartan cilexetil is converted to candesartan, the active component; 15% bioavailability of candesartan; *Eprosartan*—13% absorbed after oral administration; *Irbesartan*—60–80% absorbed after oral administration; *Losartan*—well absorbed, with extensive first-pass hepatic metabolism, resulting in 33% bioavailability; *Olmesartan*—Olmesartan medoxomil is converted to olmesartan, the active component; 26% bioavailability of olmesartan; *Telmisartan*—42–58% absorbed following oral administration (bioavailability ↑ in patients with hepatic impairment); *Valsartan*—10–35% absorbed following oral administration.

Distribution: All angiotensin receptor blockers (ARBs) cross the placenta; *Candesartan*—enters breast milk.

Protein Binding: All ARBs are >90% protein-bound.

Metabolism and Excretion: *Candesartan*—Minor metabolism by the liver; 33% excreted in urine, 67% in feces (via bile); *Eprosartan*—Excreted primarily unchanged in feces via biliary excretion; *Irbesartan*—Some hepatic metabolism; 20% excreted in urine, 80% in feces; *Losartan*—Undergoes extensive first-pass hepatic metabolism; 14% is converted to an active metabolite. 4% excreted unchanged in urine; 6% excreted in urine as active metabolite; some biliary elimination; *Olmesartan*—30–50% excreted unchanged in urine, remainder eliminated in feces via bile; *Telmisartan*—Excreted mostly unchanged in feces via biliary excretion; *Valsartan*—Minor metabolism by the liver; 13% excreted in urine, 83% in feces.

Half-life: *Candesartan*—9 hr; *Eprosartan*—20 hr; *Irbesartan*—11–15 hr; *Losartan*—2 hr (6–9 hr for metabolite); *Olmesartan*—13 hr; *Telmisartan*—24 hr; *Valsartan*—6 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antihypertensive effect with chronic dosing)

ROUTE	ONSET	PEAK	DURATION
Candesartan	2–4 hr	4 wk	24 hr
Eprosartan	1–2 hr	2–3 wk	12–24 hr
Irbesartan	within 2 hr	2 wk	24 hr
Losartan	6 hr	3–6 wk	24 hr
Olmesartan	within 1 wk	2 wk	24 hr
Telmisartan	within 3 hr	4 wk	24 hr
Valsartan	within 2 hr	4 wk	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Can cause injury or death of fetus; Lactation: Discontinue drug or provide formula.

Use Cautiously in: CHF (may result in azotemia, oliguria, acute renal failure, and/or death); Volume- or salt-depleted patients or patients receiving high doses of diuretics (correct deficits before initiating therapy or initiate at lower doses); Black patients (may not be effective); Impaired renal function due to primary renal disease or CHF (may worsen renal function); Obstructive biliary disorders (telmisartan) or hepatic impairment (candesartan, losartan, or telmisartan); Women of childbearing potential; Pedi: Safety not established in children <18 yr (<6 yr for losartan).

Adverse Reactions/Side Effects

CNS: dizziness, anxiety, depression, fatigue, headache, insomnia, weakness. **CV:** hypotension, chest pain, edema, tachycardia. **Derm:** rashes. **EENT:** nasal congestion, pharyngitis, rhinitis, sinusitis. **GI:** abdominal pain, diarrhea, drug-induced hepatitis, dyspepsia, nausea, vomiting. **GU:** impaired renal function. **F and E:** hyperkalemia. **MS:** arthralgia, back pain, myalgia. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Antihypertensive effect may be blunted by **NSAIDs**. ↑ antihypertensive effects with other **antihypertensives** and **diuretics**. Telmisartan may ↑ serum **digoxin** levels. Concurrent use of **potassium-sparing diuretics**, **potassium-containing salt substitutes**, **angiotensin-converting enzyme inhibitors**, or **potassium supplements** may ↑ risk of hyperkalemia. Candesartan may ↑ serum **lithium** levels. Irbesartan and losartan may ↑ effects of **amiodarone**, **fluoxetine**, **glimepiride**, **glipizide**, **phenytoin**, **rosiglitazone**, and **warfarin**. **Rifampin** may ↓ effects of losartan.

Route/Dosage

Candesartan

PO (Adults): *Hypertension*—16 mg once daily; may be ↑ up to 32 mg/day in 1–2 divided doses (begin therapy at a lower dose in patients who are receiving diuretics or are volume depleted). *CHF*—4 mg once daily initially, dose may be doubled at 2-wk intervals up to target dose of 32 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Initiate at a lower dose.

Eprosartan

PO (Adults): 600 mg once daily; may be ↑ to 800 mg/day (in 1–2 divided doses) (usual range 400–800 mg/day).

Renal Impairment

PO (Adults): *CCr <60 ml/min* —Do not exceed 600 mg/day.

Irbesartan

PO (Adults): *Hypertension*—150 mg once daily; may be increased to 300 mg once daily. Initiate therapy at 75 mg once daily in patients who are receiving diuretics or are volume depleted. *Type 2 diabetic nephropathy*—300 mg once daily.

Losartan

PO (Adults): *Hypertension*—50 mg once daily initially (range 25–100 mg/day as a single daily dose or 2 divided doses) (initiate therapy at 25 mg once daily in patients who are receiving diuretics or are volume depleted). *Prevention of stroke in patients with hypertension and left ventricular hypertrophy*—50 mg once daily initially; hydrochlorothiazide 12.5 mg once daily should be added and/or dose of losartan increased to 100 mg once daily followed by an increase in hydrochlorothiazide to 25 mg once daily based on blood pressure response. *Type 2 diabetic nephropathy*—50 mg once daily; may increase to 100 mg once daily; depending on blood pressure response.

Hepatic Impairment

PO (Adults): 25 mg once daily initially; may be increased as tolerated.

PO (Children >6 yr): *Hypertension*—0.7 mg/kg once daily (up to 50 mg/day); may be titrated up to 1.4 mg/kg/day (or 100 mg/day).

Renal Impairment

PO (Children >6 yr): *CCr <30 ml/min* —Contraindicated.

Copyright © 2008 by F.A. Davis

Olmesartan

PO (Adults): 20 mg once daily; may be ↑ up to 40 mg once daily (patients who are receiving diuretics or are volume-depleted should be started on lower doses).

Telmisartan

PO (Adults): 40 mg once daily (volume-depleted patients should start with 20 mg once daily); may be titrated up to 80 mg/day.

Valsartan

PO (Adults): *Hypertension*—80 mg or 160 mg once daily initially in patients who are not volume-depleted; may be increased to 320 mg once daily; *CHF*—40 mg twice daily, may be titrated up to target dose of 160 mg twice daily as tolerated; *Post-MI*—20 mg twice daily (may be initiated ≥12 hr after MI); dose may be titrated up to target dose of 160 mg twice daily, as tolerated.

Availability

Candesartan

Tablets: 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** 4 mg $154.54/90, 8 mg $155.97/90, 16 mg $155.97/90, 32 mg $215.96/90. ***In combination with:*** hydrochlorothiazide (Atacand HCT; see Appendix B).

Eprosartan

Tablets: 400 mg, 600 mg. ***In combination with:*** hydrochlorothiazide (Teveten HCT; see Appendix B).

Irbesartan

Tablets: 75 mg, 150 mg, 300 mg. **Cost:** 75 mg $149.97/90, 150 mg $165.97/90, 300 mg $199.97/90. ***In combination with:*** hydrochlorothiazide (Avalide; see Appendix B).

Losartan

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** 25 mg $157.96/90, 50 mg $162.98/90, 100 mg $219.97/90. ***In combination with:*** hydrochlorothiazide (Hyzaar; see Appendix B).

Olmesartan

Tablets: 5 mg, 20 mg, 40 mg. **Cost:** 5 mg $149.97/90, 20 mg $153.50/90, 40 mg $179.96/90. ***In combination with:*** hydrochlorothiazide (Benicar HCT; see Appendix B).

Telmisartan

Tablets: 20 mg, 40 mg, 80 mg. **Cost:** 20 mg $50.32/28, 40 mg $58.99/30, 80 mg $65.99/30. ***In combination with:*** hydrochlorothiazide (Micardis HCT; see Appendix B).

Valsartan

Tablets: 40 mg, 80 mg, 160 mg, 320 mg. **Cost:** 40 mg $151.97/90, 80 mg $179.97/90, 160 mg $179.97/90, 320 mg $261.95/90. ***In combination with:*** amlodipine (Exforge); hydrochlorothiazide (Diovan HCT; See Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess blood pressure (lying, sitting, standing) and pulse periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (dyspnea, facial swelling). May rarely cause angioedema.
- **CHF:** Monitor daily weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor renal function and electrolyte levels periodically. Serum potassium, BUN, and serum creatinine may be ↑.
- May cause ↑ AST, ALT, and serum bilirubin (candesartan and olmesartan only).
- May cause ↑ uric acid, slight ↓ in hemoglobin and hematocrit, neutropenia, and thrombocytopenia.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse valsartan with losartan.
- Correct volume depletion, if possible, prior to initiation of therapy.
- **PO:** May be administered without regard to meals.

Losartan

- **PO:** For patients with difficulty swallowing tablets, pharmacist can compound oral suspension; stable for 4 wk if refrigerated. Shake suspension before each use.

Patient/Family Teaching

- Emphasize the importance of continuing to take as directed, even if feeling well. Take

Copyright © 2008 by F.A. Davis

missed doses as soon as remembered if not almost time for next dose; do not double doses. Instruct patient to take medication at the same time each day. Warn patient not to discontinue therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes containing potassium or food containing high levels of potassium or sodium unless directed by health care professional. See Appendix L.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- Advise women of childbearing age to use contraception and notify health care professional if pregnancy is suspected or planned. If pregnancy is detected, discontinue medication as soon as possible.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking any OTC or herbal cough, cold, or allergy remedies or other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if swelling of face, eyes, lips, or tongue occurs, or if difficulty swallowing or breathing occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes.

Evaluation/Desired Outcomes
- Decrease in blood pressure without appearance of excessive side effects.
- Slowed progression of diabetic nephropathy (irbesartan, losartan).
- Decreased cardiovascular death and CHF-related hospitalizations in patients with CHF (candesartan).
- Decreased hospitalizations in patients with CHF (valsartan).
- Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction after MI (valsartan).
- Reduced risk of stroke in patients with hypertension and left ventricular hypertrophy (losartan).

anidulafungin
(a-**ni**-du-la-fun-gin)
Eraxis

Classification
Therapeutic: antifungals
Pharmacologic: echinocandins

Pregnancy Category C

Indications
Candidemia and other serious candidal infections including intra-abdominal abscess, peritonitis. Esophageal candidiasis.

Action
Inhibits the synthesis of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against *Candida albicans*, *Candida glabrata*, *Candida parapsilosis*, and *Candida tropicalis*.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Crosses the placenta.
Metabolism and Excretion: Undergoes chemical degradation without hepatic metabolism; <1% excreted in urine.
Half-life: 40–50 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Underlying liver disease (may worsen); OB: Pregnancy or lactation (use only if benefits outweigh potential risk; Pedi: Safe use in children not established.

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

Resp: dyspnea. **CV:** hypotension. **GI:** diarrhea, ↑ liver enzymes. **Derm:** flushing, rash, urticaria. **F and E:** hypokalemia.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): *Esophageal candidiasis*—100 mg loading dose on day 1, then 50 mg daily. *Candidemia and other candidal infections*—200 mg loading dose on day 1, then 100 mg daily.

Availability

Lyophilized powder for IV use (requires reconsitution): 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, alkaline phosphatase, and hepatic enzymes.
- May cause hypokalemia.
- May cause neutropenia and leukopenia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **Intermittent Infusion:** Reconstitute each 50 mg vial with 15 mL of companion diluent (20% Dehydrated Alcohol in Water for injection) for a concentration of 3.33 mg/mL. Store reconstituted solution at room temperature; do not freeze. Further dilute within 24 hr by transferring contents of reconstituted vial into IV bag containing D5W or 0.9% NaCl to provide a concentration of 0.5 mg/mL. For the 50 mg dose, dilute with 85 mL for an infusion volume of 100 mL. For the 100 mg dose, dilute with 170 mL for an infusion volume of 200 mL. For the 200 mg dose, dilute with 340 mL for a total infusion volume of 400 mL. Do not administer solutions that are discolored or contain particulate matter. ***Rate:*** Administer at a rate not to exceed 1.1 mg/min.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if diarrhea becomes pronounced.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy should be based on the patient's clinical response. Therapy should be continued for at least 14 days after the last positive culture. For esophageal candidiasis, treatment should continue for at least 7 days following resolution of symptoms.

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antifungals (topical)

Pregnancy Category B (butenafine, ciclopirox, clotrimazole, naftifine, oxiconazole, terbinafine), C (econazole, ketoconazole, miconazole, sulconazole, tolnaftate), UK (nystatin)

Indications
Treatment of a variety of cutaneous fungal infections, including cutaneous candidiasis, tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, seborrheic dermatitis, dandruff, and onychomycosis of fingernails and toes.

Action
Butenafine, nystatin, clotrimazole, econazole, ketoconazole, miconazole, naftifine, oxiconazole, sulconazole, and terbinafine affect the synthesis of the fungal cell wall, allowing leakage of cellular contents. Tolnaftate distorts the hyphae and stunts mycelial growth in fungi. Ciclopirox inhibits the transport of essential elements in the fungal cell, disrupting the synthesis of DNA, RNA, and protein. **Therapeutic Effects:** Decrease in symptoms of fungal infection.

Pharmacokinetics
Absorption: Absorption through intact skin is minimal.
Distribution: Distribution after topical administration is primarily local.
Metabolism and Excretion: Metabolism and excretion not known following local application.
Half-life: *Butenafine*—35 hr; *Ciclopirox*—5.5 hr (gel); *Terbinafine*—21 hr.

TIME/ACTION PROFILE (resolution of symptoms/lesions†)

ROUTE	ONSET	PEAK	DURATION
Butenafine	unknown	up to 4 wk	unknown
Tolnaftate	24–72 hr	unknown	unknown

† Only the drugs with known information included in this table

Contraindications/Precautions
Contraindicated in: Hypersensitivity to active ingredients, additives, preservatives, or bases; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance.

Use Cautiously in: Nail and scalp infections (may require additional systemic therapy); OB, Lactation: Safety not established.

Adverse Reactions/Side Effects
Local: burning, itching, local hypersensitivity reactions, redness, stinging.

Interactions
Drug-Drug: Either not known or insignificant.

Route/Dosage
Butenafine
Topical (Adults and Children >12 yr): Apply once daily for 2 wk for tinea corporis, tinea cruris, or tinea versicolor. Apply once daily for 4 wk or once daily for 7 days for tinea pedis.

Ciclopirox
Topical (Adults and Children >10 yr): *Cream/lotion*—Apply twice daily for 2–4 wk; *Topical solution (nail lacquer)*—Apply to nails at bedtime or 8 hr prior to bathing for up to 48 wk. Each daily application should be made over the previous coat and then removed with alcohol every 7 days; *Gel*—Apply twice daily for 4 wk; *Shampoo*—5–10 ml applied to scalp, lather and leave on for 3 min, rinse; repeat twice weekly for 4 wk (at least 3 days between applications).

Clotrimazole
Topical (Adults and Children >3 yr): Apply twice daily for 1–4 wk.

Econazole
Topical (Adults and Children): Apply once daily for tinea pedis (for 4 wk), tinea cruris (for 2 wk), tinea corporis (for 2 wk), or tinea versicolor (for 2 wk). Apply twice daily for cutaneous candidiasis (for 2 wk).

Ketoconazole
Topical (Adults): Apply cream once daily for cutaneous candidiasis (for 2 wk), tinea corporis (for 2 wk), tinea cruris (for 2 wk), tinea pedis (for 6 wk), or tinea versicolor (for 2 wk). Apply cream twice daily for seborrheic dermatitis (for 4 wk). For dandruff, use shampoo twice weekly (wait 3–4 days between treatments) for 4 wk, then intermittently.

Miconazole
Topical (Adults and Children >2 yr): Apply twice daily. Treat tinea cruris for 2 wk and tinea pedis or tinea corporis for 4 wk.

Copyright © 2008 by F.A. Davis

Naftifine

Topical (Adults): Apply cream once daily for up to 4 wk. Apply gel twice daily for up to 4 wk.

Nystatin

Topical (Adults and Children): Apply 2–3 times daily until healing is complete.

Oxiconazole

Topical (Adults and Children): Apply cream or lotion 1–2 times daily for tinea pedis (for 4 wk), tinea corporis (for 2 wk), or tinea cruris (for 2 wk). Apply cream once daily for tinea versicolor (for 2 wk).

Sulconazole

Topical (Adults): Apply 1–2 times daily (twice daily for tinea pedis). Treat tinea corporis, tinea cruris, or tinea versicolor for 3 wk, and tinea pedis for 4 wk.

Terbinafine

Topical (Adults): Apply twice daily for tinea pedis (for 1 wk) or daily for tinea cruris or tinea corporis for 1 wk.

Tolnaftate

Topical (Adults): Apply twice daily for tinea cruris (for 2 wk), tinea pedis (for 4 wk), or tinea corporis (for 4 wk).

Availability

Butenafine

Cream: 1%[Rx, OTC].

Ciclopirox

Cream: 0.77%. **Lotion:** 0.77%. **Nail lacquer:** 8%. **Shampoo:** 1%.

Clotrimazole

Cream: 1%[OTC]. **Solution:** 1%[OTC]. ***In combination with:*** betamethasone (Lotrisone). See Appendix B.

Econazole

Cream: 1%.

Ketoconazole

Cream: 2%. **Shampoo:** 1%[OTC]. **Foam:** 2%.

Miconazole

Cream: 2%[Rx, OTC]. **Lotion powder:** 2%[OTC]. **Ointment:** 2%[OTC]. **Powder:** 2%[OTC]. **Spray powder:** 2%[OTC]. **Spray liquid:** 2%[OTC]. **Solution:** 2%[OTC]. **Tincture:** 2%[OTC]. ***In combination with:*** zinc oxide (Vusion). See Appendix B.

Naftifine

Cream: 1%[Rx, OTC]. **Gel:** 1%[OTC].

Nystatin

Cream: 100,000 units/g[Rx, OTC]. **Ointment:** 100,000 units/g[Rx, OTC]. **Powder:** 100,000 units/g[Rx, OTC]. ***In combination with:*** triamcinolone. See Appendix B.

Oxiconazole

Cream: 1%. **Lotion:** 1%.

Sulconazole

Cream: 1%. **Solution:** 1%.

Terbinafine

Cream: 1%[OTC]. **Spray liquid:** 1%[OTC].

Tolnaftate

Cream: 1%[OTC]. **Solution:** 1%[OTC]. **Powder:** 1%[OTC]. **Spray powder:** 1%[OTC]. **Spray liquid:** 1%[OTC].

NURSING IMPLICATIONS

Assessment

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Indications)

Implementation

- Do not confuse Lotrimin (clotrimazole) with Lotrisone (betamethasone/clotrimazole).
- Consult physician or other health care professional for proper cleansing technique before applying medication.
- Choice of vehicle is based on use. Ointments, creams, and liquids are used as primary therapy. Lotion is usually preferred in intertriginous areas; if cream is used, apply sparingly to avoid maceration. Powders are usually used as adjunctive therapy but may be used as primary therapy for mild conditions (especially for moist lesions).
- **Topical:** Apply small amount to cover affected area completely. Avoid the use of occlusive wrappings or dressings unless directed by physician or other health care professional.
- **Nail lacquer:** Avoid contact with skin other than skin immediately surrounding treated nail. Avoid contact with eyes or mucous membranes. Removal of unattached, infected nail, as frequently as monthly, by health care professional is needed with use of this medication. Up to 48 wk of daily application and pro-

Copyright © 2008 by F.A. Davis

fessional removal may be required to achieve clear or almost clear nail. Six months of treatment may be required before results are noticed.

- **Ciclopirox or Ketoconazole shampoo:** Moisten hair and scalp thoroughly with water. Apply sufficient shampoo to produce enough lather to wash scalp and hair and gently massage it over the entire scalp area for approximately 1 min. Rinse hair thoroughly with warm water. Repeat process, leaving shampoo on hair for an additional 3 min. After the 2nd shampoo, rinse and dry hair with towel or warm air flow. Shampoo twice a week for 4 wk with at least 3 days between each shampooing and then intermittently as needed to maintain control.
- **Ketoconazole foam:** Hold container upright and dispense foam into cap of can or other smooth surface; dispensing directly on to hand is not recommended as the foam begins to melt immediately on contact with warm skin. Pick up small amounts with fingertips and gently massage into affected areas until absorbed. Move hair to allow direct application to skin.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Caution patient that some products may stain fabric, skin, or hair. Check label information. Fabrics stained from cream or lotion can usually be cleaned by handwashing with soap and warm water; stains from ointments can usually be removed with standard cleaning fluids.
- Patients with athlete's foot should be taught to wear well-fitting, ventilated shoes, to wash affected areas thoroughly, and to change shoes and socks at least once a day.
- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.
- **Nail lacquer:** File away loose nail and trim nails every 7 days after solution is removed with alcohol. Do not use nail polish on treated nails. Inform health care professional if patient has diabetes mellitus before using.

Evaluation/Desired Outcomes

- Decrease in skin irritation and resolution of infection. Early relief of symptoms may be seen in 2–3 days. For *Candida,* tinea cruris, and tinea corporis, 2 wk are needed, and for tinea pedis, therapeutic response may take 3–4 wk. Recurrent fungal infections may be a sign of systemic illness.

ANTIFUNGALS (VAGINAL)

butoconazole
(byoo-toe-**kon**-a-zole)
Gynezole-1, Mycelex-3

clotrimazole (kloe-**trye**-ma-zole)
Canesten, Clotrimaderm, Gyne-Lotrimin-3, Mycelex-7, Trivagizole-3

miconazole (mye-**kon**-a-zole)
Monistat-1, Monistat-3, Monistat-7, Vagistat-3

nystatin (nye-**stat**-in)
Mycostatin

terconazole (ter-**kon**-a-zole)
Terazol-3, Terazol-7

tioconazole (tye-oh-**kon**-a-zole)
1–Day, Vagistat-1

Classification
Therapeutic: antifungals (vaginal)

Pregnancy Category A (nystatin), B (clotrimazole), C (butoconazole, miconazole, terconazole, tioconazole)

Indications

Treatment of vulvovaginal candidiasis.

Action

Affects the permeability of the fungal cell wall, allowing leakage of cellular contents. Not active against bacteria. **Therapeutic Effects:** Inhibited growth and death of susceptible *Candida*, with decrease in accompanying symptoms of vulvovaginitis (vaginal burning, itching, discharge).

Pharmacokinetics

Absorption: Absorption through intact skin is minimal.
Distribution: Unknown. Action is primarily local.
Metabolism and Excretion: Negligible with local application.
Half-life: Not applicable.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
All agents	rapid	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to active ingredients, additives, or preservatives; OB: Safety not established; Lactation: Safety not established.

Use Cautiously in: None noted.

Adverse Reactions/Side Effects

GU: itching, pelvic pain, vulvovaginal burning.

Interactions

Drug-Drug: Concurrent use of vaginal miconazole with **warfarin** ↑ risk of bleeding/bruising (appropriate monitoring recommended).

Route/Dosage

Butoconazole

Vag (Adults and Children ≥12 yr): 1 applicatorful (5 g) at bedtime for 3 days (Mycelex-3) *or* one applicatorful single dose (Gynezole•1).

Clotrimazole

Vag (Adults and Children >12 yr): *Vaginal tablets*—100 mg at bedtime for 7 nights (preferred regimen for pregnancy) *or* 200 mg at bedtime for 3 nights. *Vaginal cream*—1 applicatorful (5 g) of 1% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 2% cream at bedtime for 3 days.

Miconazole

Vag (Adults and Children ≥12 yr): *Vaginal suppositories*—one 100-mg suppository at bedtime for 7 days *or* one 200-mg suppository at bedtime for 3 days *or* one 1200-mg suppository as a single dose. *Vaginal cream*—1 applicatorful of 2% cream at bedtime for 7 days *or* 1 applicatorful of 4% cream at bedtime for 3 days. *Combination packages*—contain a cream or suppositories as well as an external vaginal cream (may be used twice daily for up to 7 days, as needed, for symptomatic management of itching).

Nystatin

Vag (Adults): 100,000 units (1 tablet) daily for 2 wk.

Terconazole

Vag (Adults): *Vaginal cream*—1 applicatorful (5 g) of 0.4% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 0.8% cream at bedtime for 3 days. *Vaginal suppositories*—1 suppository (80 mg) at bedtime for 3 days.

Tioconazole

Vag (Adults and Children ≥12 yr): 1 applicatorful (4.6 g) at bedtime as a single dose.

Availability

Butoconazole

Vaginal cream: 2%[Rx, OTC].

Clotrimazole

Vaginal tablets: 100 mg[OTC], 200 mg[OTC]. **Vaginal cream:** 1%[OTC], 2%[OTC].

Miconazole

Vaginal cream: 2%[OTC], 4%[OTC]. **Vaginal suppositories:** 100 mg[OTC], 200 mg[Rx, OTC]. ***In combination with:*** combination package of 3 200-mg suppositories and 2% external cream[OTC]; one 1200-mg suppository and 2% external cream[OTC]; 4% vaginal cream and 2% external cream[OTC]; 7 100-mg suppositories and 2% external cream[OTC]; 2% vaginal cream and 2% external cream[OTC].

Nystatin

Vaginal tablets: 100,000 units.

Terconazole

Vaginal cream: 0.4%, 0.8%. **Vaginal suppositories:** 80 mg.

Tioconazole

Vaginal ointment: 6.5%[OTC].

NURSING IMPLICATIONS

Assessment

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for infection (Indications)
Risk for impaired skin integrity (Indications)

Implementation

- Consult physician or other health care professional for proper cleansing technique before applying medication.
- Nystatin vaginal tablets should be refrigerated.
- **Vag:** Applicators are supplied for vaginal administration.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Therapy should be continued during menstrual period.
- Instruct patient on proper use of vaginal applicator. Medication should be inserted high into the vagina at bedtime. Instruct patient to remain recumbent for at least 30 min after insertion. Advise use of sanitary napkins to prevent staining of clothing or bedding.
- Advise patient to avoid using tampons while using this product.
- Advise patient to consult health care professional regarding intercourse during therapy. Vaginal medication may cause minor skin irritation in sexual partner. Advise patient to refrain from sexual contact during therapy or have male partner wear a condom. Some products may weaken latex contraceptive devices. Another method of contraception should be used during treatment.
- Advise patient to report to health care professional increased skin irritation or lack of response to therapy. A second course may be necessary if symptoms persist.
- Advise patient to dispose of applicator after each use (except for terconazole).

Evaluation/Desired Outcomes

- Decrease in skin irritation and vaginal discomfort. Therapeutic response is usually seen after 1 wk. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

apomorphine (a-po-**mor**-feen)
Apokyn

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications

Acute, intermittent treatment of hypomotility, "off" episodes due to advanced Parkinson's disease.

Action

Stimulation of specific dopamine receptors improves motor function. **Therapeutic Effects:** Improved motor function.

Pharmacokinetics

Absorption: Well absorbed (100%) following subcut administration.
Distribution: Enters CSF.
Metabolism and Excretion: Unknown.
Half-life: 40 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
subcut	rapid	10–60 min	2 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to apomorphine or bisulfites; Concurrent use of 5-HT_3 antagonists (granisetron, ondansetron, palonosetron, alosetron, dolasetron); Lactation: May appear in human milk; discontinue medication or discontinue breast-feeding.
Use Cautiously in: Hypokalemia, hypomagnesemia, bradycardia, congenital QTc prolongation or concurrent use of drugs causing QTc prolongation (↑ risk of serious arrhythmias); Mild to moderate renal impairment (↓ starting dose); Mild to moderate hepatic impairment; OB: Use only if clearly needed; Pedi: Safety not established; Geri: Increased risk of confusion/hallucinations, falls, and cardiac, respiratory, and gastrointestinal events.
Exercise Extreme Caution in: Cardiovascular or cerebrovascular disease (may exacerbate condition).

Adverse Reactions/Side Effects

CNS: dizziness, hallucinations, somnolence, confusion, sudden drowsiness, headache. **EENT:** rhinorrhea. **CV:** CARDIAC ARREST, chest pain, hypotension, angina, CHF, QTc prolongation. **GI:** nausea, vomiting. **GU:** priapism. **Derm:** flushing, pallor, sweating. **Local:** injection site pain. **MS:** arthralgia, back pain, limb pain. **Neuro:** aggravation of Parkinson's disease, dyskinesia. **Misc:** yawning.

Interactions

Drug-Drug: Profound hypotension, loss of consciousness occurs with **5-HT_3 antagonists**. ↑ risk of hypotension with **alcohol**, **antihypertensives**, **vasodilators**, especially **nitrates**.

Route/Dosage

Subcut (Adults): *Test dose*—0.2 mL (2 mg); with further assessment and monitoring, doses should be titrated at 0.1 mL (1 mg) less than highest tolerated dose. Doses may be increased by 0.1 mL (1 mg) every few days as an outpatient

Copyright © 2008 by F.A. Davis

or no more frequently than every 2 hours in a supervised setting. Only single doses should be used during a particular off period. If more than one week passes between doses, titration should be restarted at the 0.2 mL (2 mg) level. Doses should not exceed 0.6 mL (6 mg).

Availability

Solution for injection (contains bisulfites): 10 mg/mL in 2 mL ampules and 3 mL glass cartridges.

NURSING IMPLICATIONS

Assessment

- Assess for nausea and vomiting; severe with recommended doses. Premedicate with trimethobenzamide or another antiemetic prior to and for at least the first 2 mo of therapy. Do not administer 5-HT_3 antagonist; results in profound hypotension and loss of consciousness.
- Monitor blood pressure standing and lying during dose titration. Orthostatic hypotension may occur any time during therapy but occurs more frequently during initial therapy or with a dose increase.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Always prime the APOKYN pen before every injection and after loading a new cartridge.
- Never dial the dose or attempt to correct a dialing error with the BD pen needle in the skin, as this may result in an incorrect dose.
- Do not store or carry APOKYN pen with a pen needle attached. Use a new sterile BD pen needle with each injection.
- **Subcut:** Administer subcutaneously into stomach, upper arm, or upper leg. Pinch skin with finger and thumb and insert needle all the way into pinched skin. Push the injection button until a clicking sound is heard, and hold button for 5 min and gently rub injection site. Rotate site with each injection. Do not inject into skin that is red, sore, infected, or damaged. Solution should be clear and colorless; do not administer solution that is cloudy, green, or contains particles. Do not administer IV.
- Store apomorphine at room temperature. Syringes can be filled from ampules the night before and stored in the refrigerator until next day.

Patient/Family Teaching

- Provide patient and caregiver with detailed instructions on preparation and injection of dose, use of dosing pen, storage, and disposal of equipment. Advise patient to read the Patient Package Insert and Directions for Use. Medication is dosed in mL, not mg. A dose of 1 mg is represented on dosing pen as 0.1 mL (1.0 mL equals 10 mg). Caution patient that apomorphine is not used to prevent "off" episodes and does not take the place of other medications for Parkinson's disease.
- Advise patient to change positions slowly to prevent orthostatic hypotension. Caution patient to avoid drinking alcohol; will increase hypotensive effects of apomorphine.
- May cause sudden bouts of falling asleep during activities of daily living. Advise patient to notify health care professional if daytime sleepiness occurs and to avoid other medications that cause drowsiness. May require discontinuation of apomorphine. Caution patients to avoid other medications that cause sedation and to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patients that hallucinations may occur.
- Advise patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improvement in ability to control movements when used during an "off" episode of Parkinson's disease. May improve ability to walk, talk, or move around.

aprepitant (a-**prep**-i-tant)
Emend

Classification
Therapeutic: antiemetics
Pharmacologic: neurokinin antagonists

Pregnancy Category B

Indications

Prevention of acute and delayed nausea and vomiting caused by initial/repeat treatment with

Copyright © 2008 by F.A. Davis

highly emetogenic chemotherapy (with other antiemetics). Prevention of postoperative nausea and vomiting.

Action
Acts as a selective antagonist at substance P/neurokinin 1 (NK_1) receptors in the brain.
Therapeutic Effects: Decreased nausea and vomiting associated with chemotherapy. Augments the antiemetic effects of dexamethasone and 5-HT_3 antagonists (ondansetron).

Pharmacokinetics
Absorption: 60–65% absorbed following oral administration.
Distribution: Crosses the blood brain barrier; remainder of distribution unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); not renally excreted.
Half-life: 9–13 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4 hr*	24 hr

*Blood level

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use with pimozide (risk of life-threatening adverse cardiovascular reactions); Lactation: May cause unwanted effects in nursing infants.
Use Cautiously in: Concurrent use with any agents metabolized by CYP3A4 (see Drug-Drug Interactions); OB: Use only if clearly needed; Pedi: Safety not established.

Adverse Reactions/Side Effects
CV: dizziness, fatigue, weakness. **GI:** diarrhea.
Misc: hiccups.

Interactions
Drug-Drug: Aprepitant inhibits, induces, and is metabolized by the CYP3A4 enzyme system; it also induces the CYP2C9 system. Concurrent use with other medications that are metabolized by CYP3A4 may result in increased toxicity from these agents including **docetaxel**, **paclitaxel**, **etoposide**, **irinotecan**, **ifosfamide**, **imatinib**, **vinorelbine**, **vinblastine**, **vincristine**, **midazolam**, **triazolam**, and **alprazolam**; concurrent use should be undertaken with caution. Concurrent use with **drugs that significantly inhibit the CYP3A4 enzyme system** including (**ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, **nelfinavir**, and **diltiazem**) may ↑ blood levels and effects of aprepitant. Concurrent use with **drugs that induce the CYP3A4 enzyme system** including **rifampin**, **carbamazepine**, and **phenytoin** may ↓ blood levels and effects of aprepitant. ↑ blood levels and effects of **dexamethasone** (regimen reflects a 50% dose reduction); a similar effect occurs with **methylprednisolone** (↓ IV dose by 25%, ↓ PO dose by 50% when used concurrently). May ↓ the effects of **warfarin** (careful monitoring for 2 wk recommended), **oral contraceptives** (use alternate method), **tolbutamide**, and **phenytoin**.

Route/Dosage
PO (Adults): *Chemotherapy*—125 mg 1 hr prior to chemotherapy, then 80 mg once daily for 2 days (with dexamethasone 12 mg PO 30 min prior to chemotherapy, then 8 mg once daily for 3 days and ondansetron 32 mg IV 30 min prior to chemotherapy); *Postoperative*—40 mg given within 3 hrs prior to induction of anesthesia.

Availability
Capsules: 40 mg, 80 mg, 125 mg.

NURSING IMPLICATIONS

Assessment
- Assess nausea, vomiting, appetite, bowel sounds, and abdominal pain prior to and following administration.
- Monitor hydration, nutritional status, and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.
- ***Lab Test Considerations:*** Monitor clotting status closely during the 2 wk period, especially at 7–10 days, following aprepitant therapy in patients on chronic warfarin therapy.
- May cause mild, transient ↑ in AST and ALT.

Potential Nursing Diagnoses
Risk for deficient fluid volume (Indications)
Imbalanced nutrition: less than body requirements (Indications)

Implementation
- Aprepitant is given as part of a regimen that includes a corticosteroid and a 5-HT_3 antagonist (see Route/Dosage).
- **PO:** Administer daily for 3 days. *Day 1*—administer 125 mg 1 hr prior to chemotherapy. *Days 2 and 3*—administer 80 mg once in

Copyright © 2008 by F.A. Davis

the morning. May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take aprepitant as directed. Direct patient to read the patient package insert before starting therapy and to reread it each time the prescription is renewed.
- Advise patient to notify health care professional prior to taking any other Rx, OTC, or herbal products.
- Caution patient that aprepitant may decrease the effectiveness of oral contraceptives. Advise patient to use alternate nonhormonal methods of contraception.
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; remove noxious stimuli from environment).

Evaluation/Desired Outcomes

- Decreased nausea and vomiting associated with chemotherapy.
- Prevention of postoperative nausea and vomiting.

argatroban (ar-**gat**-tro-ban)
Argatroban

Classification
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Pregnancy Category B

Indications

Prophylaxis or treatment of thrombosis in patients with heparin-induced thrombocytopenia. As an anticoagulant in patients with or at risk for heparin-induced thrombocytopenia who are undergoing percutaneous coronary intervention (PCI).

Action

Inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased thrombus formation and extension with decreased sequelae of thrombosis (emboli, postphlebitic syndromes).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; excreted primarily in feces via biliary excretion. 16% excreted unchanged in urine, 14% excreted unchanged in feces.
Half-life: 39–51 min (increased in hepatic impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	1–3 hr	2–4 hr

Contraindications/Precautions

Contraindicated in: Major bleeding; Hypersensitivity; Lactation.
Use Cautiously in: Hepatic impairment (↓ initial infusion rate recommended); OB: Use only if clearly needed; Pedi: Safety not established in children <18 yr.

Adverse Reactions/Side Effects

CV: hypotens. **GI:** diarrhea, nausea, vomiting. **Hemat:** BLEEDING. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **antiplatelet agents, thrombolytic agents,** or **other anticoagulants**.
Drug-Natural Products: ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

IV (Adults): 2 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of activated partial thromboplastin time (aPTT). *Patients undergoing PCI*—350 mcg/kg bolus followed by infusion at 25 mcg/kg/min, activated clotting time (ACT) should be assessed 5–10 min later. If ACT is 300–450 sec, procedure may be started. If ACT <300 sec, give additional bolus of 150 mcg/kg and increase infusion rate to 30 mg/kg/min. If ACT is >450 sec infusion rate should be decreased to 15 mcg/kg/min and ACT rechecked after 5–10 min. If thrombotic complications occur or ACT drops to <300 sec, an additional bolus of 150 mcg/kg may be given

Copyright © 2008 by F.A. Davis

and the infusion rate increased to 40 mcg followed by ACT monitoring. If anticoagulation is required after surgery, lower infusion rates should be used.

Hepatic Impairment

IV (Adults): 0.5 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of aPTT.

Availability

Solution for injection (must be diluted 100-fold): 250 mg/2.5 ml vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during therapy. Unexplained decreases in blood pressure may indicate hemorrhage. Assess patient for bleeding. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. Monitor for blood in urine, lower back pain, pain or burning on urination. If bleeding cannot be controlled with pressure, decrease dose or discontinue argatroban immediately.
- Monitor for signs of anaphylaxis (rash, coughing, dyspnea) throughout therapy.
- ***Lab Test Considerations:*** Monitor aPTT prior to initiation of continuous infusion, 2 hours after initiation of therapy, and periodically during therapy to confirm aPTT is within desired therapeutic range.
- For patients undergoing PCI, monitor ACT as described in Route and Dose section.
- Assess hemoglobin, hematocrit, and platelet count prior to, and periodically during, argatroban therapy. May cause ↓ hemoglobin and hematocrit. Unexplained ↓ hematocrit may indicate hemorrhage.
- Use of argatroban concurrently with multiple doses of warfarin will result in more prolonged prothrombin time and international normalized ratio (INR) (although there is not an ↑ in vitamin K-dependent factor X_a activity) than when warfarin is used alone. Monitor INR daily during concomitant therapy. Repeat INR 4–6 hr after argatroban is discontinued. If the repeat value is below the desired therapeutic value for warfarin alone, restart argatroban therapy and continue until the desired therapeutic range for warfarin alone is reached. To obtain the INR for warfarin alone when the dose of argatroban is >2 mcg/kg/min the argatroban dose should be temporarily reduced to 2 mcg/kg/min; the INR for combined therapy may then be obtained 4–6 hr after argatroban dose was redeuced.
- ***Toxicity and Overdose:*** There is no specific antidote for argatroban. If overdose occurs, discontinue argatroban. Anticoagulation parameters usually return to baseline within 2–4 hr after discontinuation.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- All parenteral anticoagulants should be discontinued before argatroban therapy is initiated. Oral anticoagulation may be initiated with maintenance dose of warfarin; do not administer loading dose. Discontinue argatroban therapy when INR for combined therapy is >4.

IV Administration

- **IV:** Solution is slightly viscous, clear, and colorless to pale yellow. Do not administer solutions that are cloudy or contain particulate matter. Discard unused portion
- **Direct IV:** ***Diluent:*** Bolus dose of 350 mcg/kg should be given prior to continuous infusion in patients undergoing PCI. For Diluent information, see Continuous Infusion section below. ***Rate:*** Administer bolus over 3–5 min.
- **Continuous Infusion:** ***Diluent:*** Dilute each 2.5 ml vial in 250 ml of 0.9% NaCl, D5W, or LR. Mix by repeated inversion for 1 min. Solution may show a slight haziness that disappears upon mixing. ***Concentration:*** 1 mg/ml. ***Rate:*** Based on patient's weight (See Route/Dosage section). Dose adjustment may be made 2 hr after starting infusion or changing dose until steady-state aPTT is 1.5–3 times the initial baseline value (not to exceed 100 sec).
- **Y-Site Compatibility:** atropine, diltiazem, diphenhydramine, dobutamine, dopamine, fenoldopam, fentanyl, furosemide, hydrocortisone sodium succinate, hydromorphone, lidocaine, metoprolol, midazolam, milrinone, morphine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, vasopressin, verapamil.
- **Y-Site Incompatibility:** amiodarone.

Patient/Family Teaching

- Inform patient of the purpose of argatroban.

Copyright © 2008 by F.A. Davis

- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Decreased thrombus formation and extension.
- Decreased sequelae of thrombosis (emboli, post-phlebitic syndromes).

aripiprazole (a-ri-pip-ra-zole)
Abilify

Classification
Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: dihydrocarbostyril

Pregnancy Category C

Indications
Schizophrenia. Acute mania, mixed mania. Maintenance of mood stability in patients with bipolar disorder. Adjunct treatment of depression in adults.

Action
Psychotropic activity may be due to agonist activity at dopamine D_2 and serotonin 5-HT_{1A} receptors and antagonist activity at the 5-HT_{2A} receptor. Also has alpha$_1$ adrenergic blocking activity. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased mania in bipolar patients.

Pharmacokinetics
Absorption: Well absorbed (87%) following oral administration; 100% following IM injection.
Distribution: Extensive extravascular distribution.
Protein Binding: *aripiprazole and dehydro-aripiprazole*—>99%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP2D6 enzymes); one metabolite (dehydro-aripiprazole) has antipsychotic activity. 18% excreted unchanged in feces; <1% excreted unchanged in urine. A small percentage of patients are poor metabolizers and may need smaller doses.
Half-life: *Aripiprazole*—75 hr; *dehydro-aripiprazole—94 hr.*

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown
IM	unk	1–3 hrs	unk

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation: Presumed to be excreted in breast milk; discontinue drug or bottle feed.
Use Cautiously in: Known cardiovascular or cerebrovascular disease; Conditions which cause hypotension (dehydration, treatment with antihypertensives or diuretics); Concurrent ketoconazole or other potential CYP3A4 inhibitors (reduce aripiprazole dose by 50%); Concurrent quinidine, fluoxetine, paroxetine, or other potential CYP2D6 inhibitors; Concurrent carbamazepine or other potential CYP3A4 inducers; OB: Use only if benefit outweighs risk to fetus; Pedi: Safety not established; Geri: Inappropriate use in elderly patients with dementia is associated with increased mortality.

Adverse Reactions/Side Effects
CNS: akathisia, confusion, depression, drowsiness, extrapyramidal reactions, fatigue, hostility, insomnia, lightheadedness, manic reactions, impaired cognitive function, nervousness, restlessness, seizures, suicidal thoughts, tardive dyskinesia. **Resp:** dyspnea. **CV:** bradycardia, chest pain, edema, hypertension, orthostatic hypotension, tachycardia. **EENT:** blurred vision, conjunctivitis, ear pain. **GI:** constipation, anorexia, ↑ salivation, nausea, vomiting, weight loss. **GU:** urinary incontinence. **Hemat:** anemia. **Derm:** dry skin, ecchymosis, skin ulcer, sweating. **MS:** muscle cramps, neck pain. **Neuro:** abnormal gait, tremor. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, ↓ heat regulation.

Interactions
Drug-Drug: Ketoconazole or **other potential CYP3A4 inhibitors** decrease metabolism and increase effects (reduce aripiprazole dose by 50%). **Quinidine**, **fluoxetine**, **paroxetine**, or **other potential CYP2D6 inhibitors** decrease metabolism and increase effects (reduce aripiprazole dose by at least 50%). Concurrent **carbamazepine** or **other potential CYP3A4 inducers** (double aripiprazole dose; then decrease to 10–15 mg/day when interfering drug is withdrawn).

Copyright © 2008 by F.A. Davis

Route/Dosage

Schizophrenia

PO (Adults): *Starting and target dose*—10 or 15 mg/day as a single dose, doses up to 30 mg/day have been used; increments in dosing should not be made before 2 wk at a given dose.
PO (Adults and Children 13–17 yrs): *Starting and target dose*—2 mg/day as a single dose, then titrated up for 5 days to a target dose of 10 mg/day.
IM (Adults): 9.75 mg/day, may use a dose of 5.25 mg based on clinical situation. May give additional doses up to 30 mg if needed for agitation.

Bipolar mania

PO (Adults): 30 mg once daily, some patients may require 15 mg/day if 30 mg/day is not tolerated.
IM (Adults): 9.75 mg/day, may use a dose of 5.25 mg based on clinical situation. May give additional doses up to 30 mg if needed for agitation.

Depression

PO, IM (Adults): 2–5 mg/day, may titrate upward at 1-wk intervals to 5–10 mg/day; not to exceed 15 mg/day.

Availability

Tablets: 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Cost:** 2 mg $999.90/90, 5 mg $999.90/90, 10 mg $1,035.88/90, 15 mg $999.88/90, 20 mg $1,375.83/90, 30 mg $1,375.83/90. **Tablets, orally disintegrating:** 10 mg, 15 mg. **Oral solution (orange cream):** 1 mg/ml. **Injection:** 7.5 mg/ml in ready-to-use vials.

NURSING IMPLICATIONS

Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Obtain fasting blood glucose and cholesterol levels initially and periodically throughout therapy.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** May cause ↑ creatinine phosphokinase.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- **PO:** Administer once daily without regard to meals.
- Do not open the blister until ready to administer. For single tablet removal, open the package and peel back the foil on the blister to expose the tablet. Do not push the tablet through the foil; may damage tablet. Immediately upon opening the blister, using dry hands, remove the tablet and place the entire orally disintegrating tablet on the tongue. Tablet disintegration occurs rapidly in saliva. Take tablet without liquid; but if needed, it can be taken with liquid. Do not attempt to split the tablet.
- **IM:** IM route should be used for agitation. Convert to oral dose as soon as possible. Administer IM; for dose of 5.25 mg use 0.7 mL, 9.75 mg use 1.3 mL, and 15 mg use 2 mL of aripiprazole solution. Solution should be

Copyright © 2008 by F.A. Davis

clear and colorless; do not administer solutions that are discolored or contain a precipitate.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Increased sense of well-being in patients with depression.

HIGH ALERT

asparaginase

(a-**spare**-a-ji-nase)
Elspar, ✱Kidrolase

Classification
Therapeutic: antineoplastics
Pharmacologic: enzymes

Pregnancy Category C

Indications

Part of combination chemotherapy in the treatment of acute lymphocytic leukemia (ALL).

Action

Catalyst in the conversion of asparagine (an amino acid) to aspartic acid and ammonia. Depletes asparagine in leukemic cells. **Therapeutic Effects:** Death of leukemic cells.

Pharmacokinetics

Absorption: Is absorbed from IM sites.
Distribution: Remains in the intravascular space. Poor penetration into the CSF.
Metabolism and Excretion: Slowly sequestered in the reticuloendothelial system.
Half-life: IV: 8–30 hr; IM: 39–49 hr.

TIME/ACTION PROFILE (depletion of asparagine)

ROUTE	ONSET	PEAK†	DURATION
IM	immediate	14–24 hr	23–33 days
IV	immediate	unknown	23–33 days

†Plasma levels of asparaginase

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity; Lactation: May cause unwanted effects in the nursing infant.
Use Cautiously in: History of hypersensitivity reactions; Severe liver disease; Renal or pancreatic disease; CNS depression; Clotting abnormalities; Chronic debilitating illnesses; OB: Use only if the potential benefit justifies the potential risk to the fetus.

Adverse Reactions/Side Effects

CNS: SEIZURES, agitation, coma, confusion, depression, dizziness, fatigue, hallucinations, headache, irritability, somnolence. **GI:** nausea, vomiting, anorexia, cramps, hepatotoxicity, pancreatitis, weight loss. **Derm:** rashes, urticaria. **Endo:** hyperglycemia. **Hemat:** coagulation abnormalities, transient bone marrow depression. **Metab:** hyperammonemia, hyperuricemia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: May negate the antineoplastic activity of **methotrexate**. May enhance the hepatotoxicity of other **hepatotoxic drugs**. Concurrent IV use with or immediately preceding **vincristine** and **prednisone** may result in ↑ neurotoxicity and hyperglycemia. May alter the response to **live vaccines** (↓ antibody response, ↑ risk of adverse reactions).

Copyright © 2008 by F.A. Davis

Route/Dosage

Various other regimens may be used.

Multiple-Agent Induction Regimen (in Combination with Vincristine and Prednisone)

IV (Children): 1000 IU/kg/day for 10 successive days beginning on day 22 of regimen.
IM (Children): 6000 IU/m^2 on days 4, 7, 10, 13, 16, 19, 22, 25, 28.

Single-Agent Therapy for Acute Lymphocytic Leukemia

IV (Adults and Children): 200 IU/kg daily for 28 days.

Desensitization Regimen

IV (Adults and Children): Administer 1 IU, then double dose every 10 min until total dose for that day has been given or reaction occurs.

Test Dose

Intradermal (Adults and Children): 2 IU.

Availability

Injection: 10,000-IU vial (with mannitol).

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy. Inform physician if fever or chills occur.
- Monitor intake and output. Notify physician of significant discrepancies. Encourage patient to drink 2000–3000 ml/day to promote excretion of uric acid. Allopurinol and alkalinization of the urine may be used to prevent urate stone formation.
- Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm). Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration. If patient requires continued therapy, pegaspargase is an alternative.
- Assess nausea, vomiting, and appetite. Weigh weekly. An antiemetic may be given before administration.
- Monitor affect and neurologic status. Notify physician if depression, drowsiness, or hallucinations occur. Symptoms usually resolve 2–3 days after drug is discontinued.
- ***Lab Test Considerations:*** Monitor CBC before and periodically throughout therapy. May alter coagulation studies. Platelets, PT, PTT, and thrombin time may be ↑. May cause ↑ BUN.
- Hepatotoxicity may be manifested by ↑ AST, ALT, alkaline phosphatase, bilirubin, or cholesterol. Liver function test results usually return to normal after therapy. May cause pancreatitis; monitor frequently for ↑ amylase or glucose.
- Monitor blood glucose during therapy. May cause hyperglycemia treatable with fluids and insulin. May be fatal.
- May cause ↑ serum and urine uric acid concentrations.
- May interfere with thyroid function tests.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Do not confuse asparaginase with pegaspargase.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers. See Appendix K.
- If coagulopathy develops, apply pressure to venipuncture sites; avoid IM injections.
- **Test Dose:** Intradermal test dose must be performed before initial dose; doses must be separated by more than 1 wk. Reconstitute vial with 5 ml of sterile water for injection or 0.9% NaCl for injection (without preservatives). Add 0.1 ml of this 2000-IU/ml solution to 9.9 ml additional diluent to yield a 20-IU/ml solution. Inject 0.1 ml (2 IU) intradermally. Observe site for 1 hr for formation of wheal. Wheal is indicative of a positive reaction.
- **Desensitization Therapy:** Begin by administering 1 IU intravenously. Double dose every 10 min if hypersensitivity does not occur until full daily dose is administered.
- **IM:** Prepare for IM dose by adding 2 ml of 0.9% NaCl for injection (without preservatives) to the 10,000-IU vial. Shake vial gently. Administer no more than 2 ml per injection site.

Copyright © 2008 by F.A. Davis

IV Administration

- **Direct IV:** ***Diluent:*** Prepare *Elspar* IV dose by diluting 10,000-IU vial with 5 ml of sterile water for injection or 0.9% NaCl (without preservatives). If gelatinous fibers are present, administration through a 5-micron filter will not alter potency. Administration through a 0.2-micron filter may cause loss of potency. Solution should be clear after reconstitution. Discard if cloudy. Stable for 8 hr if refrigerated. Prepare *Kidrolase* for IM or IV administration by adding 4 ml sterile water to 10,000 IU vial and rotate gently to dissolve. Unused reconstituted solution is stable for 14 days if refrigerated. May be further diluted with 0.9% NaCl or D5W. ***Concentration:*** Dilute doses in 50–250 ml of diluent. ***Rate:*** Administer through Y-site of rapidly flowing IV of D5W or 0.9% NaCl over 30–60 min. Maintain IV infusion for 2 hr after dose.
- **Y-Site Compatibility:** methotrexate, sodium bicarbonate.
- **Additive Incompatibility:** Information unavailable. Do not admix with other drugs.

Patient/Family Teaching

- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Advise both men and women not to conceive a child while taking asparaginase. Barrier methods of contraception are recommended.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter immunization schedule.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

aspirin, See SALICYLATES.

atazanavir (a-ta-**zan**-a-vir)
Reyataz

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Pregnancy Category B

Indications
HIV infection (with other antiretrovirals).

Action
Inhibits the action of HIV protease, preventing maturation of virions. **Therapeutic Effects:** ↑ CD4 cell counts and ↓ viral load with subsequent slowed progression of HIV and its sequelae.

Pharmacokinetics
Absorption: Rapidly absorbed (↑ by food).
Distribution: Enters cerebrospinal fluid and semen.
Metabolism and Excretion: 80% metabolized (CYP3A); 13% excreted unchanged in urine.
Half-life: 7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2.5 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe hepatic impairment; Concurrent use of ergotamine, ergonovine, dihydroergotamine, methylergonovine, midazolam, pimozide, or triazolam (potential for life-threatening toxicity); Concurrent use of rifampin, irinotecan, lovastatin, simvastatin, indinavir, proton-pump inhibitors, or St. John's wort; Pedi: ↑ risk of kernicterus in infants <3 mo.
Use Cautiously in: Mild to moderate hepatic impairment; Pre-existing conduction system disease (marked first-degree AV block or second- or third-degree AV block) or concurrent use of other drugs that increase the PR interval (especially those metabolized by CYP3A4 including verapamil or diltiazem); Diabetes melli-

Copyright © 2008 by F.A. Davis

tus; Hemophilia (↑ risk of bleeding); OB: Use only if clearly needed; Breastfeeding is not recommended if HIV-infected.

Adverse Reactions/Side Effects

When used in combination with other antiretrovirals.

CNS: headache, depression, dizziness, insomnia. **CV:** ↑ PR interval. **GI:** nausea, abdominal pain, ↑ bilirubin, diarrhea, jaundice, vomiting, ↑ transaminases. **Derm:** rash. **Endo:** hyperglycemia. **Metab:** fat redistribution. **MS:** myalgia. **Misc:** fever.

Interactions

Drug-Drug: Atazanavir is an inhibitor of CYP3A and UGT1A1 enzyme systems. It is also a substrate of CYP3A. ↑ levels of **ergotamine**, **ergonovine**, **dihydroergotamine**, **methylergonovine**, **midazolam**, **bepridol**, **pimozide**, **triazolam**, **lovastatin**, **simvastatin**, and **irinotecan**; concurrent use may result in life-threatening CNS, cardiovascular, hematologic or musculoskeletal toxicity and is contraindicated. Combination therapy with **tenofovir** may lead to ↓ virologic response and possible resistance (100 mg **ritonavir** should be added to boost blood levels and dose of atazanavir ↓ to 300 mg/day). Levels are significantly ↓ by **rifampin**, **proton-pump inhibitors**, and **St. John's wort**; may promote viral resistance, avoid concurrent use. Concurrent use with **indinavir** may ↑ risk of hyperbilirubinemia and should be avoided. Concurrent use with **didanosine** buffered tablets will ↓ absorption and levels; give atazanavir with food 2 hr before or 1 hr after **didanosine**. **Efavirenz** decreases levels and may promote viral resistance; 600 mg efavirenz should be given with 100 mg ritonavir to counteract this effect and ↓ dose of azatanavir to 300 mg/day. ↑ **saquinavir** levels. Levels are ↑ by **ritonavir**; ↓ atazanavir dose to 300 mg/day. **Nevirapine** may ↓ levels; avoid concurrent use. **Antacids** or **buffered medications** will ↓ absorption; atazanavir should be given 2 hr before or 1 hr after. ↑ levels of **lidocaine**, **amiodarone**, or **quinidine**; blood level monitoring is recommended. ↑ risk of bleeding with **warfarin**. ↑ of **tricyclic antidepressants**; blood level monitoring is recommended. ↑ levels of **rifabutin**; ↓ rifabutin dose by 75% (150 mg every other day or 3 times weekly). ↑ levels of **diltiazem** and its active metabolite; ↓ diltiazem dose by 50% and ECG monitoring recommended. Similar precautions may be needed with **felodipine**, **nifedipine**, **nicardipine**, and **verapamil**. ↑ levels of **fluticasone**; consider alternative therapy; should not be used when atazanavir is used with ritonavir. ↓ levels of **voriconazole** when atazanavir is used with ritonavir; avoid concurrent use. **Voriconazole** may also ↑ levels of atazanavir (when used without ritonavir). ↑ levels of **ketoconazole** or **itraconazole** when atazanavir is used with ritonavir. ↑ levels of **trazodone**; ↓ dose of trazodone. ↑ levels of **sildenafil**, **vardenafil**, and **tadalafil**; ↓ **sildenafil** dose to 25 mg every 48 hr; ↓ **vardenafil** dose to 2.5 mg every 72 hr; ↓ **tadalafil** dose to 10 mg every 72 hr. Exercise caution and monitor for hypertension, visual changes, and priapism. ↑ risk of myopathy with **atorvastatin**. Levels may be ↓ by **histamine H_2 antagonists**, promoting viral resistance; separate doses by at least 12 hr. ↑ levels of **cyclosporine**, **sirolimus**, and **tacrolimus**; monitor immunosuppressant blood levels. ↑ levels of **clarithromycin**; ↓ clarithromycin dose by 50% or consider alternative therapy. May ↓ levels of some **estrogens** found in **hormonal contraceptives**; use alternative non-hormonal method of contraception. Concurrent use of other **drugs known to ↑ PR interval**.

Route/Dosage

PO (Adults): *Therapy-naive*—400 mg once daily with food. *Therapy-experienced with prior virologic failure*—300 mg once daily with ritonavir 100 mg once daily with food *With efavirenz*—atazanavir 300 mg with ritonavir 100 mg and efavirenz 600 mg (all as single daily dose with food). *With tenofovir*—atazanavir 300 mg with ritonavir 100 mg and tenofovir 300 mg (all as single daily dose with food).

Hepatic Impairment (Adults): 300 mg once daily.

Availability

Capsules: 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- May also cause elevated liver function tests, increased creatine kinase or glucose, and neutropenia.
- Assess for rash which can occur within initial 8 wk of therapy. Usually resolves within 2 weeks without altering therapy.

Copyright © 2008 by F.A. Davis

- If pregnant patient is exposed to atazanavir, register patient in Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum amylase and lipase.
- May ↑ liver enzymes.
- May ↑ creatine kinase.
- May cause ↓ hemoglobin, neutrophils, and platelets.
- May cause ↑ in unconjugated bilirubin; reversible on discontinuation.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer daily with food to enhance absorption. Capsules should be swallowed whole; do not open.
- If administered with ritonavir and efavirenz, administer as one daily dose with food. Do not administer with efavirenz without also using ritonavir.
- If administered with ritonavir and tenofovir, administer as one daily dose with food. Do not administer with tenofovir without also using ritonavir.
- If administered with didanosine buffered formulations, administer atazanavir with food 2 hr before or 1 hr after didanosine.

Patient/Family Teaching

- Emphasize the importance of taking atazanavir with food as directed. Advise patient to read the Patient Information that comes with the medication each time the Rx is refilled. Atazanavir must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular dose schedule. If within 6 hr of next dose, omit dose and take next dose at regular time. Do not double doses.
- Instruct patient that atazanavir should not be shared with others.
- Inform patient that atazanavir does not cure HIV or prevent associated or opportunistic infections. Atazanavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the HIV virus to others. Advise patient that atazanavir may cause lipodystrophy (redistribution or accumulation of body fat) and the long-term effects of atazanavir are unknown at this time.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort; interactions may be fatal.
- May cause dizziness. Caution patient to notify health care professional if this occurs and to avoid driving and other activities requiring alertness until response to medication is known.
- Notify health care professional immediately if yellowing of eyes, change in heart rhythm, or high blood sugar occur.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.
- Instruct females using hormonal contraceptives to use an alternative non-hormonal method of contraception.
- OB, Lactation: Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Delayed progression of HIV and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

atenolol (a-**ten**-oh-lole)

Apo-Atenolol, Novo-Atenolol, Tenormin

Classification

Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Pregnancy Category D

Indications

Management of hypertension. Management of angina pectoris. Prevention of MI.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect

Copyright © 2008 by F.A. Davis

beta$_2$ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate. Decreased frequency of attacks of angina pectoris. Prevention of MI.

Pharmacokinetics

Absorption: 50–60% absorbed after oral administration.
Distribution: Minimal penetration of CNS. Crosses the placenta and enters breast milk.
Metabolism and Excretion: 40–50% excreted unchanged by the kidneys; remainder excreted in feces as unabsorbed drug.
Half-life: 6–9 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–4 hr	24 hr
IV	rapid	5 min	unknown

Contraindications/Precautions

Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment (dosage reduction recommended if CCr ≤35 ml/min); Hepatic impairment; Geriatric patients (increased sensitivity to beta blockers; initial dosage reduction recommended); Pulmonary disease (including asthma; beta selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, liver function abnormalities, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin** and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May decrease the effectiveness of **theophylline**. May decrease the beneficial beta$_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

PO (Adults): *Antianginal*—50 mg once daily; may be increased after 1 wk to 100 mg/day (up to 200 mg/day). *Antihypertensive*—25–50 mg once daily; may be increased after 2 wk to 50–100 mg once daily. *MI*—50 mg (given 10 min after last IV dose), then 50 mg 12 hr later, then 100 mg/day as a single dose or in 2 divided doses for 6–9 days or until hospital discharge.

Renal Impairment

PO (Adults): *CCr 15–35 ml/min*—dosage should not exceed 50 mg/day; *CCr <15 ml/min*—dosage should not exceed 50 mg every other day.
IV (Adults): *MI*—5 mg, followed by another 5 mg after 10 min; after 10 more min follow with oral dosing.

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $11.99/90, 50 mg $12.99/90, 100 mg $15.89/90. **Injection:** 0.5 mg/ml. ***In combination with:*** chlorthalidone (Tenoretic). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for CHF (dyspnea,

Copyright © 2008 by F.A. Davis

rales/crackles, weight gain, peripheral edema, jugular venous distention).

- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess frequency and characteristics of angina periodically throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse before administering drug. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. May also be diluted in D5W, 0.9% NaCl, or D5/0.9% NaCl. Diluted solution stable for 48 hr. ***Concentration:*** 0.5 mg/ml. ***Rate:*** Administer at a rate of 1 mg/min.
- **Y-Site Compatibility:** acyclovir, amphotericin B liposome, daptomycin, diltiazem, ertapenem, granisetron, hydromorphone, linezolid, lorazepam, meperidine, meropenem, morphine, ondansetron, palonosetron, piperacillin/tazobactam, tacrolimus, tirofiban, voriconazole.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, caspofungin, pantoprazole.

Patient/Family Teaching

- Instruct patient to take atenolol as directed at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that atenolol may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls, but does not cure, hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Reduction in frequency of angina
- Increase in activity tolerance.
- Prevention of MI.

Copyright © 2008 by F.A. Davis

atomoxetine

(a-to-**mox**-e-teen)
Strattera

Classification
Therapeutic: agents for attention deficit disorder
Pharmacologic: selective norepinephrine reuptake inhibitors

Pregnancy Category C

Indications
Attention-Deficit/Hyperactivity Disorder (ADHD).

Action
Selectively inhibits the presynaptic transporter of norepinephrine. **Therapeutic Effects:** Increased attention span.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 enzyme pathway). A small percentage of the population are poor metabolizers and will have higher blood levels with increased effects).
Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	12–24 hr

Contraindications/Precautions
Contraindicated in: Concurrent or within 2 wk therapy with MAO inhibitors; Angle-closure glaucoma.
Use Cautiously in: Hypertension, tachycardia, cardiovascular or cerebrovascular disease; Pre-existing psychiatric illness; May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Concurrent albuterol or vasopressors (increases risk of adverse cardiovascular reactions); OB: Use only if benefits outweigh risks to fetus; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: dizziness, fatigue, mood swings; *Adults*— insomnia. **CV:** hypertension, orthostatic hypotension, tachycardia. **GI:** dyspepsia, severe liver injury (rare), nausea, vomiting; *Adults*— dry mouth, constipation. **Derm:** rash, urticaria. **GU:** *Adults*— dysmenorrhea, ejaculatory problems, ↓ libido, erectile dysfunction, urinary hesitation, urinary retention. **Metab:** decreased appetite, weight/growth loss. **Misc:** allergic reactions including ANGIONEUROTIC EDEMA.

Interactions
Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (do not use within 2 wk of each other). Increased risk of cardiovascular effects with **albuterol** or **vasopressors** (use cautiously). **Drugs which inhibit the CYP2D6 enzyme pathway (quinidine, fluoxetine, paroxetine)** will increase blood levels and effects, dose ↓ recommended.

Route/Dosage
PO (Children and adolescents <70 kg): 0.5 mg/kg/day initially, may be increased every 3 days to a daily target dose of 1.2 mg/kg, given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening (not to exceed 1.4 mg/kg/day or 100 mg/day whichever is less). *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—0.5 mg/kg/day initially, may increase if needed to 1.2 mg/kg/day after 4 wk.
PO (Adults, adolescents, and children >70 kg): 40 mg/day initially, may be increased every 3 days to a daily target dose of 80 mg/day given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening; may be further increased after 2–4 wk up to 100 mg/day. *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—40 mg/day initially, may increase if needed to 80 mg/day after 4 wk.

Hepatic Impairment
PO (Adults and Children): *Moderate hepatic impairment (Child-Pugh Class B)*—decrease initial and target dose by 50%; *Severe hepatic impairment (Child-Pugh Class C)*—decrease initial and target dose to 25% of normal.

Availability
Capsules: 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg. **Cost:** 10 mg $368.58/90, 18 mg $433.13/90, 25 mg $369.98/90, 40 mg $389.95/90, 60 mg $389.95/90, 80 mg $435.93/90, 100 mg $439.96/90.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess attention span, impulse control, and interactions with others.
- Monitor blood pressure and pulse periodically during therapy.
- Monitor growth, body height, and weight in children.
- Assess for signs of liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) during therapy. Monitor liver function tests at first sign of liver injury. Discontinue and do not restart atomoxetine in patients with jaundice if laboratory evidence of liver injury.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired social interaction (Indications)

Implementation

- **PO:** Administer without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Advise patient and parents to read the Medication Guide prior to starting therapy and with each Rx refill.
- Advise patient to notify health care professional immediately if signs of liver injury occur.
- Caution patient to consult health care professional prior to taking other prescription, OTC, dietary supplements, or herbal products.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- OB, Lactation: Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breastfeeding.
- Pedi: Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Improved attention span and social interactions in ADHD.

atorvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

atovaquone (a-**toe**-va-kwone)

Mepron

Classification

Therapeutic: antiprotozoals

Pregnancy Category C

Indications

Treatment of mild to moderate *Pneumocystis carinii* pneumonia (PCP) in patients who are unable to tolerate trimethoprim/sulfamethoxazole. Prophylaxis of *PCP*.

Action

Inhibits the action of enzymes necessary to nucleic acid and ATP synthesis in protozoa. **Therapeutic Effects:** Antiprotozoal action against *P. carinii*.

Pharmacokinetics

Absorption: Absorption is poor but is increased by food, particularly fat.
Distribution: Enters CSF in very low concentrations (<1% of plasma levels).
Protein Binding: >99.9%.
Metabolism and Excretion: Undergoes enterohepatic recycling; elimination occurs in feces.
Half-life: 2.2–2.9 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–8 hr; 24–96 hr†	12 hr

†Two peaks are due to enterohepatic recycling

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: May appear in breast milk.
Use Cautiously in: Decreased hepatic, renal, or cardiac function (dosage modification may be necessary); GI disorders (absorption may be limited); OB: Safety not established; Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: headache, insomnia. **Resp:** cough. **GI:** diarrhea, nausea, vomiting. **Derm:** rash. **Misc:** fever.

Interactions

Drug-Drug: May interact with **drugs that are highly bound to plasma proteins** (does not appear to interact with phenytoin).

Copyright © 2008 by F.A. Davis

Drug-Food: Food enhances absorption.

Route/Dosage

Treatment

PO (Adults): 750 mg twice daily for 21 days.
PO (Children): 40 mg/kg/day (unlabeled).

Prevention

PO (Adults and Adolescents 13–16 yr): 1500 mg once daily.

Availability

Suspension: 750 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of *PCP* (vital signs, lung sounds, sputum, WBCs) at beginning of and throughout therapy.
- Obtain specimens prior to initiating therapy. First dose may be given before receiving results.
- ***Lab Test Considerations:*** Monitor hematologic and hepatic functions. May cause mild, transient anemia and neutropenia. May also cause elevated serum amylase, AST, ALT, and alkaline phosphatase.
- Monitor electrolytes. May cause hyponatremia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer with food twice daily for 21 days for treatment and once daily for prevention.

Patient/Family Teaching

- Instruct patient to take atovaquone exactly as directed around the clock for the full course of therapy, even if feeling better. Emphasize the importance of taking atovaquone with food, especially foods high in fat; taking without food may decrease plasma concentrations and effectiveness.
- Advise patient to notify health care professional if rash occurs.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of *PCP*.

atropine† (at-ro-peen)
AtroPen

Classification
Therapeutic: antiarrhythmics
Pharmacologic: anticholinergics, antimuscarinics

Pregnancy Category C

†See Appendix C for ophthalmic use

Indications

IM: Given preoperatively to decrease oral and respiratory secretions. **IV:** Treatment of sinus bradycardia and heart block. **PO:** Adjunctive therapy in the management of peptic ulcer and irritable bowel syndrome. **IV:** Reversal of adverse muscarinic effects of anticholinesterase agents (neostigmine, physostigmine, or pyridostigmine). **IM, IV:** Treatment of anticholinesterase (organophosphate pesticide) poisoning. **Inhaln:** Treatment of exercise-induced bronchospasm.

Action

Inhibits the action of acetylcholine at postganglionic sites located in: Smooth muscle, Secretory glands, CNS (antimuscarinic activity). Low doses decrease: Sweating, Salivation, Respiratory secretions. Intermediate doses result in: Mydriasis (pupillary dilation), Cycloplegia (loss of visual accommodation), Increased heart rate. GI and GU tract motility are decreased at larger doses. **Therapeutic Effects:** Increased heart rate. Decreased GI and respiratory secretions. Reversal of muscarinic effects. May have a spasmolytic action on the biliary and genitourinary tracts.

Pharmacokinetics

Absorption: Well absorbed following oral, subcut, or IM administration.
Distribution: Readily crosses the blood-brain barrier. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; 30–50% excreted unchanged by the kidneys.
Half-life: Children <2 yr: 4–10 hr; Children >2 yr: 1.5–3.5 hr; Adults: 4–5 hr.

TIME/ACTION PROFILE (inhibition of salivation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	30–60 min	4–6 hr
IM, subcut	rapid	15–50 min	4–6 hr

Copyright © 2008 by F.A. Davis

IV	immediate	2–4 min	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Obstructive disease of the GI tract. **Use Cautiously in:** Intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; OB, Lactation: Safety not established; IV administration may produce fetal tachycardia; Pedi: Infants with Down's syndrome have increased sensitivity to cardiac effects and mydriasis. Children may have increased susceptibility to adverse reactions. Exercise care when prescribing to children with spastic paralysis or brain damage; Geri: Increased susceptibility to adverse reactions.

Adverse Reactions/Side Effects

CNS: drowsiness, confusion, hyperpyrexia. **EENT:** blurred vision, cycloplegia, photophobia, dry eyes, mydriasis. **CV:** tachycardia, palpitations, arrhythmias. **GI:** dry mouth, constipation, impaired GI motility. **GU:** urinary hesitancy, retention, impotency. **Resp:** tachypnea, pulmonary edema. **Misc:** flushing, decreased sweating.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **anticholinergics**, including **antihistamines**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. Anticholinergics may alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. **Antacids** ↓ absorption of **anticholinergics**. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. May alter response to **beta-blockers**.

Route/Dosage

Preanesthesia (To Decrease Salivation/Secretions)

IM, IV, Subcut, PO (Adults): 0.4–0.6 mg 30–60 min pre-op.
IM, IV, Subcut, PO (Children >5 kg): 0.01–0.02 mg/kg/dose 30–60 min preop to a maximum of 0.4 mg/dose; minimum: 0.1 mg/dose.
IM, IV, Subcut, PO (Children <5 kg): 0.02 mg/kg/dose 30–60 min preop then q 4–6 hr as needed.

Bradycardia

IV (Adults): 0.5–1 mg; may repeat as needed q 5 min, not to exceed a total of 2 mg (q 3–5 min in Advanced Cardiac Life Support guidelines) or 0.04 mg/kg (total vagolytic dose).
IV (Children): 0.02 mg/kg (maximum single dose is 0.5 mg in children and 1 mg in adolescents); may repeat q 5 min up to a total dose of 1 mg in children (2 mg in adolescents).
Endotracheal (Children): use the IV dose and dilute before administration.

Reversal of Adverse Muscarinic Effects of Anticholinesterases

IV (Adults): 0.6–12 mg for each 0.5–2.5 mg of neostigmine methylsulfate or 10–20 mg of pyridostigmine bromide concurrently with anticholinesterase.

Organophosphate Poisoning

IM (Adults): 2 mg initially, then 2 mg q 10 min as needed up to 3 times total.
IV (Adults): 1–2 mg/dose q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr; up to 50 mg in first 24 hr and 2 g over several days may be given in severe intoxication.
IM (Children >10 yr >90 lbs): 2 mg.
IM (Children 4–10 yr 40–90 lbs): 1 mg.
IM (Children 6 mo–4 yr 15–40 lbs): 0.5 mg.
IV (Children): 0.02–0.05 mg/kg q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr.

Bronchospasm

Inhaln (Adults): 0.025–0.05 mg/kg/dose q 4–6 hr as needed; maximum 2.5 mg/dose.
Inhaln (Children): 0.03–0.05 mg/kg/dose 3–4 times/day; maximum 2.5 mg/dose.

Availability (generic available)

Tablets: 0.4 mg. ***In combination with:*** phenobarbital oral solution (Antrocol). See Appendix B. **Injection:** 0.05 mg/ml, 0.1 mg/ml, 0.4 mg/ml, 1 mg/ml, 0.5 mg/0.7 ml Auto-injector, 1 mg/0.7 ml Auto-injector, 2 mg/0.7 ml Auto-injector.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure, or

Copyright © 2008 by F.A. Davis

increased ventricular ectopy or angina to physician promptly.
- Monitor intake and output ratios in elderly or surgical patients because atropine may cause urinary retention.
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- ***Toxicity and Overdose:*** If overdose occurs, physostigmine is the antidote.

Potential Nursing Diagnoses
Decreased cardiac output (Indications)
Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

Implementation
- **PO:** Oral doses of atropine may be given without regard to food.
- **IM:** Intense flushing of the face and trunk may occur 15–20 min following IM administration. In children, this response is called "atropine flush" and is not harmful.

IV Administration
- **Direct IV:** ***Diluent:*** Administer undiluted. ***Rate:*** Administer over 1 min; more rapid administration may be used during cardiac resuscitation (follow with 20 ml saline flush). Slow administration (over >1 min) may cause a paradoxical bradycardia (usually resolved in approximately 2 min).
- **Y-Site Compatibility:** abciximab, amikacin, aminophylline, amiodarone, argatroban, buprenorphine, butorphanol, etomidate, famotidine, fenoldopam, fentanyl, heparin, hydrocortisone sodium succinate, hydromorphone, inamrinone, meropenem, methadone, morphine, nafcillin, potassium chloride, sufentanil, tirofiban, vitamin B complex with C.
- **Y-Site Incompatibility:** thiopental.
- **Endotracheal:** Dilute with 5–10 ml of 0.9% NaCl. ***Rate:*** Inject directly into the endotracheal tube followed by several positive pressure ventilations.

Patient/Family Teaching
- Instruct patient to take as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that atropine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke.
- Instruct patient to consult health care professional before taking any OTC medications or herbal products concurrently with atropine.
- Pedi: Instruct parents or caregivers that medication may cause fever and to notify health care professional before administering to a febrile child.
- Geri: Inform male patients with benign prostatic hyperplasia that atropine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

Evaluation/Desired Outcomes
- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

azacitidine (a-za-**sye**-ti-deen)
Vidaza

Classification
Therapeutic: antineoplastics
Pharmacologic: nucleoside analogues

Pregnancy Category D

Indications
Myelodysplastic syndromes including: some refractory anemias, chronic myelomonocytic leukemia.

Action
Inhibits DNS synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: Rapidly absorbed following subcutaneous administration; 89% bioavailable.
Distribution: Unknown.
Metabolism and Excretion: 85% excreted in urine; some hepatic metabolism may occur. Less than 1% fecal elimination.
Half-life: 4 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (effects on bone marrow)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Advanced malignant hepatic tumors; OB: Potential for congenital anomalies; Lactation: Potential for serious side effects in infants.

Use Cautiously in: Renal impairment; Liver disease; OB: Patients with child-bearing potential (male and female) due to potential fetal harm; Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: fatigue. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea. **GU:** nephrotoxicity, renal tubular acidosis. **Derm:** ecchymosis. **F and E:** hypokalemia. **Hemat:** anemia, neutropenia, thrombocytopenia. **Local:** injection site erythema. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Additive bone marrow depression may occur with other **antineoplastics**.

Route/Dosage

Subcut, IV (Adults): 75 mg/m²/day for 7 days every 4 weeks; may be increased to 100 mg/m²/day for 7 days every 4 wks if no beneficial effect occurs after 2 cycles. Continue for as long as patient benefits.

Availability

Suspension for injection (requires reconstitution): 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess patient for nausea and vomiting during therapy. Premedicate patient before each dose.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to each dosing cycle. If baseline WBC is more than 3 x 10^9/L, ANC is more than 1.5 x 10^9/L, and platelets are more than 75 x 10^9/L, then dose is adjusted based on nadir counts for each cycle. If ANC is less than 0.5 x 10^9 and platelets are less than 25 x 10^9 then decrease dose by 50%. If ANC is 0.5–1.5 x 10^9 and platelets are 25–50 x 10^9 then decrease dose to 67% in next course. If ANC is greater than 1.5 x 10^9 and platelets are greater than 50, then 100% of dose can be given in subsequent cycle.
- Obtain liver chemistries and serum creatinine prior to initiation of therapy.
- Monitor renal function during therapy. If serum bicarbonate is less than 20 mEq/L, reduce dose by 50% in next course. If unexplained ↑ in BUN or serum creatinine occur, delay next cycle until values return to normal or baseline and decrease dose by 50% in next course.
- May cause hypokalemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers (see Appendix K).
- **Subcut:** Reconstitute by adding 4 mL of sterile water for injection slowly into the azacitadine vial for a concentration of 25 mg/mL. Invert vial 2–3 times and rotate gently until suspension is uniform. Suspension will be cloudy. Stable for up to 1 hr at room temperature; must be administered within 1 hr of reconstitution. Suspension may also be refrigerated for up to 8 hr; may be allowed to equilibrate to room temperature for up to 30

Copyright © 2008 by F.A. Davis

min. Invert syringe 2–3 times and roll syringe gently between palms immediately prior to administration to mix suspension.
- Divide doses greater than 4 mL equally into 2 syringes and administer into separate sites. Rotate sites (thigh, abdomen, upper arm) with new injections at least one inch from old site. Do not use site that is bruised, tender, red, or hard.

IV Administration
- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial with 10 mL sterile water for injection. Shake vigorously or roll vial until all solids are dissolved. Solution should be clear; do not administer solutions that are not clear or contain particulate matter. ***Concentration:*** 10 mg/mL. Withdraw solution from required number of vials and inject into 50–100 mL of 0.9% NaCl or LR. Solution is stable for 1 hr at room temperature. ***Rate:*** Infuse over 10–40 min. Infusion must be completed within 1 hr of reconstitution.
- **Solution Incompatibility:** 5% dextrose, hespan, solutions containing bicarbonate.

Patient/Family Teaching
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if they have underlying liver or renal disease.
- OB: Advise both male and female patients of the need for contraception during therapy.

Evaluation/Desired Outcomes
- Improved bone marrow and blood counts.

azathioprine
(ay-za-**thye**-oh-preen)
Azasan, Imuran

Classification
Therapeutic: immunosuppressants
Pharmacologic: purine antagonists

Pregnancy Category D

Indications
Prevention of renal transplant rejection (with corticosteroids, local radiation, or other cytotoxic agents). Treatment of severe, active, erosive rheumatoid arthritis unresponsive to more conventional therapy. **Unlabeled uses:** Management of Crohn's disease.

Action
Antagonizes purine metabolism with subsequent inhibition of DNA and RNA synthesis. **Therapeutic Effects:** Suppression of cell-mediated immunity and altered antibody formation.

Pharmacokinetics
Absorption: Readily absorbed after oral administration.
Distribution: Crosses the placenta. Enters breast milk in low concentrations.
Metabolism and Excretion: Metabolized to mercaptopurine, which is further metabolized. Minimal renal excretion of unchanged drug.
Half-life: 3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (anti-inflammatory)	6–8 wk	12 wk	unknown
IV (immunosuppression)	days–wk	unknown	days–wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of mycophenolate; OB: Has been shown to cause fetal harm; Lactation: Appears in breast milk.
Use Cautiously in: Infections; Malignancies; Decreased bone marrow reserve; Previous or concurrent radiation therapy; Other chronic debilitating illnesses; Severe renal impairment/oliguria (increased sensitivity); OB: Patients with childbearing potential.

Adverse Reactions/Side Effects
EENT: retinopathy. **Resp:** pulmonary edema. **GI:** anorexia, hepatotoxicity, nausea, vomiting, diarrhea, mucositis, pancreatitis. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, pancytopenia, thrombocytopenia. **MS:** arthralgia.

Copyright © 2008 by F.A. Davis

Misc: SERUM SICKNESS, chills, fever, Raynaud's phenomenon, retinopathy.

Interactions

Drug-Drug: Additive myelosuppression with **antineoplastics**, **cyclosporine**, and **myelosuppressive agents**. **Allopurinol** inhibits the metabolism of azathioprine, increasing toxicity. Dose of azathioprine should be decreased by 25–33% with concurrent allopurinol. May ↓ antibody response to **live-virus vaccines** and ↑ the risk of adverse reactions.
Drug-Natural Products: Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

Renal Allograft Rejection Prevention

PO, IV (Adults and Children): 3–5 mg/kg/day initially; maintenance dose 1–3 mg/kg/day.

Rheumatoid Arthritis

PO (Adults and Children): 1 mg/kg/day for 6–8 wk, increase by 0.5 mg/kg/day q 4 wk until response or up to 2.5 mg/kg/day, then decrease by 0.5 mg/kg/day q 4–8 wk to minimal effective dose.

Availability (generic available)

Tablets: 50 mg, 75 mg, 100 mg. **Injection:** 100-mg vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs, sputum, urine, stool, WBC) during therapy.
- Monitor intake and output and daily weight. Decreased urine output may lead to toxicity with this medication.
- **Rheumatoid Arthritis:** Assess range of motion; degree of swelling, pain, and strength in affected joints; and ability to perform activities of daily living before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor renal, hepatic, and hematologic functions before beginning therapy, weekly during the 1st mo, bimonthly for the next 2–3 mo, and monthly thereafter.
- Leukocyte count of <3000 or platelet count of <100,000/mm^3 may necessitate a reduction in dosage or temporary discontinuation.
- A ↓ in hemoglobin may indicate bone marrow suppression.
- Hepatotoxicity may be manifested by ↑ alkaline phosphatase, bilirubin, AST, ALT, and amylase concentrations. Usually occurs within 6 mo of transplant, rarely with rheumatoid arthritis, and is reversible on discontinuation of azathioprine.
- May ↓ serum and urine uric acid and plasma albumin.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse Imuran (azathioprine) with IMDUR (isosorbide mononitrate).
- Protect transplant patients from staff members and visitors who may carry infection. Maintain protective isolation as indicated.
- **PO:** May be administered with or after meals or in divided doses to minimize nausea.

IV Administration

- **IV:** Reconstitute 100 mg with 10 ml of sterile water for injection. Swirl vial gently until completely dissolved. Reconstituted solution may be administered up to 24 hr after preparation.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix K).
- **Direct IV:** ***Diluent:*** 0.9% NaCl, 0.45% NaCl, or D5W. ***Concentration:*** 10 mg/ml. ***Rate:*** Give over 5 min.
- **Intermittent Infusion:** ***Diluent:*** Solution may be further diluted in 50 mL with 0.9% NaCl, 0.45% NaCl, or D5W. Do not admix. ***Rate:*** Usually infused over 30–60 min; may range 5 min–8 hr.

Patient/Family Teaching

- Instruct patient to take azathioprine exactly as directed. If a dose is missed on a once-daily regimen, omit dose; if on several-times-a-day dosing, take as soon as possible or double next dose. Consult health care professional if more than 1 dose is missed or if vomiting occurs shortly after dose is taken. Do not discontinue without consulting health care professional.

Copyright © 2008 by F.A. Davis

- Advise patient to report unusual tiredness or weakness; cough or hoarseness; fever or chills; lower back or side pain; painful or difficult urination; severe diarrhea; black, tarry stools; blood in urine; or transplant rejection to health care professional immediately.
- Reinforce the need for lifelong therapy to prevent transplant rejection.
- Instruct the patient to consult health care professional before taking any OTC medications or natural/herbal products, or receiving any vaccinations while taking this medication.
- Advise patient to avoid contact with persons with contagious diseases and persons who have recently taken oral poliovirus vaccine.
- This drug may have teratogenic properties. Advise patient to use contraception during and for at least 4 mo after therapy is completed.
- Emphasize the importance of follow-up exams and lab tests.
- **Rheumatoid Arthritis:** Concurrent therapy with salicylates, NSAIDs, or corticosteroids may be necessary. Patient should continue physical therapy and adequate rest. Explain that joint damage will not be reversed; goal is to slow or stop disease process.

Evaluation/Desired Outcomes

- Prevention of transplant rejection.
- Decreased stiffness, pain, and swelling in affected joints in 6–8 wk in rheumatoid arthritis. Therapy is discontinued if no improvement in 12 wk.

azithromycin

(aye-**zith**-row-my-sin)
Zithromax, Zmax

Classification

Therapeutic: agents for atypical mycobacterium, anti-infectives
Pharmacologic: macrolides

Pregnancy Category B

Indications

Treatment of the following infections due to susceptible organisms: Upper respiratory tract infections, including streptococcal pharyngitis, acute bacterial exacerbations of chronic bronchitis and tonsillitis, Lower respiratory tract infections, including bronchitis and pneumonia, Acute otitis media, Skin and skin structure infections, Nongonococcal urethritis, cervicitis, gonorrhea, and chancroid. Prevention of disseminated *Mycobacterium avium* complex (MAC) infection in patients with advanced HIV infection. *Extended-release suspension (ZMax)* Acute bacterial sinusitis and community-acquired pneumonia in adults. **Unlabeled uses:** Prevention of bacterial endocarditis. Treatment of cystic fibrosis lung disease.

Action

Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against the following gram-positive aerobic bacteria: *Staphylococcus aureus*, *Streptococcus pneumoniae*, *Streptococcus pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*, *Neisseria gonorrhoeae*. Also active against: *Mycoplasma*, *Legionella*, *Chlamydia pneumoniae*, *Ureaplasma urealyticum*, *Borrelia burgdorferi*, *M. avium*. Not active against methicillin-resistant *S. aureus*.

Pharmacokinetics

Absorption: Rapidly absorbed (40%) after oral administration. IV administration results in complete bioavailability.
Distribution: Widely distributed to body tissues and fluids. Intracellular and tissue levels exceed those in serum; low CSF levels.
Metabolism and Excretion: Mostly excreted unchanged in bile; 4.5% excreted unchanged in urine.
Half-life: 11–14 hr after single dose; 2–4 days after several doses; 59 hr after extended release suspension.

TIME/ACTION PROFILE (serum)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2.5–3.2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to azithromycin, erythromycin, or other macrolide anti-infectives.
Use Cautiously in: Severe liver impairment (dosage adjustment may be required); Severe renal impairment (CCr <10 ml/min); OB, Lactation: Safety not established; Pedi: Safety not established in children <5 yr.

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: dizziness, seizures, drowsiness, fatigue, headache. **CV:** chest pain, hypotension, palpitations, QT prolongation (rare). **GI:** PSEUDOMEMBRANOUS COLITIS, abdominal pain, diarrhea, nausea, cholestatic jaundice, elevated liver enzymes, dyspepsia, flatulence, melena, oral candidiasis. **GU:** nephritis, vaginitis. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** photosensitivity, Stevens-Johnson syndrome, rashes. **EENT:** ototoxicity. **F and E:** hyperkalemia. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Aluminum- and **magnesium-containing antacids** decrease peak serum levels. **Nelfinavir** increases serum levels (monitor carefully). Other macrolide anti-infectives have been known to increase serum levels and effects of **digoxin**, **theophylline**, **ergotamine**, **dihydroergotamine**, **triazolam**, **carbamazepine**, **cyclosporine**, **tacrolimus,** and **phenytoin**; careful monitoring of concurrent use is recommended.

Route/Dosage

Most Respiratory and Skin Infections

PO (Adults): 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g); *Acute bacterial sinusitis*—500 mg once daily for 3 days or single 2-g dose of extended-release suspension (Zmax).
PO (Children ≥6 months): 10 mg/kg (not >500 mg/dose) on 1st day, then 5 mg/kg (not >250 mg/dose) for 4 more days. *Pharyngitis/tonsilitis*—12 mg/kg once daily for 5 days (not >500 mg/dose); *Acute bacterial sinusitis*—10 mg/kg/day for three days.

Otitis media

PO (Children ≥6 mo): 30 mg/kg single dose (not >1500 mg/dose) *or* 10 mg/kg/day as a single dose (not >500 mg/dose) for 3 days *or* 10 mg/kg as a single dose (not >500 mg/dose) on 1st day, then 5 mg/kg as a single dose (not >250 mg/dose) daily for 4 more days.

Acute bacterial exacerbations of chronic bronchitis

PO (Adults): 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g) *or* 500 mg daily for 3 days.

Community-Acquired Pneumonia

IV, PO (Adults): *More severe*—500 mg IV q 24 hr for at least 2 doses, then 500 mg PO q 24 hr for a total of 7–10 days; *less severe*—500 mg PO, then 250 mg/day PO for 4 more days or 2 g single dose as extended-release suspension (Zmax).
PO (Children >6 mo): 10 mg/kg on 1st day, then 5 mg/kg for 4 more days.

Pelvic Inflammatory Disease

IV, PO (Adults): 500 mg IV q 24 hr for 1–2 days, then 250 mg PO q 24 hr for a total of 7 days.

Endocarditis Prophylaxis

PO (Adults): 500 mg 1 hr before procedure.
PO (Children): 15 mg/kg 1 hr before procedure.

Nongonococcal Urethritis, Cervicitis, Chancroid, Chlamydia

PO (Adults): Single 1-g dose.
PO (Children): *Chancroid:* Single 20 mg/kg dose (not >1000 mg/dose). *Urethritis or cervicitis:* Single 10 mg/kg dose (not >1000 mg/dose).

Gonorrhea

PO (Adults): Single 2-g dose.

Prevention of Disseminated MAC Infection

PO (Adults): 1.2 g once weekly (alone or with rifabutin).
PO (Children): 5 mg/kg once daily (not >250 mg/dose) or 20 mg/kg (not >1200 mg/dose) once weekly (alone or with rifabutin).

Cystic Fibrosis

PO (Children ≥6 yrs, weight ≥25 kg to <40 kg): 250 mg q MWF. ≥40 kg: 500 mg q MWF.

Availability (generic available)

Tablets: 250 mg, 500 mg, 600 mg. **Cost:** *Generic*—250 mg $15.99/6, 500 mg $44.32/3, 600 mg $399.99/30. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 1 g/pkt. **Cost:** $93.99/3 packets. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 100 mg/5 ml in 15-ml bottles, 200 mg/5 ml in 15-ml, 22.5-ml, and 30-ml bottles. **Cost:** *Zithromax*—100 mg/5 ml $44.99/15 ml, 200 mg/5 ml $43.99/22.5 ml, 200 mg/5 ml $43.99/30 ml; *Generic*—200 mg/5 ml $32.27/15 ml. **Extended-release**

Copyright © 2008 by F.A. Davis

oral suspension (ZMax) (cherry-banana): 2-g single-dose bottle. **Powder for injection:** 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify the physician or other health care professional immediately if these occur.
- ***Lab Test Considerations:*** May cause ↑ serum bilirubin, AST, ALT, LDH, and alkaline phosphatase concentrations.
- May cause ↑ creatine phosphokinase, potassium, prothrombin time, BUN, serum creatinine, and blood glucose concentrations.
- May occasionally cause ↓ WBC and platelet count.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse azithromycin with erythromycin.
- *Zmax extended release oral suspension* is not bioequivalent or interchangeable with azithromycin oral suspension.
- **PO:** Administer 1 hr before or 2 hr after meals.
- For administration of single 1-g packet, thoroughly mix entire contents of packet with 2 oz (60 ml) of water. Drink entire contents immediately; add an additional 2 oz of water, mix and drink to assure complete consumption of dose. Do not use the single packet to administer doses other than 1000 mg of azithromycin. Pedi: 1-g packet is not for pediatric use.
- For *Zmax* shake suspension well and drink entire contents of bottle. Use within 12 hrs of reconstitution. If patient vomits within 1 hr of administration, contact prescriber for instructions. *Zmax* may be taken without regard to antacids containing magnesium or aluminum hydroxide.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 500-mg vial with 4.8 ml of sterile water for injection to achieve a concentration of 100 mg/ml. Reconstituted solution is stable for 24 hr at room temperature. Further dilute the 500-mg dose in 250 ml or 500 ml of 0.9% NaCl, 0.45% NaCl, D5W, LR, D5/0.45% NaCl, or D5/LR. Infusion is stable for 24 hr at room temperature or for 7 days if refrigerated. ***Concentration:*** Final concentration of infusion is 1–2 mg/ml. ***Rate:*** Administer the 1 mg/ml solution over 3 hr or the 2 mg/ml solution over 1 hr. Do not administer as a bolus.
- **Y-Site Compatibility:** amphotericin B liposome, bivalirudin, daptomycin, diphenhydramine, dolasetron, droperidol, ertapenem, fenoldopam, palonosetron, pantoprazole, tigecycline, tirofiban, voriconazole.
- **Y-Site Incompatibility:** amikacin, aztreonam, caspofungin, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, clindamycin, famotidine, fentanyl, furosemide, gentamicin, imipenem-cilastatin, ketorolac, morphine, ondansetron, piperacillin-tazobactam, potassium chloride, quinupristin/dalfopristin, ticarcillin-clavulanate, tobramycin.

Patient/Family Teaching

- Instruct patients to take medication as directed and to finish the drug completely, even if they are feeling better. Tell patient to take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patients that sharing of this medication may be dangerous.
- Instruct patient not to take azithromycin with food or antacids.
- May cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report symptoms of chest pain, palpitations, yellowing of skin or eyes, or signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Ad-

Copyright © 2008 by F.A. Davis

vise patient not to treat diarrhea without advice of health care professional.

- Advise patients being treated for nongonococcal urethritis or cervicitis that sexual partners should also be treated.
- Instruct parents, caregivers, or patient to notify health care professional if symptoms do not improve.
- Pedi: Tell parents or caregivers that medication is generally well tolerated in children. Most common side effects in children are mild diarrhea and rash. Tell parents to notify health care practitioner if these occur.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

This page has been left intentionally blank.

Copyright © 2008 by F.A. Davis

baclofen (bak-loe-fen)
Kemstro, Lioresal

Classification
Therapeutic: antispasticity agents, skeletal muscle relaxants (centrally acting)

Pregnancy Category C

Indications
PO: Treatment of reversible spasticity due to multiple sclerosis or spinal cord lesions.
IT: Treatment of severe spasticity originating in the spinal cord. **Unlabeled uses:** Management of pain in trigeminal neuralgia.

Action
Inhibits reflexes at the spinal level. **Therapeutic Effects:** Decreased muscle spasticity; bowel and bladder function may also be improved.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed; crosses the placenta.
Metabolism and Excretion: 70–80% eliminated unchanged by the kidneys.
Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	hrs–wks	unknown	unknown
IT	0.5–1 hr	4 hr	4–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Orally-disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria.
Use Cautiously in: Patients in whom spasticity maintains posture and balance; Patients with epilepsy (may ↓ seizure threshold); Renal impairment (↓ dose may be required); OB, Lactation, Pedi: Safety not established; Geri: Geriatric patients are at ↑ risk of CNS side effects.

Adverse Reactions/Side Effects
CNS: SEIZURES (IT), dizziness, drowsiness, fatigue, weakness, confusion, depression, headache, insomnia. **EENT:** nasal congestion, tinnitus. **CV:** edema, hypotension. **GI:** nausea, constipation. **GU:** frequency. **Derm:** pruritus, rash. **Metab:** hyperglycemia, weight gain. **Neuro:** ataxia. **Misc:** hypersensitivity reactions, sweating.

Interactions
Drug-Drug: ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Use with **MAO inhibitors** may lead to ↑ CNS depression or hypotension.
Drug-Natural Products: Concomitant use of **kava kava, valerian, or chamomile can ↑ CNS depression.**

Route/Dosage
PO (Adults): 5 mg 3 times daily. May increase q 3 days by 5 mg/dose up to 80 mg/day (some patients may have a better response to 4 divided doses).
IT (Adults): 100–800 mcg/day infusion; dose is determined by response during screening phase.
IT (Children): 25–1200 mcg/day infusion (average 275 mcg/day); dose is determined by response during screening phase.

Availability (generic available)
Tablets: 10 mg, 20 mg. **Cost:** *Generic*—10 mg $78.16/270, 20 mg $137.92/270. **Orally-disintegrating tablets (Kemstro) (orange):** 10 mg, 20 mg. **Intrathecal injection:** 50 mcg/ml, 500 mcg/ml, 2000 mcg/ml.

NURSING IMPLICATIONS

Assessment
- Assess muscle spasticity before and periodically during therapy.
- Observe patient for drowsiness, dizziness, or ataxia. May be alleviated by a change in dose.
- **IT:** Monitor patient closely during test dose and titration. Resuscitative equipment should be immediately available for life-threatening or intolerable side effects.
- ***Lab Test Considerations:*** May cause ↑ in serum glucose, alkaline phosphatase, AST, and ALT levels.

Potential Nursing Diagnoses
Impaired wheelchair mobility (Indications)
Risk for injury (Adverse Reactions)

Implementation
- **PO:** Administer with milk or food to minimize gastric irritation.
- For *orally disintegrating tablets,* just prior to administration place tablet on tongue with

Copyright © 2008 by F.A. Davis

dry hands. Tablet will disintegrate, then swallow with saliva or water. Administration with liquid is not necessary. **IT:** For *screening phase,* dilute for a concentration of 50 mcg/ml with sterile preservative-free NaCl for injection. Test dose should be administered over at least 1 min. Observe patient for a significant decrease in muscle tone or frequency or severity of spasm. If response is inadequate, 2 additional test doses, each 24 hr apart, 75 mcg/1.5 ml and 100 mcg/2 ml respectively, may be administered. Patients with an inadequate response should not receive chronic IT therapy.

- Dose titration for implantable IT pumps is based on patient response. If no substantive response after dose increase, check pump function and catheter patency.

Patient/Family Teaching

- Instruct patient to take baclofen as directed. Take a missed dose within 1 hr; do not double doses. Caution patient to avoid abrupt withdrawal of this medication because it may precipitate an acute withdrawal reaction (hallucinations, increased spasticity, seizures, mental changes, restlessness). Discontinue baclofen gradually over 2 wk or more.
- May cause dizziness and drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if frequent urge to urinate or painful urination, constipation, nausea, headache, insomnia, tinnitus, depression, or confusion persists. Geri: Geriatric patients are at greater risk for these side effects.
- Advise patient to report signs and symptoms of hypersensitivity (rash, itching) promptly.
- **IT:** Caution patient and caregiver to not discontinue IT therapy abruptly. May result in fever, mental status changes, exaggerated rebound spasticity, and muscle rigidity. Advise patient not to miss scheduled refill appointments and to notify health care professional promptly if signs of withdrawal occur.

Evaluation/Desired Outcomes

- Decrease in muscle spasticity and associated musculoskeletal pain with an increased ability to perform activities of daily living.
- Decreased pain in patients with trigeminal neuralgia. May take weeks to obtain optimal effect.

balsalazide (ba-**sal**-a-zide)
Colazal

Classification
Therapeutic: gastrointestinal anti-inflammatories—therapeutic

Pregnancy Category B

Indications
Treatment of mild to moderately active ulcerative colitis.

Action
Drug is metabolized in the colon to mesalamine (5-aminosalicylic acid), which is a local anti-inflammatory. **Therapeutic Effects:** Reduction in the symptoms of ulcerative colitis.

Pharmacokinetics
Absorption: Absorption is low and variable; drug is delivered intact to the colon.
Distribution: Mostly delivered intact to the colon; remainder of distribution unknown.
Protein Binding: ≥99%.
Metabolism and Excretion: Following delivery to the colon, bacteria break balsalazide down into mesalamine (5-aminosalicylic acid) and an inactive metabolite; mostly excreted in feces.
Half-life: *Mesalamine*—12 hr (range 2–15 hr).

TIME/ACTION PROFILE (decreased symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	up to 8 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to salicylates or other metabolites.
Use Cautiously in: Pyloric stenosis (may have prolonged gastric retention of capsules); OB: Use only if clearly needed; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects
GI: abdominal pain, diarrhea.

Interactions
Drug-Drug: None known.

Copyright © 2008 by F.A. Davis

Route/Dosage

PO (Adults): three 750-mg capsules three times daily for 8–12 wks.
PO (Children 5–17 yrs): three 750-mg capsules three times daily for up to 8 wks *or* one 750-mg capsule three times daily for up to 8 wks.

Availability

Capsules: 750 mg.

NURSING IMPLICATIONS

Assessment

- Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and throughout therapy.
- Assess patient for allergy to salicylates.
- ***Lab Test Considerations:*** May cause elevated AST, ALT, serum alkaline phosphatase, gamma glutamyl transpepsidase (GGT), LDH, and bilirubin.

Potential Nursing Diagnoses

Acute pain (Indications)
Diarrhea (Indications)

Implementation

- **PO:** Administer capsules three times a day. Capsules may be opened and sprinkled on applesauce and taken immediately; do not store mixture. Color of powder inside of capsules may range from yellow to orange. Teeth or tongue staining may occur when powder is sprinkled on applesauce and swallowed.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. If a dose is missed, it should be taken as soon as remembered unless almost time for next dose.
- Advise patient to notify health care professional if skin rash, difficulty breathing, or hives occur.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain in patients with ulcerative colitis.

basiliximab (ba-sil-**ix**-i-mab)
Simulect

Classification
Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

Pregnancy Category B

Indications

Prevention of acute organ rejection in patients undergoing renal transplantation; used with corticosteroids and cyclosporine.

Action

Binds to and blocks specific interleukin-2 (IL-2) receptor sites on activated T lymphocytes.
Therapeutic Effects: Prevention of acute organ rejection following renal transplantation.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 7.2 days.

TIME/ACTION PROFILE (effect on immune function)

ROUTE	ONSET	PEAK	DURATION
IV	2 hr	unknown	36 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: May affect fetal developing immune system; Lactation: Make enter breast milk.
Use Cautiously in: Women with childbearing potential; Geri: Due to greater incidence of infection.

Adverse Reactions/Side Effects

Noted for patients receiving corticosteroids and cyclosporine in addition to basiliximab.
CNS: dizziness, headache, insomnia, weakness. **EENT:** abnormal vision, cataracts. **Resp:** coughing. **CV:** HEART FAILURE, edema, hypertension, angina, arrhythmias, hypotension. **GI:** abdominal pain, constipation, diarrhea, dyspepsia, moniliasis, nausea, vomiting, GI bleeding, gingival hyperplasia, stomatitis. **Derm:** acne, wound complications, hypertrichosis, pruritus. **Endo:** hyperglycemia, hypoglycemia. **F and E:** acidosis, hypercholesterolemia, hyperkalemia, hyperuricemia, hypocalcemia, hypokalemia, hypophosphatemia. **Hemat:** bleeding, coagulation abnormalities. **MS:** back pain, leg pain.

Copyright © 2008 by F.A. Davis

Neuro: tremor, neuropathy, paresthesia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, infection, weight gain, chills.

Interactions

Drug-Drug: Immunosuppression may be ↑ with other **immunosuppressants**.
Drug-Natural Products: Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

IV (Adults and Children ≥35 kg): 20 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.
IV (Children <35 kg): 10 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.

Availability

Powder for reconstitution: 20 mg/vial, 10 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of anaphylactic or hypersensitivity reactions (hypotension, tachycardia, cardiac failure, dyspnea, wheezing, bronchospasm, pulmonary edema, respiratory failure, urticaria, rash, pruritus, sneezing) at each dose. Onset of symptoms is usually within 24 hr. Resuscitation equipment and medications for treatment of severe hypersensitivity should be readily available. If a severe hypersensitivity reaction occurs, basiliximab therapy should be permanently discontinued. Patients who have previously received basiliximab should only receive subsequent therapy with extreme caution.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ or ↓ hemoglobin, hematocrit, serum glucose, potassium, and calcium concentrations.
- May cause ↑ serum cholesterol levels.
- May cause ↑ BUN, serum creatinine, and uric acid concentrations.
- May cause ↓ serum magnesium, phosphate, and platelet levels.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Implementation

IV Administration

- Basiliximab is usually administered concurrently with cyclosporine and corticosteroids
- Reconstitute with 2.5 ml or 5 ml of sterile water for injection for the 10 mg or 20 mg vial, respectively. Shake gently to dissolve powder.
- **Direct IV:** ***Diluent:*** May be administered undiluted. Bolus administration may be associated with nausea, vomiting, and local reactions (pain). ***Concentration:*** 4 mg/ml. ***Rate:*** Administer over 20–30 min via peripheral or central line.
- **Intermittent Infusion:** ***Diluent:*** Dilute further with 25–50 ml of 0.9% NaCl or D5W. Gently invert bag to mix; do not shake, to avoid foaming. Solution is clear to opalescent and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion. Administer within 4 hr or may be refrigerated for up to 24 hr. Discard after 24 hr. ***Concentration:*** 0.08–0.16 mg/ml. ***Rate:*** Administer over 20–30 min via peripheral or central line. **Compatibility:** Do not admix; do not administer in IV line containing other medications.

Patient/Family Teaching

- Explain purpose of medication to patient. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of basiliximab course.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient to continue to avoid crowds and persons with known infections, because basiliximab also suppresses the immune system.

Evaluation/Desired Outcomes

- Prevention of acute organ rejection in patients receiving renal transplantation.

beclomethasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL).

benazepril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

Copyright © 2008 by F.A. Davis

benzathine penicillin G, See **PENICILLINS.**

benzonatate (ben-zoe-na-tate)
Tessalon

Classification
Therapeutic: allergy, cold, and cough remedies, antitussives (local anesthetic)

Pregnancy Category C

Indications
Relief of nonproductive cough due to minor throat or bronchial irritation from inhaled irritants or colds.

Action
Anesthetizes cough or stretch receptors in vagal nerve afferent fibers found in lungs, pleura, and respiratory passages. May also decrease transmission of the cough reflex centrally. **Therapeutic Effects:** Decrease in cough.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (antitussive effect)

ROUTE	ONSET	PEAK	DURATION
PO	15–20 min	unknown	3–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to benzonatate. Cross-sensitivity with other ester-type local anesthetics (tetracaine, procaine, and others) may occur.
Use Cautiously in: OB, Lactation: Safety not established; Pedi: Safety not established in children <10 yr.

Adverse Reactions/Side Effects
CNS: headache, mild dizziness, sedation. **EENT:** burning sensation in eyes, nasal congestion. **GI:** constipation, GI upset, nausea. **Derm:** pruritus, skin eruptions. **Misc:** chest numbness, chilly sensation, hypersensitivity reactions.

Interactions
Drug-Drug: Additive CNS depression may occur with **antihistamines**, **alcohol**, **opioids**, and **sedative/hypnotics**.

Route/Dosage
PO (Adults and Children ≥10 yr): 100 mg 3 times daily (up to 600 mg/day).

Availability (generic available)
Capsules: 100 mg.

NURSING IMPLICATIONS

Assessment
- Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 ml to decrease viscosity of bronchial secretions.

Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

Implementation
- Capsules should be swallowed whole. Do not chew, because release of benzonatate from capsules may cause local anesthetic effect and choking.

Patient/Family Teaching
- Instruct patient to take exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- Caution patient not to chew capsules.
- Instruct patient to cough effectively: Sit upright and take several deep breaths before attempting to cough.
- Advise patient to minimize cough by avoiding irritants, such as cigarette smoke, fumes, and dust. Humidification of environmental air, frequent sips of water, and sugarless hard candy may also decrease the frequency of dry, irritating cough.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- May occasionally cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that any cough lasting more than 1 wk or accompanied by fever, chest pain, persistent headache, or skin rash warrants medical attention.
- Advise patient to notify health care professional if symptoms of overdose (seizures, restlessness, trembling) occur.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in frequency and intensity of cough without eliminating patient's cough reflex.

benztropine (benz-troe-peen)

Apo-Benztropine, Cogentin

Classification

Therapeutic: antiparkinson agents
Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Adjunctive treatment of all forms of Parkinson's disease, including drug-induced extrapyramidal effects and acute dystonic reactions.

Action

Blocks cholinergic activity in the CNS, which is partially responsible for the symptoms of Parkinson's disease. Restores the natural balance of neurotransmitters in the CNS. **Therapeutic Effects:** Reduction of rigidity and tremors.

Pharmacokinetics

Absorption: Well absorbed following PO and IM administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (antidyskinetic activity)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	several days	24 hr
IM, IV	within min	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Children <3 yr; Angle-closure glaucoma; Tardive dyskinesia.
Use Cautiously in: Prostatic hypertension; Seizure disorders; Cardiac arrhythmias; OB, Lactation: Safety not established; Geri: Increased risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: confusion, depression, dizziness, hallucinations, headache, sedation, weakness. **EENT:** blurred vision, dry eyes, mydriasis. **CV:** arrhythmias, hypotension, palpitations, tachycardia. **GI:** constipation, dry mouth, ileus, nausea. **GU:** hesitancy, urinary retention. **Misc:** decreased sweating.

Interactions

Drug-Drug: Additive anticholinergic effects with **drugs sharing anticholinergic properties**, such as **antihistamines**, **phenothiazines**, **quinidine**, **disopyramide**, and **tricyclic antidepressants**. Counteracts the cholinergic effects of **bethanechol**. **Antacids** and **antidiarrheals** may ↓ absorption.
Drug-Natural Products: ↑ anticholinergic effect with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

Parkinsonism

PO (Adults): 1–2 mg/day in 1–2 divided doses (range 0.5–6 mg/day).

Acute Dystonic Reactions

IM, IV (Adults): 1–2 mg, then 1–2 mg PO twice daily.

Drug-Induced Extrapyramidal Reactions

PO, IM, IV (Adults): 1–4 mg given once or twice daily (1–2 mg 2–3 times daily may also be used PO).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Injection:** 1 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and throughout therapy.
- Assess bowel function daily. Monitor for constipation, abdominal pain, distention, or absence of bowel sounds.
- Monitor intake and output ratios and assess patient for urinary retention (dysuria, distended abdomen, infrequent voiding of small amounts, overflow incontinence).
- Patients with mental illness are at risk of developing exaggerated symptoms of their disorder during early therapy with benztropine. Withhold drug and notify physician or other health care professional if significant behavioral changes occur.
- **IM/IV:** Monitor pulse and blood pressure closely and maintain bedrest for 1 hr after administration. Advise patients to change posi-

Copyright © 2008 by F.A. Davis

tions slowly to minimize orthostatic hypotension.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

Implementation

- **PO:** Administer with food or immediately after meals to minimize gastric irritation. May be crushed and administered with food if patient has difficulty swallowing.
- **IM:** Parenteral route is used only for dystonic reactions.

IV Administration

- **Direct IV:** IV route is rarely used because onset is same as with IM route. ***Rate:*** Administer at a rate of 1 mg over 1 min.
- **Syringe Compatibility:** metoclopramide, perphenazine.
- **Y-Site Compatibility:** fluconazole, tacrolimus.

Patient/Family Teaching

- Encourage patient to take benztropine as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur (anxiety, tachycardia, insomnia, return of parkinsonian or extrapyramidal symptoms).
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also, notify the dentist if dryness interferes with use of dentures.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if difficulty with urination, constipation, abdominal discomfort, rapid or pounding heartbeat, confusion, eye pain, or rash occurs.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages.
- Caution patient that this medication decreases perspiration. Overheating may occur during hot weather. Patient should notify health care professional if unable to remain indoors in an air-conditioned environment during hot weather.
- Advise patient to avoid taking antacids or antidiarrheals within 1–2 hr of this medication.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decrease in tremors and rigidity and an improvement in gait and balance. Therapeutic effects are usually seen 2–3 days after the initiation of therapy.

betamethasone, See CORTICOSTEROIDS (SYSTEMIC), CORTICOSTEROIDS (TOPICAL/LOCAL).

betaxolol† (be-**tax**-oh-lol)

Kerlone

Classification

Therapeutic: antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

†See Appendix C for ophthalmic use

Indications

Management of hypertension.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, uterine) receptor sites.
Therapeutic Effects: Decreased blood pressure and heart rate.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Mostly metabolized by the liver, 20% excreted unchanged by the kidneys.
Half-life: 15–20 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	3–4 hr	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.

Use Cautiously in: Renal or hepatic impairment; Pulmonary disease (including asthma; beta$_1$ selectivity may be lost at higher doses); avoid use if possible; Diabetes mellitus; Thyrotoxicosis; Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB, Lactation, Pedi: Safety not established; all agents cross the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Geri: Increased sensitivity to beta blockers; initial dosage reduction recommended.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, liver function abnormalities, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid preparation** administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May decrease the effectiveness of **theophylline**. May decrease the beneficial beta$_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

PO (Adults): 10 mg once daily, may be increased to 20 mg after 7 days; start with 5 mg in geriatric patients.

Renal Impairment

PO (Adults): start with 5 mg once daily.

Availability

Tablets: 10 mg, 20 mg. **Cost:** 10 mg $82.63/100, 20 mg $123.95/100.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, ECG, and pulse frequently during dose adjustment and periodically during therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of congestive heart failure (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or health care professional immediately if these signs occur: Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose. Abrupt

Copyright © 2008 by F.A. Davis

withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Betaxolol may mask some signs of hypoglycemia, but sweating and dizziness may occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of detrimental side effects.

bevacizumab

(be-va-**kiz**-oo-mab)
Avastin

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Metastatic colon or rectal carcinoma (with IV 5–fluorouracil). First line treatment of patients with unresectable, locally advanced, recurrent or metastatic non-squamous, non-small cell lung cancer with carboplatin and paclitaxel.

Action

A monoclonal antibody that binds to vascular endothelial growth factor (VEGF), preventing its attachment to binding sites on vascular endothelium, thereby inhibiting growth of new blood vessels (angiogenesis). **Therapeutic Effects:** Decreased metastatic disease progression and microvascular growth.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 20 days (range 11–50 days).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent hemoptysis or other serious recent bleeding episode; First 28 days after major surgery; OB: Angiogenesis is critical to the developing fetus. Contraindicated unless benefit to mother outweighs potential fetal harm. Lactation: Discontinue nursing during treatment and, due to long half-life, for several weeks following treatment.
Use Cautiously in: Cardiovascular disease; Pedi: Safety not established; Geri: ↑ risk of serious adverse reactions including arterial thromboembolic events.

Adverse Reactions/Side Effects

CNS: reversible posterior leukoencephalopathy syndrome (RPLS). **CV:** ARTERIAL THROMBOEMBOLIC

Copyright © 2008 by F.A. Davis

EVENTS, CHF, hypertension, hypotension. **Resp:** HEMOPTYSIS, non-gastrointestinal fistulas, nasal septum perforation. **GI:** GI PERFORATION. **GU:** nephrotic syndrome, proteinuria. **Hemat:** BLEEDING. **Misc:** WOUND DEHISCENCE, impaired wound healing, infusion reactions.

Interactions

Drug-Drug: ↑ blood levels of SN 38 (the active metabolite of **irinotecan**); significance is not known.

Route/Dosage

Colon Cancer

IV (Adults): 5 mg/kg infusion every 14 days.

Lung Cancer

IV (Adults): 15 mg/kg infusion every 3 wks.

Availability

Solution for injection (requires dilution): 100 mg/4 ml vial, 400 mg/16 ml vial.

NURSING IMPLICATIONS

Assessment

- Assess for signs of GI perforation (abdominal pain associated with constipation and vomiting), fistula formation, and wound dehiscence during therapy; therapy should be discontined.
- Assess for signs of hemorrhage (epistaxis, hemoptysis, bleeding) and thromboembolic events (stroke, MI, deep vein thrombosis) during therapy; may require discontinuation.
- Monitor BP every 2–3 wk during therapy. Temporarily suspend therapy during severe hypertension not controlled with medical management; permanently discontinue if hypertensive crisis occurs.
- Assess for infusion reactions (stridor, wheezing) during therapy.
- Assess for signs of CHF (dyspnea, peripheral edema, rales/crackles, jugular venous distension) during therapy.
- Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur within 16 hrs to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bevacizumab therapy. Symptoms usually resolve within days.
- ***Lab Test Considerations:*** Monitor serial urinalysis for proteinuria during therapy. Patients with a 2+ or greater urine dipstick require further testing with a 24–hr urine collection.
- May cause leukopenia, thrombocytopenia, hypokalemia, and bilirubinemia.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Adverse Reactions)

Implementation

- Avoid administration for at least 28 days following major surgery; surgical incision should be fully healed due to potential for impaired wound healing.
- **Intermittent Infusion:** ***Diluent:*** Dilute by withdrawing necessary amount of bevacizumab for a dose of 5 mg/kg and dilute in total volume of 100 ml of 0.9% NaCl. Do not shake. Discard unused portions. Do not administer solution that is discolored or contains particulate matter. Stable if refrigerated for up to 8 hr. ***Rate:*** Administer initial dose over 90 min. If well tolerated, second infusion may be administered over 60 min. If well tolerated, all subsequent infusions may be administered over 30 min. **Do not administer as an IV push or bolus**.
- **Additive Incompatibility:** Do not mix or administer with dextrose solutions.

Patient/Family Teaching

- Inform patient of purpose of medication.
- Advise patient to report any signs of bleeding immediately to health care professional.

Evaluation/Desired Outcomes

- Decreased metastatic disease progression and microvascular growth.

bicalutamide

(bye-ka-**loot**-a-mide)
Casodex

Classification
Therapeutic: antineoplastics
Pharmacologic: antiandrogens

Pregnancy Category X

Indications

Treatment of metastatic prostate carcinoma in conjunction with luteinizing hormone–releasing hormone (LHRH) analogues (goserelin, leuprolide).

Action

Antagonizes the effects of androgen at the cellular level. **Therapeutic Effects:** Decreased spread of prostate carcinoma.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 5.8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	31.3 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Not for use in women.
Use Cautiously in: Moderate to severe liver impairment; Patients with childbearing potential; Lactation: Not for use in women; Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: weakness, dizziness, headache, insomnia. **Resp:** dyspnea. **CV:** chest pain, hypertension, peripheral edema. **GI:** constipation, diarrhea, nausea, abdominal pain, increased liver enzymes, vomiting. **GU:** hematuria, erectile dysfunction, incontinence, nocturia, urinary tract infections. **Derm:** alopecia, rashes, sweating. **Endo:** breast pain, gynecomastia. **Hemat:** anemia. **Metab:** hyperglycemia, weight loss. **MS:** back pain, pelvic pain, bone pain. **Neuro:** paresthesia. **Misc:** generalized pain, hot flashes, flu-like syndrome, infection.

Interactions

Drug-Drug: May increase the effect of **warfarin**.

Route/Dosage

PO (Adults): 50 mg once daily (must be given concurrently with LHRH analogue or following surgical castration).

Availability

Tablets: 50 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for adverse GI effects. Diarrhea is the most common cause of discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor serum prostate-specific antigen (PSA) periodically to determine response to therapy. If levels rise, assess patient for disease progression. May require periodic LHRH analogue administration without bicalutamide.
- Monitor liver function tests before and periodically during therapy. May cause elevated serum alkaline phosphatase, AST, ALT, and bilirubin concentrations. If transaminases increase >2 times normal, bicalutamide should be discontinued; levels usually return to normal after discontinuation.
- May cause increased BUN and serum creatinine, and decreased hemoglobin and WBCs.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Implementation

- Start treatment with bicalutamide at the same time as LHRH analogue.
- **PO:** May be administered in the morning or evening, without regard to food.

Patient/Family Teaching

- Instruct patient to take bicalutamide exactly as directed at the same time each day. Do not discontinue without consulting health care professional.
- Advise patient not to take other medications without consulting health care professional.
- Instruct patient to report severe or persistent diarrhea.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress; monitor for side effects.

Evaluation/Desired Outcomes

- Decreased spread of prostate carcinoma.

bisacodyl (bis-a-**koe**-dill)
Bisac-Evac, Bisaco-Lax, Bisacolax, Caroid, Carter's Little Pills, Dacodyl, Deficol, Dulcagen, Dulcolax, Feen-a-Mint, Fleet Laxative, Laxit, Modane, Reliable Gentle Laxative, Theralax, Women's Gentle Laxative

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: laxatives
Pharmacologic: stimulant laxatives

Pregnancy Category UK

Indications
Treatment of constipation. Evacuation of the bowel before radiologic studies or surgery. Part of a bowel regimen in spinal cord injury patients.

Action
Stimulates peristalsis. Alters fluid and electrolyte transport, producing fluid accumulation in the colon. **Therapeutic Effects:** Evacuation of the colon.

Pharmacokinetics
Absorption: Variable absorption follows oral administration; rectal absorption is minimal; action is local in the colon.
Distribution: Small amounts of metabolites excreted in breast milk.
Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (evacuation of bowel)

ROUTE	ONSET	PEAK	DURATION
PO	6–12 hr	unknown	unknown
Rectal	15–60 min	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Abdominal pain; Obstruction; Nausea or vomiting (especially with fever or other signs of an acute abdomen).
Use Cautiously in: Severe cardiovascular disease; Anal or rectal fissures; Excess or prolonged use (may result in dependence); Products containing tannic acid (Clysodrast) should not be used as multiple enemas (increased risk of hepatotoxicity); May be used during pregnancy and lactation.

Adverse Reactions/Side Effects
GI: abdominal cramps, nausea, diarrhea, rectal burning. **F and E:** hypokalemia (with chronic use). **MS:** muscle weakness (with chronic use). **Misc:** protein-losing enteropathy, tetany (with chronic use).

Interactions
Drug-Drug: Antacids, histamine H_2-receptor antagonists, and **gastric acid–pump inhibitors** may remove enteric coating of tablets resulting in gastric irritation/dyspepsia. May decrease the absorption of other **orally administered drugs** because of increased motility and decreased transit time.
Drug-Food: Milk may remove enteric coating of tablets, resulting in gastric irritation/dyspepsia.

Route/Dosage
PO (Adults and Children ≥12 yr): 5–15 mg (up to 30 mg/day) as a single dose.
PO (Children 3–11 yr): 5–10 mg (0.3 mg/kg) as a single dose.
Rect (Adults and Children ≥12 yr): 10 mg single dose.
Rect (Children 2–11 yr): 5–10 mg single dose.
Rect (Children <2 yr): 5 mg single dose.

Availability (generic available)
Enteric-coated tablets: 5 mg[OTC]. **Enteric coated and delayed release:** 5 mg[OTC]. **Suppositories:** 5 mg[OTC], 10 mg[OTC]. **Rectal suspension:** 10 mg/30 ml[OTC]. ***In combination with:*** tannic acid (Clysodrast[OTC]), docusate (Dulcodos[OTC]), hydroxypropyl methylcellulose (Fleet Bisacodyl Prep[OTC]). Also in Bowel Preparation kits with Magnesium citrate (Evac-Q-Kwik[OTC], EZ-EM Prep Kit[OTC], LiquiPrep Bowel Evacuant[OTC], Tridate Bowel Cleansing Kit[OTC]), Phosphate/biphosphate (Fleet Prep Kit. No. 1[OTC], Fleet Prep Kit No. 2[OTC], Fleet Prep Kit No. 3[OTC]), sennosides (X-Prep Bowel Evacuant Kit #1[OTC]), sennosides, magnesium citrate, magnesium sulfate (X-Prep Bowel Evacuant Kit #2[OTC]). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses
Constipation (Indications)

Implementation
- May be administered at bedtime for morning results.
- **PO:** Taking on an empty stomach will produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.

Copyright © 2008 by F.A. Davis

- Do not administer oral doses within 1 hr of milk or antacids; this may lead to premature dissolution of tablet and gastric or duodenal irritation.
- **Rect:** Suppository or enema can be given at the time a bowel movement is desired. Lubricate suppositories with water or water-soluble lubricant before insertion. Encourage patient to retain the suppository or enema 15–30 min before expelling.

Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Prolonged therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to at least 1500–2000 ml/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation (increasing bulk in the diet, increasing fluid intake, or increasing mobility). Normal bowel habits may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that bisacodyl should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

Evaluation/Desired Outcomes

- The patient's having a soft, formed bowel movement when used for constipation.
- Evacuation of colon before surgery or radiologic studies, or for patients with spinal cord injury.

bismuth subsalicylate

(**biz**-muth sub-sa-**lis**-i-late)
Bismatrol, Bismed, Kaopectate, Kapectolin, Kao-Tin, K-Pek, Peptic Relief, Pepto-Bismol, Pink Bismuth, PMS-Bismuth Subsalicylate

Classification
Therapeutic: antidiarrheals, antiulcer agents
Pharmacologic: adsorbents

Pregnancy Category C

Indications

Mild to moderate diarrhea. Nausea, abdominal cramping, heartburn, and indigestion that may accompany diarrheal illnesses. Treatment of ulcer disease associated with *Helicobacter pylori* (with anti-infectives). Treatment/prevention of traveler's (enterotoxigenic *Escherichia coli*) diarrhea. **Unlabeled uses:** Chronic infantile diarrhea.

Action

Promotes intestinal adsorption of fluids and electrolytes. Decreases synthesis of intestinal prostaglandins. **Therapeutic Effects:** Relief of diarrhea. Eradication of *H. pylori* with decreased recurrence of ulcer disease (with other agents).

Pharmacokinetics

Absorption: Bismuth is not absorbed; salicylate split from parent compound is >90% absorbed from the small intestine. Salicylate is highly bound to albumin.
Distribution: Salicylate crosses the placenta and enters breast milk.
Metabolism and Excretion: Bismuth is excreted unchanged in the feces. Salicylate undergoes extensive hepatic metabolism.
Half-life: Salicylate—2–3 hr for low doses; 15–30 hr with larger doses.

TIME/ACTION PROFILE (relief of diarrhea and other GI symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Aspirin hypersensitivity; cross-sensitivity with NSAIDs or oil of wintergreen may occur; Pedi: During or after recovery from chickenpox or flu-like illness (contains salicylate, which can cause Reye's syndrome); Geri: Geriatric patients who may have fecal impaction.
Use Cautiously in: Patients undergoing radiologic examination of the GI tract (bismuth is ra-

Copyright © 2008 by F.A. Davis

diopaque); Diabetes mellitus; Gout; OB, Lactation: Safety not established; avoid chronic use of large doses; Pedi, Geri: Potential for impaction.

Adverse Reactions/Side Effects

GI: constipation, gray-black stools, impaction (infants, debilitated patients).

Interactions

Drug-Drug: If taken with **aspirin**, may ↑ the risk of salicylate toxicity. May ↓ absorption of **tetracycline**. May ↓ effectiveness of **probenecid** (large doses).

Route/Dosage

PO (Adults): *Antidiarrheal*—2 tablets or 30 ml (15 ml of extra/maximum strength) q 30 min *or* 2 tablets q 60 min as needed (not to exceed 4.2 g/24 hr). *Antiulcer*—524 mg 4 times daily (as 2 tablets, 30 ml of regular strenth suspension or 15 ml of extra/maximum strength).
PO (Children 9–12 yr): 1 tablet or 15 ml (7.5 ml of extra/maximum strength) q 30–60 min (not to exceed 2.1 g/24 hr).
PO (Children 6–9 yr): 10 ml (5 ml of extra/maximum strength) q 30–60 min (not to exceed 1.4 g/24 hr).
PO (Children 3–6 yr): 5 ml (2.5 ml of extra/maximum strength) q 30–60 min (not to exceed 704 mg/24 hr).

Availability (generic available)

Tablets: 262 mg[OTC]. **Chewable tablets (cherry and other flavors):** 262 mg (contain calcium carbonate)[OTC], 300 mg[OTC]. **Liquid (cherry, caramel, peppermint, and other flavors):** 262 mg/15 ml[OTC], 264 mg/15 ml[OTC], 525 mg/15 ml[OTC]. ***In combination with:*** kaolin/pectin (Kaodene Non-Narcotic)[OTC], in a convenience package with metronidazole and tetracycline (Helidac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Diarrhea:** Assess the frequency and consistency of stools, presence of nausea and indigestion, and bowel sounds before and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration if diarrhea is prolonged.
- **Ulcers:** Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Chronic high doses may cause falsely ↑ uric acid levels with colorimetric assay.
- May interfere with radiologic examination of the GI tract.
- May cause abnormal results with alkaline phosphatase, AST, and ALT tests.
- May cause ↓ potassium levels and serum T_3 and T_4 concentrations.
- Large doses of salicylates may also cause prolonged prothrombin time (PT).
- For additional lab test considerations related to salicylate content, see salicylates monograph.

Potential Nursing Diagnoses

Diarrhea (Indications)
Constipation (Side Effects)

Implementation

- **PO:** Shake liquid before using. Chewable tablets may be chewed or allowed to dissolve before swallowing.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Inform patient that medication may temporarily cause stools and tongue to appear gray-black.
- Instruct patient that this medication contains aspirin. Advise patient taking concurrent aspirin products to discontinue bismuth subsalicylate if tinnitus, ringing in the ears occurs.
- **Diarrhea:** Instruct patient to notify health care professional if diarrhea persists for more than 2 days or if accompanied by a high fever.
- U.S. Centers for Disease Control and Prevention warn against giving salicylates to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.
- **Ulcers:** Advise patient to consult health care professional before taking other OTC ulcer remedies concurrently with bismuth subsalicylate.

Evaluation/Desired Outcomes

- Decrease in diarrhea.
- Decrease in symptoms of indigestion.
- Prevention of traveler's diarrhea.
- Treatment of ulcers.

bisoprolol (bis-**oh**-proe-lol)
Monocor, Zebeta

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

Indications
Management of hypertension.

Action
Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate.

Pharmacokinetics
Absorption: Well absorbed after oral administration, but 20% undergoes first-pass hepatic metabolism.
Distribution: Unknown.
Metabolism and Excretion: 50% excreted unchanged by the kidneys; remainder renally excreted as metabolites; 2% excreted in feces.
Half-life: 9–12 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment (dosage reduction recommended); Hepatic impairment (dosage reduction recommended); Pulmonary disease (including asthma; $beta_1$ selectivity may be lost at higher doses); avoid use if possible; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB, Lactation, Pedi: Safety not established; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Geri: Increased sensitivity to beta blockers; initial dosage reduction recommended.

Adverse Reactions/Side Effects
CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, liver function abnormalities, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions
Drug-Drug: General anesthetics, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent thyroid preparation administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May decrease the effectiveness of **theophylline**. May decrease the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage
PO (Adults): 5 mg once daily, may be increased to 10 mg once daily (range 2.5–20 mg/day).

Renal Impairment

Hepatic Impairment
PO (Adults): *CCr <40 ml/min*—Initiate therapy with 2.5 mg/day, titrate cautiously.

Availability (generic available)
Tablets: 5 mg, 10 mg. **Cost:** 5-mg and 10-mg tablets $35.75/30 tablets. ***In combination with:*** hydrochlorothiazide (Ziac). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.

Copyright © 2008 by F.A. Davis

- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. If a dose is missed, it should be taken as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls, but does not cure, hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure.

bivalirudin (bi-val-i-**roo**-din)
Angiomax

Classification
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Pregnancy Category B

Indications

Used in conjunction with aspirin to reduce the risk of acute ischemic complications in patients with unstable angina who are undergoing percutaneous transluminal angioplasty (PCTA) or percutaneous coronary intervention (PCI). Patients with or at risk of heparin-induced thrombocytopenia (HIT) and thrombosis syndrome (HITTS) who are undergoing PCI.

Action

Specifically and reversibly inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Copyright © 2008 by F.A. Davis

Distribution: Unknown.
Metabolism and Excretion: Cleared from plasma by a combination of renal mechanisms and proteolytic breakdown.
Half-life: 25 min (increased in renal impairment).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1–2 hr

Contraindications/Precautions
Contraindicated in: Active major bleeding; Hypersensitivity.
Use Cautiously in: Any disease state associated with an increased risk of bleeding; Heparin-induced thrombocytopenia or heparin-induced thrombocytopenia-thrombosis syndrome; Patients with unstable angina not undergoing PCTA; Patients with other acute coronary syndromes; Concurrent use with other platelet aggregation inhibitors (safety not established); Renal impairment (infusion rate reduction recommended if GFR <60 ml/min); Lactation, Pedi: Safety not established; OB: Use only if clearly needed.

Adverse Reactions/Side Effects
CNS: headache, anxiety, insomnia, nervousness. **CV:** hypotension, bradycardia, hypertension. **GI:** nausea, abdominal pain, dyspepsia, vomiting. **Hemat:** BLEEDING. **Local:** injection site pain. **MS:** back pain. **Misc:** pain, fever, pelvic pain.

Interactions
Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **abciximab**, **heparin**, **low molecular weight heparins/heparinoids**, **ticlopidine**, **thrombolytics**, or any other **drugs that inhibit coagulation**.
Drug-Natural Products: ↑ risk of bleeding with **arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, gingko, Panax ginseng, and others.**

Route/Dosage
IV (Adults): 0.75 mg/kg as a bolus injection, followed by a an infusion at a rate of 1.75 mg/kg/hr for the duration of the PCI procedure. An activated clotting time (ACT) should be performed 5 min after bolus dose and an additional bolus dose of 0.3 mg/kg may be administered if needed. Continuation of the infusion (at a rate of 1.75 mg/kg/hr) for up to 4 hr post-procedure is optional. If needed, the infusion may be continued beyond this initial 4 hr at a rate of 0.2 mg/kg/hr for up to 20 hr. Therapy should be initiated prior to the procedure and given in conjunction with aspirin.

Renal Impairment
IV (Adults): No reduction in the bolus dose is needed in any patient with renal impairment. *GFR 10–29 ml/min*—Reduce infusion rate to 1 mg/kg/hr; *Dialysis-dependent patients (off dialysis)*—Reduce infusion rate to 0.25 mg/kg/hr. ACT should be monitored in all patients with renal impairment.

Availability
Powder for injection: 250 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess for bleeding. Most common is oozing from the arterial access site for cardiac catheterization. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue bivalirudin immediately.
- Monitor vital signs. May cause bradycardia, hypertension, or hypotension. An unexplained decrease in blood pressure may indicate hemorrhage.
- ***Lab Test Considerations:*** Assess hemoglobin, hematocrit, and platelet count prior to bivalirudin therapy and periodically during therapy. May cause ↓ hemoglobin and hematocrit. An unexplained ↓ in hematocrit may indicate hemorrhage.
- Monitor ACT periodically in patients with renal dysfunction.

Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)

Implementation
- Administer IV just prior to PTCA, in conjunction with aspirin 300 mg to 325 mg/day. Do not administer IM.

IV Administration
- **Direct IV:** (for bolus dose). ***Diluent:*** Reconstitute each 250-mg vial with 5 ml of ster-

Copyright © 2008 by F.A. Davis

ile water for injection. Reconstituted vials are stable for 24 hr if refrigerated. Further dilute in 50 ml of D5W or 0.9% NaCl. Withdraw bolus dose out of bag. Infusion is stable for 24 hr at room temperature. ***Concentration:*** Final concentration of infusion is 5 mg/ml. ***Rate:*** Administer as a bolus injection.

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 250-mg vial as per the above directions. Further dilute in 50 ml of D5W or 0.9% NaCl. If infusion is to be continued after 4 hr (at a rate of 0.2 mg/kg/hr), reconstituted vial should be diluted in 500 ml of D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 5 mg/ml (for infusion rate of 1.75 mg/kg/hr); 0.5 mg/ml (for infusion rate of 0.2 mg/kg/hr). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** abciximab, amikacin, aminophylline, ampicillin, ampicillin-sulbactam, atropine, azithromycin, aztreonam, bumetanide, calcium gluconate, cefazolin, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftozoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dopamine, doxycycline, droperidol, enaprilat, epinephrine, epoprostenol, eptifibatide, erythromycin, esmolol, famotidine, fentanyl, fluconazole, furosemide, gentamicin, haloperidol, heparin, hydrocortisone, hydromorphone, isoproterenol, labetalol, levofloxacin, lidocaine, lorazepam, magnesium sulfate, meperidine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, piperacillin-tazobactam, potassium chloride, procainamide, promethazine, ranitidine, sodium bicarbonate, theophylline, ticarcillin-clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, verapamil.
- **Y-Site Incompatibility:** alteplase, amiodarone, amphotericin B, diazepam, prochlorperazine, reteplase, vancomycin.

Patient/Family Teaching

- Inform patient of the purpose of bivalirudin.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

HIGH ALERT

bleomycin (blee-oh-**mye**-sin)

Blenoxane

Classification

Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

Pregnancy Category D

Indications

Treatment of: Lymphomas, Squamous cell carcinoma, Testicular embryonal cell carcinoma, Choriocarcinoma, Teratocarcinoma. Intrapleural administration to prevent the reaccumulation of malignant effusions.

Action

Inhibits DNA and RNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed from IM and subcut sites. Absorption follows intrapleural and intraperitoneal administration.
Distribution: Widely distributed, concentrates in skin, lungs, peritoneum, kidneys, and lymphatics.
Metabolism and Excretion: 60–70% excreted unchanged by the kidneys.
Half-life: 2 hr (increased in renal impairment).

TIME/ACTION PROFILE (tumor response)

ROUTE	ONSET	PEAK	DURATION
IV, IM, Subcut	2–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Potential for fetal, infant harm.
Use Cautiously in: Renal impairment (dosage reduction required if <35 ml/min); Pulmonary impairment; Nonmalignant chronic debilitating illness; Patients with childbearing potential; Geri: Increased risk of pulmonary toxicity and related decrease in renal function.

Adverse Reactions/Side Effects

CNS: aggressive behavior, disorientation, weakness. **Resp:** PULMONARY FIBROSIS, pneumonitis. **CV:** hypotension, peripheral vaso-

Copyright © 2008 by F.A. Davis

constriction. **GI:** anorexia, nausea, stomatitis, vomiting. **Derm:** hyperpigmentation, mucocutaneous toxicity, alopecia, erythema, rashes, urticaria, vesiculation. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at tumor site, phlebitis at IV site. **Metab:** weight loss. **Misc:** ANAPHYLACTOID REACTIONS, chills, fever.

Interactions

Drug-Drug: Hematologic toxicity ↑ with concurrent use of **radiation therapy** and other **antineoplastics**. Concurrent use with **cisplatin** ↓ elimination of bleomycin and may ↑ toxicity. ↑ risk of pulmonary toxicity with other **antineoplastics** or thoracic **radiation therapy**. **General anesthesia** ↑ the risk of pulmonary toxicity. ↑ risk of Raynaud's syndrome when used with **vinblastine**.

Route/Dosage

Lymphoma patients should receive initial test doses of 2 units or less for the first 2 doses.

IV, IM, Subcut (Adults and Children): 0.25–0.5 unit/kg (10–20 units/m^2) weekly or twice weekly initially. If favorable response, lower maintenance doses given (1 unit/day or 5 units/wk IM or IV). May also be given as continuous IV infusion at 0.25 unit/kg or 15 units/m^2/day for 4–5 days.

Intrapleural (Adults): 15–20 units instilled for 4 hr, then removed.

Availability

Injection: 15 units/vial, 30 units vial/.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess for fever and chills. May occur 3–6 hr after administration and last 4–12 hr.
- Monitor for anaphylactic (fever, chills, hypotension, wheezing) and idiosyncratic (confusion, hypotension, fever, chills, wheezing) reactions. Keep resuscitation equipment and medications on hand. Lymphoma patients are at particular risk for idiosyncratic reactions that may occur immediately or several hours after therapy, usually after the first or second dose.
- Assess respiratory status for dyspnea and rales/crackles. Monitor chest x-ray before and periodically during therapy. Pulmonary toxicity occurs primarily in geriatric patients (age 70 or older) who have received 400 or more units or at lower doses in patients who received other antineoplastics or thoracic radiation. May occur 4–10 wk after therapy. Discontinue and do not resume bleomycin if pulmonary toxicity occurs.
- Assess nausea, vomiting, and appetite. Weigh weekly. Modify diet as tolerated. Antiemetics may be given before administration.
- ***Lab Test Considerations:*** Monitor CBC before and periodically during therapy. May cause thrombocytopenia and leukopenia (nadir occurs in 12 days and usually returns to pretreatment levels by day 17).
- Monitor baseline and periodic renal and hepatic function.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Disturbed body image (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Lymphoma patients should receive a 1- or 2-unit test dose 2–4 hrs before initiation of therapy. Monitor closely for anaphylactic reaction. May not detect reactors.
- Premedication with acetaminophen, corticosteroids, and diphenhydramine may reduce drug fever and risk of anaphylaxis.
- Reconstituted solution is stable for 24 hr at room temperature and for 14 days if refrigerated.
- **IM, Subcut:** ***Diluent:*** Reconstitute vial with 1–5 ml of sterile water for injection, 0.9% NaCl, or bacteriostatic water for injection. Do not reconstitute with diluents containing benzyl alcohol when used for neonates.

IV Administration

- **Direct IV:** ***Diluent:*** Prepare IV doses by diluting 15-unit vial with at least 5 ml of 0.9% NaCl. ***Concentration:*** Further dilute dose

Copyright © 2008 by F.A. Davis

in 50 to 1000 ml of D5W or 0.9% NaCl. ***Rate:*** Administer slowly over 10 min.

- **Syringe Compatibility:** cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cefepime, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, filgrastim, fludarabine, fluorouracil, gemcitabine, granisetron, heparin, leucovorin calcium, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine.
- **Intrapleural:** Dissolve 60 units in 50–100 ml of 0.9% NaCl.
- May be administered through thoracotomy tube by physician. Position patient as directed.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever, chills, wheezing, faintness, diaphoresis, shortness of breath, prolonged nausea and vomiting, or mouth sores occur.
- Encourage patient not to smoke because this may worsen pulmonary toxicity.
- Explain to the patient that skin toxicity may manifest itself as skin sensitivity, hyperpigmentation (especially at skin folds and points of skin irritation), and skin rashes and thickening.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Opioid analgesics may be required if pain interferes with eating.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in tumor size without evidence of hypersensitivity or pulmonary toxicity.

BRONCHODILATORS (XANTHINES)

aminophylline (am-in-**off**-i-lin)
Phyllocontin, Truphylline

theophylline (thee-**off**-i-lin)
Apo-Theo LA, Novo-Theophyl SR, PMS-Theophylline, Pulmophylline, Quibron-T, Theochron, Theo-24, Uniphyl

Classification
Therapeutic: bronchodilators
Pharmacologic: xanthines

Pregnancy Category C

Indications

Long-term control of reversible airway obstruction caused by asthma or COPD. Increases diaphragmatic contractility (aminophylline). **Unlabeled uses:** Respiratory and myocardial stimulant in premature infant apnea (apnea of prematurity) (aminophylline).

Action

Inhibit phosphodiesterase, producing increased tissue concentrations of cyclic adenosine monophosphate (cAMP). Increased levels of cAMP result in: Bronchodilation, CNS stimulation, Positive inotropic and chronotropic effects, Diuresis, Gastric acid secretion. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Aminophylline releases theophylline after administration. Well absorbed from oral dosage forms; absorption from extended-release dosage forms is slow but complete.
Distribution: Widely distributed; crosses the placenta; breast milk concentrations are 70% of plasma levels; not distributed into adipose tissue.
Metabolism and Excretion: Aminophylline is converted to theophylline; theophylline is 90% metabolized by the liver to several metabolites (including the active metabolites, caffeine and 3–methylxanthine) which may accumulate in neonates; metabolites are renally excreted; 10% excreted unchanged by the kidneys.
Half-life: *Theophylline*—Premature infants: 20–30 hr; Term infants: 11–25 hr; Children 1–4 yr: 3.4 hr; Children 6–17 yr: 3.7 hr; Adults: 9–10 hr (increased in patients >60 yr, patients with CHF or liver disease; decreased in cigarette smokers).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET†	PEAK	DURATION
Aminophylline PO	15–60 min	1–2 hr	6–8 hr
Aminophylline PO–ER	unknown	4–7 hr	8–12 hr
Aminophylline IV	rapid	end of infusion	6–8 hr
Theophylline PO	rapid	1–2 hr	6 hr
Theophylline PO–ER	delayed	4–8 hr	8–24 hr
Theophylline IV	rapid	end of infusion	6–8 hr

†Provided that a loading dose has been given and steady-state blood levels exist

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aminophylline or theophylline.

Use Cautiously in: CHF, liver disease, or hypothyroidism (dosage reduction required); Cardiac arrhythmias; Peptic ulcer disease; Seizure disorder; OB: Has been used safely; Lactation: Safety not established; Pedi: Dosage reduction required in children <1 yr; Geri, OB: Dosage reduction required due to enhanced potential for adverse reaction.

Adverse Reactions/Side Effects

CNS: SEIZURES, anxiety, headache, insomnia, irritability. **CV:** ARRHYTHMIAS, tachycardia, angina, palpitations. **GI:** nausea, vomiting, anorexia. **Neuro:** tremor. **Derm:** rashes.

Interactions

Drug-Drug: Additive CV and CNS side effects with **adrenergics (sympathomimetic)**. May ↓ the therapeutic effect of **lithium** and **phenytoin**. **Nicotine** (cigarettes, gum, transdermal patches), **barbiturates**, **phenytoin**, **nevirapine** and **rifampin** may ↑ metabolism and may ↓ effectiveness. **Erythromycin**, **beta blockers**, **clarithromycin**, **calcium channel blockers**, **cimetidine**, **doxycycline**, **estrogens**, **hormonal contraceptives**, **disulfiram**, **fluvoxamine**, **isoniazid**, **ketoconazole**, **mexiletine**, **nefazodone**, **protease inhibitors**, **quinidine**, some **fluoroquinolones**, and large doses of **allopurinol** ↓ metabolism and may lead to toxicity.

Drug-Natural Products: Caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↑ serum levels and risk of CNS and cardiovascular side effects. ↓ serum levels and effectiveness with **St. John's wort**.

Drug-Food: Excessive regular intake of **charcoal-broiled foods** may ↓ effectiveness.

Route/Dosage

Dose should be determined by theophylline serum level monitoring. Loading dose should be decreased or eliminated if theophylline preparation has been used in preceding 24 hr. Aminophylline is 80% theophylline (100 mg aminophylline = 80 mg theophylline). Extended-release (controlled-release, sustained-release) products may be given q 8–24 hr, depending upon the formulation.

Aminophylline

PO (Adults and Children): See theophylline for oral doses.

IV (Adults): *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.7 mg/kg/hr (0.56 mg/kg/hr of theophylline) via continuous infusion (non-smokers); an infusion rate of 0.9 mg/kg/hr (0.72 mg/kg/hr of theophylline) should be used for smokers.

IV (Geriatric Patients and Adult Patients with Cor Pulmonale): *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.6 mg/kg/hr (0.47 mg/kg/hr of theophylline) via continuous infusion.

IV (Adults with CHF or Liver Failure): *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.5 mg/kg/hr (0.39 mg/kg/hr of theophylline) via continuous infusion.

IV (Children 12–16 yr): *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.7 mg/kg/hr (0.56 mg/kg/hr of theophylline) via continuous infusion.

IV (Children 9–12 yr): *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.9 mg/kg/hr (0.72 mg/kg/hr of theophylline) via continuous infusion.

IV (Children 1–9 yr): *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 1–1.2 mg/kg/hr (0.8–0.96 mg/kg/hr of theophyllne) via continuous infusion.

IV (Children 6 mo–1 yr): *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.6–0.7 mg/kg/hr

Copyright © 2008 by F.A. Davis

(0.48–0.56 mg/kg/hr of theophylline) via continuous infusion.
IV (Infants 6 wk–6 mo): *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.5 mg/kg/hr (0.4 mg/kg/hr of theophylline) via continuous infusion.

Theophylline

PO (Adults Healthy, Non-smoking): *Loading dose*—5 mg/kg, followed by 10 mg/kg/day divided q 8–12 hr (not to exceed 900 mg/day).
PO (Adults with CHF, Cor Pulmonale, or Liver Dysfunction): *Loading dose*—5 mg/kg, followed by 5 mg/kg/day divided q 8–12 hr (not to exceed 400 mg/day).
PO (Children 12–16 yr, Non-smoking): *Loading dose*—5 mg/kg, followed by 13 mg/kg/day divided q 8–12 hr.
PO (Children 9–12 yr, adolescent and adult smokers <50 yr): *Loading dose*—5 mg/kg, followed by 16 mg/kg/day divided q 8–12 hr.
PO (Children 1–9 yr): *Loading dose*—5 mg/kg, followed by 20–24 mg/kg/day divided q 8–12 hr.
PO (Infants 6 mo–1 yr): *Loading dose*—5 mg/kg, followed by 12–18 mg/kg/day divided q 6–8 hr.
PO (Infants 6 wk–6 mo): *Loading dose*—5 mg/kg, followed by 10 mg/kg/day divided q 6–8 hr.
PO (Neonates up to 6 wks): *Loading dose*—4 mg/kg, followed by 4 mg/kg/day divided q 12 hr.
IV (Adults and Children): See aminophylline for IV doses.

Availability

Aminophylline

Tablets: 100 mg, 200 mg. **Extended-release tablets:** ♣225 mg, ♣350 mg. **Oral solution:** 105 mg/5 ml. **Suppositories:** 250 mg, 500 mg. **Injection:** 25 mg/ml.

Theophylline

Sustained-release tablets (8–12 hr): 300 mg. **Extended-release tablets (12–24 hr):** 100 mg, 200 mg, 300 mg, 450 mg. **Controlled-release tablets (24 hr):** 400 mg, 600 mg. **Extended-release capsules (12 hr):** 125 mg, 200 mg, 300 mg. **Extended-release capsules (24 hr):** 100 mg, 200 mg, 300 mg, 400 mg. **Elixir (orange/raspberry, mixed fruit, and other flavors):** 80 mg/15 ml. **Injection (with dextrose):** 0.8 mg/ml, 1.6 mg/ml, 2 mg/ml, 3.2 mg/ml, 4 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure, pulse, respiratory status (rate, lung sounds, use of accessory muscles, number and severity of apnea spells in infants) before and throughout therapy. Ensure that oxygen therapy is correctly instituted during acute asthma attacks.
- Monitor intake and output ratios for an increase in diuresis or fluid overload.
- Patients with a history of cardiovascular problems should be monitored for chest pain and ECG changes (PACs, supraventricular tachycardia, PVCs, ventricular tachycardia). Resuscitative equipment should be readily available.
- Monitor pulmonary function tests before and periodically during therapy to determine therapeutic efficacy in patients with chronic bronchitis or emphysema.
- ***Lab Test Considerations:*** Monitor ABGs, acid-base, and fluid and electrolyte balance in patients receiving parenteral therapy or whenever required by patient's condition.
- ***Toxicity and Overdose:*** Monitor drug levels routinely, especially in patients requiring high doses or during prolonged intensive therapy. Serum sample should be obtained at time of peak absorption. Peak levels should be evaluated 30 min after a 30 min IV loading dose, 12–24 hr after initiation of a continuous infusion, 1–2 hr after rapid-acting oral forms, and 4–12 hr after extended-release oral forms. Therapeutic plasma levels range from 10–15 mcg/ml for asthma and 6–14 mcg/ml for apnea of prematurity. Drug levels in excess of 20 mcg/ml are associated with toxicity. Caffeine ingestion may falsely elevate drug concentration levels: Observe patient for symptoms of drug toxicity (anorexia, nausea, vomiting, stomach cramps, diarrhea, confusion, headache, restlessness, flushing, increased urination, insomnia, tachycardia, arrhythmias, seizures). Notify physician or other health care professional immediately if these occur. Tachycardia, ventricular arrhythmias, or seizures may be the first sign of toxicity. Geri: Patients over 60 yr have increased risk of toxicity and sensitivity to toxic effects due to age-related pharmacodynamic and pharmacokinetic changes. Theophylline doses should not exceed 400 mg/d. Assess frequently.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Activity intolerance (Indications)

Implementation

- Administer around the clock to maintain therapeutic plasma levels. Once-a-day doses should be administered in the morning.
- Do not refrigerate elixirs; crystals may form. Crystals should dissolve when liquid is warmed to room temperature.
- Wait at least 4–6 hr after stopping IV therapy to begin immediate-release oral dosage; for extended-release oral dosage form, give first oral dose at time of IV discontinuation.
- **PO:** Administer oral preparations with food or a full glass of water to minimize GI irritation. Food slows, but does not reduce, the extent of absorption. May be administered 1 hr before or 2 hr after meals for more rapid absorption. Swallow tablets whole; do not crush, break, or chew enteric-coated or extended-release tablets (extended-release tablets may be broken if scored). Pedi: Use calibrated measuring device to ensure accurate dose of liquid preparations.

Aminophylline

IV Administration

- **IV:** ***Diluent:*** May be diluted in D5W, D10W, D20W, 0.9% NaCl, 0.45% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.25% NaCl, or LR. ***Concentration:*** 1 mg/ml (maximum 25 mg/ml). Mixture is stable for 24 hr if refrigerated.
- Do not administer discolored or precipitated solution. Flush main IV line before administration.
- If extravasation occurs, local injection of 1% procaine and application of heat may relieve pain and promote vasodilation. Loading Dose. Administer over 20–30 min. ***Rate:*** Do not exceed 20–25 mg/min in adults or 0.36 mg/kg/min in children. Administer via infusion pump to ensure accurate dosage. Rapid administration may cause chest pain, dizziness, hypotension, tachypnea, flushing, arrhythmias, or a reaction to the solution or administration technique (chills; fever; redness, pain, or swelling at injection site).
- **Continuous Infusion:** Usually given as a loading dose in a small volume followed by continuous infusion in larger volume. ***Rate:*** See Route and Dosage section for rates.
- **Syringe Compatibility:** heparin, metoclopramide.
- **Syringe Incompatibility:** doxapram.
- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, ceftazidime, cimetidine, cladribine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gemcitabine, granisetron, inamrinone, labetalol, melphalan, meropenem, morphine, paclitaxel, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vecuronium, vitamin B complex with vitamin C.
- **Y-Site Incompatibility:** amiodarone, ciprofloxacin, dobutamine, hydralazine, ondansetron, vinorelbine, warfarin.
- **Additive Incompatibility:** Admixing is not recommended because of dose titration and incompatibilities.

Theophylline

IV Administration

- **Continuous Infusion:** Premixed IV theophylline and 5% dextrose are packed in a moisture-barrier overwrap. Remove immediately before administration and squeeze bag to check for leaks. Discard if solution is not clear.
- **Loading Dose:** Administer over 20–30 min. If patient has had another form of theophylline before loading dose, serum theophylline level should be obtained and loading dose proportionately reduced. ***Rate:*** Do not exceed 20–25 mg/min. Rapid administration may cause chest pain, dizziness, hypotension, tachypnea, flushing, arrhythmias, or a reaction to the solution or administration technique (chills; fever; redness, pain, or swelling at injection site). Infusion rate may be increased after 12 hr. Administer via infusion pump to ensure accurate dosage. Monitor ECG continuously; tachyarrhythmias may occur.
- **Y-Site Compatibility:** acyclovir, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefotetan, ceftazidime, ceftriaxone, cimetidine, cisatracurium, clindamycin, diltiazem,

Copyright © 2008 by F.A. Davis

dobutamine, dopamine, doxycycline, erythromycin lactobionate, famotidine, fluconazole, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, lidocaine, methyldopate, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, nafcillin, nitroglycerin, nitroprusside, penicillin G potassium, piperacillin, potassium chloride, ranitidine, remifentanil, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin.

- **Y-Site Incompatibility:** hetastarch, phenytoin.
- **Additive Incompatibility:** Admixing is not recommended because of dose titration and incompatibilities.

Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals. Missed doses should be taken as soon as possible or omitted if close to next dose.
- Encourage the patient to drink adequate liquids (2000 ml/day minimum) to decrease the viscosity of the airway secretions.
- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional. These medications may increase side effects and cause arrhythmias.
- Encourage patients not to smoke. A change in smoking habits may necessitate a change in dosage.
- Advise patient to minimize intake of xanthine-containing foods or beverages (colas, coffee, chocolate) and not to eat charcoal-broiled foods daily.
- Instruct patient not to change brands without consulting health care professional.
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Emphasize the importance of having serum levels routinely tested every 6–12 mo.

Evaluation/Desired Outcomes

- Increased ease in breathing.
- Clearing of lung fields on auscultation.
- Respiratory and myocardial stimulation in apnea of infancy (aminophylline).

budesonide, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), CORTICOSTEROIDS (SYSTEMIC).

bumetanide

(byoo-**met**-a-nide)
Bumex, ✱Burinex

Classification
Therapeutic: diuretics
Pharmacologic: loop diuretics

Pregnancy Category C

Indications

Edema due to heart failure, hepatic disease, or renal impairment.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions).

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration.
Distribution: Widely distributed.
Protein Binding: 72–96%.
Metabolism and Excretion: Partially metabolized by liver; 50% eliminated unchanged by kidneys and 20% excreted in feces.
Half-life: 60–90 min (6 hr in neonates).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	4–6 hr
IM	30–60 min	1–2 hr	4–6 hr
IV	2–3min	15–45 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria.
Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; Lactation, Pedi: Safety not established; bumetanide is a potent displacer of bilirubin and should be used cautiously in critically ill or jaundiced neonates because of risk of kernicterus. Injection contains benzyl alcohol, which may cause gasping syndrome in neonates; Geri: May have increased risk of side ef-

Copyright © 2008 by F.A. Davis

fects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

CNS: dizziness, encephalopathy, headache. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** diarrhea, dry mouth, nausea, vomiting. **GU:** excessive urination. **Derm:** photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **MS:** arthralgia, muscle cramps, myalgia. **Misc:** increased BUN.

Interactions

Drug-Drug: ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDS** ↓ effects of bumetanide.

Route/Dosage

PO (Adults): 0.5–2 mg/day given in 1–2 doses; titrate to desired response (maximum daily dose = 10 mg/day).
IM, IV (Adults): 0.5–1 mg/dose, may repeat q 2–3 hr as needed (up to 10 mg/day).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg. **Cost:** *Generic*—0.5 mg $37.32/100, 1 mg $31.31/100, 2 mg $49.97/100. **Injection:** 0.25 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify physician or other health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. ↑ risk of digoxin toxicity due to potassium-depleting effect of diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

Implementation

- Do not confuse Bumex (bumetanide) with Buprenex (buprenorphine).
- If administering twice daily, give last dose no later than 5pm to minimize disruption of sleep cycle.
- IV is preferred over IM for parenteral administration.
- **PO:** May be taken with food to minimize gastric irritation.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 0.25 mg/ml. ***Rate:*** Administer slowly over 1–2 min.
- **Continuous Infusion:** ***Diluent:*** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. ***Concentration:*** Not to exceed 0.25 mg/ml. ***Rate:*** Infuse over 5 min. May be administered over 12 hr for patients with renal impairment.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, atropine, aztreonam, bivalirudin, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime,

Copyright © 2008 by F.A. Davis

ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone, dexmedetomidate, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, filgrastim, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, ranitidine, rifampin, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.

- **Y-Site Incompatibility:** diazepam, fenoldopam, ganciclovir, haloperidol, nesiritide, phenytoin, quinupristin/dalfopristin, sulfamethoxazole/trimethoprim.

Patient/Family Teaching

- Instruct patient to take bumetanide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that drinking alcohol, exercising during hot weather, or standing for long periods may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium. See Appendix L.
- Advise patient to contact health care professional of gain more than 3 lbs in one day.
- Advise patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise patients with diabetes to monitor blood glucose closely; may cause increased levels.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.

bupivacaine, See EPIDURAL LOCAL ANESTHETICS.

HIGH ALERT

buprenorphine

(byoo-pre-**nor**-feen)
Buprenex, Subutex

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

Schedule III

Pregnancy Category C

Indications

IM, IV: Management of moderate to severe acute pain. **SL:** Treatment of opioid dependence; suppresses withdrawal symptoms in opioid detoxification.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients when used as an analgesic. **Therapeutic Effects: IM, IV: Decreased severity of pain. SL:** Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids. Produces a relatively mild withdrawal compared to other agents.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed after IM and SL use; IV administration results in complete bioavailability.
Distribution: Crosses the placenta; enters breast milk. CNS concentration is 15–25% of plasma.
Protein Binding: 96%.
Metabolism and Excretion: Metabolized by the liver mostly via the CYP3A4 enzyme system; one metabolite is active.
Half-life: 2–3 hr (parenteral).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	15 min	60 min	6 hr†
IV	rapid	less than 60 min	6 hr†

†4–5 hr in children

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Enters breast milk; avoid use or discontinue nursing.
Use Cautiously in: Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients (dose reduction required); Undiagnosed abdominal pain; Prostatic hyperplasia; OB: Safety not established; neonatal withdrawal may occur in infants born to patients receiving SL buprenorphine during pregnancy; Geri: Dose reduction required.

Adverse Reactions/Side Effects

CNS: confusion, dysphoria, hallucinations, sedation, dizziness, euphoria, floating feeling, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** sweating, clammy feeling. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (↑ CNS and respiratory depression and hypotension ↓ buprenorphine dose by 50%; may need to ↓ **MAO inhibitor** dose). ↑ CNS depression with **alcohol**, **antihistamines**, **antidepressants**, and **sedative/hypnotics**. May ↓ effectiveness of other **opioid analgesics**. Inhibitors of the CYP3A4 enzyme system including **azole antifungals (itraconazole, ketoconazole), erythromycin protease inhibitor antiretrovirals (ritonavir, indinavir, saquinavir)** ↑ blood levels and effects; dose reduction may be necessary during concurrent use. Inducers of the CYP3A4 enzyme system including **carbamazepine**, **rifampin**, or **phenytoin** ↓ blood levels and effects; dose modification may be necessary during concurrent use. Concurrent abuse of IV buprenorphine and **benzodiazepines** may result in coma and death.
Drug-Natural Products: Concomitant use of **kava kava, valerian, chamomile**, or **hops can ↑ CNS depression.**

Route/Dosage

Analgesia

IM, IV (Adults): 0.3 mg q 4–6 hr as needed. May repeat initial dose after 30 min (up to 0.3 mg q 4 hr or 0.6 mg q 6 hr); 0.6-mg doses should be given only IM.
IM, IV (Children 2–12 yr): 2–6 mcg (0.002–0.006 mg)/kg q 4–6 hr.

Treatment of opioid dependence

SL (Adults): 12–16 mg/day as a single dose.

Availability

Sublingual tablets: 2 mg, 8 mg. ***In combination with:*** naloxone (Suboxone). See Appendix B. **Injection:** 300 mcg (0.3 mg)/ml.

NURSING IMPLICATIONS

Assessment

- **Pain:** Assess type, location, and intensity of pain before and 1 hr after IM and 5 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Single doses of 600 mcg (0.6 mg) should be administered IM. Patients requiring doses higher than 600 mcg (0.6 mg) should be converted to an opioid agonist. Buprenorphine is not recommended

Copyright © 2008 by F.A. Davis

for prolonged use or as first-line therapy for acute or cancer pain.

- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess level of consciousness, blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Buprenorphine 0.3–0.4 mg has approximately equal analgesic and respiratory depressant effects to morphine 10 mg.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased blood pressure and temperature) in patients who are physically dependent on opioid agonists. Symptoms may occur up to 15 days after discontinuation and persist for 1–2 wk.
- Buprenorphine has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving buprenorphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- **Opioid Dependence:** Assess patient for signs and symptoms of opioid withdrawal before and during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- Monitor liver function tests prior to and periodically during therapy for opioid dependence.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Naloxone may not completely reverse respiratory depressant effects of buprenorphine; may require mechanical ventilation, oxygen, IV fluids, and vasopressors.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Ineffective coping (Indications)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse Buprenex (buprenorphine) with Bumex (bumetanide).
- **Pain:** Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics has additive effects and may permit lower opioid doses. **SL:** Administer sublingually. Usually takes 2–10 min for tablets to dissolve. If more than one tablet is prescribed, place multiple tablets under the tongue or 2 at a time until all tablets are dissolved. Do not chew or swallow; decreases amount of medication absorbed.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **Direct IV:** May give IV undiluted. ***High Alert:*** Administer slowly. Rapid administration may cause respiratory depression, hypotension, and cardiac arrest. ***Rate:*** Give over at least 2 minutes.
- **Syringe Compatibility:** glycopyrrolate, heparin, midazolam.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cefipime, cisatracurium, cladribine, docetaxel, etoposide phosphate, filgrastim, granisetron, linezolid, melphalan, oxaliplatin, pemetrexed, piperacillin/tazobactam, propofol, remifentanil, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, doxorubicin liposome, lansoprazole.
- **Solution Compatibility:** 0.9% NaCl, D5W, D5/0.9% NaCl, lactated Ringer's injection,

Copyright © 2008 by F.A. Davis

Ringer's injection. Opioid Dependence. Must be prescribed by health care professional with special training. Induction is usually started with buprenorphine (Subutex) over 3–4 days. Initial dose should be administered at least 4 hr after last opioid dose and preferably when early signs of opioid whitdrawal appear. Once patient is on a stable dose, maintenance therapy with buprenorphine/naloxone (Suboxone) is preferred for continued, unsupervised treatment.

Patient/Family Teaching

- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional before taking other Rx or OTC medication or herbal products.
- **Pain:** Instruct patient on how and when to ask for pain medication.
- Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- **Opioid Dependence:** Instruct patient in the correct use of medication; directions for use must be followed exactly. Medication must be used regularly, not occasionally. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular dosing schedule. Do not take 2 doses at once unless directed by health care professional. Do not discontinue use without consulting health care professional; abrupt discontinuation may cause withdrawal symptoms. If medication is discontinued, flush unused tablets down the toilet.
- Caution patient that buprenorphine may be a target for people who abuse drugs; store medications in a safe place to protect them from theft. Selling or giving this medication to others is against the law.
- Caution patient that injection of Suboxone can lead to bad withdrawal symptoms.
- Advise patient if admitted to the emergency room to inform treating physician and emergency room staff of physical dependence on opioids and of treatment regimen.
- Advise patient to notify health care professional promptly if faintness, dizziness, confusion, slowed breathing, skin or whites of eyes turn yellow, urine turns dark, light colored stools, decreased appetite, nausea, or abdominal pain occur.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids.

buPROPion

(byoo-**proe**-pee-on)
Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

Classification
Therapeutic: antidepressants
Pharmacologic: aminoketones

Pregnancy Category B

Indications

Treatment of depression (with psychotherapy). Depression in patient with seasonal affective disorder (XL only). Smoking cessation (Zyban only). **Unlabeled uses:** Treatment of ADHD in adults (SR only). To increase sexual desire in women.

Action

Decreases neuronal reuptake of dopamine in the CNS. Diminished neuronal uptake of serotonin and norepinephrine (less than tricyclic antidepressants). **Therapeutic Effects:** Diminished depression. Decreased craving for cigarettes.

Pharmacokinetics

Absorption: Although well absorbed, rapidly and extensively metabolized by the liver.
Distribution: Unknown.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Extensively metabolized by the liver. Some conversion to active metabolites.
Half-life: 14 hr (active metabolites may have longer half-lives).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of bulimia, and anorexia nervosa; Concurrent MAO inhibitor or ritonavir therapy; Lactation: Secreted in breast milk; potential for serious adverse reactions in nursing infants. Discontinue nursing or discontinue drug.
Use Cautiously in: Renal/hepatic impairment (↓ dose recommended); Recent history of MI; History of suicide attempt; Unstable cardiovascular status; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; this risk appears to be greater in adolescents or children; OB: Use only if benefit to patient outweighs potential risk to fetus; Geri: Increased risk of drug accumulation; increased sensitivity to effects.
Exercise Extreme Caution in: History of seizures, head trauma or concurrent medications that ↓ seizure threshold (theophylline, antipsychotics, antidepressants, systemic corticosteroids); Severe hepatic cirrhosis (↓ dose required). Pedi: Increased risk of suicidal thinking and behavior. Observe carefully, especially at initiation of therapy and during increases or decreases in dose.

Adverse Reactions/Side Effects

CNS: SEIZURES, agitation, headache, insomnia, mania, psychoses. **GI:** dry mouth, nausea, vomiting, change in appetite, weight gain, weight loss. **Derm:** photosensitivity. **Endo:** hyperglycemia, hypoglycemia, syndrome of inappropriate ADH secretion. **Neuro:** tremor.

Interactions

Drug-Drug: ↑ risk of adverse reactions when used with **amantadine**, **levodopa**, or **MAO inhibitors** (concurrent use of MAO inhibitors is contraindicated). ↑ risk of seizures with **phenothiazines**, **antidepressants**, **theophylline**, **corticosteroids**, **OTC stimulants/anorectics**, or cessation of **alcohol** or **benzodiazepines** (avoid or minimize alcohol use). Blood levels ↑ by **ritonavir** (avoid concurrent use). **Carbamazepine** may ↓ blood levels and effectiveness. Concurrent use with **nicotine** replacement may cause hypertension. ↑ risk of bleeding with **warfarin**. Bupropion and one of its metabolites inhibit the CYP2D6 enzyme system and may ↑ levels and risk of toxicity from **antidepressants** (SSRIs and tricyclic), some **beta blockers**, **antiarrhythmics**, and **antipsychotics**.

Route/Dosage

Depression

PO (Adults): *Immediate-release*—100 mg twice daily initially; after 3 days may increase to 100 mg 3 times daily; after at least 4 wk of therapy, may increase up to 450 mg/day in divided doses (not to exceed 150 mg/dose; wait at least 6 hr between doses at the 300 mg/day dose or at least 4 hr between doses at the 450 mg/day dose). *Sustained-release*—150 mg once daily in the morning; after 3 days, may increase to 150 mg twice daily with at least 8 hr between doses; after at least 4 wk of therapy, may increase to a maximum daily dose of 400 mg given as 200 mg twice daily. *Extended-release*—150 mg once daily in the morning, may be increased after 4 days to 300 mg once daily; some patients may require up to 450 mg/day as a single daily dose.

Seasonal Affective Disorder

PO (Adults): 150 mg/day in the morning; if dose is well tolerated, increase to 300 mg/day in one wk. Doses should be tapered to 150 mg/day for 2 wks before discontinuing.

Smoking cessation

PO (Adults): *Zyban*—150 mg once daily for 3 days, then 150 mg twice daily for 7–12 wk (doses should be at least 8 hr apart).

Availability (generic available)

Tablets: 75 mg, 100 mg. **Cost:** *Generic*—75 mg $54.99/90, 100 mg $66.99/90. **Sustained-release tablets:** 100 mg, 150 mg, 200 mg. **Cost:** *Generic*—100 mg $189.97/180, 150 mg $163.93/180, 200 mg $334.96/180. **Extended-release tablets:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg $367.97/90, 300 mg $365.96/90.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Inform physician or other health care professional if patient dem-

Copyright © 2008 by F.A. Davis

onstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- ***Lab Test Considerations:*** Monitor hepatic and renal function closely in patients with kidney or liver impairment to prevent ↑ serum and tissue bupropion concentrations.

Potential Nursing Diagnoses
Ineffective coping (Indications)

Implementation
- Do not confuse bupropion with buspirone. Do not confuse Zyban (bupropion) with Zagam (Sparfloxacin). Do not administer bupropion (Wellbutrin) with Zyban, which contains the same ingredients.
- Administer doses in equally spaced time increments during day to minimize the risk of seizures. Risk of seizures increases fourfold in doses greater than 450 mg per day.
- May be initially administered concurrently with sedatives to minimize agitation. This is not usually required after the 1st wk of therapy.
- Insomnia may be decreased by avoiding bedtime doses. May require treatment during 1st wk of therapy.
- May be administered with food to lessen GI irritation.
- Nicotine patches, gum, inhalers, and spray may be used concurrently with bupropion.
- **PO:** Sustained-release (SR or XL) tablets should be swallowed whole; do not break, crush, or chew.
- **Seasonal Affective Disorder:** Begin administration in autumn prior to the onset of depressive symptoms. Continue therapy through winter and begin to taper and discontinue in early spring.

Patient/Family Teaching
- Instruct patient to take bupropion as directed. Take missed doses as soon as possible and space day's remaining doses evenly at not less than 4-hr intervals. Missed doses for smoking cessation should be omitted. Do not double doses or take more than prescribed. May require 4 wk or longer for full effects. Do not discontinue without consulting health care professional. May require gradual reduction before discontinuation.
- Bupropion may impair judgment or motor and cognitive skills. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol during therapy and to consult with health care professional before taking other medications with bupropion, such as Zyban.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to notify health care professional if rash or other troublesome side effects occur.
- Inform patient that unused shell of XL tablets may appear in stool; this is normal.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.
- **Smoking Cessation:** Smoking should be stopped during the 2nd week of therapy to allow for the onset of bupropion and to maximize the chances of quitting.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. Acute episodes of depression may require several months of treatment.
- Cessation of smoking.

busPIRone (byoo-spye-rone)
BuSpar

Classification
Therapeutic: antianxiety agents

Pregnancy Category B

Copyright © 2008 by F.A. Davis

Indications
Management of anxiety.

Action
Binds to serotonin and dopamine receptors in the brain. Increases norepinephrine metabolism in the brain. **Therapeutic Effects:** Relief of anxiety.

Pharmacokinetics
Absorption: Rapidly absorbed.
Distribution: Unknown.
Protein Binding: 95% bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); 20–40% excreted in feces.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (relief of anxiety)

ROUTE	ONSET	PEAK	DURATION
PO	7–10 days	3–4 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment; Concurrent use of MAO inhibitors; Ingestion of large amounts of grapefruit juice.
Use Cautiously in: Patients receiving other antianxiety agents (other agents should be slowly withdrawn to prevent withdrawal or rebound phenomenon); Patients receiving other psychotropics; Lactation, OB, Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, excitement, fatigue, headache, insomnia, nervousness, weakness, personality changes. **EENT:** blurred vision, nasal congestion, sore throat, tinnitus, altered taste or smell, conjunctivitis. **Resp:** chest congestion, hyperventilation, shortness of breath. **CV:** chest pain, palpitations, tachycardia, hypertension, hypotension, syncope. **GI:** nausea, abdominal pain, constipation, diarrhea, dry mouth, vomiting. **GU:** changes in libido, dysuria, urinary frequency, urinary hesitancy. **Derm:** rashes, alopecia, blisters, dry skin, easy bruising, edema, flushing, pruritus. **Endo:** irregular menses. **MS:** myalgia. **Neuro:** incoordination, numbness, paresthesia, tremor. **Misc:** clamminess, sweating, fever.

Interactions
Drug-Drug: Use with **MAO inhibitors** may result in hypertension and is not recommended. **Erythromycin**, **nefazodone**, **ketoconazole**, **itraconazole**, **ritonavir**, and other **inhibitors of CYP3A4** ↑ blood levels and effects of buspirone; dose reduction is recommended (decrease to 2.5 mg twice daily with erythromycin, decrease to 2.5 mg once daily with nefazodone). **Rifampin**, **dexamethasone**, **phenytoin**, **phenobarbital**, **carbamazepine**, and other **inducers of CYP3A4** ↓ blood levels and effects of buspirone; dose adjustment may be necessary. Avoid concurrent use with **alcohol**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression.
Drug-Food: Grapefruit juice ↑ serum levels and effect; ingestion of large amounts of grapefruit juice is not recommended.

Route/Dosage
PO (Adults): 7.5 mg twice daily; increase by 5 mg/day q 2–4 days as needed (not to exceed 60 mg/day). Usual dose is 20–30 mg/day (in 2 divided doses).

Availability (generic available)
Tablets: 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg.
Cost: *Generic*—5 mg $79.97/180, 7.5 mg $110.97/180, 10 mg $128.99/180, 15 mg $129.40/180, 30 mg $267.93/180.

NURSING IMPLICATIONS

Assessment
- Assess degree and manifestations of anxiety before and periodically during therapy.
- Buspirone does not appear to cause physical or psychological dependence or tolerance. However, patients with a history of drug abuse should be assessed for tolerance or dependence. Restrict amount of drug available to these patients.

Potential Nursing Diagnoses
Anxiety (Indications)
Risk for injury (Side Effects)

Implementation
- Do not confuse buspirone with bupropion.
- Patients changing from other antianxiety agents should receive gradually decreasing doses. Buspirone will not prevent withdrawal symptoms.
- **PO:** May be administered with food to minimize gastric irritation. Food slows but does not alter extent of absorption.

Patient/Family Teaching
- Instruct patient to take buspirone exactly as directed. Take missed doses as soon as possi-

Copyright © 2008 by F.A. Davis

ble if not just before next dose; do not double doses. Do not take more than amount prescribed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to consult health care professional before taking OTC medications or herbal products with this drug.
- Instruct patient to notify health care professional if any chronic abnormal movements occur (dystonia, motor restlessness, involuntary movements of facial or cervical muscles) or if pregnancy is suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety. Some improvement may be seen in 7–10 days. Optimal results take 3–4 wk of therapy. Buspirone is usually used for short-term therapy (3–4 wk). If prescribed for long-term therapy, efficacy should be periodically assessed.

HIGH ALERT

busulfan (byoo-sul-fan)

Busulfex, Myleran

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications

PO: Treatment of chronic myelogenous leukemia (CML) and bone marrow disorders. **IV:** With cyclophosphamide as a conditioning regimen before allogenic hematopoietic progenitor cell transplantation for CML.

Action

Disrupts nucleic acid function and protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing cells, especially malignant ones.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver.
Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	weeks	up to 1 mo†
IV	unknown	unknown	13 days‡

†Complete recovery may take up to 20 mo
‡After administration of last dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Failure to respond to previous courses; OB, Lactation: Potential for serious side effects in fetus or infant.
Use Cautiously in: Active infections; Decreased bone marrow reserve; Obese patients (base dose on ideal body weight); Other chronic debilitating diseases; Patients with childbearing potential; Geri: Begin therapy at lower end of dose range due to increased frequency of impaired cardiac, hepatic, or renal function.

Adverse Reactions/Side Effects

Incidence and severity of adverse reactions and side effects are increased with IV use.
CNS: *IV*— SEIZURES, CEREBRAL HEMORRHAGE/COMA, anxiety, confusion, depression, dizziness, headache, encephalopathy, mental status changes, weakness. **EENT:** *PO*— cataracts; *IV*— epistaxis, pharyngitis, ear disorders. **CV:** hepatic veno-occlusive disease (↑ allogenic transplantation). **Resp:** *PO*— PULMONARY FIBROSIS; *IV*— alveolar hemorrhage, asthma, atelectasis, cough, hemoptysis, hypoxia, pleural effusion, pneumonia, rhinitis, sinusitis. **CV:** *PO*— CARDIAC TAMPONADE (WITH HIGH-DOSE CYCLOPHOSPHAMIDE); *IV*— chest pain, hypotension, tachycardia, thrombosis, arrhythmias, atrial fibrillation, cardiomegaly, ECG changes, edema, heart block, hypertension, left-sided heart failure, pericardial effusion, ventricular extrasystoles. **GI:** *PO*— drug-induced hepatitis, nausea, vomiting; *IV*— abdominal enlargement, anorexia, constipation, diarrhea, dry mouth, hematemesis, nausea, rectal discomfort, vomiting, abdominal pain, dyspepsia,

Copyright © 2008 by F.A. Davis

hepatomegaly, pancreatitis, stomatitis. **GU:** oliguria, dysuria, hematuria. **Derm:** *PO*— itching, rashes, acne, alopecia, erythema nodosum, exfoliative dermatitis, hyperpigmentation. **Endo:** *PO*— sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*— hyperuricemia; *IV*— hyperglycemia. **MS:** arthralgia, myalgia, back pain. **Misc:** allergic reactions, chills, fever, infection.

Interactions

Drug-Drug: Concurrent or previous (within 72 hr) use of **acetaminophen** may ↓ elimination and ↑ toxicity. Concurrent use with high-dose **cyclophosphamide** in patients with thalassemia may result in cardiac tamponade. Concurrent use with **itraconazole** or **phenytoin** ↓ blood level effectiveness. Long-term continuous therapy with **thioguanine** may ↑ risk of hepatic toxicity. ↑ bone marrow suppression with other **antineoplastics** or **radiation therapy**. May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage

Many other regimens are used. See current protocols for up-to-date dosage.

PO (Adults): *Induction*—1.8 mg/m²/day or 60 mcg (0.06 mg)/kg/day until WBCs <15,000/mm³. Usual dose is 4–8 mg/day (range 1–12 mg/day). *Maintenance*—1–3 mg/day.

PO (Children): 0.06–0.12 mg/kg/day or 1.8–4.6 mg/m²/day initially. Titrate dose to maintain WBC of approximately 20,000/mm³.

IV (Adults): 0.8 mg/kg q 6 hr (dose based on ideal body weight or actual weight, whichever is less; in obese patients, dosage should be based on adjusted ideal body weight) for 4 days (total of 16 doses); given in combination with cyclophosphamide.

Availability

Tablets: 2 mg. **Solution for injection:** 6 mg/ml in 10 ml ampules (60 mg).

NURSING IMPLICATIONS

Assessment

- ***High Alert:*** Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, emesis) and avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination) during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension. Notify physician if these symptoms occur.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, lower back or side pain, swelling of feet or lower legs). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.
- Assess for pulmonary fibrosis (fever, cough, shortness of breath) periodically during and after therapy. Discontinue therapy at the first sign of pulmonary fibrosis. Usually occurs 8 mo–10 yr (average 4 yr) after initiation of therapy.
- **IV:** Premedicate patient with phenytoin before IV administration to minimize the risk of seizures.
- Administer antiemetics before IV administration and on a fixed schedule throughout IV administration.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and weekly during therapy. The nadir of leukopenia occurs within 10–15 days and the nadir of WBC at 11–30 days. Recovery usually occurs within 12–20 wk. Notify physician if WBC is <15,000/mm³ or if a precipitous drop occurs. Institute thrombocytopenia precautions if platelet count is <150,000/mm³. Bone marrow depression may be severe and progressive, with recovery taking 1 mo–2 yr after discontinuation of therapy.
- Monitor serum ALT, bilirubin, alkaline phosphatase, and uric acid before and periodically during therapy. May cause ↑ uric acid levels.
- May cause false-positive cytology results of breast, bladder, cervix, and lung tissues.

Potential Nursing Diagnoses

Disturbed body image (Side Effects)
Risk for injury (Side Effects)
Risk for infection (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-

Copyright © 2008 by F.A. Davis

check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

- **PO:** Administer at the same time each day. Administer on an empty stomach to decrease nausea and vomiting.

IV Administration

- **IV:** Solution for IV administration should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 10 times the volume of busulfan using 0.9% NaCl or D5W. ***Concentration:*** ≥0.5 mg/ml. When drawing busulfan from vial, use needle with 5-micron nylon filter provided, remove calculated volume from vial, remove needle and filter, replace needle and inject busulfan into diluent. Do not use polycarbonate syringes with busulfan. Only use filters provided with busulfan. Always add busulfan to diluent, not diluent to busulfan. Solution diluted with 0.9% NaCl or D5W is stable for 8 hr at room temperature and solution diluted with 0.9% NaCl is stable for 12 hr if refrigerated. Administration must be completed during this time. ***Rate:*** Administer via central venous catheter over 2 hr every 6 hr for 4 days for a total of 16 doses. Use infusion pump to administer entire dose over 2 hr.
- **Y-Site Incompatibility:** Do not administer with other solutions. Flush catheter with 0.9% NaCl or D5W before and after administration.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if nausea and vomiting are a problem. Consult health care professional if vomiting occurs shortly after dose is taken. If a dose is missed, do not take at all; do not double doses.
- Advise patient to notify health care professional if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; chills; dyspnea; persistent cough; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Review with patient the need for contraception during therapy. Women need to use contraception even if amenorrhea occurs.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional if unusual bleeding; bruising; or flank, stomach, or joint pain occurs. Advise patients on long-term therapy to notify health care professional immediately if cough, shortness of breath, and fever occur or if darkening of skin, diarrhea, dizziness, fatigue, anorexia, confusion, or nausea and vomiting become pronounced.
- Inform patient of increased risk of a second malignancy with busulfan.

Evaluation/Desired Outcomes

- Decrease in leukocyte count to within normal limits.
- Decreased night sweats.
- Increase in appetite.
- Increased sense of well-being. Therapy is resumed when leukocyte count reaches 50,000/mm^3.

BUTALBITAL COMPOUND

(byoo-**tal**-bi-tal)

butalbital, acetaminophen†

Axocet, Bucet, Bupap, Butex Forte, Dolgic, Marten-Tab, Phrenilin, Phrenilin Forte, Repap CF, Sedapap, Tencon, Triaprin

butalbital, acetaminophen, caffeine†

Endolor, Esgic, Esgic-Plus, Fioricet, Margesic, Medigesic, Repan, Triad

butalbital, aspirin, caffeine‡

Fiorinal, Fiortal, Tecnal

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: nonopioid analgesics (combination with barbiturate)
Pharmacologic: barbiturates

Schedule III (products with aspirin only)

Pregnancy Category D

†For information on acetaminophen component in formulation, see acetaminophen monograph

‡For information on aspirin component in formulation, see salicylates monograph

Indications
Management of mild to moderate pain.

Action
Contain an analgesic (aspirin or acetaminophen) for relief of pain, a barbiturate (butalbital) for its sedative effect, and some contain caffeine, which may be of benefit in vascular headaches. **Therapeutic Effects:** Decreased severity of pain with some sedation.

Pharmacokinetics
Absorption: Well absorbed.
Distribution: Widely distributed; cross the placenta and enter breast milk.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 35 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	1–2 hr	2–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to individual components; Cross-sensitivity may occur; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Aspirin should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen should be avoided in patients with severe hepatic or renal disease; Caffeine should be avoided in patients with severe cardiovascular disease; Pregnancy or lactation; Porphyria.
Use Cautiously in: History of suicide attempt or drug addiction; Chronic alcohol use/abuse (for aspirin and acetaminophen content); Geri: Appears on Beers list. Geriatric patients are at increased risk for side effects (dosage reduction recommended); Use should be short-term only; Children (safety not established).

Adverse Reactions/Side Effects
CNS: *caffeine*— drowsiness, hangover, delirium, depression, excitation, headache (with chronic use), insomnia, irritability, lethargy, nervousness, vertigo. **Resp:** respiratory depression. **CV:** *caffeine*— palpitations, tachycardia. **GI:** *caffeine*— constipation, diarrhea, epigastric distress, heartburn, nausea, vomiting. **Derm:** dermatitis, rash. **Misc:** hypersensitivity reactions including ANGIOEDEMA and SERUM SICKNESS, physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**. May increase the liver metabolism and decrease the effectiveness of other drugs including **hormonal contraceptives**, **chloramphenicol**, **acebutolol**, **propranolol**, **metoprolol**, **timolol**, **doxycycline**, **corticosteroids**, **tricyclic antidepressants**, **phenothiazines**, **phenylbutazone**, and **quinidine**. **MAO inhibitors**, **primidone**, and **valproic acid** may prevent metabolism and increase the effectiveness of butalbital. May enhance the hematologic toxicity of **cyclophosphamide**.
Drug-Natural Products: St. John's wort may decrease barbiturate effect. Concurrent use of **kava kava, valerian, skullcap, chamomile, or hops** can increase CNS depression.

Route/Dosage
PO (Adults): 1–2 capsules or tablets (50–100 mg butalbital) every 4 hr as needed for pain (not to exceed 4 g acetaminophen or aspirin/24 hr).

Availability (generic available)
Tablets and capsules: 50 mg. ***In combination with:*** aspirin, acetaminophen, caffeine, and codeine Rx. See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess type, location, and intensity of pain before and 60 min following administration.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive butalbital compound for pain do not develop psychological dependence.

Copyright © 2008 by F.A. Davis

- Assess frequency of use. Frequent, chronic use may lead to daily headaches in headache-prone individuals because of physical dependence on caffeine and other components. Chronic headaches from overmedication are difficult to treat and may require hospitalization for treatment and prophylaxis.

Potential Nursing Diagnosis

Acute pain (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Fiorinal with Fioricet.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Oral doses should be administered with food, milk, or a full glass of water to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Do not increase dose because of the habit-forming potential of butalbital. If medication appears less effective after a few weeks, consult health care professional. Doses of acetaminophen or aspirin should not exceed the maximum recommended daily dose. Chronic excessive use of >4 g/day (2 g in chronic alcoholism) may lead to hepatotoxicity, renal or cardiac damage.
- Advise patients with vascular headaches to take medication at first sign of headache. Lying down in a quiet, dark room may also be helpful. Medications taken for prophylaxis should be continued.
- May cause drowsiness or dizziness. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to use an additional nonhormonal method of contraception while taking butalbital compound.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness.

butenafine, See ANTIFUNGALS (TOPICAL).

butoconazole, See ANTIFUNGALS (VAGINAL).

HIGH ALERT

butorphanol (byoo-tor-fa-nole)
Stadol, Stadol NS

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

Schedule IV

Pregnancy Category C

Indications

Management of moderate to severe pain. Analgesia during labor. Sedation before surgery. Supplement in balanced anesthesia.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased severity of pain.

Pharmacokinetics

Absorption: Well absorbed from IM sites and nasal mucosa.
Distribution: Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; 11–14% excreted in the feces. Minimal renal excretion.
Half-life: 3–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	within 15 min	30–60 min	3–4 hr
IV	within mins	4–5 min	2–4 hr
Intranasal	within 15 min	1–2 hr	4–5 hr

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients physically dependent on opioids (may precipitate withdrawal).

Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease (increase interval to q 6–8 hr initially in hepatic/renal impairment); Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia; OB, Lactation, Pedi: Safety not established but has been used during labor (may cause respiratory depression in the newborn); Geri: Decrease usual dose by 50%; give at twice the usual interval initially.

Adverse Reactions/Side Effects

CNS: confusion, dysphoria, hallucinations, sedation, euphoria, floating feeling, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** sweating, clammy feeling. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may produce severe, potentially fatal reactions—reduce initial dose of butorphanol to 25% of usual dose). Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioids** and have not been detoxified. May ↓ effects of concurrently administered **opioids**.

Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

IM (Adults): 2 mg q 3–4 hr as needed (range 1–4 mg).

IV (Adults): 1 mg q 3–4 hr as needed (range 0.5–2 mg).

IM, IV (Geriatric Patients): 1 mg q 4–6 hr, increased as necessary.

Intranasal (Adults): 1 mg (1 spray in 1 nostril) initially. An additional dose may be given 60–90 min later. This sequence may be repeated in 3–4 hr. If pain is severe, an initial dose of 2 mg (1 spray in each nostril) may be given. May be repeated in 3–4 hr.

Intranasal (Geriatric Patients): 1 mg (1 spray in 1 nostril) initially. An additional dose may be given 90–120 min later. This sequence may be repeated in 3–4 hr.

Availability (generic available)

Injection: 1 mg/ml, 2 mg/ml. **Intranasal solution:** 10 mg/ml, in 2.5-ml metered-dose spray pump (14–15 doses; 1 mg/spray).

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 30–60 min after IM, 5 min after IV, and 60–90 min after intranasal administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 4 mg should be converted to an opioid agonist. Butorphanol is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Respiratory depression does not increase in severity, only in duration, with increased dosage.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased blood pressure and temperature) in patients who are physically dependent on opioid agonists.
- Butorphanol has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent the patient from receiving adequate analgesia. Most patients receiving butorphanol for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.

Copyright © 2008 by F.A. Davis

- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Disturbed sensory perception (visual, auditory) (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse Stadol with Haldol.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **Direct IV:** ***Diluent:*** May give IV undiluted. ***Concentration:*** 1–2 mg/ml. ***Rate:*** Administer over 3–5 min. ***High Alert:*** Rapid administration may cause respiratory depression, hypotension, and cardiac arrest.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, diphenhydramine, droperidol, fentanyl, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, thiethylperazine.
- **Syringe Incompatibility:** dimenhydrinate, pentobarbital.
- **Y-Site Compatibility:** allopurinol sodium, amifostine, aztreonam, bivalirudin, cefepime, cisatracurium, cladribine, dexmedetomidine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, labetalol, linezolid, melphalan, nicardipine, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole, midazolam. **Intranasal:** Administer 1 spray in 1 nostril.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- **Intranasal:** Instruct patient on proper use of nasal spray. See package insert for detailed instructions. Instruct patient to replace protective clip and clear cover after use and to store the unit in the child resistant container. Caution patient that medication should not be used by anyone other than the person for whom it was prescribed. Excess medication should be disposed of as soon as it is no longer needed. To dispose of, unscrew cap, rinse bottle and pump with water, and dispose of in waste can.

Copyright © 2008 by F.A. Davis

- If 2-mg dose is prescribed, administer additional spray in other nostril. May cause dizziness and dysphoria. Patient should remain recumbent after administration of 2-mg dose until response to medication is known.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

Copyright © 2008 by F.A. Davis

cabergoline (ka-**ber**-goe-leen)
Dostinex

Classification
Therapeutic: antihyperprolactinemics
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications
Treatment of hyperprolactinemia (idiopathic or pituitary in origin). **Unlabeled uses:** Adjunctive treatment of Parkinson's disease.

Action
Inhibits secretion of prolactin by acting as a dopamine agonist. In Parkinson's, dopamine agonists directly stimulate neural dopamine receptors. **Therapeutic Effects:** Decreased secretion of prolactin in hyperprolactinemia. Reduced involuntary movements associated with Parkinson's disease.

Pharmacokinetics
Absorption: Well absorbed but undergoes extensive first-pass hepatic metabolism.
Distribution: Widely distributed; concentrates in pituitary.
Metabolism and Excretion: Extensively metabolized by the liver; <4% excreted unchanged in urine.
Protein Binding: 40–42%.
Half-life: 63–69 hr.

TIME/ACTION PROFILE (effect on serum prolactin levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hrs	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cabergoline or ergot alkaloids; Uncontrolled hypertension; Coadministration with potent inhibitors of CYP3A4 (**protease inhibitors**, **azole antifungals**, **clarithromycin**, and **telithromycin**; OB, Lactation: Has been associated with hypertension, stroke, and seizures. Not to be used for suppression of physiologic lactation.
Use Cautiously in: Hepatic impairment; Lactation: Will interfere with breast milk production; Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: dizziness, headache, depression, drowsiness, fatigue, nervousness, vertigo, weakness. **EENT:** abnormal vision. **CV:** postural hypotension, hot flashes. **GI:** constipation, nausea, abdominal pain, dyspepsia, vomiting. **GU:** dysmenorrhea. **Endo:** breast pain. **Neuro:** paresthesia.

Interactions
Drug-Drug: Increased risk of hypotension with **antihypertensives**. May increase the effects of **sibutramine**, **SSRIs**, and other **serotonin agonists** (induces serotonin syndrome). Effectiveness may be decreased by **phenothiazines**, **butyrophenones** (**haloperidol**), **thioxanthenes**, or **metoclopramide** (avoid concurrent use).

Route/Dosage
PO (Adults): 0.25 mg twice weekly; may be increased at 4-wk intervals up to 1 mg twice weekly.

Availability
Tablets: 0.5 mg.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure before and frequently during initial therapy. Initial doses >1 mg may cause orthostatic hypotension. Use with caution when administering concurrently with other medications that lower blood pressure. Supervise ambulation and transfer during initial dosing to prevent injury from hypotension.
- **Parkinson's Disease:** Assess symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, masklike face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and throughout therapy.
- ***Lab Test Considerations:*** Serum prolactin concentrations should be measured monthly until normalized (<20 mcg/liter in women and <15 mcg/liter in men).

Potential Nursing Diagnoses
Risk for injury (Side Effects)
Impaired physical mobility (Indications)

Implementation
- **PO:** May be taken without regard to food.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as possible within 1 or 2 days. If not remembered until time of next dose, double dose. If nausea occurs, discuss with health care professional.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol during the course of therapy.
- Advise women to consult with health care professional regarding a nonhormonal method of birth control. Women should contact health care professional promptly if pregnancy is planned or suspected.
- Instruct patients taking cabergoline for pituitary tumors to inform health care professional immediately if signs of tumor enlargement occur (blurred vision, sudden headache, severe nausea, and vomiting).
- Emphasize the importance of regular follow-up exams to determine effectiveness and monitor side effects.

Evaluation/Desired Outcomes

- Decrease in galactorrhea in patients with hyperprolactinemia.
- After a normal serum prolactin level has been maintained for more than 6 mo, cabergoline may be discontinued. Serum prolactin levels should be monitored periodically to determine necessity of reinstituting cabergoline.
- Decrease in tremor, rigidity, and bradykinesia.
- Improvement in balance and gait in patients with Parkinson's disease.

CALCITONIN

calcitonin (salmon)
(kal-si-**toe**-nin)
Miacalcin

calcitonin (rDNA)
Fortical

Classification
Therapeutic: hypocalcemics
Pharmacologic: hormones

Pregnancy Category C

Indications

IM, Subcut Treatment of Paget's disease of bone. Adjunctive therapy for hypercalcemia.
IM, Subcut, Intranasal: Management of postmenopausal osteoporosis.

Action

Inhibits osteoclastic bone resorption and promotes renal excretion of calcium. **Therapeutic Effects:** Decreased rate of bone turnover. Lowering of serum calcium.

Pharmacokinetics

Absorption: Completely absorbed from IM and subcut sites. Rapidly absorbed from nasal mucosa; absorption is 3% compared with parenteral administration.
Distribution: Unknown.
Metabolism and Excretion: Rapidly metabolized in kidneys, blood, and tissues.
Half-life: 40–90 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM, subcut†	Unknown	2 hr	6–8 hr
Intranasal‡	rapid	31–39 min	Unknown

†Effects on serum calcium; effects on serum alkaline phosphates and urinary hydroxyproline in Paget's disease may require 6–24 months of continuous treatment
‡Serum levels of administered calcitonin

Contraindications/Precautions

Contraindicated in: Hypersensitivity to calcitonin, salmon protein, or gelatin diluent (in some products); OB, Lactation: Use is not recommended.
Use Cautiously in: Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: *nasal only*— headaches. **EENT:** *nasal only*— rhinitis, epistaxis, nasal irritation. **GI:** *IM, subcut*— nausea, vomiting. **GU:** *IM, subcut*— urinary frequency. **Derm:** rashes. **Local:** injection site reactions. **MS:** *nasal*— arthralgia, back pain. **Misc:** allergic reactions including ANAPHYLAXIS, facial flushing, swelling.

Interactions

Drug-Drug: Previous bisphosphonate therapy, including **alendronate**, **risedronate**, **etidronate**, **ibandronate**, or **pamidronate**, may ↓ response to calcitonin.

Route/Dosage

Postmenopausal osteoporosis

IM, Subcut (Adults): 100 IU every other day.

Copyright © 2008 by F.A. Davis

Intranasal (Adults): 1 spray (200 IU)/day in alternating nostrils.

Paget's disease

IM, Subcut (Adults): 100 IU/day initially, after titration, maintenance dose is usually 50 IU/day or every other day.

Hypercalcemia

IM, Subcut (Adults): 4 IU/kg q 12 hr; if adequate response not achieved, may increase dose after 1–2 days to 8 IU/kg q 12 hr, and if necessary after 2 more days may be increased to 8 IU/kg q 6 hr.

Availability

Injection: 200 IU/ml in 2-ml vials. **Cost:** $50.89/vial. **Nasal spray:** 200 IU/actuation in 3.7-ml bottles. **Cost:** *Miacalcin*—$112.22/bottle.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs of hypersensitivity (skin rash, fever, hives, anaphylaxis, serum sickness). Keep epinephrine, antihistamines, and oxygen nearby in the event of a reaction.
- Assess patient for signs of hypocalcemic tetany (nervousness, irritability, paresthesia, muscle twitching, tetanic spasms, seizures) during the first several doses of calcitonin. Parenteral calcium, such as calcium gluconate, should be available in case of this event.
- **Intranasal:** Assess nasal mucosa, septum, turbinates, and mucosal blood vessels periodically during therapy. If severe ulceration occurs, drug should be discontinued.
- ***Lab Test Considerations:*** Monitor serum calcium and alkaline phosphatase periodically during therapy. Levels should normalize within a few months of initiation of therapy.
- Urine hydroxyproline (24 hr) may be monitored periodically in patients with Paget's disease.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- In patients with suspected sensitivity to calcitonin, skin test should be considered before starting therapy. Test dose is prepared in a dilution of 10 IU/ml by withdrawing 0.05 ml in a tuberculin syringe and filling to 1 ml with 0.9% NaCl for injection. Mix well and discard 0.9 ml. Administer 0.1 ml intradermally on inner aspect of forearm and observe site for 15 min. More than mild erythema or wheal constitutes positive response.
- Store injection and unopened nasal spray bottle in refrigerator. Nasal spray bottle in use can be stored at room temperature.
- **IM, Subcut:** Inspect injection site for the appearance of redness, swelling, or pain. Rotate injection sites. Subcut is the preferred route. Use IM route if dose exceeds 2 ml in volume. Use multiple sites to minimize inflammatory reaction.

Patient/Family Teaching

- Advise patient to take medication exactly as directed. If dose is missed and medication is scheduled for twice a day, take only if possible within 2 hr of correct time. If scheduled for daily dose, take only if remembered that day. If scheduled for every other day, take when remembered and restart alternate day schedule. If taking 1 dose 3 times weekly (Mon, Wed, Fri), take missed dose the next day and set each injection back 1 day; resume regular schedule the following week. Do not double doses.
- Instruct patient in the proper method of self-injection and care and disposal of equipment.
- Advise patient to report signs of hypercalcemic relapse (deep bone or flank pain, renal calculi, anorexia, nausea, vomiting, thirst, lethargy) or allergic response promptly.
- Reassure patient that flushing and warmth following injection are transient and usually last about 1 hr.
- Explain that nausea following injection tends to decrease even with continued therapy.
- Instruct patient to follow low-calcium diet if recommended by health care professional (see Appendix L). Women with postmenopausal osteoporosis should adhere to a diet high in calcium and vitamin D.
- **Osteoporosis:** Advise patients receiving calcitonin for the treatment of osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.

Copyright © 2008 by F.A. Davis

- **Intranasal:** Instruct patient on correct use of nasal spray. Demonstrate procedure for use. Before first use, activate pump by holding upright and depressing white side arms down toward bottle 5 times until a full spray is emitted. Following activation, place nozzle firmly in nostril with head in an upright position and depress the pump toward the bottle. The pump should NOT be primed before each daily use. Discard bottle 30 days after first use.
- Advise patient to notify health care professional if significant nasal irritation occurs.

Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased bone pain.
- Slowed progression of postmenopausal osteoporosis. Significant increases in bone marrow density may be seen as early as 6 months after initiation of therapy.

calcitriol, See VITAMIN D COMPOUNDS.

tricalcium phosphate (39% Ca or 19.5 mEq/g)
Posture

Classification
Therapeutic: mineral and electrolyte replacements/supplements

Pregnancy Category C (calcium acetate, calcium chloride, calcium gluconate injections), UK (calcium carbonate, calcium citrate, calcium lactate, tricalcium phosphate)

Indications

PO, IV: Treatment and prevention of hypocalcemia. **PO:** Adjunct in the prevention of postmenopausal osteoporosis. **IV:** Emergency treatment of hyperkalemia and hypermagnesemia and adjunct in cardiac arrest or calcium channel blocking agent toxicity (calcium chloride, calcium gluconate). **Calcium carbonate:** May be used as an antacid. **Calcium acetate:** Control of hyperphosphatemia in end-stage renal disease.

Action

Essential for nervous, muscular, and skeletal systems. Maintain cell membrane and capillary permeability. Act as an activator in the transmission of nerve impulses and contraction of cardiac, skeletal, and smooth muscle. Essential for bone formation and blood coagulation. **Therapeutic Effects:** Replacement of calcium in deficiency states. Control of hyperphosphatemia in end-stage renal disease without promoting aluminum absorption (calcium acetate).

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Absorption from the GI tract requires vitamin D. IV administration results in complete bioavailability.
Distribution: Readily enters extracellular fluid. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Excreted mostly in the feces; 20% eliminated by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum calcium)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IV	immediate	immediate	0.5–2 hr

Contraindications/Precautions

Contraindicated in: Hypercalcemia; Renal calculi; Ventricular fibrillation.
Use Cautiously in: Patients receiving digitalis glycosides; Severe respiratory insufficiency; Renal disease; Cardiac disease.

Adverse Reactions/Side Effects

CNS: syncope (IV only), tingling. **CV:** CARDIAC ARREST (IV only), arrhythmias, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** calculi, hypercalciuria. **Local:** phlebitis (IV ONLY).

Interactions

Drug-Drug: Hypercalcemia increases the risk of **digoxin** toxicity. Chronic use with **antacids** in renal insufficiency may lead to milk-alkali syndrome. Ingestion by mouth decreases the absorption of orally administered **tetracyclines**, **fluoroquinolones**, **phenytoin**, and **iron salts**. Excessive amounts may decrease the effects of **calcium channel blockers**. Decreases absorption of **etidronate** and **risedronate** (do not take within 2 hr of calcium supplements). May decrease the effectiveness of **atenolol**. Concurrent use with **diuretics (thiazide)** may result in hypercalcemia. May decrease the ability of **sodium polystyrene sulfonate** to decrease serum potassium.
Drug-Food: Cereals, **spinach**, or **rhubarb** may decrease the absorption of calcium supplements. Calcium acetate should not be given concurrently with other calcium supplements.

Route/Dosage

Doses are expressed in mg, g, or mEq of calcium.

PO (Adults): *Prevention of hypocalcemia, treatment of depletion, osteoporosis*—1–2 g/day. *Antacid*—0.5–1.5 g as needed (calcium carbonate only). *Hyperphosphatemia in end-stage renal disease (calcium acetate only)*—Amount necessary to control serum phosphate and calcium.
PO (Children): *Supplementation*—45–65 mg/kg/day.
PO (Infants): *Neonatal hypocalcemia*—50–150 mg/kg (not to exceed 1 g).
IV (Adults): *Emergency treatment of hypocalcemia, cardiac standstill*—7–14 mEq. *Hypocalcemic tetany*—4.5–16 mEq; repeat until symptoms are controlled. *Hyperkalemia with cardiac toxicity*—2.25–14 mEq; may repeat in 1–2 min. *Hypermagnesemia*—7 mEq.
IV (Children): *Emergency treatment of hypocalcemia*—1–7 mEq. *Hypocalcemic tetany*—0.5–0.7 mEq/kg 3–4 times daily.
IV (Infants): *Emergency treatment of hypocalcemia*—<1 mEq. *Hypocalcemic tetany*—2.4 mEq/kg/day in divided doses.

Availability (generic available)

Calcium Acetate

Tablets: 250 mg (65 mg Ca)[OTC], 667 mg (169 mg Ca)[OTC], 668 mg (169 mg Ca)[OTC], 1 g (250 mg Ca)[OTC]. **Capsules:** 500 mg (125 mg Ca)[OTC].

Calcium Carbonate

Tablets: 500 mg (200 mg Ca)[OTC], 600 mg (240 mg Ca)[OTC], 650 mg (260 mg Ca)[OTC], 667 mg (266.8 mg Ca)[OTC], 1 g (400 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC], 1.5 g (600 mg Ca)[OTC]. **Chewable tablets:** 350 mg (300 mg Ca)[OTC], 420 mg (168 mg Ca)[OTC], 450 mg[OTC], 500 mg (200 mg Ca)[OTC], 750 mg (300 mg Ca)[OTC], 1 g (400 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC]. **Gum tablets:** 300 mg[OTC], 450 mg[OTC], 500 mg (200 mg Ca)[OTC]. **Capsules:** 1.25 g (500 mg Ca)[OTC]. **Lozenges:** 600 mg (240 mg Ca)[OTC]. **Oral suspension:** 1.25 g (500 mg Ca)/5 ml[OTC]. **Powder:** 6.5 g (2400 mg Ca)/packet[OTC].

Calcium Chloride

Injection: 10% (1.36 mEq/ml).

Calcium Citrate

Tablets: 250 mg[OTC].

Calcium Gluconate

Tablets: 500 mg (45 mg Ca)[OTC], 650 mg (58.5 mg Ca)[OTC], 975 mg (87.75 mg Ca)[OTC], 1 g (90 mg Ca)[OTC]. **Injection:** 10% (0.45 mEq/ml).

Copyright © 2008 by F.A. Davis

Calcium Lactate

Tablets: 325 mg (42.45 mg Ca)[OTC], 500 mg[OTC], 650 mg (84.5 mg Ca)[OTC].

NURSING IMPLICATIONS

Assessment

- **Calcium Supplement/Replacement:** Observe patient closely for symptoms of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, Chvostek's or Trousseau's sign). Notify physician or other health care professional if these occur. Protect symptomatic patients by elevating and padding siderails and keeping bed in low position.
- Monitor blood pressure, pulse, and ECG frequently throughout parenteral therapy. May cause vasodilation with resulting hypotension, bradycardia, arrhythmias, and cardiac arrest. Transient increases in blood pressure may occur during IV administration, especially in geriatric patients or in patients with hypertension.
- Assess IV site for patency. Extravasation may cause cellulitis, necrosis, and sloughing.
- Monitor patient on digitalis glycosides for signs of toxicity.
- **Antacid:** When used as an antacid, assess for heartburn, indigestion, and abdominal pain. Inspect abdomen; auscultate bowel sounds.
- ***Lab Test Considerations:*** Monitor serum calcium or ionized calcium chloride, sodium, potassium, magnesium, albumin, and parathyroid hormone (PTH) concentrations before and periodically during therapy for treatment of hypocalcemia.
- May cause decreased serum phosphate concentrations with excessive and prolonged use. When used to treat hyperphosphatemia in renal failure patients, monitor phosphate levels.
- ***Toxicity and Overdose:*** Assess patient for nausea, vomiting, anorexia, thirst, severe constipation, paralytic ileus, and bradycardia. Contact physician or other health care professional immediately if these signs of hypercalcemia occur.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Risk for injury, related to osteoporosis or electrolyte imbalance (Indications)

Implementation

- ***High Alert:*** Errors with IV calcium gluconate and chloride have occurred secondary to confusion over which salt is ordered. Clarify incomplete orders. Confusion has occurred with milligram doses of calcium chloride and calcium gluconate, which are not equal. Chloride and gluconate forms are routinely available on most hospital crash carts; physician should specify form of calcium desired. Doses should be expressed in mEq.
- Do not confuse Os-Cal (calcium carbonate) with Asacol (mesalamine).
- In arrest situations, the use of calcium chloride is now limited to patients with hyperkalemia, hypocalcemia, and calcium channel blocker toxicity.
- **PO:** Administer calcium carbonate or phosphate 1–1.5 hr after meals and at bedtime. Chewable tablets should be well chewed before swallowing. Dissolve effervescent tablets in glass of water. Follow oral doses with a full glass of water, except when using calcium carbonate as a phosphate binder in renal dialysis. Administer on an empty stomach before meals to optimize effectiveness in patients with hyperphosphatemia.
- **IM:** IM administration of calcium salts can cause severe necrosis and tissue sloughing. Do not administer IM.

IV Administration

- **IV:** IV solution should be warmed to body temperature and given through a small-bore needle in a large vein to minimize phlebitis. Do not administer through a scalp vein. May cause cutaneous burning sensation, peripheral vasodilation, and drop in blood pressure. Patient should remain recumbent for 30–60 min after IV administration.
- If infiltration occurs, discontinue IV. May be treated with application of heat, elevation, and local infiltration of normal saline, 1% procaine HCl, or hyaluronidase.
- ***High Alert:*** Administer slowly. High concentrations may cause cardiac arrest. Rapid administration may cause tingling, sensation of warmth, and a metallic taste. Halt infusion if these symptoms occur, and resume infusion at a slower rate when they subside.
- Do not administer solutions that are not clear or that contain a precipitate.

Copyright © 2008 by F.A. Davis

Calcium Chloride

IV Administration

- **Direct IV:** May be administered undiluted by IV push. **Intermittent/Continuous Infusion:** May be diluted with D5W, D10W, 0.9% NaCl, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or D5/LR. ***Rate:*** Maximum rate for adults is 0.7–1.4 mEq/min (0.5–1 ml of 10% solution); for children, 0.5 ml/min.
- **Syringe Compatibility:** milrinone.
- **Y-Site Compatibility:** amiodarone, dobutamine, doxapram, epinephrine, esmolol, inamrinone, milrinone, morphine, nitroprusside, paclitaxel.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, propofol, sodium bicarbonate.

Calcium Gluconate

IV Administration

- **Direct IV:** Administer slowly by direct IV push. ***Rate:*** Maximum administration rate for adults is 1.5–2 ml/min.
- **Continuous Infusion:** May be further diluted in 1000 ml of D5W, D10W, D20W, D5/0.9% NaCl, 0.9% NaCl, D5/LR, or LR. ***Rate:*** Administer at a rate not to exceed 200 mg/min over 12–24 hr.
- **Syringe Incompatibility:** metoclopramide.
- **Y-Site Compatibility:** aldesleukin, allopurinol, amifostine, amiodarone, aztreonam, bivalirudin, cefazolin, cefepime, ciprofloxacin, cisatracurium, cladribine, dexmedetomidate, dobutamine, docetaxel, doxapram, doxorubicin liposome, enalaprilat, epinephrine, etoposide, famotidine, fenoldopam, filgrastim, gemcitabine, granisetron, labetalol, linezolid, melphalan, midazolam, milrinone, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, propofol, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vinorelbine, vitamin B complex with C.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, fluconazole, indomethacin.

Patient/Family Teaching

- Instruct patient not to take enteric-coated tablets within 1 hr of calcium carbonate; this will result in premature dissolution of the tablets.
- Do not administer concurrently with foods containing large amounts of oxalic acid (spinach, rhubarb), phytic acid (brans, cereals), or phosphorus (milk or dairy products). Administration with milk products may lead to milk-alkali syndrome (nausea, vomiting, confusion, headache). Do not take within 1–2 hr of other medications if possible.
- Instruct patients on a regular schedule to take missed doses as soon as possible, then go back to regular schedule.
- Advise patient that calcium carbonate may cause constipation. Review methods of preventing constipation (increasing bulk in diet, increasing fluid intake, increasing mobility) and using laxatives. Severe constipation may indicate toxicity.
- Advise patient to avoid excessive use of tobacco or beverages containing alcohol or caffeine.
- **Calcium Supplement:** Encourage patients to maintain a diet adequate in vitamin D (see Appendix L).
- **Osteoporosis:** Advise patients that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.

Evaluation/Desired Outcomes

- Increase in serum calcium levels.
- Decrease in the signs and symptoms of hypocalcemia.
- Resolution of indigestion.
- Control of hyperphosphatemia in patients with renal failure (calcium acetate only).

candesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

HIGH ALERT

capecitabine

(kap-pe-**site**-a-been)
Xeloda

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Pregnancy Category D

Copyright © 2008 by F.A. Davis

Indications

Metastatic colorectal cancer. Adjuvant treatment for Dukes' C colon cancer following primary resection. Metastatic breast cancer that has worsened despite prior therapy with anthracycline (daunorubicin, doxorubicin, idarubicin) (to be used in combination with docetaxel). Metastatic breast cancer that is resistant to both paclitaxel and an anthracycline (daunorubicin, doxorubicin, idarubicin) or is resistant to paclitaxel and further anthracycline therapy is contraindicated.

Action

Converted in tissue to 5-fluorouracil (5-FU), which inhibits DNA and RNA synthesis by preventing thymidine production. The enzyme responsible for the final step in the conversion to 5-FU may be found in higher concentrations in some tumors. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Metabolized mostly in tissue and by the liver; inactive metabolites are excreted primarily in urine.
Half-life: 45 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	1.5 hr (2 hr for 5-FU)‡	unknown

†Onset of antineoplastic effect is 6 wk
‡Peak 5-FU levels occur at 2 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to capecitabine or 5-FU; Dihydropyrimidine dehydrogenase deficiency (enzyme metabolizes 5-FU to nontoxic compounds); Severe renal impairment (CCr <30 ml/min); OB: Potential for fetal harm or death; Lactation: Potential for serious adverse effects in nursing infants.
Use Cautiously in: Mild-moderate renal impairment (decrease starting dose to 75% in patients with CCr 30–50 ml/min); Hepatic dysfunction; Coronary artery disease; Pedi: Safety not established; Geri: Increased risk of severe diarrhea in patients ≥80 yr.

Adverse Reactions/Side Effects

CNS: fatigue, headache, dizziness, insomnia. **EENT:** eye irritation, epistaxis, rhinorrhea. **CV:** edema, chest pain. **GI:** DIARRHEA, NECROTIZING ENTEROCOLITIS, abdominal pain, anorexia, constipation, dysgeusia, hyperbilirubinemia, nausea, stomatitis, vomiting, dyspepsia, xerostomia. **Derm:** dermatitis, hand-and-foot syndrome, nail disorder, alopecia, erythema, rashes. **F and E:** dehydration. **Hemat:** anemia, leukopenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Resp:** cough, dyspnea. **Misc:** fever.

Interactions

Drug-Drug: May ↑ risk of bleeding with **warfarin** (frequent monitoring of PT/INR recommended). Toxicity ↑ by concurrent **leucovorin**. **Antacids** may ↑ absorption. May ↑ blood levels and risk of toxicity from **phenytoin** (may need to decrease phenytoin dose).
Drug-Food: Food ↑ absorption, although capecitabine should be given within 30 min after a meal.

Route/Dosage

PO (Adults): 1250 mg/m² twice daily for 14 days, followed by 7-day rest period; given as 3-wk cycles.

Renal Impairment

PO (Adults CCr 30-50 ml/min): Decrease initial dose to 75% of usual.

Availability

Tablets: 150 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac-test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- ***High Alert:*** Notify physician if symptoms of toxicity (stomatitis, uncontrollable vomiting, diarrhea, fever) occur; drug may need to be discontinued or dose decreased. Patients with severe diarrhea should be monitored

Copyright © 2008 by F.A. Davis

carefully and given fluid and electrolyte replacement if they become dehydrated.

- Assess patient for hand-and-foot syndrome. Symptoms include numbness, dysesthesia or paresthesia, tingling, painless or painful swelling, erythema, desquamation, blistering, and severe pain.
- ***Lab Test Considerations:*** Monitor hepatic (serum alkaline phosphatase, AST, ALT, and bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) function before and periodically during therapy. May cause leukopenia, anemia, and thrombocytopenia. Leukopenia may require discontinuation of therapy. Therapy should be interrupted if serum bilirubin ↑ to 1.5 times normal or greater; may be reinstituted after bilirubin returns to normal.
- ***Lab Test Considerations: High Alert:*** Monitor PT or INR frequently in patients receiving warfarin and capecitabine to adjust warfarin dose. May cause ↑ bleeding within a few days of initiation of therapy to 1 mo following discontinuation of therapy. Risk is greater in patients over 60 years.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Do not confuse capecitabine (Xeloda) with orlistat (Xenical).
- Dose modifications are based on degree of toxicity encountered. Once a dose has been reduced because of toxicity, it should not be increased at a later time. See manufacturer's recommendations.
- **PO:** Administer every 12 hr for 2 wk, followed by a 1-wk rest period. Tablets should be taken with water within 30 min after a meal.

Patient/Family Teaching

- Instruct patient to take medication every 12 hr with water within 30 min after a meal. Missed doses should be omitted; continue regular schedule. Do not double dose.
- Inform patient of the most common side effects. Instruct patient to notify health care provider immediately if any of the following occur: diarrhea (>4 bowel movements in a day or any diarrhea at night), vomiting (more than once in 24 hr), nausea (loss of appetite and significant decrease in daily food intake), stomatitis (pain, redness, swelling, or sore in mouth), hand-and-foot syndrome (pain, swelling, or redness of hands and/or feet), fever or infection (temperature of ≥100.5° F or other signs of infection).
- Instruct patient to notify health care professional if he or she is taking folic acid.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Review with patient the need for contraception during therapy.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Tumor regression.

capsaicin (kap-**say**-sin)
🍁Axsam, Capsin, Capzasin-P, Dolorac, No Pain-HP, Pain Doctor, Pain-X, R-Gel, Rid•a•Pain•HP, Zostrix, Zostrix-HP

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: nonopioid analgesics (topical)

Pregnancy Category UK

Indications
Temporary management of pain due to rheumatoid arthritis and osteoarthritis. Treatment of pain associated with postherpetic neuralgia or diabetic neuropathy. **Unlabeled uses:** Treatment of postmastectomy pain syndrome. Treatment of complex regional pain syndrome.

Action
May deplete and prevent the reaccumulation of a chemical (substance P) responsible for transmitting painful impulses from peripheral sites to the CNS. **Therapeutic Effects:** Relief of discomfort associated with painful peripheral syndromes.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
topical	1–2 wk	2–4 wk†	unknown

†May take up to 6 wk for head and neck neuralgias

Contraindications/Precautions
Contraindicated in: Hypersensitivity to capsaicin or hot peppers; Not for use near eyes or on open or broken skin.
Use Cautiously in: OB, Lactation, Pedi: Safety not established for pregnant women, breastfeeding infants, or children <2 yr.

Adverse Reactions/Side Effects
Resp: cough. **Derm:** transient burning.

Interactions
Drug-Drug: None significant.

Route/Dosage
Topical (Adults and Children ≥2 yr): Apply to affected areas 3–4 times daily.

Availability
Cream: 0.025%[OTC], 0.075%[OTC]. **Gel:** 0.05%[OTC]. **Lotion:** 0.025%[OTC]. **Roll-on:** 0.075%[OTC]. ***In combination with:*** methyl salicylate (Ziks[OTC]). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess pain intensity and location before and periodically throughout therapy.

Potential Nursing Diagnoses
Chronic pain (Indications)
Noncompliance (Patient/Family Teaching)

Implementation
- **Topical:** Apply to affected area not more than 3–4 times daily. Avoid getting medication into eyes or on broken or irritated skin. Do not bandage tightly.
- Topical lidocaine may be applied during the first 1–2 wk of treatment to reduce initial discomfort.

Patient/Family Teaching
- Instruct patient on the correct method for application of capsaicin. Rub cream into affected area well so that little or no cream is left on the surface. Gloves should be worn during application or hands should be washed immediately after application. If application is to hands for arthritis, do not wash hands for at least 30 min after application.
- Advise patient to apply missed doses as soon as possible unless almost time for next dose. Pain relief lasts only as long as capsaicin is used regularly.
- Advise patient that transient burning may occur with application, especially if applied fewer than 3–4 times daily. Burning usually disappears after the first few days but may continue for 2–4 wk or longer. Burning is increased by heat, sweating, bathing in warm water, humidity, and clothing. Burning usually decreases in frequency and intensity the longer capsaicin is used. Decreasing number of daily doses will not lessen burning but may decrease amount of pain relief and may prolong period of burning.
- Caution patient to flush area with water if capsaicin gets into eyes and to wash with warm, but not hot, soapy water if capsaicin gets on other sensitive areas of the body.
- Instruct patient with herpes zoster (shingles) not to apply capsaicin cream until lesions have healed completely.
- Advise patient to discontinue use and notify health care professional if pain persists longer than 1 month, worsens, or if signs of infection are present.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in discomfort associated with: Postherpetic neuropathy, Diabetic neuropathy, Rheumatoid arthritis, Osteoarthritis. Pain relief usually begins within 1–2 wk with arthritis, 2–4 wk with neuralgias, and 4–6 wk with neuralgias of the head and neck.

captopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

carbamazepine

(kar-ba-**maz**-e-peen)

Apo-Carbamazepine, Carbatrol, Epitol, Equetro, Novo-Carbamaz, Tegretol, Tegretol CR, Tegretol-XR, Teril

Classification

Therapeutic: anticonvulsants, mood stabilizers

Pregnancy Category D

Indications

Treatment of tonic-clonic, mixed, and complex-partial seizures. Management of pain in trigeminal neuralgia or diabetic neuropathy. **Equetro only:** Acute mania and mixed mania. **Unlabeled uses:** Other forms of neurogenic pain.

Action

Decreases synaptic transmission in the CNS by affecting sodium channels in neurons. **Therapeutic Effects:** Prevention of seizures. Relief of pain in trigeminal neuralgia. Decreased mania.

Pharmacokinetics

Absorption: Absorption is slow but complete. Suspension produces earlier, higher peak and lower trough levels.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta rapidly and enters breast milk in high concentrations.

Protein Binding: *Carbamazepine*—75–90%; *epoxide*—50%.

Metabolism and Excretion: Extensively metabolized in the liver by cytochrome P450 3A4 to active epoxide metabolite; epoxide metabolite has anticonvulsant and antineuralgic activity.

Half-life: *Carbamazapine*—single dose—25–65 hr, chronic dosing— *Children*—8–14 hr; *Adults*—12–17 hr; *epoxide*—34±9hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	up to one month†	4–5 hr‡	6–12 hr
PO-ER	up to one month†	2–3–12 hr‡	12 hr

†Onset of antineuralgic activity is 8–72 hr

‡Listed for tablets; peak level occurs 1.5 hr after a chronic dose of suspension

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bone marrow suppression; Concomitant use or use within 14 days of MAO inhibitors; OB: Use only during pregnancy if potential benefits outweigh risks to the fetus; additional vitamin K during last weeks of pregnancy has been recommended; Lactation: Discontinue drug or bottle feed.

Use Cautiously in: Cardiac or hepatic disease; renal failure (dosing adjustment required for ClCr <10 ml/min; Increased intraocular pressure; Geri: Older men with prostatic hyperplasia may be at increased risk for acute urinary retention or difficulty initiating stream.

Adverse Reactions/Side Effects

CNS: ataxia, drowsiness, fatigue, psychosis, sedation, vertigo. **EENT:** blurred vision, nystagmus, corneal opacities. **Resp:** pneumonitis. **CV:** CHF, edema, hypertension, hypotension, syncope. **GI:** hepatitis, pancreatitis, weight gain. **GU:** hesitancy, urinary retention. **Derm:** photosensitivity, rashes, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria. **Endo:** syndrome of inappropriate antidiuretic hormone (SIADH), hyponatremia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, THROMBOCYTOPENIA, eosinophilia, leukopenia. **Misc:** chills, fever, lymphadenopathy, elevated liver enzymes, multi-organ hypersensitivity reactions, hepatic failure (rare).

Interactions

Drug-Drug: May ↑ metabolism of and therefore ↓ levels/effectiveness of **corticosteroids**, **doxycycline**, **felbamate**, **quinidine**, **warfarin**, **estrogen-containing contraceptives**, **barbiturates**, **cyclosporine**, **benzodiaze-**

Copyright © 2008 by F.A. Davis

pines, **theophylline**, **lamotrigine**, **phenytoin**, **topiramate**, **valproic acid**, **bupropion**, and **haloperidol**. **Danazol** ↑ blood levels (avoid concurrent use if possible). Concurrent use (within 2 wk) of **MAO inhibitors** may result in hyperpyrexia, hypertension, seizures, and death. **Verapamil**, **diltiazem**, **propoxyphene**, **itraconazole**, **ketoconazole**, **erythromycin**, **clarithromycin**, **SSRIs**, **antidepressants**, or **cimetidine** may inhibit the hepatic metabolism or carbamazepine and ↑ levels; may cause toxicity. Enzyme inducers such as **rifampin**, **phenobarbital**, **phenytoin**, **primidone**, and **methosuximide** may ↓ serum concentration of carbamazepine. May ↑ risk of hepatotoxicity from **isoniazid**. **Felbamate** ↓ carbamazepine levels but ↑ levels of active metabolite. May ↓ effectiveness and ↑ risk of toxicity from **acetaminophen**. May ↑ risk of CNS toxicity from **lithium**. May ↓ duration of action of **nondepolarizing neuromuscular blocking agents**.
Drug-Food: Grapefruit juice ↑ serum levels and oral bioavailability by 40% and therefore may ↑ effects.

Route/Dosage

PO (Adults): *Anticonvulsant*—200 mg twice daily (tablets) or 100 mg 4 times daily (suspension); increase by 200 mg/day q 7 days until therapeutic levels are achieved (range is 600–1200 mg/day in divided doses q 6–8 hr; not to exceed 1 g/day in 12–15-yr-olds. Extended-release products are given twice daily (XR, CR). *Antineuralgic*—100 mg twice daily or 50 mg 4 times daily (suspension); increase by up to 200 mg/day until pain is relieved, then maintenance dose of 200–1200 mg/day in divided doses (usual range, 400–800 mg/day).
PO (Children 6–12 yr): 100 mg twice daily (tablets) or 50 mg 4 times daily (suspension) increased by 100 mg weekly until therapeutic levels are obtained (usual range 400–800 mg/day; not to exceed 1 g/day). Extended-release products (XR, CR) are given twice daily.
PO (Children <6 yr): 10–20 mg/kg/day in 2–3 divided doses; may be increased at weekly intervals until optimal response and therapeutic levels are acheived. Usual maintenance dose is 250–350 mg/day (not to exceed 35 mg/kg/day).

Availability (generic available)

Tablets: 200 mg. **Cost:** *Generic*—$25.97/180. **Chewable tablets:** 100 mg, 200 mg. **Cost:** *Generic*—100 mg $21.98/180. **Extended-release capsules:** 100 mg, 200 mg, 300 mg. **Cost:** 100 mg $235.66/180, 200 mg $226.49/180, 300 mg $216.88/180. **Extended-release tablets:** 100 mg, 200 mg, 400 mg. **Cost:** 100 mg $83.93/180, 200 mg $143.93/180, 400 mg $279.94/180. **Oral suspension (citrus/vanilla flavor):** 100 mg/5 ml. **Cost:** *Generic*—$28.26/450 ml.

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity.
- **Trigeminal Neuralgia:** Assess for facial pain (location, intensity, duration). Ask patient to identify stimuli that may precipitate facial pain (hot or cold foods, bedclothes, touching face).
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC, including platelet count, reticulocyte count, and serum iron, weekly during the first 2 mo and yearly thereafter for evidence of potentially fatal blood cell abnormalities. Medication should be discontinued if bone marrow depression occurs.
- Liver function tests, urinalysis, and BUN should be routinely performed. May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, BUN, urine protein, and urine glucose levels.
- Monitor serum ionized calcium levels every 6 mo or if seizure frequency increases. Thyroid function tests and ionized serum calcium concentrations may be ↓; hypocalcemia decreases seizure threshold.
- Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia.
- May occasionally cause ↑ serum cholesterol, high-density lipoprotein, and triglyceride concentrations.
- May cause false-negative pregnancy test results with tests that determine human chorionic gonadotropin.
- ***Toxicity and Overdose:*** Serum blood levels should be routinely monitored during therapy. Therapeutic levels range from 4–12 mcg/ml.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Copyright © 2008 by F.A. Davis

Chronic pain (Indications)
Disturbed thought process (Indications)

Implementation

- Implement seizure precautions as indicated.
- **PO:** Administer medication with food to minimize gastric irritation. May take at bedtime to reduce daytime sedation. Tablets may be crushed if patient has difficulty swallowing. Do not crush or chew extended-release tablets. Extended-release capsules may be opened and the contents sprinkled on applesauce or other similar foods.
- Do not administer suspension simultaneously with other liquid medications or diluents; mixture produces an orange rubbery mass.

Patient/Family Teaching

- Instruct patient to take carbamazepine around the clock, as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than one dose is missed. Medication should be gradually discontinued to prevent seizures.
- May cause dizziness or drowsiness. Advise patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patients that fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, rash, pale stools, dark urine, or jaundice should be reported to health care professional immediately.
- Inform patient that coating of *Tegretol XR* is not absorbed, but is excreted in feces and may be visible in stool.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Caution patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help reduce dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists >2 wk.
- Advise female patients to use a nonhormonal form of contraception while taking carbamazepine.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up lab tests and eye exams to monitor for side effects.
- Inform patient and family that the Manic-Depressive and Depressive Association can offer support for mania.
- **Seizures:** Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.
- Decrease in trigeminal neuralgia pain. Patients with trigeminal neuralgia who are pain-free should be re-evaluated every 3 mo to determine minimum effective dose.
- Decreased mania and depressive symptoms in Bipolar I disorder.

carbonyl iron, See IRON SUPPLEMENTS.

HIGH ALERT

carboplatin (kar-boe-**pla**-tin)

Paraplatin, ✱Paraplatin-AQ

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications

Advanced ovarian carcinoma (with other agents). Palliative treatment of ovarian carcinoma unresponsive to other modalities.

Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: Platinum is irreversibly bound to plasma proteins.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Excreted mostly by the kidneys.
Half-life: *Carboplatin*—2.6–5.9 hr (increased in renal impairment); *platinum*—5 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21 days	28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to carboplatin, cisplatin, or mannitol; OB: Pregnancy or lactation.
Use Cautiously in: Hearing loss; Electrolyte abnormalities; Renal impairment (dose reduction recommended if creatinine <60 ml/min); Active infections; Diminished bone marrow reserve (dose reduction recommended); Other chronic debilitating illnesses; Geri: ↑ risk of thrombocytopenia, consider renal function in dose determination; Patients with childbearing potential; Pedi: Safe use in children not established.

Adverse Reactions/Side Effects

CNS: weakness. **EENT:** ototoxicity. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, hepatitis, stomatitis. **GU:** gonadal suppression, nephrotoxicity. **Derm:** alopecia, rash. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLACTIC-LIKE REACTIONS.

Interactions

Drug-Drug: ↑ nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ bone marrow depression with other **bone marrow–depressing drugs** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other dosing formulas are used.
IV (Adults): *Initial treatment*—300 mg/m² with cyclophosphamide at 4-wk intervals. *Treatment of refractory tumors*—360 mg/m² as a single dose; may be repeated at 4-wk intervals, depending on response.

Renal Impairment

IV (Adults): *CCr 41–59 ml/min*—initial dose 250 mg/m²; *CCr 16–40 ml/min*—initial dose 200 mg/m².

Availability (generic available)

Lyophilized powder for injection: 50-mg vials, 150-mg vials, 450-mg vials. **Aqueous solution for injection:** 50 mg/5-ml vial, 150-mg/15-ml vial, 450-mg/45-ml vial, 600 mg/60-ml vial.

NURSING IMPLICATIONS

Assessment

- Assess for nausea and vomiting; often occur 6–12 hr after therapy (1–4 hr for aqueous solution) and may persist for 24 hr. Prophylactic antiemetics may be used. Adjust diet as tolerated to maintain fluid and electrolyte balance and ensure adequate nutritional intake. May require discontinuation of therapy.
- Assess patients receiving *Paraplatin-AQ* for neurotoxicity (paresthesias in a stocking—glove distribution, areflexia, loss of proprioception and vibratory sensations). Discontinue therapy when symptoms are first observed. May progress further even after stopping therapy. May be irreversible.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur and may be cumulative; transfusions are frequently required. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (rash, urticaria, pruritus, facial swelling, wheezing, tachycardia, hypotension). Discontinue medication immediately and notify physician if these occur. Epinephrine and resuscitation equipment should be readily available.
- Audiometry is recommended before initiation of therapy and subsequent doses. Ototoxicity manifests as tinnitus and unilateral or bilateral hearing loss in high frequencies and becomes more frequent and severe with repeated doses. Ototoxicity is more pronounced in children.
- ***Lab Test Considerations:*** Monitor CBC, differential, and clotting studies before and weekly during therapy. For *Paraplatin:* The

Copyright © 2008 by F.A. Davis

nadirs of thrombocytopenia and leukopenia occur after 21 days and recover by 30 days after a dose. Nadir of granulocyte counts usually occurs after 21–28 days and recovers by day 35. Withhold subsequent doses until neutrophil count is >2000/mm^3 and platelet count is >100,000/mm^3. For *Paraplatin-AQ:* The nadirs of thrombocytopenia and leukopenia occur between days 18 and 23 and recover by day 39. Anemia also occurs with the same frequency and timing as thrombocytopenia and leukopenia.

- Monitor renal function and serum electrolytes before initiation of therapy and before each course of carboplatin. Nephrotoxicity with *Paraplatin-AQ* is cumulative and is potentiated by aminoglycoside antibiotics. Monitor serum creatinine, BUN, creatinine clearance, and magnesium, sodium, potassium, and calcium levels prior to initiating therapy and before each subsequent dose. May cause ↑ BUN and serum creatinine concentrations and ↓ CCr. May cause ↓ serum potassium, calcium, magnesium, and sodium concentrations. Renal function must return to normal before each dose of *Paraplatin-AQ* is given.
- Monitor hepatic function before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, and AST concentrations.
- *Paraplatin-AQ* may cause hyperuricemia, usually occurring 3–5 days after therapy. Allopurinol may be used to ↓ uric acid levels.
- *Paraplatin-AQ* may cause ↑ serum amylase levels.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse carboplatin with cisplatin. Do not confuse Paraplatin (carboplatin) with Platinol (cisplatin).
- ***High Alert:*** Carboplatin should be administered in a monitored setting under the supervision of a physician experienced in cancer chemotherapy.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Do not use aluminum needles or equipment during preparation or administration; aluminum reacts with the drug.

Paraplatin

- **Intermittent Infusion:** Reconstitute to a concentration of 10 mg/ml with sterile water for injection, D5W, or 0.9% NaCl for injection. ***Diluent:*** May be further diluted in D5W or 0.9% NaCl. ***Concentration:*** 0.5 mg/ml. Stable for 8 hr at room temperature.
- May also be administered over 24 hr or by dividing total dose into 5 consecutive pulse doses; may decrease nausea and vomiting but does not decrease nephrotoxicity or ototoxicity. ***Rate:*** Administer over 15–60 min.
- **Y-Site Compatibility:** allopurinol, amifostine, anidlafungin, aztreonam, cefepime, cladribine, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, ondansetron, oxaliplatin, paclitaxel, palonosetron, pemetrexed, piperacillin/tazobactam, propofol, sargramostim, teniposide, thiotepa, topotecan, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole.

Paraplatin-AQ

- Hydrate patient with 1–2 liters of fluid infused over 8–12 hr prior to therapy. Adequate hydration and urinary output must be maintained for 24 hr following infusion
- **Intermittent Infusion:** ***Diluent:*** Dilute Paraplatin-AQ with 2 liters of D5/0.45% NaCl containing 37.5 g of mannitol. Do not dilute with D5W. If diluted solution is not to be used within 6 hrs, protect solution from light. Do not refrigerate.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; bleeding gums; bruising; pinpoint red spots on skin; blood in

Copyright © 2008 by F.A. Davis

stools, urine, or emesis; increased fatigue, dyspnea, or orthostatic hypotension occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patients not to drink alcoholic beverages or take medication containing aspirin or NSAIDs because they may precipitate gastric bleeding.
- Instruct patient to promptly report any numbness or tingling in extremities or face, decreased coordination, difficulty with hearing or ringing in the ears, unusual swelling, or weight gain to health care professional.
- Instruct patient not to receive any vaccinations without advice of health care professional and to avoid contact with persons who have received oral polio vaccine within the past several months.
- Advise patient of the need for contraception (if patient is not infertile as a result of surgical or radiation therapy).
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional, rinse mouth with water after eating, and use sponge brush. Mouth pain may require treatment with opioids.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size or spread of ovarian carcinoma.

carisoprodol
(kar-i-**sop**-roe-dole)
Soma, Vanadom

Classification
Therapeutic: skeletal muscle relaxants (centrally acting)

Pregnancy Category UK

Indications
Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions.

Action
Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Crosses the placenta; high concentrations in breast milk.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 8 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	4–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to carisoprodol or to meprobamate; Porphyria or suspected porphyria.
Use Cautiously in: Severe liver or kidney disease; OB, Lactation, Pedi: Safety not established for pregnant women, breastfeeding infants, or children <16 yr; Geri: Poorly tolerated due to anticholinergic effects. Appears on Beers list.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, agitation, ataxia, depression, headache, insomnia, irritability, syncope. **Resp:** asthma attacks. **CV:** hypotension, tachycardia. **GI:** epigastric distress, hiccups, nausea, vomiting. **Derm:** flushing, rashes. **Hemat:** eosinophilia, leukopenia. **Misc:** ANAPHYLACTIC SHOCK, fever, psychological dependence, severe idiosyncratic reaction.

Interactions
Drug-Drug: Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

Route/Dosage
PO (Adults ≥16 yrs): 250–350 mg 4 times daily for no >2–3 wks.

Availability (generic available)
Tablets: 250 mg, 350 mg. ***In combination with:*** aspirin (Soma compound) and codeine. See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.

Copyright © 2008 by F.A. Davis

- Observe patient for idiosyncratic symptoms that may appear within minutes or hours of administration during the first dose. Symptoms include extreme weakness, quadriplegia, dizziness, ataxia, dysarthria, visual disturbances, agitation, euphoria, confusion, and disorientation. Usually subsides over several hours.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired bed mobility (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Soma with Soma Compound.
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Administer with food to minimize GI irritation. Give dose at bedtime.

Patient/Family Teaching

- Instruct patient to take medication as directed. Missed doses should be taken within 1 hr; if not, omit and return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat, etc.).
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling of tongue or lips, dyspnea) or idiosyncratic reaction occur.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

HIGH ALERT

carmustine (kar-mus-teen)

BCNU, BiCNU, Gliadel

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

C

Indications

Alone or with other treatments (surgery, radiation) in the management of: Brain tumors, Multiple myeloma, Hodgkin's disease, Other lymphomas.

Action

Inhibits DNA and RNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, especially malignant ones.

Pharmacokinetics

Absorption: Following IV administration, absorption is complete. Following implantation, action is primarily local.
Distribution: Highly lipid soluble; readily penetrates CSF. Enters breast milk.
Metabolism and Excretion: Rapidly metabolized. Some metabolites have antineoplastic activity.
Half-life: *Biologic*—15–30 min; *chemical*—5 min.

TIME/ACTION PROFILE (effect on platelet counts)

ROUTE	ONSET	PEAK	DURATION
IV	days	4–5 wk	6 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: Infections; Depressed bone marrow reserve; Geriatric patients (consider age related decrease in body mass, renal/hepatic/cardiovascular function, concurrent medications and chronic illnesses); Impaired pulmonary, hepatic, or renal function; Other chronic debilitating illnesses; Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: PULMONARY FIBROSIS, pulmonary infiltrates. **GI:** hepatotoxicity, nausea, vomiting, anorexia, diarrhea, esophagitis. **GU:** renal failure. **Derm:** alopecia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** pain at IV site.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. **Smoking** ↑ risk of pulmonary toxicity. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Myelosuppression may be ↑ by **cimetidine**.

Route/Dosage

IV (Adults and Children): 150–200 mg/m² single dose every 6–8 wk *or* 75–100 mg/m²/day for 2 days q 6 wk *or* 40 mg/m²/day for 5 days q 6 wk.

Intracavitary (Adults): Up to 61.6 mg (8 implants) placed in cavity created during surgical resection of brain tumor.

Availability

Injection: 100-mg vial. **Intracavitary wafer:** 7.7 mg in packages of 8.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess respiratory status for dyspnea or cough. Pulmonary toxicity usually occurs after high cumulative doses or several courses of therapy but may also occur following 1–2 courses of low doses. Symptoms may be rapid or gradual in onset; damage may be reversible or irreversible. Delayed pulmonary fibrosis may occur years after therapy. Notify physician promptly if symptoms occur.
- Monitor IV site closely. Carmustine is an irritant. Instruct patient to notify nurse immediately if discomfort occurs at IV site. Discontinue IV immediately if infiltration occurs. Ice may be applied to site. May cause hyperpigmentation of skin along vein.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which occur within 2 hr of administration and persist for 4–6 hr. Administration of an antiemetic before and during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and throughout therapy. The nadir of thrombocytopenia occurs in 4–5 wk; the nadir of leukopenia in 5–6 wk. Recovery usually occurs in 6–7 wk but may take 10–12 wk after prolonged therapy. Withhold dose and notify physician if platelet count is <100,000/mm³ or leukocyte count is <4000/mm³. Anemia is usually mild.
- Monitor serum bilirubin, AST, ALT, and LDH before and periodically during therapy. May cause mild, reversible ↑ in AST, alkaline phosphatase, and bilirubin.
- Monitor BUN, serum creatinine, and uric acid before and periodically during therapy. Notify physician if BUN is elevated.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Disturbed body image (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers. Contact with skin may cause transient hyperpigmentation.
- **Intermittent Infusion:** Dilute contents of each 100-mg vial with 3 ml of absolute ethyl alcohol provided as a diluent. Dilute this solution with 27 ml of sterile water for injection. ***Concentration:*** 3.3 mg/ml. ***Diluent:*** May be further diluted with 500 ml of D5W or 0.9% NaCl in a glass container.
- Solution is clear and colorless. Do not use vials that contain an oily film, which indicates decomposition. Reconstituted solution is stable for 24 hr when refrigerated and protected from light. Solution contains no preservatives; do not use as a multidose vial.
- IV lines may be flushed with 5–10 ml of 0.9% NaCl before and after carmustine infusion to minimize irritation at the injection site. ***Rate:*** Administer dose over 1–2 hr at rate of <3

Copyright © 2008 by F.A. Davis

mg/ml/min. Rapid infusion rate may cause local pain, burning at site, and flushing. Facial flushing occurs within 2 hr and may persist for 4 hr.

- **Y-Site Compatibility:** amifostine, aztreonam, cefepime, etoposide, filgrastim, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinorelbine.
- **Additive Incompatibility:** allopurinol, sodium bicarbonate.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs.
- Instruct patient to notify health care professional if shortness of breath or increased cough occurs. Encourage patient not to smoke, because smokers are at greater risk for pulmonary toxicity.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic parameters in nonsolid cancers.

carvedilol (kar-**ve**-dil-ole)
Coreg, Coreg CR

Classification
Therapeutic: antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

C

Indications
Hypertension. CHF (ischemic or cardiomyopathic) with digoxin, diuretics, and ACE inhibitors. Left ventricular dysfunction after myocardial infarction.

Action
Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$ blocking activity, which may result in orthostatic hypotension. **Therapeutic Effects:** Decreased heart rate and blood pressure. Improved cardiac output, slowing of the progression of CHF and decreased risk of death.

Pharmacokinetics
Absorption: Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25–35% bioavailability. Food slows absorption.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized, excreted in feces via bile, <2% excreted unchanged in urine.
Half-life: 7–10 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	12 hr
PO-CR	unknown	5 hr	24 hr

Contraindications/Precautions
Contraindicated in: Pulmonary edema; Cardiogenic shock; Bradycardia, heart block, or sick sinus syndrome (unless a pacemaker is in place); Uncompensated CHF requiring IV inotropic agents (wean before starting carvedilol); Severe hepatic impairment; Asthma or other bronchospastic disorders.
Use Cautiously in: CHF (condition may deteriorate during initial therapy); Renal impairment; Hepatic impairment; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Peripheral vascular dis-

Copyright © 2008 by F.A. Davis

ease; History of severe allergic reactions (intensity of reactions may be increased); OB: Crosses placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation, Pedi: Safety not established; Geri: Increased sensitivity to beta blockers; initial dosage reduction recommended.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, weakness, anxiety, depression, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA. **GI:** diarrhea, constipation, nausea. **GU:** erectile dysfunction, decreased libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthetics, **IV phenytoin**, **diltiazem**, and **verapamil** may cause ↑ myocardial depression. ↑ risk of bradycardia with **digoxin**. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **clonidine** ↑ hypotension and bradycardia. May ↑ withdrawal phenomenon from **clonidine** (discontinue carvedilol first). Concurrent administration of **thyroid preparations** may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypotension/bradycardia). **Cimetidine** may ↑ toxicity from carvedilol. Concurrent **NSAIDs** may ↓ antihypertensive action. Effectiveness may be ↓ by **rifampin**. May ↑ serum **digoxin** levels. May ↑ blood levels of **cyclosporine** (monitor blood levels).

Route/Dosage

PO (Adults): *Hypertension*—6.25 mg twice daily, may be increased q 7–14 days up to 25 mg twice daily or Extended-release-20 mg once daily, dose may be doubled every 7–14 days up to 80 mg once daily; *CHF*—3.125 mg twice daily for 2 wk; may be increased to 6.25 mg twice daily. Dose may be doubled q 2 wk as tolerated (not to exceed 25 mg twice daily in patients <85 kg or 50 mg twice daily in patients >85 kg *or* Extended-release-10 mg once daily, dose may be doubled every 2 wks as tolerated up to 80 mg once daily; *Left ventricular dysfunction after MI*—6.25 mg twice daily, increase after 3–10 days to 12.5 twice daily then to target dose of 25 mg twice daily; some patients may require lower initial doses and slower titration *or* Extended-release-20 mg once daily, dose may be doubled every 3–10 days up to 80 mg once daily.

Availability (generic available)

Tablets: 3.125 mg, 6.25 mg, 12.5 mg, 25 mg. **Cost:** *Generic*—3.125 mg $89.95/180, 6.25 mg $79.94/180, 12.5 mg $79.94/180, 25 mg $89.93/180. **Extended-release capsules:** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** all strengths $333.97/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dose adjustment period and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention). Patients may experience worsening of symptoms during initiation of therapy for CHF.
- **Hypertension:** Check frequency of refills to determine adherence.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse carvedilol with captopril or carteolol.

Copyright © 2008 by F.A. Davis

- Discontinuation of concurrent clonidine should be gradual, with carvedilol discontinued first over 1-2 week with limitation of physical activity; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with food to minimize orthostatic hypotension.
- Extended-release capsules should be taken in the morning and swallowed whole, do not crush, break, or chew. Extended-release capsules may be opened and sprinkled on cold applesauce and take immediately; do not store mixture.
- To convert from immediate-release to extended-release product, doses of 3.125 mg twice daily can be converted to 10 mg daily; doses of 6.25 mg twice daily can be converted to 20 mg daily; doses of 12.5 mg twice daily can be converted to 40 mg daily; and doses of 25 mg twice daily can be converted to 80 mg daily.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of detrimental side effects.
- Decrease in severity of CHF.

caspofungin (kas-po-**fun**-gin)
Cancidas

Classification
Therapeutic: antifungals (systemic)
Pharmacologic: echinocandins

Pregnancy Category C

Indications

Invasive aspergillosis refractory to, or intolerant of, other therapies. Candidemia and associated serious infections (intra-abdominal abscesses, peritonitis, pleural space infections). Esophageal candidiasis. Suspected fungal infections in febrile neutropenic patients.

Copyright © 2008 by F.A. Davis

Action
Inhibits the synthesis of β (1, 3)-D-glucan, a necessary component of the fungal cell wall.
Therapeutic Effects: Death of susceptible fungi.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed to tissues.
Protein Binding: 97%.
Metabolism and Excretion: Slowly and extensively metabolized; <1.5% excreted unchanged in urine.
Half-life: Polyphasic: β *phase*—9–11 hr; ξ *phase*—40–50 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use with cyclosporine.
Use Cautiously in: Moderate hepatic impairment (decreased maintenance dose recommended); Pedi: Children <18 yr (safety not established).

Adverse Reactions/Side Effects
CNS: headache. **GI:** diarrhea, nausea, vomiting. **Derm:** flushing. **Local:** venous irritation at injection site. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions
Drug-Drug: Concurrent use with **cyclosporine** is not recommended due to ↑ risk of hepatic toxicity. May ↓ blood levels and effects of **tacrolimus**. Blood levels and effectiveness may be ↓ by **rifampin**; maintenance dose should be ↑ to 70 mg (in patients with normal liver function). Blood levels and effectiveness may be also be ↓ by **efavirenz**, **nelfinavir**, **nevirapine**, **phenytoin**, **dexamethasone**, or **carbamazepine** an ↑ in the maintenance dose to 70 mg should be considered in patients who are not clinically responding.

Route/Dosage
IV (Adults): 70 mg initially followed by 50 mg daily, duration determined by clinical situation and response; *Esophageal candidiasis*—50 mg daily, duration determined by clinical situation and response.

Moderate Hepatic Impairment (Child-Pugh Score 5–6)
IV (Adults): 70 mg initially followed by 35 mg daily, duration determined by clinical situation and response.

Availability
Powder for injection: 50 mg/vial, 70 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess patient for signs and symptoms of fungal infections prior to and periodically during therapy.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, stridor) during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, AST, ALT, eosinophils, and urine protein and RBCs. May also cause ↓ serum potassium, hemoglobin, hematocrit, and WBCs.

Potential Nursing Diagnoses
Risk for infection (Indications)

Implementation
IV Administration
- **Intermittent Infusion:** ***Diluent:*** Allow refrigerated vial to reach room temperature. *For 75-mg or 50-mg dose*—Reconstitute vials with 10.5 ml of 0.9% NaCl or sterile water for injection. Reconstituted solution is stable for 1 hr at room temperature. Withdraw 10 ml from vial and add to 250 ml of 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, or LR. The 50-mg dose can also be diluted in 100 ml when volume restriction is necessary. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. *For 35-mg dose*—Reconstitute a 50-mg vial as per the directions above. Withdraw 7 ml from vial and add to 250 ml of appropriate diluent. May also be diluted in 100 ml if volume restriction is necessary. White cake should dissolve completely. Mix gently until a clear solution is obtained. Do not use a solution that is cloudy, discolored, or contains precipitates. ***Concentration:*** 0.14–0.47 mg/ml. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, aztreonam, bumetanide, calcium chloride, calcium gluconate, ceftizoxime, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, diltiazem, diphenhydramine, dobutamine,

Copyright © 2008 by F.A. Davis

dolasetron, dopamine, doxycycline, droperidol, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, ganciclovir, gentamicin, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, linezolid, magnesium sulfate, meperidine, meropenem, metoclopramide, metoprolol, midazolam, milrinone, morphine, moxifloxacin, nicardipine, nitroglycerin, norepinephrine, ondansetron, palonosetron, phenylephrine, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, tacrolimus, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil.

- **Y-Site Incompatibility:** amphotericin B, ampicillin, ampicillin/sulbactam, azithromycin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dexamethasone sodium phosphate, diazepam, digoxin, enalaprilat, ertapenem, furosemide, heparin, hydralazine, ketorolac, lidocaine, lorazepam, methylprednisolone sodium succinate, metronidazole, nafcillin, nitroprusside, pamidronate, pancuronium, pantoprazole, phenytoin, piperacillin/tazobactam, potassium chloride, potassium phosphate, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.
- **Solution Incompatibility:** Solutions containing dextrose.

Patient/Family Teaching

- Explain the purpose of caspofungin to patient and family.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of fungal infections. Duration of therapy is determined based on severity of underlying disease, recovery from immunosuppression, and clinical response.

cefaclor, See CEPHALOSPORINS—SECOND GENERATION.

cefadroxil, See CEPHALOSPORINS—FIRST GENERATION.

cefazolin, See CEPHALOSPORINS—FIRST GENERATION.

cefdinir, See CEPHALOSPORINS—THIRD GENERATION.

cefditoren, See CEPHALOSPORINS—THIRD GENERATION.

cefepime (**seff**-e-peem)
Maxipime

Classification
Therapeutic: anti-infectives
Pharmacologic: fourth-generation cephalosporins

Pregnancy Category B

Indications

Treatment of the following infections caused by susceptible organisms: Uncomplicated skin and skin structure infections, Bone and joint infections, Uncomplicated and complicated urinary tract infections, Respiratory tract infections, Complicated intra-abdominal infections (with metronidazole), Septicemia. Empiric treatment of febrile neutropenic patients.

Action

Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second-, and third-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first-, second- and third-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae* (including β-lactamase-producing strains), *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria*, *Proteus*, *Providencia*, *Pseudomonas aeruginosa*, *Serratia*, *Moraxella catarrhalis* (including β-lactamase-producing strains). Not active against methicillin-resistant staphylococci or enterococci.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed after IM administration; IV administration results in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in low concentrations. Some CSF penetration.
Metabolism and Excretion: 85% excreted unchanged in urine.
Half-life: 2 hr (increased in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
Use Cautiously in: Renal impairment (decreased dosing/increased dosing interval recommended if CCr ≤60 ml/min); History of GI disease, especially colitis; Patients with hepatic dysfunction or poor nutritional status (may be at increased risk of bleeding); Geriatric patients (dosage adjustment due to age-related decrease in renal function may be necessary); Pregnancy, lactation, and children <2 mo (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses in patients with renal impairment), encephalopathy, headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, pruritis, urticaria. **Hemat:** bleeding, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis AT IV SITE. **Misc:** allergic reactions including ANAPHYLAXIS, superinfection, fever.

Interactions

Drug-Drug: Probenecid decreases excretion and increases blood levels. Concurrent use of **loop diuretics** or **aminoglycosides** may increase the risk of nephrotoxicity.

Route/Dosage

IM (Adults): *Mild-to-moderate uncomplicated or complicated urinary tract infections due to E. coli* –0.5–1 g every 12 hr.
IV (Adults): *Moderate-to-severe pneumonia*—1–2 g every 12 hr. *Mild-to-moderate uncomplicated or complicated urinary tract infections* 0.5–1 g every 12 hr. *Severe uncomplicated or complicated urinary tract infections, moderate-to-severe uncomplicated skin and skin structure infections, complicated intra-abdominal infections*—2 g every 12 hr. *Empiric treatment of febrile neutropenia*—2 g every 8 hr.
IV (Children 2 mo–16 yr): *Uncomplicated and complicated urinary tract infections, uncomplicated skin and skin structure infections, pneumonia*—50 mg/kg every 12 hr (not to exceed 2 g/dose). *Febrile neutropenia*—50 mg/kg every 8 hr (not to exceed 2 g/dose).

Renal Impairment

IM, IV (Adults): (See Manufacturer's specific recommendations) *CCr 30–60 ml/min*—0.5–1 g every 24 hr or 2 g every 12–24 hr; *CCr 11–29 ml/min*—0.5–2 g every 24 hr; *CCr <11 ml/min*—250 mg–1 g every 24 hr.

Availability

Powder for injection: 500 mg, 1 g, 2 g.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause increased serum AST, ALT, bilirubin, BUN, and creatinine.
- May rarely cause leukopenia, neutropenia, thrombocytopenia, and eosinophilia.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- IM route should only be used for treatment of mild-to-moderate uncomplicated or complicated urinary tract infections due to *Escherichia coli*.
- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.
- **Intermittent Infusion:** Reconstitute with 5 ml sterile water, 0.9% NaCl, or D5W for the 500-mg vial, or 10 ml for the 1-g or 2-g vials. Reconstituted solution should be further diluted in 50–100 ml of D5W, 0.9% NaCl, D10W, D5/0.9% NaCl, or D5/LR.
- Solution is stable for 24 hr at room temperature and 7 days if refrigerated. ***Rate:*** Administer over 30 min.
- **Y-Site Compatibility:** ampicillin-sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cyclophosphamide, cytarabine, dactinomycin, dexamethasone sodium phosphate, docetaxel, fluconazole, fludarabine, fluorouracil, furosemide, granisetron, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, imipenem-cilastatin, leukcovorin, lorazepam, melphalan, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, paclitaxel, piperacillin-tazobactam, ranitidine, sargramostim, sodium bicarbonate, thiotepa, ticarcillin-clavulanate, trimethoprim/sulfamethoxazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amphotericin B, chlordiazepoxide, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin, diazepam, diphenhydramine, dobutamine, dopamine, doxorubicin, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, ganciclovir, haloperidol, hydroxyzine, idarubicin, ifosfamide, magnesium sulfate, mannitol, mechlorethamine, meperidine, metoclopramide, mitomycin, mitoxantrone, morphine, nalbuphine, ondansetron, prochlorperazine, promethazine, streptozocin, vancomycin, vinblastine, vincristine.

Patient/Family Teaching

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

celecoxib (sel-e-**kox**-ib)
Celebrex

Classification
Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents
Pharmacologic: COX-2 inhibitors

Pregnancy Category C

Indications
Relief of signs and symptoms of osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and juvenile rheumatoid arthritis. Reduction of the number of adenomatous colorectal polyps in familial adenomatous polyposis (FAP), as an adjunct to usual care (endoscopic surveillance, surgery). Management of acute pain including primary dysmenorrhea.

Action
Inhibits the enzyme COX-2. This enzyme is required for the synthesis of prostaglandins. Has analgesic, anti-inflammatory, and antipyretic properties. **Therapeutic Effects:** Decreased pain and inflammation caused by arthritis or spondylitis. Decreased number of colorectal polyps. Decreased pain.

Pharmacokinetics
Absorption: Bioavailability unknown.
Distribution: 97% bound to plasma proteins; extensive tissue distribution.
Metabolism and Excretion: Mostly metabolized by the liver; <3% excreted unchanged in urine and feces.
Half-life: 11 hr.

TIME/ACTION PROFILE (pain reduction)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	12–24 hr†

†After discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; History of allergic-type reactions to sulfonamides; History of asthma, urticaria, or allergic-type reactions to aspirin or other NSAIDs, including the aspirin triad (asthma, nasal polyps, and severe hypersensitivity reactions to aspirin); Advanced renal disease; Peri-operative pain from coronary artery bypass graft (CABG) surgery; OB: Should not be used in late pregnancy (may cause premature closure of the ductus arteriosus). Lactation: Potential for serious neonatal adverse effects. Discontinue drug or bottle feed.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Pre-existing renal disease, heart failure, liver dysfunction, concurrent diuretic or ACE inhibitor therapy (increased risk of renal impairment); Hypertension or fluid retention; Renal insufficiency (may precipitate acute renal failure); Serious dehydration (correct deficits before administering); Pre-existing asthma; Pedi: Safety not established in children <2 yrs or for longer than 6 mos; Geri: Concurrent therapy with corticosteroids or anticoagulants, long duration of NSAID therapy, history of smoking, alcoholism, geriatric patients, or poor general health status (increased risk of GI bleeding).
Exercise Extreme Caution in: History of ulcer disease or GI bleeding.

Adverse Reactions/Side Effects
CNS: dizziness, headache, insomnia. **CV:** edema. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, flatulence, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Significant interactions may occur when celecoxib is coadministered with other drugs that inhibit the CYP450 2C9 enzyme system. May ↓ effectiveness of **ACE inhibitors**, **thiazide diuretics**, and **furosemide**. **Fluconazole** ↑ celecoxib blood levels (dosage reduction recommended). May ↑ risk of bleeding with **warfarin**. May ↑ serum **lithium** levels. Does not inhibit the cardioprotective effect of low-dose **aspirin**.

Route/Dosage

PO (Adults): *Osteoarthritis*—200 mg/day as a single dose *or* 100 mg twice daily. *Rheumatoid arthritis*—100–200 mg twice daily. *Ankylosing spondylitis*—200 mg once daily *or* 100 mg twice daily; dose may be increased after 6 wk to 400 mg daily. *Familial adenomatous polyosis*—400 mg twice daily. *Acute pain, including dysmenorrhea*—400 mg initially, then a 200 mg dose if needed on the first day; then 200 mg twice daily as needed.
PO (Children 2 yrs and older, ≥10 kg–≤25 kg): 50-mg capsule twice daily.
PO (Children 2 yrs and older, >25 kg): 100-mg capsule twice daily.

Availability

Capsules: 50 mg, 100 mg, 200 mg, 400 mg.
Cost: 100 mg $213.29/100, 200 mg $362.17/100, 400 mg $524.26/100.

NURSING IMPLICATIONS

Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically throughout therapy.
- Assess patient for allergy to sulfonamides, aspirin, or NSAIDs. Patients with these allergies should not receive celecoxib.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.
- May cause hypophosphatemia and ↑ BUN.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

Implementation

- Do not confuse with Celexa (citalopram) or Cerebyx (fosphenytoin).
- **PO:** May be administered without regard to meals. Capsules may be opened and sprinkled on applesauce and ingested immediately with water. Mixture may be stored in the refrigerator for up to 6 hrs.

Patient/Family Teaching

- Instruct patient to take celecoxib exactly as directed. Do not take more than prescribed dose. Increasing doses does not appear to increase effectiveness. Use lowest effective dose for shortest period of time.
- Advise patient to notify health care professional promptly if signs or symptoms of GI toxicity (abdominal pain, black stools), skin rash, unexplained weight gain, or edema occurs. Patients should discontinue celecoxib and notify health care professional if signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, pruritus, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Advise patients with FAP to continue routine surveillance procedures.

Evaluation/Desired Outcomes

- Reduction in joint pain in patients with osteoarthritis.
- Reduction in joint tenderness, pain, and joint swelling in patients with rheumatoid arthritis and juvenile rheumatoid arthritis.
- Decreased number of colonic polyps in patients with FAP.

CEPHALOSPORINS—FIRST GENERATION

Classification
Therapeutic: anti-infectives
Pharmacologic: first-generation cephalosporins

Pregnancy Category B

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (including burn wounds), Pneumonia, Urinary tract infections, Bone and joint infections, Septicemia. Not suitable for the treatment of meningitis. **Cefadroxil:** Pharyngitis and/or tonsillitis. **Cefazolin:** Perioperative prophylaxis, biliary tract infections, genital infections, bacterial endocarditis prophylaxis for dental and upper respiratory tract procedures. **Cephalexin and cephadrine:** Otitis media.

Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci including: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, Penicillinase-producing staphylococci. Not active against: Methicillin-resistant staphylococci, *Bacteroides fragilis*, *Enterococcus*. Active against some gram-negative rods including: *Klebsiella pneumoniae*, *Proteus mirabilis*, *Escherichia coli*.

Pharmacokinetics

Absorption: *Cefadroxil, cephalexin,* and *cephradine* are well absorbed following oral administration. *Cefazolin* is well absorbed following IM administration.
Distribution: Widely distributed. Cefazolin penetrates bone and synovial fluid well. All cross the placenta and enter breast milk in low concentrations. Minimal CSF penetration.
Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.
Half-life: *Cefadroxil*—60–120 min; *cefazolin*—90–150 min; *cephalexin*—50–80 min; *cephradine*—60–120 min (all are increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Cefadroxil PO	rapid	1.5–2 hr	12–24 hr
Cefazolin IM	rapid	0.5–2 hr	6–12 hr
Cefazolin IV	rapid	5 min	6–12 hr
Cephalexin PO	rapid	1 hr	6–12 hr
Cephradine PO	rapid	1–2 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
Use Cautiously in: Renal impairment (dosage reduction and/or increased dosing interval recommended for: *cefadroxil, cephradine, and cephalexin*, if CCr ≤50 ml/min, and *cefazolin*, if CCr <30 ml/min; History of GI disease, especially colitis; Geri: Dosage adjustment due to age-related decrease in renal function may be necessary; OB: Pregnancy or lactation (half-life is shorter and blood levels lower during pregnancy; have been used safely).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, cramps. **Derm:** rashes, pruritis, urticaria. **Hemat:** agranulocytosis, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis AT IV SITE. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ blood levels of renally excreted cephalosporins. Concurrent use of **loop diuretics** or **aminoglycosides** may ↑ risk of renal toxicity.

Route/Dosage

Cefadroxil

PO (Adults): *Pharyngitis and tonsillitis*—500 mg q 12 hr or 1 g q 24 hr for 10 days. *Skin and soft-tissue infections*—500 mg q 12 hr or 1 g q 24 hr. *Urinary tract infections*—500 mg–1 g q 12 hr or 1–2 g q 24 hr.
PO (Children): *Pharyngitis, tonsillitis, or impetigo*—15 mg/kg q 12 hr or 30 mg/kg q 24 hr for 10 days. *Skin and soft-tissue infections*—15 mg/kg q 12 hr. *Urinary tract infections*—15 mg/kg q 12 hr.

Renal Impairment

PO (Adults): *CCr 25–50 ml/min*—500 mg q 12 hr; *CCr 10–25 ml/min*—500 mg q 24 hr; *CCr <10 ml/min*—500 mg q 36 hr.

Cefazolin

IM, IV (Adults): *Moderate to severe infections*—500 mg–2 g q 6–8 hr (maximum 12 g/day). *Mild infections with gram-positive coc-*

ci—250–500 mg q 8 hr. *Uncomplicated urinary tract infections*—1 g q 12 hr. *Pneumococcal pneumonia*—500 mg q 12 hr. *Infective endocarditis or septicemia*—1–1.5 g q 6 hr. *Perioperative prophylaxis*—1 g given 30–60 min prior to incision. Additional 500 mg–1 g should be given for surgeries ≥2 hr. 500 mg–1 g should then be given for all surgeries q 6–8 hr for 24 hr postoperatively.
IM, IV (Children and Infants >1 mo): 16.7–33.3 mg/kg q 8 hr (maximum 6 g/day); *Bacterial endocarditis prophylaxis in penicillin-allergic patients:* 25 mg/kg 30 minutes prior to procedure (maximum dose = 1 g).
IM, IV (Neonates ≤7 days): 40 mg/kg/day divided q 12 hr.
IM, IV (Neonates >7 days and ≤2 kg): 40 mg/kg/day divided q 12 hr.
IM, IV (Neonates >7 days and >2 kg): 60 mg/kg/day divided q 8 hr.

Renal Impairment
IM, IV (Adults): *CCr 10–30 ml/min*—Administer q 12 hr; *CCr ≤10 ml/min*—Administer q 24 hr.

Cephalexin

PO (Adults): *Most infections*—250–500 mg q 6 hr. *Uncomplicated cystitis, skin and soft-tissue infections, streptococcal pharyngitis*—500 mg q 12 hr.
PO (Children): *Most infections*—25–50 mg/kg/day divided q 6–8 hr (can be administered q 12 hr in skin/skin structure infections or streptococcal pharyngitis). *Otitis media*—18.75—25 mg/kg q 6 hr (maximum = 4 g/day).

Renal Impairment
PO (Adults): *CCr 10–50 ml/min*—500 mg q 8–12 hr; *CCr <10 ml/min*—250–500 mg q 12–24 hr.

Cephradine

PO (Adults): *Most infections*—250–500 mg q 6–12 hr.
PO (Children ≥9 mo): *Most infections*—6.25–12.5 mg/kg q 6 hr; *Otitis media*—18.75–25 mg/kg q 6 hr *or* 37.5–50 mg/kg q 12 hr.

Renal Impairment
PO (Adults): *CCr 10–50 ml/min*—Decrease dose by 50%; *CCr <10 ml/min*—Decrease dose by 75%.

Availability

Cefadroxil
Capsules: 500 mg. **Tablets:** 1 g. **Oral suspension (orange-pineapple flavor):** 250 mg/5 ml, 500 mg/5 ml.

Cefazolin
Powder for injection: 500 mg, 1 g, 10 g, 20 g. **Premixed containers:** 500 mg/50 ml D5W, 1 g/50 ml D5W.

Cephalexin
Capsules: 250 mg, 333 mg, 500 mg, 750 mg. **Tablets:** 250 mg, 500 mg. **Oral suspension:** 100 mg/ml, 125 mg/5 ml, 250 mg/5 ml.

Cephradine
Capsules: 250 mg. **Oral suspension (fruit flavored):** 250 mg/5 ml.

NURSING IMPLICATIONS

Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, or eosinophilia.

Potential Nursing Diagnoses
Risk for infection (Indications, Side Effects)

Copyright © 2008 by F.A. Davis

Diarrhea (Adverse Reactions)

Implementation

- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Refrigerate oral suspensions.

Cefazolin

- **IM:** Reconstitute IM doses with 2 ml or 2.5 ml of cefazolin with sterile water for injection to achieve a final concentration of 225–330 mg/mL.
- Inject deep into a well-developed muscle mass; massage well.

IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. ***Concentration:*** 100 mg/ml. May use up to 138 mg/ml in fluid-restricted patients. ***Rate:*** May administer over 3–5 min.
- **Intermittent Infusion:** ***Diluent:*** Reconstituted 500-mg or 1-g solution may be diluted in 50–100 ml of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. Solution is stable for 24 hr at room temperature and 10 days if refrigerated. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer over 10–60 min.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, anidulafungin, atracurium, aztreonam, bivalirudin, calcium gluconate, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxapram, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, fenoldopma, filgrastim, fluconazole, fludarabine, foscarnet, gemcitabine, granisetron, heparin, insulin, labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, meperidine, midazolam, milrinone, morphine, multivitamins, nicardipine, ondansetron, pancuronium, pantoprazole, perphenazine, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, vecuronium, vitamin B complex with C, warfarin.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, idarubicin, lansoprazole, pemetrexed, pentamidine, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Instruct patient to use calibrated measuring device with liquid preparations. Advise patient that sharing this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

Indications

Treatment of the following infections caused by susceptible organisms: Respiratory tract infec-

Copyright © 2008 by F.A. Davis

tions, Skin and skin structure infections, Bone and joint infections (not cefaclor or cefprozil), Urinary tract infections (not cefprozil). **Cefotetan and cefoxitin:** Intra-abdominal and gynecologic infections. **Cefuroxime:** Meningitis, gynecologic infections, and Lyme disease. **Cefaclor, cefprozil, cefuroxime:** Otitis media. **Cefoxitin and cefuroxime:** Septicemia. **Cefotetan, cefoxitin, cefuroxime:** Perioperative prophylaxis.

Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of first-generation cephalosporins but have ↑ activity against several other gram-negative pathogens including: *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Morganella morganii*, *Neisseria gonorrhoeae* (including penicillinase-producing strains), *Proteus*, *Providencia*, *Serratia marcescens*, *Moraxella catarrhalis*. Not active against methicillin-resistant staphylococci or enterococci. **Cefuroxime:** Active against *Borrelia burgdorferi.* **Cefotetan and cefoxitin:** Active against *Bacteroides fragilis*.

Pharmacokinetics

Absorption: *Cefotetan, cefoxitin,* and *cefuroxime*—well absorbed following IM administration. *Cefaclor, cefprozil,* and *cefuroxime*—well absorbed following oral administration. **Distribution:** Widely distributed. Penetration into CSF is poor, but adequate for cefuroxime (IV) to be used in treating meningitis. All cross the placenta and enter breast milk in low concentrations.

Metabolism and Excretion: Excreted primarily unchanged by the kidneys.

Half-life: *Cefaclor*—30–60 min; *cefotetan*—3–4.6 hr; *cefoxitin*—40–60 min; *cefprozil*—90 min; *cefuroxime*—60–120 min; (all are increased in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefaclor PO	rapid	30–60 min	6–12 hr
Cefaclor PO-CD	unknown	unknown	12 hr
Cefotetan IM	rapid	1–3 hr	12 hr
Cefotetan IV	rapid	end of infusion	12 hr
Cefoxitin IM	rapid	30 min	4–8 hr
Cefoxitin IV	rapid	end of infusion	4–8 hr
Cefprozil PO	unknown	1–2 hr	12–24 hr
Cefuroxime PO	unknown	2–3 hr	8–12 hr
Cefuroxime IM	rapid	15–60 min	6–12 hr
Cefuroxime IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.

Use Cautiously in: Renal impairment (↓ dose/ ↑ dosing interval recommended for: *cefotetan* if CCr ≤30 ml/min, *cefoxitin* if CCr ≤50 ml/min, *cefprozil* if CCr <30 ml/min, *cefuroxime* if CCr ≤20 ml/min); **Cefotetan and cefoxitin:** Patients with hepatic dysfunction, poor nutritional state, or cancer may be at ↑ risk for bleeding; History of GI disease, especially colitis; *Cefprozil (oral suspension)* contains aspartame and should be avoided in patients with phenylketonuria; Geri: Dosage adjustment due to age-related ↓ in renal function may be necessary; may also be at ↑ risk for bleeding with *cefotetan* or *cefoxitin*; OB: Pregnancy and lactation (have been used safely).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, cramps, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** agranulocytosis, bleeding (↑ with cefotetan and cefoxitin), eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis AT IV SITE. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ blood levels. If **alcohol** is ingested within 48–72 hr of cefotetan, a disulfiram-like reaction may occur. Cefotetan may ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents**, **thrombolytics**, and **NSAIDs**. **Antacids** ↓ absorption of cefaclor. Concurrent use of **aminoglycosides** or **loop diuretics** may ↑ risk of nephrotoxicity.

Route/Dosage

Cefaclor

PO (Adults): 250–500 mg q 8 hr or 375–500 mg q 12 hr as extended-release tablets.

Copyright © 2008 by F.A. Davis

PO (Children >1 mo): 6.7–13.4 mg/kg q 8 hr or 10–20 mg/kg q 12 hr (up to 1 g/day).

Cefotetan

IM, IV (Adults): *Most infections*—1–2 g q 12 hr. *Severe/life-threatening infections*—2–3 g q 12 hr. *Urinary tract infections*—500 mg–2 g q 12 hr *or* 1–2 g q 24 hr. *Perioperative prophylaxis*—1–2 g 30–60 min before initial incision (one-time dose).

Renal Impairment

IM, IV (Adults): *CCr 10–30 ml/min*—Usual adult dose q 24 hr *or* ½ usual adult dose q 12 hr; *<CCr 10 ml/min*—Usual adult dose q 48 hr *or* ¼ usual adult dose q 12 hr.

Cefoxitin

IM, IV (Adults): *Most infections*—1 g q 6–8 hr. *Severe infections*—1 g q 4 hr *or* 2 g q 6–8 hr. *Life-threatening infections*—2 g q 4 hr *or* 3 g q 6 hr. *Perioperative prophylaxis*—2 g 30–60 min before initial incision, then 2 g q 6 hr for up to 24 hr.

IM, IV (Children and Infants >3 mo): *Most infections*—13.3–26.7 mg/kg q 4 hr *or* 20–40 mg/kg q 6 hr. *Perioperative prophylaxis*—30–40 mg/kg within 60 min of initial incision, then 30–40 mg/kg q 6 hr for up to 24 hr.

Renal Impairment

IM, IV (Adults): *CCr 30–50 ml/min*—1–2 g q 8–12 hr; *CCr 10–29 ml/min*—1–2 g q 12–24 hr; *CCr 5–9 ml/min*—0.5–1 g q 12–24 hr; *CCr <5 ml/min*—0.5–1 g q 24–48 hr.

Cefprozil

PO (Adults): *Most infections*—250–500 mg q 12 hr *or* 500 mg q 24 hr.

PO (Children 6 mo–12 yr): *Otitis media*—15 mg/kg q 12 hr. *Acute sinusitis*—7.5–15 mg/kg q 12 hr (higher dose should be used for moderate-to-severe infections).

PO (Children 2–12 yr): *Pharyngitis/tonsillitis*—7.5 mg/kg q 12 hr. *Skin/skin structure infections*—20 mg/kg q 24 hr.

Renal Impairment

PO (Adults and Children ≥6 mo): *CCr <30 ml/min*—½ of usual dose at normal dosing interval.

Cefuroxime

Cefuroxime oral tablets and oral suspension are not bioequivalent and are not substitutable on a mg-to-mg basis.

PO (Adults and Children >12 yr): *Pharyngitis/tonsillitis, maxillary sinusitis, uncomplicated UTIs*—250 mg q 12 hr. *Bronchitis, uncomplicated skin/skin structure infections*—250–500 mg q 12 hr. *Gonorrhea*—1 g (single dose). *Lyme disease*—500 mg q 12 hr for 20 days.

PO (Children 3 mo–12 yr): *Otitis media, acute bacterial maxillary sinusitis, impetigo*—15 mg/kg q 12 hr as oral suspension (not to exceed 1 g/day) *or* 250 mg q 12 hr as tablets. *Pharyngitis/tonsillitis*—10 mg/kg q 12 hr as oral suspension (not to exceed 500 mg/day).

IM, IV (Adults): *Uncomplicated urinary tract infections, skin/skin structure infections, disseminated gonococcal infections, uncomplicated pneumonia*—750 mg every 8 hr. *Bone/joint infections, severe or complicated infections*—1.5 g every 8 hr. *Life-threatening infections*—1.5 g every 6 hr. *Meningitis*—3 g every 8 hr. *Perioperative prophylaxis*—1.5 g IV 30–60 min before initial incision; 750 mg IM/IV every 8 hr can be given when procedure prolonged. *Prophylaxis during open-heart surgery*—1.5 g IV at induction of anesthesia and then every 12 hr for 3 additional doses. *Gonorrhea*—1.5 g IM (750 mg in two sites) with 1 g probenecid PO.

IM, IV (Children and Infants >3 mo): *Most infections*—12.5–25 mg/kg q 6 hr *or* 16.7–33.3 mg/kg q 8 hr (maximum dose = 6 g/day). *Bone and joint infections*—50 mg/kg q 8 hr (maximum dose = 6 g/day). *Bacterial meningitis*—50–60 mg/kg q 6 hr *or* 66.7–80 mg/kg q 8 hr.

Renal Impairment

IM, IV (Adults): *CCr 10–20 ml/min*—750 mg q 12 hr; *CCr <10 ml/min*—750 mg q 24 hr.

Availability

Cefaclor

Capsules: 250 mg, 500 mg. **Chewable tablets (fruity):** 125 mg, 187 mg, 250 mg, 375 mg. **Extended-release tablets (CD):** 375 mg, 500 mg. **Oral suspension (strawberry):** 125 mg/5 ml, 187 mg/5 ml, 250 mg/5 ml, 375 mg/5 ml.

Cefotetan

Powder for injection: 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

Cefoxitin

Powder for injection: 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 ml D5W, 2 g/50 ml D5W.

Copyright © 2008 by F.A. Davis

Cefprozil

Tablets: 250 mg, 500 mg. **Oral suspension (bubblegum flavor):** 125 mg/5 ml, 250 mg/5 ml.

Cefuroxime

Tablets: 250 mg, 500 mg. **Oral suspension (tutti-frutti flavor):** 125 mg/5 ml, 250 mg/5 ml. **Powder for injection:** 750 mg, 1.5 g, 7.5 g. **Premixed containers:** 750 mg/50 ml, 1.5 g/50 ml.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician or other health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- *Cefotetan*—monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in high-risk patients; may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and creatinine.
- *Cefoxitin* may cause falsely ↑ test results for serum and urine creatinine; do not obtain serum samples within 2 hr of administration.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, and eosinophilia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering.
- Administer cefaclor extended-release tablets with food; do not crush, break, or chew.
- Do not administer cefaclor within 1 hr of antacids.
- *Cefuroxime* tablets should be swallowed whole, not crushed; crushed tablets have a strong, persistent bitter taste. Tablets may be taken without regard to meals. Suspension must be taken with food. Shake well each time before using. Tablets and suspension are not interchangeable.
- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- **IV:** Change sites every 48–72 hr to prevent phlebitis. Monitor site frequently for thrombophlebitis (pain, redness, swelling).
- If aminoglycosides are administered concurrently, administer in separate sites if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.

IV Administration

- **Direct IV:** Dilute each cephalosporin in at least 1 g/10 ml. Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.

Cefotetan

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 ml of D5W or 0.9% NaCl. Solution may be colorless or yellow. Solution is stable for 24 hr at room temperature or 96 hr if refrigerated. ***Concentration:*** 10–40 mg/ml. ***Rate:*** Administer over 20–30 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, bivalirudin, dexmedetomi-

Copyright © 2008 by F.A. Davis

date, diltiazem, docetaxel, etoposide phosphate, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, heparin, insulin, lansoprazole, linezolid, melphalan, meperidine, morphine, paclitaxel, pemetrexed, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa.
- **Y-Site Incompatibility:** pemetrexed, promethazine, vinorelbine.

Cefoxitin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 ml of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, D5/LR, Ringer's, or LR. Stable for 24 hr at room temperature and 1 wk if refrigerated. Darkening of powder does not alter potency. ***Concentration:*** 40 mg/ml. ***Rate:*** Administer over 10–60 min.
- **Continuous Infusion:** May be diluted in 500–1000 ml for continuous infusion.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, amifostine, amphotericin B cholesteryl sulfate, anidulafungin, aztreonam, bivalirudin, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, etoposide phosphate, famotidine, fluconazole, foscarnet, gemcitabine, granisetron, hydromorphone, linezolid, magnesium sulfate, meperidine, morphine, ondansetrol, perphenazine, propofol, ranitidine, remifentanil, teniposide, thiotepa.
- **Y-Site Incompatibility:** Manufacturer recommends stopping other medications during infusion, fenoldopam, filgrastim, lansoprazole, pemetrexed, pentamidine.

Cefuroxime

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Solution may be further diluted in 100 ml of 0.9% NaCl, D5W, D10W, or dextrose/saline combinations. Stable for 24 hr at room temperature and 1 wk if refrigerated. ***Concentration:*** 30 mg/ml. ***Rate:*** Administer over 15–60 min.
- **Continuous Infusion:** May also be diluted in 500–1000 ml for continuous infusion.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amiodarone, anidulafungin, atracurium, aztreonam, bivalirudin, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, etoposide phosphate, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, granisetron, hydromorphone, linezolid, melphalan, meperidine, milrinone, morphine, ondansetron, pancuronium, pemetrexed, perphenazine, propofol, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, vecuronium.
- **Y-Site Incompatibility:** Manufacturer recommends temporarily discontinuing primary solution when administering cefuroxime via Y-site, azithromycin, filgrastim, fluconazole, midazolam, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patients that concurrent use of alcohol with *cefotetan* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and alcohol-containing medications should be avoided during and for several days after therapy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

Rocephin

Classification
Therapeutic: anti-infectives
Pharmacologic: third-generation cephalosporins

Pregnancy Category B

Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (not cefixime), Urinary and gynecologic infections (not cefdinir, cefditoren, or ceftibuten), Respiratory tract infections (not cefdinir, cefditoren, or ceftibuten). **Cefotaxime, ceftazidime, ceftizoxime, ceftriaxone:** Meningitis and bone/joint infections. **Cefoperazone, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone:** Intra-abdominal infections and septicemia. **Cefdinir, cefixime, cefpodoxime, ceftibuten, ceftriaxone:** Otitis media. **Cefotaxime and ceftriaxone:** Perioperative prophylaxis. **Ceftazidime:** Febrile neutropenia. **Cefotaxime, ceftriaxone:** Lyme disease.

Action

Bind to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first- and second-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria gonorrhea*, *Citrobacter*, *Morganella*, *Proteus*, *Providencia*, *Serratia*, *Moraxella catarrhalis*, *Borrelia burgdorferi.* Some agents have activity against *Neisseria meningitidis* (cefotaxime, ceftazidime, ceftizoxime, ceftriaxone). Some agents have enhanced activity against *Pseudomonas aeruginosa* (ceftazidime, cefoperazone). Not active against methicillin-resistance staphylococci or enterococci. Some agents have activity against anaerobes, including *Bacteroides fragilis* (cefoperazone, cefotaxime, ceftizoxime, ceftriaxone).

Pharmacokinetics

Absorption: *Cefoperazone, cefotaxime, ceftazidime, ceftizoxime,* and *ceftriaxone* are well absorbed after IM administration. *Ceftibuten* is well absorbed after oral administration; *cefixime* 40–50% absorbed after oral administration (oral suspension); *cefdinir* 16–25% absorbed after oral administration. *Cefditoren pivoxil* and *cefpodoxime proxetil* are prodrugs that are converted to their active components in GI tract during absorption (*cefditoren*—14% absorbed [↑ by high-fat meal]; *cefpodoxime*—50% absorbed).
Distribution: Widely distributed. Cross the placenta; enter breast milk in low concentrations. CSF penetration better than with first- and second-generation agents.
Protein Binding: *Cefoperazone* and *ceftriaxone* ≥90%.
Metabolism and Excretion: *Cefdinir*, *ceftazidime*, *cefditoren*, and *ceftizoxime*—>85% excreted in urine. *Cefpodoxime*—30% excreted in urine. *Cefoperazone*—excreted in the bile. *Ceftibuten, ceftriaxone,* and *cefotaxime*—partly metabolized and partly excreted in the urine. *Cefixime*—50% excreted unchanged in urine, ≥10% in bile.
Half-life: *Cefdinir*—1.7 hr; *cefditoren*—1.6 hr; *cefixime*—3–4 hr; *cefoperazone*—2 hr; *cefotaxime*—1–1.5 hr; *cefpodoxime*—2–3 hr; *ceftazidime*—2 hr; *ceftibuten*—2 hr;

Copyright © 2008 by F.A. Davis

ceftizoxime—1.4–1.9 hr; *ceftriaxone*—6–9 hr (all except *cefoperazone* and *ceftriaxone* are increased in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cefdinir PO	rapid	2–4 hr	12–24 hr
Cefditoren PO	rapid	1.5–3 hr	12 hr
Cefixime PO	rapid	2–6 hr	24 hr
Cefoperazone IM	rapid	1–2 hr	12 hr
Cefoperazone IV	rapid	end of infusion	12 hr
Cefotaxime IM	rapid	0.5 hr	4–12 hr
Cefotaxime IV	rapid	end of infusion	4–12 hr
Cefpodoxime PO	unknown	2–3 hr	12 hr
Ceftazidime IM	rapid	1 hr	6–12 hr
Ceftazidime IV	rapid	end of infusion	6–12 hr
Ceftibuten PO	rapid	3 hr	24 hr
Ceftizoxime IM	rapid	0.5–1.5 hr	6–12 hr
Ceftizoxime IV	rapid	end of infusion	6–12 hr
Ceftriaxone IM	rapid	1–2 hr	12–24 hr
Ceftriaxone IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins; Hyperbilirubinemic neonates (ceftriaxone only; may lead to kernicterus); Carnitine deficiency or inborn errors of metabolism (cefditoren only); Hypersensitivity to milk protein (ceftidoren only; contains sodium caseinate).

Use Cautiously in: Renal impairment (decreased dosing/increased dosing interval recommended for: *Cefdinir* if CCr <30 ml/min, *cefixime* if CCr ≤60 ml/min, *cefotaxime* if CCr <20 ml/min, *cefpodoxime* if CCr <30 ml/min, *ceftazidime* if CCr ≤50 ml/min, *ceftibuten* and *cefditoren* if CCr <50 ml/min, *ceftizoxime* if CCr ≤80 ml/min); Hepatic/biliary impairment or combined hepatic/biliary/renal impairment (dosage reduction/increased dosing interval recommended for *cefoperazone*); Combined severe hepatic and renal impairment (dosage reduction/increased dosing interval recommended for *ceftriaxone*); Diabetes (*ceftibuten* and *cefdinir* suspensions contain sucrose); History of GI disease, especially colitis; Patients with poor nutritional status, malabsorption states, or alcoholism may be at ↑ risk for bleeding with *cefoperazone*; Geri: Dosage adjustment due to age-related ↓ in renal function may be necessary; Pregnancy and lactation (have been used safely).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses), headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, cholelithiasis (ceftriaxone), cramps. **Derm:** rashes, urticaria. **Hemat:** agranulocytosis, bleeding (↑ with cefoperazone), eosinophilia, hemolytic anemia, lymphocytosis, neutropenia, thrombocytopenia, thrombocytosis. **GU:** hematuria, vaginal moniliasis. **Local:** pain at IM site, phlebitis AT IV SITE. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ serum levels (cefdinir, cefditoren, cefixime, cefotaxime, cefpodoxime, ceftizoxime, ceftriaxone). Ingestion of **alcohol** within 48–72 hr of cefoperazone may result in a disulfiram-like reaction. Cefoperazone may ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents**, **thrombolytic agents**, and **NSAIDS**. Concurrent use of **loop diuretics** or **nephrotoxic agents** including **aminoglycosides** may ↑ risk of nephrotoxicity. **Antacids** ↓ absorption of cefdinir, cefditoren, and cefpodoxime. **Iron supplements** ↓ absorption of cefdinir. **H_2-receptor antagonists** ↓ absorption of cefditoren and cefpodoxime. Cefixime may ↑ **carbamazepine** levels.

Route/Dosage

Cefdinir

PO (Adults ≥13 yr): 300 mg q 12 hr *or* 600 mg q 24 hr (use q 12 hr dosing only for community-acquired pneumonia or skin and skin structure infections).

PO (Children 6 mo–12 yr): 7 mg/kg q 12 hr (use only for skin/skin structure infections) *or* 14 mg/kg q 24 hr; dose should not exceed 600 mg/day.

Renal Impairment

PO (Adults and Children ≥13 yr): *CCr <30 ml/min*—300 mg q 24 hr.

Renal Impairment

PO (Children 6 mo–12 yr): *CCr <30 ml/min*—7 mg/kg q 24 hr.

Cefditoren

PO (Adults and Children ≥12 yr): *Pharyngitis/tonsillitis, skin/skin structure infections*—200 mg twice daily; *Acute bacterial exacerbation of chronic bronchitis or community acquired pneumonia*—400 mg twice daily.

Copyright © 2008 by F.A. Davis

Renal Impairment

PO (Adults): *CCr 30–49 ml/min*—dose should not exceed 200 mg twice daily; *CCr <30 ml/min*—dose should not exceed 200 mg once daily.

Cefixime

PO (Adults and Children >12 yr or >50 kg): *Most infections*—400 mg once daily; *Gonorrhea*— 400 mg single dose.
PO (Children): 8 mg/kg once daily *or* 4 mg/kg q 12 h

Renal Impairment

PO (Adults): *CCr 21–60 ml/min*— 75% of standard dose once daily; *CCr ≤20 ml/min*—50% of standard dose once daily.

Cefoperazone

IM, IV (Adults): *Mild to moderate infections*—1–2 g q 12 hr. *Severe infections*—2–4 g q 8 hr *or* 1.5–3 g q 6 hr.

Hepatic/Renal Impairment

IM, IV (Adults): *Impaired hepatic function/biliary obstruction*—daily dose should not exceed 4 g; *combined hepatic and renal impairment*—daily dose should not exceed 1–2 g.

Cefotaxime

IM, IV (Adults and Children >12 yr): *Most uncomplicated infections*—1 g q 12 hr. *Moderate or severe infections*—1–2 g q 6–8 hr. *Life-threatening infections*—2 g q 4 hr (maximum dose = 12 g/day). *Gonococcal urethritis/cervicitis or rectal gonorrhea in females*—500 mg IM (single dose). *Rectal gonorrhea in males* —1 g IM (single dose). *Perioperative prophylaxis* —1 g 30–90 min before initial incision (one-time dose).
IM, IV (Children 1 mo–12 yr): *<50 kg*—100–200 mg/kg/day divided q 6–8 hr. *Meningitis* —200 mg/kg/day divided q 6 hr. *Invasive pneumococcal meningitis*—225–300 mg/kg/day divided q 6–8 hr. *≥50 kg*—see adult dosing.
IV (Neonates 1–4 wk): 50 mg/kg q 6–8 hr.
IV (Neonates ≤1 wk): 50 mg/kg q 8–12 hr.

Renal Impairment

(Adults): *CCr <20 ml/min*— ↓ dose by 50%.

Cefpodoxime

PO (Adults): *Most infections*—200 mg q 12 hr. *Skin and skin structure infections*—400 mg q 12 hr. *Urinary tract infections/pharyngitis*—100 mg q 12 hr. *Gonorrhea*—200 mg single dose.
PO (Children 2 mo–12 yr): *Pharyngitis/tonsillitis/otitis media/acute maxillary sinusitis*—5 mg/kg q 12 hr (not to exceed 200 mg/dose).

Renal Impairment

PO (Adults): *CCr <30 ml/min*— ↑ dosing interval to q 24 hr.

Ceftazidime

IM, IV (Adults and Children ≥12 yr): *Pneumonia and skin/skin structure infections*—500 mg–1 g q 8 hr. *Bone and joint infections*—2 g q 12 hr. *Severe and life-threatening infections*—2 g q 8 hr. *Complicated urinary tract infections*—500 mg q 8–12 hr. *Uncomplicated urinary tract infections*—250 mg q 12 hr. *Cystic fibrosis lung infection caused by Pseudomonas aeruginosa* —30–50 mg/kg q 8 hr (maximum dose = 6 g/day).
IM, IV (Children 1 mo–12 yr): 33.3–50 mg/kg q 8 hr (maximum dose = 6 g/day).
IM, IV (Neonates ≤4 wk): 50 mg/kg q 8–12 hr.

Renal Impairment

IM, IV (Adults): *CCr 31–50 ml/min*—1 g q 12 hr; *CCr 16–30 ml/min*—1 g q 24 hr; *CCr 6–15 ml/min*—500 mg q 24 hr; *CCr <5 ml/min*—500 mg q 48 hr.

Ceftibuten

PO (Adults and Children ≥12 yr): 400 mg q 24 hr for 10 days.
PO (Children 6 mo–12 yr): 9 mg/kg q 24 hr for 10 days (maximum dose = 400 mg/day).

Renal Impairment

PO (Adults): *CCr 30–49 ml/min*—200 mg q 24 hr as capsules *or* 4.5 mg/kg q 24 hr as suspension; *CCr 5–29 ml/min*—100 mg q 24 hr as capsules *or* 2.25 mg/kg q 24 hr as suspension.

Ceftizoxime

IM, IV (Adults): *Severe infections*—1–2 g q 8–12 hr. *Life-threatening infections*—3–4 g q 8 hr. *Uncomplicated urinary tract infections*—500 mg q 12 hr. *Gonococcal urethritis/cervicitis* —1 g IM (single dose).
IM, IV (Children >6 mo): 50 mg/kg q 6–8 hr (not to exceed 200 mg/kg/day).

Copyright © 2008 by F.A. Davis

Renal Impairment

IM, IV (Adults): *CCr 50–79 ml/min*—500 mg–1.5 g q 8 hr; *CCr 5–49 ml/min*—250 mg–1 g q 12 hr; *CCr 0–4 ml/min*—500 mg–1 g q 48 hr *or* 250–500 mg q 24 hr.

Ceftriaxone

IM, IV (Adults): *Most infections*—1–2 g q 12–24 hr. *Gonorrhea*—250 mg IM (single dose). *Meningitis*—2 g q 12 hr. *Perioperative prophylaxis*—1 g 30–120 min before initial incision (single dose).
IM, IV (Children): *Most infections*—25–37.5 mg/kg q 12 hr *or* 50–75 mg/kg q 24 hr; dose should not exceed 2 g/day. *Meningitis*—100 mg/kg q 24 hr *or* 50 mg/kg q 12 hr; dose should not exceed 4 g/day. *Acute otitis media*—50 mg/kg IM single dose; dose should not exceed 1 g. *Uncomplicated gonorrhea*—125 mg IM (single dose).

Availability

Cefdinir

Oral suspension (strawberry): 125 mg/5 ml, 250 mg/5 ml. **Cost:** *Generic*—125 mg/5 ml $73.40/100 ml, 250 mg/5 ml $83.87/60 ml. **Capsules:** 300 mg. **Cost:** $104.99/20.

Cefditoren

Tablets: 200 mg.

Cefixime

Oral suspension (strawberry): 100 mg/5 ml.

Cefoperazone

Powder for injection: 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

Cefotaxime

Powder for injection: 500 mg, 1 g, 2 g, 10 g, 20 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

Cefpodoxime

Tablets: 100 mg, 200 mg. **Oral suspension (lemon creme):** 50 mg/5 ml, 100 mg/5 ml.

Ceftazidime

Powder for injection: 500 mg, 1 g, 2 g, 6 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

Ceftibuten

Capsules: 400 mg. **Oral suspension (cherry):** 90 mg/5 ml.

Ceftizoxime

Powder for injection: 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

Ceftriaxone

Powder for injection: 250 mg, 500 mg, 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 ml, 2 g/50 ml.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Pedi: Assess newborns for jaundice and hyperbilirubinemia before making decision to use ceftriaxone (should not be used in jaundiced or hyperbilirubinemic neonates).
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- Monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in patients receiving *cefoperazone* or *cefditoren*, as this agent may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, eosinophilia, lymphocytosis, and thrombocytosis.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Copyright © 2008 by F.A. Davis

Implementation

- Cefditoren is not recommended for prolonged use since other piralate-containing compounds have caused clinical manifestations of carnitine deficiency when used over a period of months.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. *Cefditoren* should be administered with meals to enhance absorption. *Cefpodoxime tablets* should be administered with meals to enhance absorption (the suspension may be administered without regard to meals. *Ceftibuten* should be administered at least 1 hr before or 2 hr after meals.
- *Cefixime oral suspension* should be used to treat otitis media (results in higher peak concentrations than tablets).
- Do not administer cefdinir or cefpodoxime within 2 hr before or after an antacid. Do not administer cefpodoxime within 2 hr before or after an H_2 receptor antagonist. Do not administer cefdinir within 2 hr before or after iron supplements. Do not administer cefditoren concomitantly with antacids.
- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

IV Administration

- **Direct IV:** Dilute cephalosporins in at least 1 g/10 ml. Avoid direct IV administration of *cefoperazone* and *ceftriaxone*. Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.

Cefoperazone

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each gram with at least 2.8 ml of sterile or bacteriostatic water for injection or 0.9% NaCl. Shake vigorously and allow to stand for visualization and clarity. Solution may be colorless to straw colored. Each gram in solution should be further diluted in 20–40 ml of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR, or LR. ***Concentration:*** 25–50 mg/mlSolution is stable for 24 hr at room temperature and 5 days if refrigerated. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** For continuous infusion, concentration should be 2–25 mg/ml.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, allopurinol, aztreonam, cyclophosphamide, docetaxel, enalaprilat, esmolol, etoposide, famotidine, fludarabine, foscarnet, granisetron, hydromorphone, linezolid, magnesium sulfate, melphalan, morphine, propofol, ranitidine, teniposide, thiotepa.
- **Y-Site Incompatibility:** amifostine, amphotericin B cholesteryl sulfate, cisatracurium, doxorubicin liposome, filgrastim, gemcitabine, labetalol, meperidine, ondansetron, pentamidine, perphenazine, promethazine, sargramostim, vinorelbine.

Cefotaxime

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 ml of D5W, D10W, LR, dextrose/saline combinations, or 0.9% NaCl. Solution may appear light yellow to amber. Solution is stable for 24 hr at room temperature and 5 days if refrigerated. ***Concentration:*** 20–60 mg/ml. ***Rate:*** Administer over 20–30 min.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, amifostine, aztreonam, bivalirudin, cyclophosphamide, dexmedetomidine, diltiazem, docetaxel, etoposide phosphate, famotidine, fenoldopam, fludarabine, granisetron, hydromorphone, levofloxacin, lorazepam, magnesium sulfate, melphalan, meperidine, midazolam, milrinone, morphine, ondansetron, perphenazine, propofol, remifentanil, sargramostim, teniposide, thiotepa, tolazoline, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, azithromycin, filgrastim, fluconazole, gemcitabine, pemetrexed, pentamidine.

Copyright © 2008 by F.A. Davis

Ceftazidime

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in at least 1 g/10 ml of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, or LR. Dilution causes CO_2 to form inside vial, resulting in positive pressure; vial may require venting after dissolution to preserve sterility of vial. Not required with L-arginine formulation (Ceptaz). Solution may appear yellow to amber; darkening does not alter potency. Solution is stable for 18 hr at room temperature and 7 days if refrigerated. ***Concentration:*** 40 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Syringe Compatibility:** hydromorphone.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, aminophylline, anidulafungin, aztreonam, bivalirudin, ciprofloxacin, dexmedetomidine, diltiazem, docetaxel, dopamine, doxapram, enalaprilat, epinephrine, esmolol, etoposide phosphate, famotidine, fenoldopam, filgrastim, fludarabine, foscarnet, furosemide, gemcitabine, granisetron, heparin, hydromorphone, insulin, ketamine, labetalol, linezolid, melphalan, meperidine, milrinone, morphine, ondansetron, paclitaxel, ranitidine, remifentanil, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tobramycin, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl sulfate, amsacrine, azithromycin, doxorubicin liposome, erythromycin, fluconazole, idarubicin, lansoprazole, midazolam, pemetrexed, pentamidine, phenytoin, warfarin.

Ceftizoxime

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 ml of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution is stable for 8 hr at room temperature and 48 hr if refrigerated. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amiodarone, amphotericin B cholesteryl sulfate, anidulafungin, aztreonam, bivalirudin, dexmedetomidine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, granisetron, hydromorphone, labetalol, linezolid, melphalan, meperidine, morphine, nicardipine, ondansetron, pemetrexed, propofol, ranitidine, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** filgrastim, lansoprazole.

Ceftriaxone

IV Administration

- **Intermittent Infusion:** Reconstitute each 250-mg vial with 2.4 ml, each 500-mg vial with 4.8 ml, each 1-g vial with 9.6 ml, and each 2-g vial with 19.2 ml of sterile water for injection, 0.9% NaCl, or D5W for a concentration of 100 mg/ml. ***Diluent:*** Solution may be further diluted in 50–100 ml of 0.9% NaCl, D5W, D10W, D5/0.45% NaCl, or LR. Solution may appear light yellow to amber. Solution is stable for 3 days at room temperature. ***Concentration:*** 40 mg/ml. ***Rate:*** Administer over 10–30 min.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amiodarone, anidulafungin, aztreonam, bivalirudin, cisatracurium, daptomycin, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, drotrecogin, etoposide phosphate, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, granisetron, heparin, lansoprazole, linezolid, melphalan, meperidine, methotrexate, morphine, paclitaxel, pantoprazole, pemetrexed, propofol, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, warfarin, zidovudine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, amsacrine, azithromycin, filgrastim, fluconazole, labetalol, pentamidine, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.

Copyright © 2008 by F.A. Davis

- Caution patients that concurrent use of alcohol with *cefoperazone* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and alcohol-containing medications should be avoided during and for several days after therapy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

cephradine, See CEPHALOSPORINS—FIRST GENERATION.

cetirizine (se-ti-ra-zeen)
Zyrtec

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines
Pharmacologic: piperazines (peripherally selective)

Pregnancy Category B

Indications
Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria.

Action
Antagonizes the effects of histamine at H_1-receptor sites; does not bind to or inactivate histamine. Anticholinergic effects are minimal and sedation is dose related. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, ocular tearing and redness, pruritus).

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 93%.
Metabolism and Excretion: Excreted primarily unchanged by the kidneys.
Half-life: 7.4–9 hr (decreased in children to 6.2 hr, increased in renal impairment up to 19–21 hr).

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	4–8 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cetirizine, hydroxyzine, or any component; Lactation: Excreted in breast milk; not recommended for use.
Use Cautiously in: Patients with hepatic or renal impairment (dosage reduction recommended if CCr ≤31 ml/min or hepatic function is impaired); OB, Pedi: Safety not established for pregnant women or children <6 mo; Geri: Initiate at lower doses.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness (significant with doses >10 mg/day), fatigue. **EENT:** pharyngitis. **GI:** dry mouth.

Interactions
Drug-Drug: Additive CNS depression may occur with **alcohol**, **opioid analgesics**, or **sedative/hypnotics**. **Theophylline** may decrease clearance and increase toxicity.

Route/Dosage
PO (Adults and Children >6 yr): 5–10 mg given once or divided twice daily.
PO (Children 2–5 yr): 2.5 mg once daily initially, may be increased to 5 mg once daily or 2.5 mg every 12 hr.
PO (Children 1–2 yr): 2.5 mg once daily; may be increased to 2.5 mg every 12 hr.
PO (Children 6–12 mo): 2.5 once daily.

Renal/Hepatic Impairment
PO (Adults and Children >12 yr): *CCr ≤31 ml/min, hepatic impairment or hemodialysis*—5 mg once daily.
PO (Children 6–11 yr): start therapy at <2.5 mg/day.
PO (Children <6 yr): use not recommended.

Copyright © 2008 by F.A. Davis

Availability

Tablets: 5 mg, 10 mg. **Cost:** 5 mg $76.99/30, 10 mg $75.99/30. **Chewable tablets (grape):** 5 mg, 10 mg. **Cost:** 5 mg $75.99/30, 10 mg $75.99/30. **Syrup (banana-grape flavor):** 1 mg/ml in 120-ml and 480-ml bottles. **Cost:** $41.99/120 ml, $145.97/480 ml. ***In combination with:*** pseudoephedrine (Zyrtec-D 12 Hour) (See Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result in allergy skin testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation

- Do not confuse Zyrtec (cetirizine) with Zantac (ranitidine) or Zyprexa (olanzapine).
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional if dizziness occurs or if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

cetuximab (se-**tux**-i-mab)
Erbitux

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Locally or regionally advanced squamous cell carcinoma of the head and neck with radiation. Recurrent or metastatic squamous cell carcinoma of the head and neck progressing after platinum-based therapy. EGFR expressing metastatic colorectal cancer in patients who have not responded to irinotecan and oxaliplatin. Metastatic colorectal cancer (with irinotecan) when tumors express the epidermal growth factor receptor (EGFR) and have not responded or are intolerant to irinotecan alone.

Action

Binds specifically to EGFR thereby preventing the binding of endogenous epidermal growth factor (EGF). This prevents cell growth and differentiation processes. Combination with irinotecan enhances antitumor effects of irinotecan. **Therapeutic Effects:** Decreased tumor growth and spread.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 97–114 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cetuximab or murine (mouse) proteins; OB: Pregnancy or lactation.
Use Cautiously in: Exposure to sunlight (may exacerbate dermatologic toxicity); Pedi: Children (safety not established).

Adverse Reactions/Side Effects

Most adverse reactions reflect combination therapy with irinotecan. **CNS:** malaise, depression, headache, insomnia. **EENT:** conjunctivitis. **Resp:** dyspnea, ↑ cough, interstitial lung disease. **CV:** PULMONARY EMBOLISM. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, anorexia, stomatitis. **GU:** renal failure. **Derm:** acneform dermatitis, alopecia, nail disorder,

Copyright © 2008 by F.A. Davis

pruritus, skin desquamation. **F and E:** dehydration, hypomagnesemia, peripheral edema. **Hemat:** anemia, leukopenia. **MS:** back pain. **Metab:** weight loss. **Misc:** INFUSION REACTIONS, fever, desquamation of mucosal epithelium.

Interactions

Drug-Drug: None noted.

Route/Dosage

Head & Neck Cancer with Radiation

IV (Adults): 400 mg/m² administered 1 wk prior to initiation of radiation therapy, followed by weekly maintenance doses of 250 mg/m² for the duration of radiation therapy. Complete infusion 1 hr prior to radiation therapy; dose modification recommended for dermatologic toxicity.

Head and Neck Cancer Monotherapy

IV (Adults): 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m² until disease progression or unacceptable toxicity; dose modification recommended for dermatologic toxicity.

Colorectal Cancer

IV (Adults): 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m²; dose modification recommended for dermatologic toxicity.

Availability

Solution for injection: 2 mg/ml in 50 ml vials.

NURSING IMPLICATIONS

Assessment

- Assess for infusion reaction (rapid onset of airway obstruction [bronchospasm, stridor, hoarseness], urticaria, hypotension) for at least 1 hr following infusion. Longer observation periods may be required for those who experience infusion reactions. Most reactions occur during first dose, but may also occur in later doses. For severe reactions, immediately stop infusion and discontinue cetuximab permanently. Epinephrine, corticosteroids, IV antihistamines, bronchodilators, and oxygen should be available for reactions. Mild to moderate reactions (chills, fever, dyspnea) may be managed by slowing rate of infusion and administration of antihistamines.
- Assess for onset or worsening of pulmonary symptoms. Interrupt therapy to determine nature of symptoms. If interstitial lung disease is confirmed, discontinue cetuximab and treat appropriately.
- Assess for dermatologic toxicities (acneform rash, skin drying and fissuring, inflammatory and infectious sequelae [blepharitis, cheilitis, cellulitis, cyst]). Treat symptomatically. If acneform rash occurs, modify dose of future infusions.
- ***Lab Test Considerations:*** May cause anemia and leukopenia.
- Monitor serum electrolytes periodically during and for at least 8 wks following infusion. May cause hypomagnesemia, hypocalcemia, and hypokalemia; may occur from days to months after initiation of therapy. May require electrolyte replacement.

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Impaired skin integrity (Adverse Reactions)

Implementation

- Premedicate with histamine$_1$ antagonist (diphenhydramine 50 mg) 30–60 min prior to first dose; base subsequent administration on presence and severity of infusion reactions.
- Administer through a low protein binding 0.22-micrometer in-line filter placed as proximal to patient as possible. Solution should be clear and colorless and may contain a small amount of white amorphous cetuximab particles. Do not shake or dilute.
- Can be administered via infusion pump or syringe pump. Cetuximab should be piggybacked to the patient's infusion line.
- Observe patient for 1 hr following infusion.

IV Administration

- **Intermittent Infusion:** *For administration via infusion pump:* Draw up volume of a vial using vented spike needle or other transfer device. Transfer to a sterile evacuated container or bag. Repeat with new needle for each vial until calculated volume is in container. Affix infusion line and prime with cetuximab before starting infusion.
- *For administration via syringe pump:* Draw up volume of a vial using sterile syringe attached to an appropriate vented spike needle. Place syringe into syringe driver of a syringe pump and set rate. Connect infusion line and prime with cetuximab. Use a new needle and filter for each vial. ***Diluent:*** Do not dilute.

Copyright © 2008 by F.A. Davis

Concentration: 2 mg/ml. ***Rate:*** Administer over 2 hr at a rate not to exceed 10 ml/min. Use 0.9% NaCl to flush line at end of infusion.

Patient/Family Teaching

- Explain purpose of cetuximab and potential side effects to patient. Advise patient to report dermatologic changes promptly.
- Caution patient to wear sunscreen and hats and limit sun exposure during therapy.

Evaluation/Desired Outcomes

- Decreased tumor growth and spread.

HIGH ALERT

chloral hydrate

(**klor**-al **hye**-drate)
Aquachloral, ♣Novo-Chlorhydrate, ♣PMS-Chloral Hydrate

Classification
Therapeutic: sedative/hypnotics

Schedule IV

Pregnancy Category C

Indications

Short-term sedative and hypnotic (effectiveness decreases after 2 wk of use). Sedation or reduction of anxiety preoperatively (anesthetic adjunct) or prior to diagnostic procedures.

Action

Converted to trichloroethanol, which is the active drug. Has generalized CNS depressant properties. **Therapeutic Effects:** Sedation or induction of sleep.

Pharmacokinetics

Absorption: Well absorbed following oral or rectal administration.
Distribution: Widely distributed. Crosses the placenta and enters breast milk in low concentrations.
Metabolism and Excretion: Converted by liver to trichloroethanol, which is active. Trichloroethanol is, in turn, metabolized by the liver and kidneys to inactive compounds.
Half-life: *Chloral hydrate*—Infants: 1 hr. *Trichloroethanol*—Neonates: 8.5–66 hr; Children: 10 hr; Adults: 8–11 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1 hr	4–8 hr
Rectal	0.5–1 hr	1 hr	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe cardiac disease; Severe renal impairment (ClCr <50 ml/min); Coma or pre-existing CNS depression; Uncontrolled severe pain; OB: Crosses placenta; chronic use during pregnancy may cause withdrawal symptoms in the neonate. Lactation: Excreted in human milk, use by nursing mothers may cause sedation in the infant; Esophagitis, gastritis, or ulcer disease; Proctitis (rectal use); Tartrazine hypersensitivity (some rectal products); Impaired respiratory function; Sleep apnea.
Use Cautiously in: Hepatic dysfunction; History of suicide attempt or substance abuse; Obstructive sleep apnea; Pedi: May cause direct hyperbilirubinemia in neonates; Geri, Pedi: Dosage reduction recommended.

Adverse Reactions/Side Effects

CNS: excess sedation, disorientation, dizziness, hangover, headache, incoordination, irritability, paradoxical excitation (children). **Resp:** respiratory depression. **GI:** diarrhea, nausea, vomiting, flatulence. **Derm:** rashes. **Misc:** tolerance, physical dependence, psychological dependence.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and **opioid analgesics**. May potentiate **warfarin**. When given within 24 hr of IV **furosemide**, may cause diaphoresis, changes in blood pressure, and flushing. May increase metabolism and decrease effects of **phenytoin**. May increase toxicity of **ifosfamide** and **cyclophoshamide**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

Route/Dosage

PO (Adults): *Hypnotic*—500–1000 mg 15–30 min before bedtime. *Preoperative sedation*—500 mg–1000 mg 30 min before surgery. *Daytime sedation*—250 mg 3 times daily. Single dose/daily dose should not >2 g.
PO (Geriatric Patients): *Hypnotic*—250 mg 15–30 min before bedtime.
Rect (Adults): *Sedation*—325 mg 3 times daily. *Hypnotic*—500–1000 mg. Single dose/daily dose should not >2 g.
PO, Rect (Children >1 month): *Pre-electroencephalogram sedation*—20–25 mg/kg 30–

Copyright © 2008 by F.A. Davis

60 min prior. *Sedation prior to dental/medical procedures*—50–75 mg/kg 30–60 min prior; may repeat within 30 min if needed; single dose should not exceed 1 g total for infants or 2 g total for children). *Hypnotic*—50 mg/kg; maximum 2 g/day. *Sedation/anxiety:* 25–50 mg/kg/day divided q 6–8 hr; maximum 500 mg/dose.

PO, Rect (Neonates): 25 mg/kg/dose prior to a procedure.

Availability (generic available)

Capsules: 500 mg. **Syrup:** 500 mg/5 ml. **Suppositories:** 325 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) and potential for abuse prior to administering this medication. Prolonged use may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess sleep pattern before and periodically throughout therapy.
- Geri: Assess CNS effects and risk for falls. Institute fall prevention strategies.
- Assess level of consciousness at time of peak effect. Notify physician or other health care professional if desired sedation does not occur or if paradoxical reaction occurs.
- ***Lab Test Considerations:*** Interferes with tests for urinary 17-hydroxycorticosteroids and urinary catecholamines.

Potential Nursing Diagnoses

Insomnia (Indications)
Anxiety (Indications)
Risk for injury (Side Effects)
Ineffective coping (Indications)
Sleep deprivation (Indications)
Risk for falls (Side Effects)
Acute confusion (Side Effects)

Implementation

- ***High Alert:*** **Pedi:** Chloral hydrate overdosage has resulted in fatalities in children. Only accept orders written in milligrams, not volume (teaspoons) or concentration. Chloral hydrate should be administered to children only by trained staff in the health care setting. When administered to children for sedation before outpatient procedures, administer at the facility where procedure is to be performed. Repeated doses should be used with great caution in neonates, as drug and metabolites accumulate and may lead to toxicity. Continue monitoring until level of consciousness is safe for discharge.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Refer for psychotherapy if ineffective coping is basis for sleep pattern disturbance.
- Protect patient from injury. Place bed-side rails up. Assist with ambulation. Remove cigarettes from patients receiving hypnotic dose.
- **PO:** Capsules should be swallowed whole with a full glass of water or juice to minimize gastric irritation; do not chew. Dilute syrup in a half glass of water, juice, ginger ale, or formula to mask taste.
- **Rect:** If suppository is too soft for insertion, chill in refrigerator for 30 min or run under cold water before removing foil wrapper.

Patient/Family Teaching

- Instruct patient to take chloral hydrate exactly as directed. Missed doses should be omitted; do not double doses. If used for 2 wk or longer, abrupt withdrawal may result in CNS excitement, tremor, anxiety, hallucinations, and delirium.
- Chloral hydrate causes drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that concurrent alcohol use may create an additive effect that results in tachycardia, vasodilation, flushing, headache, hypotension, and pronounced CNS depression. Alcohol and other CNS depressants should be avoided while taking chloral hydrate.
- Advise patient to discontinue use and notify health care professional if skin rash, dizziness, irritability, impaired thought processes, headache, or motor incoordination occurs.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).

Evaluation/Desired Outcomes

- Sedation.
- Improvement in sleep pattern.

Copyright © 2008 by F.A. Davis

chlordiazepoxide

(klor-dye-az-e-**pox**-ide)
♣Apo-Chlordiazepoxide, Libritabs, Librium, ♣Mitran, ♣Novopoxide, ♣Poxi

Classification
Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications
Adjunct management of anxiety. Treatment of alcohol withdrawal. Adjunct management of anxiety associated with acute myocardial infarction.

Action
Acts at many levels of the CNS to produce anxiolytic effect. Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Sedation. Relief of anxiety.

Pharmacokinetics
Absorption: Well absorbed from the GI tract. IM absorption may be slow and unpredictable. **Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk. Recommend to discontinue drug or bottle feed. **Metabolism and Excretion:** Highly metabolized by the liver. Some products of metabolism are active as CNS depressants. **Half-life:** 5–30 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	0.5–4 hr	up to 24 hr
IM	15–30 min	unknown	unknown
IV	1–5 min	unknown	0.25–1 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance; Cross-sensitivity with other benzodiazepines may occur; Comatose patients or those with preexisting CNS depression; Uncontrolled severe pain; Pulmonary disease; Angle-closure glaucoma; Porphyria; OB, Lactation: May cause CNS depression, flaccidity, feeding difficulties, and weight loss in infants; Pedi: Not for use in children ≤6 yr.
Use Cautiously in: Hepatic dysfunction; Severe renal impairment; History of suicide attempt or substance abuse; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on Beers list and is associated with increased risk of falls (↓ dose required or consider short-acting benzodiazepine); Debilitated patients (initial dose reduction required).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, hangover, headache, mental depression, paradoxical excitation, sedation. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Derm:** rashes. **Local:** pain at IM site. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Alcohol, **antidepressants**, **antihistamines**, and **opioid analgesics**—concurrent use results in additive CNS depression. **Cimetidine**, **oral contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may enhance effects. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↓ effectiveness of chlordiazepoxide. Sedative effects may be ↓ by **theophylline**. **Drug-Natural Products:** Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage
PO (Adults): *Alcohol withdrawal*—50–100 mg, repeated until agitation is controlled (up to 400 mg/day). *Anxiety*—5–25 mg 3–4 times daily.
PO (Geriatric Patients or Debilitated Patients): *Anxiety*—5 mg 2–4 times daily initially, increased as needed.
PO (Children >6 yr): *Anxiety*—5 mg 2–4 times daily, up to 10 mg 2–3 times daily.
IM, IV (Adults): *Alcohol withdrawal*—50–100 mg initially; may be repeated in 2–4 hr. *Anxiety*—50–100 mg initially, then 25–50 mg 3–4 times daily as required (25–50 mg initially in geriatric patients). *Preoperative sedation*—50–100 mg 1 hr preop.
IM, IV (Geriatric Patients or Debilitated Patients): *Anxiety/sedation*—25–50 mg/dose.
IM, IV (Children >12 yr): *Anxiety/sedation*—25–50 mg/dose.

Copyright © 2008 by F.A. Davis

Availability (generic available)

Capsules: 5 mg, 10 mg, 25 mg. **Tablets:** 5 mg, 10 mg, 25 mg. **Injection:** 100-mg ampule. ***In combination with:*** amitriptyline (Limbitrol DS), clidinium (Librax). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for anxiety and level of sedation (ataxia, dizziness, slurred speech) periodically during therapy.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Monitor blood pressure, heart rate, and respiratory rate frequently when administering parenterally. Report significant changes immediately.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- Geri: Assess risk of falls and institute fall prevention strategies.
- **Alcohol Withdrawal:** Assess for tremors, agitation, delirium, and hallucinations. Protect patient from injury. Institute seizure precautions.
- Geri: Assess risk of falls and institute fall prevention strategies.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function tests evaluated periodically. May cause ↑ in serum bilirubin, AST, and ALT.
- May alter results of urine 17-ketosteroids and 17-ketogenic steroids. May cause ↓ response on metyrapone tests and decreased thyroidal uptake of ^{123}I and ^{131}I.
- ***Toxicity and Overdose:*** Flumazenil reverses sedation caused by chlordiazepoxide toxicity or overdose (flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants).

Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Side Effects)
Ineffective coping
Dysfunctional family processes: alcoholism

Implementation

- Do not confuse Librium with Librax.
- IV administration is usually the preferred route for parenteral administration because of the slow, erratic absorption after IM administration.
- After parenteral administration, have patient remain recumbent and observe for 3–8 hr or longer, depending on patient's response.
- Equipment to maintain a patent airway should be immediately available when chlordiazepoxide is administered intravenously.
- Use parenteral solution immediately after reconstitution and discard any unused portion.
- **PO:** Administer after meals or with milk to minimize GI irritation. Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Administer greater dose at bedtime to avoid daytime sedation. Do not discontinue abruptly; taper by 10 mg every 3 days to reduce chance of withdrawal effects. Some patients may require longer taper period (months). Monitor patients closely with seizure disorder as abrupt withdrawal may precipitate seizures.
- **IM:** Reconstitute only with 2 ml of diluent provided by manufacturer. Do not use solution if opalescent or hazy. Agitate gently to minimize bubbling. Administer slowly, deep into a well-developed muscle mass to minimize pain at injection site. Solution reconstituted with IM diluent should not be given IV.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 100 mg in 5 ml of 0.9% NaCl or sterile water for injection. Do not use IM diluent. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer prescribed dose slowly over at least 1 min. Rapid administration may cause apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take chlordiazepoxide as directed. If medication is less effective after a few weeks, check with health care professional; do not increase dose. Medication should be tapered at the completion of long-term therapy. Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).

Copyright © 2008 by F.A. Davis

- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to consult health care professional before taking OTC medications.
- Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Advise patient that benzodiazepines do not cure underlying problems. Psychotherapy is beneficial in addressing source of anxiety and improve coping skills.
- Teach other methods to decrease anxiety, such as: exercise, use of support group (e.g., Alcoholics Anonymous), or relaxation techniques.
- Teach patient not to share medication with anyone.

Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Decreased delirium tremens and more rational ideation when used for alcohol withdrawal.

chlorothiazide, See DIURETICS (THIAZIDE).

chlorpheniramine

(klor-fen-**ir**-a-meen)
Aller-Chlor, Allergy, Chlo-Amine, Chlorate, Chlor-Trimeton, Chlor-Trimeton Allergy 4 Hour, Chlor-Trimeton Allergy 8 Hour, Chlor-Trimeton Allergy 12 Hour, ✱Chlor-Tripolon, ✱Novo-Pheniram, PediaCare Allergy Formula, Phenetron, Telechlor, Teldrin

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines

Pregnancy Category B

Indications

Relief of allergic symptoms caused by histamine release, including: Nasal allergies, Allergic dermatoses. Management of severe allergic or hypersensitivity reactions, including anaphylaxis and transfusion reactions.

Action

Antagonizes the effects of histamine at H_2-receptor sites; does not bind to or inactivate histamine. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing, and redness).

Pharmacokinetics

Absorption: Well absorbed following oral and parenteral administration.
Distribution: Widely distributed. Minimal amounts excreted in breast milk. Crosses the blood-brain barrier.
Metabolism and Excretion: Extensively metabolized by the liver.
Half-life: 12–15 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	6 hr	4–12 hr
PO–ER	unknown	unknown	8–24 hr
Subcut	unknown	unknown	4–12 hr
IM	unknown	unknown	4–12 hr
IV	rapid	unknown	4–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma; Lactation: Avoid use or use alternative feeding method; Known alcohol intolerance (some liquid forms).
Use Cautiously in: Angle-closure glaucoma; Liver disease; Geri: Appears on Beers list. Geriatric patients are more susceptible to adverse reactions due to anticholinergic effects; OB: Pregnancy (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, dizziness, excitation (in children). **EENT:** blurred vision. **CV:** hypertension, arrhythmias, hypotension, palpitations. **GI:** dry mouth, constipation, obstruction. **GU:** retention, urinary hesitancy.

Interactions

Drug-Drug: ↑ CNS depression with other **CNS depressants**, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. **MAO inhibitors** intensify and prolong anticholinergic effects of antihistamines. ↑ anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antidepres-**

Copyright © 2008 by F.A. Davis

sants, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**.

Route/Dosage

PO (Adults): 4 mg q 4–6 hr *or* 8–12 mg of extended-release formulation q 8–12 hr (not to exceed 24 mg/day).
PO (Geriatric Patients): 4 mg twice daily *or* 8 mg of extended-release formulation at bedtime.
PO (Children 6–12 yr): 2 mg 3–4 times daily (not to exceed 12 mg/day).

Injectable formulation is available only in Canada
Subcut, IM, IV (Adults): 5–40-mg single dose (not to exceed 40 mg/day).
Subcut (Children): 87.5 mcg (0.0875 mg)/kg or 2.5 mg/m^2 q 6 hr as needed.

Availability (generic available)

Tablets: 4 mg[Rx, OTC], 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Chewable tablets (orange flavor):** 2 mg[Rx, OTC]. **Timed-release tablets:** 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Timed-release capsules:** 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Syrup:** 1 mg/5 ml[Rx, OTC], 2 mg/5 ml[Rx, OTC], ✱2.5 mg/5 ml[Rx, OTC]. **Injection:** 10 mg/ml, 100 mg/ml. ***In combination with:*** Codeine (Codeprex), pseudoephedrine (Advil), and decongestants[Rx, OTC]. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) prior to and periodically during therapy.
- Monitor pulse and blood pressure before initiating and throughout IV therapy.
- Geri: Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative reactions on allergy skin tests; discontinue 4 days prior to testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation

- **PO:** Administer oral doses with food or milk to decrease GI irritation. Extended-release tablets and capsules should be swallowed whole; do not crush, break, or chew. Chewable tablets should not be swallowed whole; chew well before swallowing.
- **Subcut, IM:** The 100-mg/ml solution is recommended for IM or subcut routes only. The 10-mg/ml solution may be used for IM, subcut, or IV.

IV Administration

- **Direct IV:** ***Diluent:*** May be given undiluted. Use only the 10 mg/ml strength for IV administration. ***Concentration:*** 10 mg/ml. ***Rate:*** Administer each 10-mg dose over at least 1 min.

Patient/Family Teaching

- Instruct patient to take chlorpheniramine as directed.
- Geri: Teach patient and family about anticholinergic effects and to contact a health care professional if such effects persist.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

chlorproMAZINE

(klor-**proe**-ma-zeen)
✱Chlorpromanyl, ✱Largactil, ✱Novo-Chlorpromazine, Thorazine, Thor-Prom

Classification
Therapeutic: antiemetics, antipsychotics
Pharmacologic: phenothiazines

Pregnancy Category UK

✱ = Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Indications

Second-line treatment for schizophrenia and psychoses after failure with atypical antipsychotics. Hyperexcitable, combative behavior in children. Nausea and vomiting. Intractable hiccups. Preoperative sedation. Acute intermittent porphyria. **Unlabeled uses:** Vascular headache. Bipolar disorder.

Action

Alters the effects of dopamine in the CNS. Has significant anticholinergic/alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs/symptoms of psychosis. Relief of nausea/vomiting/intractable hiccups. Decreased symptoms of porphyria.

Pharmacokinetics

Absorption: Variable absorption from tablets/suppositories; better with oral liquid formulations. Well absorbed following IM administration.
Distribution: Widely distributed; high CNS concentrations. Crosses the placenta; enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Highly metabolized by the liver and GI mucosa. Some metabolites are active.
Half-life: 30 hr.

TIME/ACTION PROFILE (antipsychotic activity, antiemetic activity, sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	4–6 hr
PO–ER	30–60 min	unknown	10–12 hr
Rectal	1–2 hr	unknown	3–4 hr
IM	unknown	unknown	4–8 hr
IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to sulfites (injectable) or benzyl alcohol (sustained-release capsules); Cross-sensitivity with other phenothiazines may occur; Angle-closure glaucoma; Bone marrow depression; Severe liver/cardiovascular disease; Concurrent pimozide use.
Use Cautiously in: Geriatric/debilitated patients (decrease initial dose); Diabetes; Respiratory disease; Prostatic hyperplasia; CNS tumors; Epilepsy; Intestinal obstruction; OB: Lactation Safety not established. Discontinue drug or bottle feed. Pedi: Children with acute illnesses, infections, gastroenteritis, or dehydration (increased risk of extrapyramidal reactions).

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, sedation, extrapyramidal reactions, tardive dyskinesia.
EENT: blurred vision, dry eyes, lens opacities.
CV: hypotension (↑ with IM, IV), tachycardia.
GI: constipation, dry mouth, anorexia, hepatitis, ileus, priapism. **GU:** urinary retention. **Derm:** photosensitivity, pigment changes, rashes.
Endo: galactorrhea, amenorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia. **Metab:** hyperthermia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Concurrent use with **pimozide** ↑ the risk of potentially serious cardiovascular reactions. May alter serum **phenytoin** levels. ↓ pressor effect of **norepinephrine** and eliminates bradycardia. Antagonizes peripheral vasoconstriction from **epinephrine** and may reverse some of its actions. May ↓ elimination and ↑ effects of **valproic acid**. May ↓ the pharmacologic effects of **amphetamine** and **related compounds**. May ↓ the effectiveness of **bromocriptine**. May ↑ blood levels and effects of **tricyclic antidepressants**. **Antacids** or **adsorbent antidiarrheals** may ↓ adsorption; administer 1 hr before or 2 hr after chlorpromazine. **Activated charcoal** ↓ absorption. ↑ risk of anticholinergic effects with **antihistamines**, **tricyclic antidepressants**, **quinidine**, or **disopyramide**. Premedication with chlorpromazine ↑ the risk of neuromuscular excitation and hypotension when followed by **barbiturate** anesthesia. **Barbiturates** may ↑ metabolism and ↓ effectiveness. Chlorpromazine may ↓ **barbiturate** blood levels. Additive hypotension with **antihypertensives**. Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **MAO inhibitors**, **opioid analgesics**, **sedative/hypnotics**, or **general anesthetics**. Concurrent use with **lithium** may produce disorientation, unconsciousness, or extrapyramidal symptoms. Concurrent use with **meperidine** may produce excessive sedation and hypotension. May ↑ the risk of seizures with subarachnoid **metrizamide**. Concurrent use with **propranolol** ↑ blood levels of both drugs.
Drug-Natural Products: Concomitant use of **kava kava, valerian, chamomile, or hops can ↑ CNS depression. ↑ anticholinergic effects with angel's trumpet, jimson weed, and scopolia.**

Copyright © 2008 by F.A. Davis

Route/Dosage

PO (Adults): *Psychoses*—10–25 mg 2–4 times daily; may increase every 3–4 days (usual dose is 200 mg/day; up to 1 g/day) *or* 30–300 mg 1–3 times daily as extended-release capsules. *Nausea and vomiting*—10–25 mg q 4 hr as needed. *Preoperative sedation*—25–50 mg 2–3 hr before surgery. *Hiccups/porphyria*—25–50 mg 3–4 times daily.
PO (Children): *Psychoses/nausea and vomiting*—0.55 mg/kg (15 mg/m^2) q 4–6 hr as needed. *Preoperative sedation*—0.55 mg/kg (15 mg/m^2) 2–3 hr before surgery.
Rect (Adults): *Nausea/vomiting*—50–100 mg q 6–8 hr as needed.
Rect (Children >6 mo): 1 mg/kg q 6–8 hr as needed.
IM (Adults): *Severe psychoses*—25–50 mg initially, may be repeated in 1 hr; increase to maximum of 400 mg q 3–12 hr if needed (up to 1 g/day). *Nausea/vomiting*— 25 mg initially, may repeat with 25–50 mg q 3–4 hr as needed. *Nausea/vomiting during surgery*—12.5 mg, may be repeated in 30 min as needed. *Preoperative sedation*—12.5–25 mg 1–2 hr prior to surgery. *Hiccups/tetanus*—25–50 mg 3–4 times daily. *Porphyria*—25 mg q 6–8 hr until patient can take PO.
IM (Children >6 mo): *Psychoses/nausea and vomiting*—0.55 mg/kg (15 mg/m^2) q 6–8 hr (not to exceed 40 mg/day in children 6 mo–5 yr, or 75 mg/day in children 5–12 yr). *Nausea/vomiting during surgery*—0.275 mg/kg, may repeat in 30 min as needed. *Preoperative sedation*—0.55 mg/kg 1–2 hr prior to surgery. *Tetanus*—0.55 mg/kg q 6–8 hr.
IV (Adults): *Nausea/vomiting during surgery*—up to 25 mg. *Hiccups/tetanus*—25–50 mg. *Porphyria*—25 mg q 8 hr.
IV (Children): *Nausea/vomiting during surgery*—0.275 mg/kg. *Tetanus*—0.55 mg/kg.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 100 mg, 200 mg. **Sustained-release capsules:** 30 mg, 75 mg, 150 mg, 200 mg, 300 mg. **Syrup (orange custard flavor):** 10 mg/5 ml, ✤25 mg/5 ml, ✤100 mg/5 ml. **Oral concentrate (custard flavor):** 30 mg/ml, ✤40 mg/ml, 100 mg/ml. **Suppositories:** 25 mg, 100 mg. **Injection:** 25 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess weight and BMI initially and throughout therapy.
- Assess fasting blood glucose and cholesterol levels initially and periodically throughout therapy. Refer as appropriate for nutritional/weight and medical management.
- Assess positive (hallucinations, delusions, agitation) and negative (social withdrawal) symptoms of schizophrenia.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate prior to and frequently during the period of dose adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation may be necessary. Trihexyphenidyl, diphenhydramine, or Benzotropine may be used to control these symptoms. Benzodiazepines may alleviate symptoms of akathisia.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking). Report these symptoms immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, se-

Copyright © 2008 by F.A. Davis

vere muscle stiffness, loss of bladder control). Report these symptoms immediately.

- **Preoperative Sedation:** Assess level of anxiety prior to and following administration.
- **Vascular Headache:** Assess type, location, intensity, and duration of pain and accompanying symptoms.
- ***Lab Test Considerations:*** Monitor CBC, liver function tests, and ocular exams periodically throughout therapy. May cause ↓ hematocrit, hemoglobin, leukocytes, granulocytes, platelets. May cause ↑ bilirubin, AST, ALT, and alkaline phosphatase. Agranulocytosis occurs 4–10 wk after initiation of therapy, with recovery 1–2 wk following discontinuation. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy. May cause false-positive or false-negative pregnancy tests and false-positive urine bilirubin test results.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- Do not confuse chlorpromazine with chlorpropamide or prochlorperazine.
- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects.
- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following metrizamide myelography, because they lower the seizure threshold.
- **Hiccups:** Initial treatment is with oral doses. If hiccups persist 2–3 days, IM injection may be used, followed by IV infusion.
- **PO:** Administer oral doses with food, milk, or a full glass of water to minimize gastric irritation. Tablets may be crushed. Do not open capsules; swallow whole. Sustained-release capsules may be opened but contents should not be chewed. Dilute concentrate just prior to administration in 120 ml of coffee, tea, tomato or fruit juice, milk, water, soup, or carbonated beverages.
- **Rect:** If suppository is too soft for insertion, chill in refrigerator for 30 min or run under cold water before removing foil wrapper.
- **IM:** Do not inject subcut. Inject slowly into deep, well-developed muscle. May be diluted with 0.9% NaCl or 2% procaine. Lemon-yellow color does not alter potency of solution. Do not administer solution that is markedly discolored or contains a precipitate.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute with 0.9% NaCl. ***Concentration:*** Do not exceed 1 mg/ml. ***Rate:*** Inject slowly at a rate of at least 1 mg/min for adults and 0.5 mg/min for children.
- **Continuous Infusion:** ***Diluent:*** May further dilute 25–50 mg in 500–1000 ml of D5W, D10W, 0.45% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's injection, dextrose/Ringer's or dextrose/lactated Ringer's combinations.
- **Syringe Compatibility:** atropine, benztropine, butorphanol, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, scopolamine.
- **Syringe Incompatibility:** cimetidine, heparin, pantoprazole, pentobarbital, thiopental.
- **Y-Site Compatibility:** Amsacrine, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, doxorubicin liposome, famotidine, filgrastim, fluconazole, gemcitabine, granisetron, heparin, hydrocortisone sodium succinate, ondansetron, oxaliplatin, potassium chloride, propofol, teniposide, thiotepa, vinorelbine, vitamin B complex with C.
- **Y-Site Incompatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, bivalirudin, cefepime, etoposide phosphate, fludarabine, furosemide, lansoprazole, linezolid, melphalan, methotrexate, paclitaxel, pemetrexed, piperacillin/tazobactam, sargramostim.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. If a dose is missed, take within 1 hr or omit dose and return to regular schedule. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities re-

Copyright © 2008 by F.A. Davis

quiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Exposed surfaces may develop a temporary pigment change (ranging from yellow-brown to grayish purple). Extremes of temperature (exercise, hot weather, hot baths or showers) should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient not to take chlorpromazine within 2 hr of antacids or antidiarrheal medication.
- Inform patient that this medication may turn urine a pink-to-reddish-brown color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects. Encourage continued participation in psychotherapy as indicated.
- Treatment is not a cure since symptoms can recur after discontinuation of medication.

Evaluation/Desired Outcomes
- Decrease in excitable, manic behavior. Therapeutic effects may not be seen for 7–8 wk.
- Relief of nausea and vomiting.
- Relief of hiccups.
- Preoperative sedation.
- Management of porphyria.
- Relief of vascular headache.
- Decrease in positive (hallucinations, delusions, agitation) symptoms of schizophrenia.

chlorthalidone, See DIURETICS (THIAZIDE).

chlorzoxazone
(klor-**zox**-a-zohn)
EZE-DS, Paraflex, Parafon Forte DSC, Relaxazone, Remular, Remular-S, Strifon Forte DSC

Classification
Therapeutic: skeletal muscle relaxants (centrally acting)

Pregnancy Category UK

Indications
Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions.

Action
Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation with decreased discomfort.

Pharmacokinetics
Absorption: Readily absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; <1% excreted unchanged in urine.
Half-life: 1.1 hr.

TIME/ACTION PROFILE (skeletal muscle effects)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1–2 hr	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Porphyria.
Use Cautiously in: Underlying cardiovascular disease; Impaired renal or hepatic function; OB, Lactation, Pedi: Safety not established; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness. **GI:** GI BLEEDING, constipation, diarrhea, heartburn, nausea, vomiting. **Derm:** allergic dermatitis. **Hemat:** AGRANULOCYTOSIS, anemia. **Misc:** allergic reactions including ANGIOEDEMA.

Interactions
Drug-Drug: Increased risk of CNS depression with other **CNS depressants**, including **alco-**

Copyright © 2008 by F.A. Davis

hol, **antihistamines**, **antidepressants**, **sedative/hypnotics**, or **opioid analgesics**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

Route/Dosage

PO (Adults): 250–750 mg 3–4 times daily.
PO (Children): 20 mg/kg or 600 mg/m²/day in 3–4 divided doses.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Cost:** *250-mg generic*—$29.86/100; *500 mg Parafon Forte DSC*—$126.84/100; *generic*—$102.96/100.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

Implementation

- **PO:** May be administered with meals to minimize gastric irritation. Tablets may be crushed and mixed with food or liquid for ease of administration.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not take more than the prescribed amount. Missed doses should be taken within 1 hr of time ordered; otherwise, omit and return to normal dosage schedule. Do not double doses.
- Medication may cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.

Evaluation/Desired Outcomes

- Relief of muscular spasm in acute skeletal muscle conditions.

cholecalciferol, See VITAMIN D COMPOUNDS.

cholestyramine

(koe-less-**tear**-a-meen)
LoCHOLEST, LoCHOLEST Light, Prevalite, Questran, Questran Light

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

Pregnancy Category C

Indications

Management of primary hypercholesterolemia. Pruritus associated with elevated levels of bile acids. **Unlabeled uses:** Diarrhea associated with excess bile acids.

Action

Bind bile acids in the GI tract, forming an insoluble complex. Result is increased clearance of cholesterol. **Therapeutic Effects:** Decreased plasma cholesterol and low-density lipoproteins (LDLs). Decreased pruritus.

Pharmacokinetics

Absorption: Action takes place in the GI tract. No absorption occurs.
Distribution: No distribution.
Metabolism and Excretion: After binding bile acids, insoluble complex is eliminated in the feces.
Half-life: Unknown.

TIME/ACTION PROFILE (hypocholesterolemic effects)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	1–3 wk	2–4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Complete biliary obstruction; Some products contain aspartame and should be avoided in patients with phenylketonuria.
Use Cautiously in: History of constipation.
Exercise Extreme Caution in: Children (may cause intestinal obstruction; deaths have occurred).

Adverse Reactions/Side Effects

EENT: irritation of the tongue. **GI:** abdominal discomfort, constipation, nausea, fecal impac-

Copyright © 2008 by F.A. Davis

tion, flatulence, hemorrhoids, perianal irritation, steatorrhea, vomiting. **Derm:** irritation, rashes. **F and E:** hyperchloremic acidosis. **Metab:** vitamin A, D, and K deficiency.

Interactions

Drug-Drug: May decrease absorption/effects of orally administered **acetaminophen**, **amiodarone**, **clindamycin**, **clofibrate**, **digoxin**, **diuretics**, **gemfibrozil**, **glipizide**, **corticosteroids**, **imipramine**, **mycophenolate**, **methotrexate**, **methyldopa**, **niacin**, **NSAIDs**, **penicillin**, **phenytoin**, **phosphates**, **propranolol**, **tetracyclines**, **tolbutamide**, **thyroid preparations**, **ursodiol**, **warfarin**, and **fat-soluble vitamins (A, D, E,** and **K)**. May decrease absorption of other **orally administered medications**.

Route/Dosage

PO (Adults): 4 g 1–2 times daily (initially, may be increased as needed/tolerated up to 24 g/day in 6 divided doses).

PO (Children): 240 mg/kg/day in 2–3 divided doses (not >8 g/day).

Availability (generic available)

Powder for suspension with aspartame (strawberry flavor [LoCHOLEST], unflavored [Prevalite, Questran Light]): 4 g cholestyramine/packet or scoop. **Powder for suspension (strawberry flavor [LoCHOLEST], unflavored [Questran, generic]):** 4 g cholestyramine/packet or scoop.

NURSING IMPLICATIONS

Assessment

- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Pruritus:** Assess severity of itching and skin integrity. Dose may be decreased when relief of pruritus occurs.
- **Diarrhea:** Assess frequency, amount, and consistency of stools.
- ***Lab Test Considerations:*** Serum cholesterol and triglyceride levels should be evaluated before initiating, frequently during first few months and periodically throughout therapy. Discontinue medication if paradoxical increase in cholesterol level occurs.
- May cause an increase in AST, ALT, phosphorus, chloride, and alkaline phosphatase and a decrease in serum calcium, sodium, and potassium levels.
- May also cause prolonged prothrombin times.

Potential Nursing Diagnoses

Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Parenteral or water-miscible forms of fat-soluble vitamins (A, D, and K) and folic acid may be ordered for patients on chronic therapy.
- **PO:** Administer before meals.
- Scoops for powdered preparations may not be exchangable between products.
- Administer other medications 1 hr before or 4–6 hr after the administration of this medication.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip doses or double up on missed doses.
- Instruct patient to take medication before meals. Mix cholestyramine with 4–6 oz water, milk, fruit juice, or other noncarbonated beverages. Shake vigorously. Slowly stir in a large glass. Rinse glass with small amount of additional beverage to ensure all medication is taken. May also mix with highly fluid soups, cereals, or pulpy fruits (applesauce, crushed pineapple). Allow powder to sit on fluid and hydrate for 1–2 min before mixing. Do not take dry. Variations in the color of cholestyramine do not alter stability.
- Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Explain that constipation may occur. Increase in fluids and bulk in diet, exercise, stool softeners, and laxatives may be required to minimize the constipating effects. Instruct patient to notify health care professional if constipation, nausea, flatulence, and heartburn persist or if stools become frothy and foul smelling.
- Advise patient to notify health care professional if unusual bleeding or bruising; petechiae; or black, tarry stools occur. Treatment with vitamin K may be necessary.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in serum low-density lipoprotein cholesterol levels. Therapy is usually discontinued if the clinical response remains poor after 3 mo of therapy.
- Decrease in severity of pruritus. Relief usually occurs 1–3 wk after therapy is initiated.
- Decrease in frequency and severity of diarrhea.

choline, See SALICYLATES.

ciclesonide, See CORTICOSTEROIDS (NASAL).

ciclopirox, See ANTIFUNGALS (TOPICAL).

cidofovir (sye-doe-**foe**-veer)
Vistide

Classification
Therapeutic: antivirals

Pregnancy Category C

Indications
Management of cytomegalovirus (CMV) retinitis in HIV-infected patients (with probenecid).

Action
Suppresses replication of CMV by inhibiting viral DNA synthesis. **Therapeutic Effects:** Slows progression of CMV retinitis; may not be curative.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Excreted mostly unchanged by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to cidofovir, probenecid, or sulfonamides; Serum Cr >1.5 mg/dl, CCr ≤55 ml/min, or urine protein ≥100 mg/dl (≥2+ proteinuria); Concurrent use of foscarnet, amphotericin B, aminoglycoside anti-infectives, NSAIDs, or IV pentamidine.
Use Cautiously in: Pregnancy or children (safety not established); breastfeeding is not recommended in HIV-positive patients.
Exercise Extreme Caution in: Any condition or medication that increases the risk of dehydration.

Adverse Reactions/Side Effects
CNS: headache, weakness. **EENT:** decreased intraocular pressure, hearing loss, iritis, ocular hypotony, uveitis. **Resp:** dyspnea, pneumonia. **GI:** HEPATIC DYSFUNCTION, PANCREATITIS, abdominal pain, nausea, vomiting, anorexia, diarrhea. **GU:** RENAL FAILURE, proteinuria. **Derm:** alopecia, rash. **F and E:** decreased serum bicarbonate. **Hemat:** neutropenia, anemia. **Metab:** METABOLIC ACIDOSIS. **Misc:** chills, fever, infection.

Interactions
Drug-Drug: ↑ risk of nephrotoxicity with **aminoglycosides**, **amphotericin B**, **foscarnet**, and **pentamidine** and should be avoided; wait 7 days after giving other nephrotoxic agents. **Probenecid**, which is required concurrently, may interact with **acetaminophen**, **acyclovir**, **ACE inhibitors**, **barbiturates**, **benzodiazepines**, **bumetanide**, **methotrexate**, **famotidine**, **furosemide**, **NSAIDs**, **theophylline**, and **zidovudine**.

Route/Dosage
IV (Adults): 5 mg/kg once weekly for 2 wk, followed by 5 mg/kg every 2 wk (must be given with probenecid).

Renal Impairment
IV (Adults): *Increase in serum creatinine of 0.3–0.4 mg/dL*—decrease dose to 3 mg/kg; discontinue if serum creatinine increases ≥0.5 mg/dL over baseline.

Availability
Solution for injection: 75 mg/ml in 5-ml ampules.

NURSING IMPLICATIONS

Assessment
- Monitor vision for progression of CMV retinitis. Monitor ocular symptoms, intraocular pressure, and visual acuity periodically.
- Antiemetics and administration after a meal may minimize nausea and vomiting associated with probenecid. If allergic reactions occur in association with probenecid, pretreat-

Copyright © 2008 by F.A. Davis

ment with antihistamines or acetaminophen should be considered.
- Monitor vital signs periodically. May cause fever, hypotension, and tachycardia. Monitor patients for early signs and symptoms of infection.
- ***Lab Test Considerations:*** Renal function, measured by serum Cr and urine protein, must be monitored within 48 hr before each dose and throughout cidofovir therapy. In patients with proteinuria, administer IV hydration and repeat urine protein test. If renal function deteriorates, dose modification or temporary discontinuation should be considered.
- Monitor WBC before each dose. Granulocytopenia may occur.
- May cause hyperglycemia, hyperlipemia, hypocalcemia, hypokalemia, and elevated alkaline phosphatase, AST, and ALT.

Potential Nursing Diagnoses
Risk for infection (Indications)

Implementation
- Probenecid and saline prehydration must be given with cidofovir to minimize renal toxicity. *Probenecid* must be administered 2 g orally given 3 hr before, then 1 g given 2 hr and 8 hr after completion of cidofovir infusion. *Saline prehydration* with 1 L of 0.9% NaCl must be given over 1–2 hr before cidofovir. A second liter over 1–3 hr is recommended concurrently with or after cidofovir.
- Patients receiving foscarnet, amphotericin B, aminoglycoside, NSAIDs, or IV pentamidine should wait at least 7 days after these agents to begin cidofovir.

IV Administration
- **Intermittent Infusion:** ***Diluent:*** Dilute in 100 mL of 0.9% NaCl. Solution is stable for 24 hr if refrigerated. Allow refrigerated solution to return to room temperature before administration. ***Rate:*** Administer over 1 hr.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

Patient/Family Teaching
- Inform patient that cidofovir is not a cure for CMV retinitis and that retinitis may continue to progress during and after therapy.
- Inform patient that concurrent antiretroviral therapy may be continued. However, zidovudine therapy should be temporarily discontinued or decreased by 50% on the days of cidofovir therapy because of the effects of probenicid on zidovudine.
- Advise patient of the possibility of renal toxicity from cidofovir. Emphasize the importance of routine lab tests to monitor renal function.
- Inform patient that cidofovir may have teratogenic effects. Women should use contraception during and for 1 mo after therapy. Men should use barrier contraception during and for 3 mo after therapy.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patients to have routine ophthalmologic exams after cidofovir therapy.

Evaluation/Desired Outcomes
- Decrease in symptoms and arrest of progression of CMV retinitis in HIV-infected patients.

cilostazol (sil-**os**-tah-zol)
Pletal

Classification
Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

Pregnancy Category C

Indications
Reduction of the symptoms of intermittent claudication as measured by increased walking distance.

Action
Inhibits the enzyme cyclic adenosine monophosphate (cAMP) phosphodiesterase III (PDE III), which results in increased cAMP in platelets and blood vessels, producing inhibition of platelet aggregation and vasodilation. **Therapeutic Effects:** Reduced symptoms of intermittent claudication with improved walking distance.

Pharmacokinetics
Absorption: Slowly absorbed after oral administration.
Distribution: Unknown.

Copyright © 2008 by F.A. Davis

Protein Binding: 95–98% bound to plasma proteins; one active metabolite is 97.4% bound, the other is 66% bound.
Metabolism and Excretion: Extensively metabolized by the liver, two metabolites have platelet aggregation inhibitory activity; metabolites are mostly excreted by the kidneys.
Half-life: *Cilostazol and its active metabolites*—11–13 hr.

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	up to 12 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; CHF; OB: Potential for congenital defects, stillbirth, and low birth weight; Lactation: Potential risk to nursing infants; discontinue or bottle feed.
Use Cautiously in: Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: headache, dizziness. **CV:** palpitations, tachycardia. **GI:** diarrhea.

Interactions
Drug-Drug: Concurrent administration of **ketoconazole**, **itraconazole**, **erythromycin**, **diltiazem**, **fluconazole**, **miconazole**, **fluvoxamine**, **fluoxetine**, **nefazodone**, **sertraline**, or **omeprazole** decreases metabolism and increases levels and activity of cilostazol (use lower doses). Concurrent use with **aspirin** has additive effects on platelet function.
Drug-Food: Grapefruit juice inhibits metabolism and increases effects; concurrent use should be avoided.

Route/Dosage
PO (Adults): 100 mg twice daily (50 mg twice daily if receiving inhibitors of cilostazol metabolism).

Availability (generic available)
Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient for intermittent claudication before and periodically during therapy.
- ***Lab Test Considerations:*** May occasionally cause anemia, hyperlipemia, hyperuricemia, and albuminuria. May prolong bleeding time.

Potential Nursing Diagnoses
Activity intolerance (Indications)

Implementation
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals.
- Do not administer with grapefruit juice. May increase cilostazol levels.

Patient/Family Teaching
- Instruct patient to take cilostazol on an empty stomach, exactly as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid smoking; nicotine constricts blood vessels.

Evaluation/Desired Outcomes
- Relief from cramping in calf muscles, buttocks, thighs, and feet during exercise.
- Improvement in walking endurance. Therapeutic effects may be seen in 2–4 wk.

cimetidine, See HISTAMINE H_2 ANTAGONISTS.

ciprofloxacin, See FLUOROQUINOLONES.

HIGH ALERT

cisplatin (sis-**pla**-tin)
Platinol, Platinol-AQ

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications
Metastatic testicular and ovarian carcinoma. Advanced bladder cancer. Head and neck cancer. Cervical cancer. Lung cancer. Other tumors.

Action
Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed; accumulates for months; enters breast milk.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Excreted mainly by the kidneys.
Half-life: 30–100 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	18–23 days	39 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: Hearing loss; Renal impairment (dosage ↓ recommended); CHF; Electrolyte abnormalities; Active infections; Bone marrow depression; Geriatric patients (↑ risk of nephrotoxicity, peripheral neuropathy); Chronic debilitating illnesses; Patients with childbearing potential.

Adverse Reactions/Side Effects

CNS: SEIZURES, malaise, weakness. **EENT:** ototoxicity, tinnitus. **GI:** severe nausea, vomiting, diarrhea, hepatotoxicity. **GU:** nephrotoxicity, sterility. **Derm:** alopecia. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** anaphylactoid reactions.

Interactions

Drug-Drug: ↑ nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ risk of hypokalemia and hypomagnesemia with **loop diuretics** and **amphotericin B**. May ↓ **phenytoin** levels. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ adverse reactions.

Route/Dosage

Other regimens are used.
IV (Adults): *Metastatic testicular tumors*—20 mg/m² daily for 5 days repeated q 3–4 wk. *Metastatic ovarian cancer*—75–100 mg/m², repeat q 4 wk in combination with cyclophosphamide *or* 100 mg/m² q 3 wk if used as a single agent. *Advanced bladder cancer*—50–70 mg/m² q 3–4 wk as a single agent.

Availability (generic available)

Powder for injection: 10-mg, 50-mg vials.
Injection: 1 mg/ml in 50- and 100-mg vials.

C

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration. Report significant changes.
- Monitor intake and output and specific gravity frequently during therapy. Report discrepancies immediately. To reduce the risk of nephrotoxicity, maintain a urinary output of at least 100 ml/hr for 4 hr before initiating and for at least 24 hr after administration.
- Encourage patient to drink 2000–3000 ml/day to promote excretion of uric acid. Allopurinol and alkalinization of the urine may be used to help prevent uric acid nephropathy.
- Assess patency of IV site frequently during therapy. Cisplatin may cause severe irritation and necrosis of tissue if extravasation occurs. If a large amount of highly concentrated cisplatin solution extravasates, mix 4 ml of 10% sodium thiosulfate with 6 ml of sterile water or 1.6 ml of 25% sodium thiosulfate with 8.4 ml of sterile water and inject 1–4 ml (1 ml for each ml extravasated) through existing line or cannula. Inject subcut if needle has been removed. Sodium thiosulfate inactivates cisplatin.
- Severe and protracted nausea and vomiting usually occur 1–4 hr after a dose; vomiting may last for 24 hr. Administer parenteral antiemetic agents 30–45 min before therapy and routinely around the clock for the next 24 hr. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration. Nausea and anorexia may persist for up to 1 wk.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication

Copyright © 2008 by F.A. Davis

immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.

- Medication may cause ototoxicity and neurotoxicity. Assess patient frequently for dizziness, tinnitus, hearing loss, loss of coordination, loss of taste, or numbness and tingling of extremities; may be irreversible. Notify health care professional promptly if these occur. Audiometry should be performed before initiation of therapy and before subsequent doses. Hearing loss is more frequent with children and usually occurs first with high frequencies and may be unilateral or bilateral.
- Monitor for inadvertent cisplatin overdose. Doses >100 mg/m²/cycle once every 3–4 wk are rarely used. Differentiate daily doses from total dose/cycle. Symptoms of high cumulative doses include muscle cramps (localized, painful involuntary skeletal muscle contractions of sudden onset and short duration) and are usually associated with advanced stages of peripheral neuropathy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and routinely throughout therapy. The nadir of leukopenia, thrombocytopenia, and anemia occurs within 18–23 days and recovery 39 days after a dose. Withhold further doses until WBC is >4000/mm³ and platelet count is >100,000/mm³.
- Monitor BUN, serum creatinine, and CCr before initiation of therapy and before each course of cisplatin to detect nephrotoxicity. May cause ↑ BUN and creatinine and ↓ calcium, magnesium, phosphate, sodium, and potassium levels that usually occur the 2nd wk after a dose. Do not administer additional doses until BUN is <25 mg/100 ml and serum creatinine is <1.5 mg/100 ml. May cause ↑ uric acid level, which usually peaks 3–5 days after a dose.
- May cause transiently ↑ serum bilirubin and AST concentrations.
- May cause positive Coombs' test result.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse with carboplatin. To prevent confusion, orders should include generic and brand names. Administer under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers (see Appendix K).
- Hydrate patient with at least 1–2 L of IV fluid 8–12 hr before initiating therapy with cisplatin. Amifostine may be administered to minimize nephrotoxicity.
- Do not use aluminum needles or equipment during preparation or administration. Aluminum reacts with this drug, forms a black or brown precipitate, and renders the drug ineffective.
- Unopened vials of powder and constituted solution must not be refrigerated.

IV Administration

- **Intermittent Infusion:** Reconstitute 10-mg vials with 10 ml of sterile water for injection and 50-mg vial with 50 ml. Stable for 20 hr if reconstituted with sterile water, for 72 hr with bacteriostatic water. Do not refrigerate, because crystals will form. Solution should be clear and colorless; discard if turbid or if it contains precipitates
- ***Diluent:*** Dilution in 2 L of 5% dextrose in 0.3% or 0.45% NaCl containing 37.5 g of mannitol is recommended. ***Concentration:*** Keep under 0.5 mg/ml to prevent tissue necrosis. ***Rate:*** Variable. Maximum rate 1 mg/min.
- **Continuous Infusion:** Has been administered as continuous infusion over 24 hr to 5 days with resultant decrease in nausea and vomiting. ***High Alert:*** Clarify dose to ensure cumulative dosage is not confused with daily dose; errors may be fatal.
- **Syringe Compatibility:** bleomycin, cyclophosphamide, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Y-Site Compatibility:** allopurinol, aztreonam, bleomycin, chlorpromazine, cimeti-

Copyright © 2008 by F.A. Davis

dine, cladribine, cyclophosphamide, dexamethasone, diphenhydramine, doxorubicin, doxorubicin liposome, droperidol, etoposide, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, granisetron, heparin, hydromorphone, leucovorin calcium, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, mitomycin, morphine, ondansetron, paclitaxel, palonosetron, pemetrexed, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, teniposide, topotecan, vinblastine, vincristine, vinorelbine.

- **Y-Site Incompatibility:** amifostine, amphotericin B cholesteryl sulfate, cefepime, lansoprazole, piperacillin/tazobactam, thiotepa.
- **Additive Compatibility:** etoposide, floxuridine, ifosfamide, leucovorin calcium, magnesium sulfate, mannitol, ondansetron, 0.9% NaCl, D5/0.9% NaCl.
- **Additive Incompatibility:** fluorouracil, mesna, thiotepa.

Patient/Family Teaching

- Instruct patient to report pain at injection site immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report promptly any numbness or tingling in extremities or face, difficulty with hearing or tinnitus, unusual swelling, or joint pain.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient of the need for contraception, although cisplatin may cause infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies. Therapy should not be administered more frequently than every 3–4 wk, and only if lab values are within acceptable parameters and patient is not exhibiting signs of ototoxicity or other serious adverse effects.

citalopram (si-tal-oh-pram)
Celexa

Classification
Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category C

Indications

Depression. **Unlabeled uses:** Premenstrual dysphoric disorder (PMDD). Obsessive-compulsive discorder (OCD). Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia).

Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (10% by CYP3A4 and 2C19 enzymes); excreted unchanged in urine.
Half-life: 35 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor or pimozide therapy.
Use Cautiously in: History of mania; History of suicide attempt/ideation (↑ risk during early therapy and during dose adjustment); History of seizure disorder; Illnesses or conditions that are likely to result in altered metabolism or hemo-

Copyright © 2008 by F.A. Davis

dynamic responses; Severe renal or hepatic impairment; OB: Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Lactation: Citalopram is present in breast milk and may result in lethargy with ↓ feeding in infants; weigh risk/benefits; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment in children/adolescents (unlabeled for pediatric use); Geri: ↓ doses recommended.

Adverse Reactions/Side Effects

CNS: apathy, confusion, drowsiness, insomnia, weakness, agitation, amnesia, anxiety, decreased libido, dizziness, fatigue, impaired concentration, increased depression, migraine headache, suicide attempt. **EENT:** abnormal accommodation. **Resp:** cough. **CV:** postural hypotension, tachycardia. **GI:** abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, increased saliva, nausea, altered taste, increased appetite, vomiting. **GU:** amenorrhea, dysmenorrhea, ejaculatory delay, erectile dysfunction, polyuria. **Derm:** increased sweating, photosensitivity, pruritus, rash. **Metab:** decreased weight, increased weight. **MS:** arthralgia, myalgia. **Neuro:** tremor, paresthesia. **Misc:** fever, yawning.

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between citalopram and **MAO inhibitors** . Concurrent use with **pimozide** may result in prolongation of the QTc interval and is contraindicated. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). **Cimetidine** ↑ blood levels of citalopram. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Ketoconazole**, **itraconazole**, **erythromycin**, and **omeprazole** may ↑ blood levels. **Carbamazepine** may ↓ blood levels. May ↑ blood levels of **metoprolol**. Concurrent use with **tricyclic antidepressants** should be undertaken with caution because of altered pharmacokinetics. Concurrent use with **5-HT$_1$ agonists** used for migraine headaches may ↑ risk of adverse reactions (weakness, hyperreflexia, incoordination). Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. Risk of bleeding may be ↑ with **aspirin**, **NSAIDs**, **warfarin**, **thrombolytics**, and other **agents affecting coagulation and platelet function**.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 20 mg once daily initially, may be increased by 20 mg/day at weekly intervals, up to 60 mg/day (usual dose is 40 mg/day).

PO (Geriatric Patients): 20 mg once daily initially, may be increased to 40 mg/day only in nonresponding patients.

Hepatic Impairment

PO (Adults): 20 mg once daily initially, may be increased to 40 mg/day only in nonresponding patients.

Availability (generic available)

Tablets: 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg $89.97/90, 20 mg $89.97/90, 40 mg $89.97/90. **Oral solution (peppermint flavor):** 10 mg/5 ml. **Cost:** *Generic*—10 mg/5 ml $114.00/240 ml.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes during therapy.
- Assess for suicidal tendencies, especially during early therapy and dose changes. Restrict amount of drug available to patient.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse with Celebrex (celecoxib), Cerebyx (fosphenytoin), Zyprexa (olanzapine), or Lexapro (escitalopram).
- **PO:** Administer as a single dose in the morning or evening without regard to food.

Patient/Family Teaching

- Instruct patient to take citalopram as directed.
- May cause drowsiness, dizziness, impaired concentration, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to con-

Copyright © 2008 by F.A. Davis

sult health care professional before taking other medications with citalopram.
- Caution patient to change positions slowly to minimize dizziness.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected, or if they plan to breastfeed an infant. If used during pregnancy should be tapered during third trimester to avoid neontal serotonin syndrome.
- Caution patients that citalopram should not be used for at least 14 days after discontinuing MAO inhibitors, and at least 14 days should be allowed after stopping citalopram before starting an MAO inhibitor.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.
- Refer patient/family to local support group.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.

clarithromycin
(kla-**rith**-roe-mye-sin)
Biaxin, Biaxin XL

Classification
Therapeutic: agents for atypical mycobacterium, anti-infectives, antiulcer agents
Pharmacologic: macrolides

Pregnancy Category C

Indications
Respiratory tract infections including streptococcal pharyngitis, sinusitis, bronchitis, and pneumonia. Treatment (with ethambutol) and prevention of disseminated *Mycobacterium avium* complex (MAC). Treatment of following pediatric infections: Otitis media, Sinusitis, Pharyngitis, Skin/skin structure infections. Part of a combination regimen for ulcer disease due to *Helicobacter pylori*. Endocarditis prophylaxis.

Action
Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action. **Spectrum:** Active against these gram-positive aerobic bacteria: *Staphylococcus aureus*, *Streptococcus pneumoniae*, *Streptococcus pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*. Also active against: *Mycoplasma*, *Legionella*, *H. pylori*, *M. avium*.

Pharmacokinetics
Absorption: Rapidly absorbed (50%) after oral administration.
Distribution: Widely distributed; tissue levels may exceed those in serum.
Protein Binding: 65–70%.
Metabolism and Excretion: 10–15% converted by the liver to 14-hydroxyclarithromycin, which has anti-infective activity; 20–30% excreted unchanged in urine. Metabolized by and also inhibits the CYP3A enzyme system.
Half-life: Dose-dependent and prolonged with renal dysfunction *250-mg dose*—3–4 hr; *500-mg dose*—5–7 hr.

TIME/ACTION PROFILE (serum levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr
PO-XL	unknown	4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to clarithromycin, erythromycin, or other macrolide anti-infectives; Concurrent use of pimozide; OB: Avoid use during pregnancy unless no alternatives are available; Lactation: Not recommended for breastfeeding women.
Use Cautiously in: Severe liver or renal impairment (dose adjustment required if CCr <30 ml/min).

Adverse Reactions/Side Effects
CNS: headache. **Derm:** pruritus, rash, Stevens-Johnson syndrome. **GI:** PSEUDOMEMBRANOUS COLITIS,

Copyright © 2008 by F.A. Davis

abdominal pain/discomfort, abnormal taste, diarrhea, dyspepsia, nausea.

Interactions

Drug-Drug: Clarithromycin is an inhibitor of the CYP3A enzyme system. Concurrent use with other agents metabolized by this system can ↑ levels and risk of toxicity. May prolong the QT interval and ↑ risk of arrhythmias with **pimozide**; concurrent use is contraindicated. Similar effects may occur with antiarrhythmics; ECG should be monitored for QTc prolongation and serum levels monitored. May ↑ serum levels and the risk of toxicity from **carbamazepine**, some **benzodiazepines (midazolam, triazolam, alprazolam)**, **cyclosporine**, **buspirone**, **disopyramide**, **ergot alkaloids**, **felodipine**, **omeprazole**, **tacrolimus**, **digoxin**, or **theophylline**. **Ritonavir** ↑ increases blood levels (↓ clarithromycin dose in patients with CC <60 ml/min). ↑ levels of **HMG-CoA reductase inhibitors** and may ↑ risk of rhabdomyolysis. May ↑ effect of **warfarin** and **sildenafil** (dose reduction may be warranted). May ↑ or ↓ effects of **zidovudine**. Blood levels are ↑ by **delavirdine** and **fluconazole**. Blood levels may be ↓ by **rifampin** and **rifabutin**. ↑ risk of colchicine toxicity when administered with **colchicine**, especially in the elderly.

Route/Dosage

PO (Adults): *Pharyngitis/tonsillitis*—250 mg q 12 hr for 10 days; *Acute maxillary sinusitis*—500 mg q 12 hr for 14 days or 1000 mg once daily for 14 days as XL tablets; *Acute exacerbation of chronic bronchitis*—250–500 mg q 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *Community-Acquired pneumonia*—250 mg q 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *skin/skin structure infections*—250 mg q 12 hr for 7–14 days; *H. pylori*—500 mg 2–3 times daily with a proton pump inhibitor (lansoprazole or omeprazole) or ranitidine with or without amoxicillin for 10–14 days; *Endocarditis prophylaxis*—500 mg 1 hr before procedure; *MAC prophylaxis/treatment*—500 mg twice daily, for active infection another antimycobacterial is required.

PO (Children): *Most infections*—15 mg/kg/day divided q 12 hr for 7–14 days (up to 500 mg/dose for MAC). *Endocarditis prophylaxis*—15 mg/kg 1 hr before procedure.

Renal Impairment

PO (Adults): *CCr <30 ml/min*—250 mg 1-2 times daily, a 500-mg initial dose may be used.
PO (Children): *CCr <30 ml/min*—decrease dose by 50% or double dosing interval.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Cost:** *Generic*—250 mg $73.32/20, 500 mg $73.32/20. **Extended-release tablets:** 500 mg. **Cost:** $109.99/20. **Oral suspension (fruit punch and vanilla flavors):** 125 mg/5 ml, 250 mg/5 ml. **Cost:** *Generic*—125 mg/5 ml $39.98/100 ml, 250 mg/5 ml $71.38/100 ml. ***In combination with:*** amoxicillin and lansoprazole as part of a compliance package (Prevpac); See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Ulcers:** Assess patient for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May rarely cause ↑ serum AST, ALT, and alkaline phosphatase concentrations.
- May occasionally cause ↑ BUN.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock, without regard to meals. Food slows but does not decrease the extent of absorption.
- Administer XL tablets with food or milk; do not crush, break, or chew.
- Shake suspension well before administration. Store suspension at room temperature; do not refrigerate.
- Do not administer within 4 hr of zidovudine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise

Copyright © 2008 by F.A. Davis

patient that sharing of this medication may be dangerous.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Caution patients taking zidovudine that clarithromycin and zidovudine must be taken at least 4 hr apart.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Instruct the patient to notify health care professional if symptoms do not improve within a few days.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Treatment of ulcers.
- Endocarditis prophylaxis.

clindamycin (klin-da-**mye**-sin)
Cleocin, Cleocin T, Clinda-Derm, Clindagel, Clindesse, ClindaMax, Clindets, C/T/S, Dalacin C, Dalacin T, Evoclin

Classification
Therapeutic: anti-infectives

Pregnancy Category B

Indications
PO, IM, IV: Treatment of: Skin and skin structure infections, Respiratory tract infections, Septicemia, Intra-abdominal infections, Gynecologic infections, Osteomyelitis, Endocarditis prophylaxis. **Topical:** Severe acne. **Vag:** Bacterial vaginosis. **Unlabeled uses: PO, IM, IV:** Treatment of *Pneumocystis carinii* pneumonia, CNS toxoplasmosis, and babesiosis.

Action
Inhibits protein synthesis in susceptible bacteria at the level of the 50S ribosome. **Therapeutic Effects:** Bactericidal or bacteriostatic, depending on susceptibility and concentration. **Spectrum:** Active against most gram-positive aerobic cocci, including: Staphylococci, *Streptococcus pneumoniae*, Other streptococci, but not enterococci. Has good activity against those anaerobic bacteria that cause bacterial vaginosis, including *Bacteroides fragilis*, *Gardnerella vaginalis*, *Mobiluncus* spp, *Mycoplasma hominis*, and *Corynebacterium*. Also active against *P. carinii* and *Toxoplasma gondii*.

Pharmacokinetics
Absorption: Well absorbed following PO/IM administration. Minimal absorption following topical/vaginal use.
Distribution: Widely distributed. Does not significantly cross blood-brain barrier. Crosses the placenta; enters breast milk.
Protein Binding: 94%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Neonates: 3.6–8.7 hr; Infants up to 1 yr: 3 hr; Children and adults: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	6–8 hr
IM	rapid	1–3 hr	6–8 hr
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Previous pseudomembranous colitis; Severe liver impairment; Diarrhea; Known alcohol intolerance (topical solution, suspension).
Use Cautiously in: OB: Safety not established for systemic and topical; vaginal approved for use in 3rd trimester of pregnancy. Lactation: Has been used safely but does appear in breast milk and exposes infant to drug and its side effects.

Adverse Reactions/Side Effects
CNS: dizziness, headache, vertigo. **CV:** arrhythmias, hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, bitter taste (IV only), nausea, vomiting. **Derm:** rashes. **Local:** phlebitis at IV site.

Interactions
Drug-Drug: Kaolin/pectin may ↓ GI absorption. May enhance the neuromuscular blocking action of other **neuromuscular blocking agents**. **Topical:** Concurrent use

Copyright © 2008 by F.A. Davis

with **irritants**, **abrasives**, or **desquamating agents** may result in additive irritation.

Route/Dosage

PO (Adults): *Most infections*—150–450 mg q 6 hr. *P. carinii pneumonia*—1200–1800 mg/day in divided doses with 15–30 mg primaquine/day (unlabeled). *CNS toxoplasmosis*—1200–2400 mg/day in divided doses with pyrimethamine 50–100 mg/day (unlabeled); *Bacterial endocarditis prophylaxis*—600 mg 1 hr before procedure.

PO (Children >1 mo): 10–30 mg/kg/day divided q 6–8 hr; maximum dose 1.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 1 hr before procedure.

IM, IV (Adults): *Most infections*—300–600 mg q 6–8 hr *or* 900 mg q 8 hr (up to 4.8 g/day IV has been used; single IM doses of >600 mg are not recommended). *P. carinii pneumonia*—2400–2700 mg/day in divided doses with primaquine (unlabeled). *Toxoplasmosis*—1200–4800 mg/day in divided doses with pyrimethamine. *Bacterial endocarditis prophylaxis* —600 mg 30 min before procedure.

IM, IV (Children >1 mo): 25–40 mg/kg/day divided q 6–8 hr; maximum dose: 4.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 30 min before procedure; maximum dose: 600 mg.

IM, IV (Infants <1 mo and <2 kg): 5 mg/kg q 8–12 hr *≥2 kg*—20–30 mg/kg/day divided q 6–8 hr.

Vag (Adults and Adolescents): *Cleocin, Clindamax*— 1 applicatorful (5 g) q hs for 3 or 7 days (7 days in pregnant patients); *Clindesse*— one applicatorful (5 g) single dose *or* 1 suppository (100 mg) at bedtime for 3 nights.

Topical (Adults and Adolescents): *Solution*—1% solution/suspension applied twice daily (range 1–4 times daily). *Foam, gel*—1% foam or gel applied once daily.

Availability (generic available)

Capsules: 75 mg, 150 mg, 300 mg. **Oral suspension:** 75 mg/5 ml. **Injection:** 150 mg/ml. **Premixed infusion:** 300 mg/50 ml, 600 mg/50 ml, 900 mg/50 ml. **Topical:** 1% lotion, gel, foam, solution, suspension, single-use applicators. ***In combination with:*** benzoyl peroxide (BenzaClin); (see Appendix B). **Vaginal cream:** 2% cream. **Vaginal suppositories (ovules):** 100 mg. ***In combination with:*** tretinoin (Ziana); (see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel elimination. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. This may begin up to several weeks following the cessation of therapy.
- Assess patient for hypersensitivity (skin rash, urticaria).
- ***Lab Test Considerations:*** Monitor CBC; may cause transient ↓ in leukocytes, eosinophils, and platelets.
- May cause ↑ alkaline phosphatase, bilirubin, CPK, AST, and ALT concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Side Effects)

Implementation

- **PO:** Administer with a full glass of water. May be given with or without meals. Shake liquid preparations well. Do not refrigerate. Stable for 14 days at room temperature.
- **IM:** Do not administer >600 mg in a single IM injection.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Vials must be diluted before use. Dilute a dose of 300 mg or 600 mg in 50 ml and a dose of 900 mg or 1200 mg in 100 ml. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, or LR. Admixed solution stable for 16 days at room temperature. Premixed infusion is already diluted and ready to use. ***Concentration:*** Not to exceed 18 mg/ml. ***Rate:*** Not to exceed 30 mg/min. Hypotension and cardiopulmonary arrest have been reported following rapid IV administration.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl sulfate, amsacrine, anakinra, anidulafungin, atropine, aztreonam, bumetanide, bivalirudin, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cimetidine,

Copyright © 2008 by F.A. Davis

cisatracurium, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, pemetrexed, penicillin G potassium, perphenazine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vinorelbine, vitamin B complex with C, voriconazole, zidovudine.

- **Y-Site Incompatibility:** allopurinol, azithromycin, caspofungin, ceftriaxone, diazepam, filgrastim, fluconazole, ganciclovir, haloperidol, hydroxyzine, idarubicin, lansoprazole, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.
- **Vag:** Applicators are supplied for vaginal administration. When treating bacterial vaginosis, concurrent treatment of male partner is not usually necessary.
- **Topical:** Contact with eyes, mucous membranes, and open cuts should be avoided during topical application. If accidental contact occurs, rinse with copious amounts of cool water.
- Wash affected areas with warm water and soap, rinse, and pat dry prior to application. Apply to entire affected area.

Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal or anal itching or discharge).
- Notify health care professional if no improvement within a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of antimicrobial prophylaxis before invasive medical or dental procedures.
- **IV:** Inform patient that bitter taste occurring with IV administration is not clinically significant.
- **Vag:** Instruct patient on proper use of vaginal applicator. Insert high into vagina at bedtime. Instruct patient to remain recumbent for at least 30 min following insertion. Advise patient to use sanitary napkin to prevent staining of clothing or bedding. Continue therapy during menstrual period.
- Advise patient to refrain from vaginal sexual intercourse during treatment.
- Caution patient that mineral oil in clindamycin cream may weaken latex or rubber contraceptive devices. Such products should not be used within 72 hr of vaginal cream.
- **Topical:** Caution patient applying topical clindamycin that solution is flammable (vehicle is isopropyl alcohol). Avoid application while smoking or near heat or flame.
- Advise patient to notify health care professional if excessive drying of skin occurs.
- Advise patient to wait 30 min after washing or shaving area before applying.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.

Copyright © 2008 by F.A. Davis

- Improvement in acne vulgaris lesions. Improvement should be seen in 6 wk but may take 8–12 wk for maximum benefit.

clobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

clocortolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

clonazepam (kloe-na-ze-pam)

Klonopin, Rivotril, Syn-Clonazepam

Classification

Therapeutic: anticonvulsants
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category C

Indications

Prophylaxis of: Petit mal, Petit mal variant, Akinetic, Myoclonic seizures. Panic disorder with or without agoraphobia. **Unlabeled uses:** Uncontrolled leg movements during sleep. Neuralgias. Sedation. Adjunct management of acute mania, acute psychosis, or insomnia.

Action

Anticonvulsant effects may be due to presynaptic inhibition. Produces sedative effects in the CNS, probably by stimulating inhibitory GABA receptors. **Therapeutic Effects:** Prevention of seizures. Decreased manifestations of panic disorder.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Probably crosses the blood-brain barrier and the placenta.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 18–50 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

ROUTE	ONSET	PEAK	DURATION
PO	20–60 min	1–2 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to clonazepam or other benzodiazepines; Severe liver disease.

Use Cautiously in: Angle-closure glaucoma; Obstructive sleep apnea; Chronic respiratory disease; History of porphyria; Do not discontinue abruptly; OB: Safety not established; chronic use during pregnancy may result in withdrawal in the neonate; Lactation: May enter breast milk; discontinue drug or bottle feed; Pedi: Safety not established; Geri: May experience excessive sedation at usual doses; decreased dosage recommended.

Adverse Reactions/Side Effects

CNS: behavioral changes, drowsiness, fatigue, slurred speech, ataxia, sedation, abnormal eye movements, diplopia, nystagmus. **Resp:** increased secretions. **CV:** palpitations. **GI:** constipation, diarrhea, hepatitis, weight gain. **GU:** dysuria, nocturia, urinary retention. **Hemat:** anemia, eosinophilia, leukopenia, thrombocytopenia. **Neuro:** ataxia, hypotonia. **Misc:** fever, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Alcohol, **antidepressants**, **antihistamines**, other **benzodiazepines**, and **opioid analgesics—**concurrent use results in ↑ CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ metabolism of clonazepam, ↑ its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and ↓ effectiveness of clonazepam. Sedative effects may be ↓ by **theophylline**. May ↑ serum **phenytoin** levels. **Phenytoin** may ↓ serum clonazepam levels.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can increase CNS depression.

Route/Dosage

PO (Adults): 0.5 mg 3 times daily; may increase by 0.5–1 mg q 3rd day. Total daily maintenance dose not to exceed 20 mg. *Panic disorder*—0.125 mg twice daily; increase after 3 days toward target dose of 1 mg/day (some patients may require up to 4 mg/day).
PO (Children <10 yr or 30 kg): Initial daily dose 0.01–0.03 mg/kg/day (not to exceed 0.05 mg/kg/day) given in 2–3 equally divided doses; increase by no more than 0.25–0.5 mg q 3rd day until therapeutic blood levels are reached (not to exceed 0.2 mg/kg/day).

Copyright © 2008 by F.A. Davis

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $29.99/100, 1 mg $29.99/100, 2 mg $26.66/100. **Orally-disintegrating tablets:** 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.125 mg $69.99/60, 0.25 mg $72.99/60, 0.5 mg $70.99/60, 2 mg $100.00/60.

NURSING IMPLICATIONS

Assessment

- Observe and record intensity, duration, and location of seizure activity.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess need for continued treatment regularly.
- Assess patient for drowsiness, unsteadiness, and clumsiness. These symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function test results evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of sodium iodide, ^{123}I, and ^{131}I.
- ***Toxicity and Overdose:*** Therapeutic serum concentrations are 20–80 mg/ml. Flumazenil antagonizes clonazepam toxicity or overdose (may induce seizures in patients with history of seizure disorder or who are on tricyclic antidepressants).

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse clonazepam with clonidine or clorazepate.
- Institute seizure precautions for patients on initial therapy or undergoing dose manipulations.
- **PO:** Administer with food to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing. Administer largest dose at bedtime to avoid daytime sedation. Taper by 0.25 mg every 3 days to decrease signs and symptoms of withdrawal. Some patients may require longer taper period (months).

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses within 1 hr or omit; do not double doses. Abrupt withdrawal of clonazepam may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps.
- Medication may cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes.
- Patient on anticonvulsant therapy should carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.
- Advise patient that clonazepam is usually prescribed for short-term use and does not cure underlying problems.
- Advise patient to participate in psychotherapy to address anxiety and improve coping skills.
- Teach other methods to decrease anxiety, such as exercise, support groups, relaxation techniques.
- Advise patient to not share medication with others.

Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without undue sedation. Dose adjustments may be required after several months of therapy.
- Decrease in frequency and severity of panic attacks.
- Relief of leg movements during sleep.
- Decrease in pain from neuralgia.

clonidine (**klon**-i-deen)
Catapres, Catapres-TTS, ✱Dixarit, Duraclon

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antihypertensives
Pharmacologic: adrenergics (centrally acting)

Pregnancy Category C

Indications
PO, Transdermal: Management of mild to moderate hypertension. **Epidural:** Management of cancer pain unresponsive to opioids alone. **Unlabeled uses:** Management of opioid withdrawal.

Action
Stimulates alpha-adrenergic receptors in the CNS; which results in decreased sympathetic outflow inhibiting cardioacceleration and vasoconstriction centers. Prevents pain signal transmission to the CNS by stimulating alpha-adrenergic receptors in the spinal cord. **Therapeutic Effects:** Decreased blood pressure. Decreased pain.

Pharmacokinetics
Absorption: Well absorbed from the GI tract and skin. Enters systemic circulation following epidural use. Some absorption follows sublingual administration.
Distribution: Widely distributed; enters CNS. Crosses the placenta readily; enters breast milk in high concentrations.
Metabolism and Excretion: Mostly metabolized by the liver; 40–50% eliminated unchanged in urine.
Half-life: *Plasma*—12–22 hr; *CNS*—1.3 hr.

TIME/ACTION PROFILE (PO, TD = antihypertensive effect; epidural = analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2–4 hr	8–12 hr
Transdermal	2–3 days	unknown	7 days†
Epidural	unknown	unknown	unknown

†8 hr following removal of patch

Contraindications/Precautions
Contraindicated in: Hypersensitivity; *Epidural*—injection site infection, anticoagulant therapy, or bleeding problems.
Use Cautiously in: Serious cardiac or cerebrovascular disease; Renal insufficiency; Geri: Appear on Beers list due to increased risk of orthostatic hypotension and adverse CNS effects in geriatric patients (↓ dose recommended); Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: drowsiness, depression, dizziness, nervousness, nightmares. **CV:** bradycardia, hypotension (increased with epidural), palpitations. **GI:** dry mouth, constipation, nausea, vomiting. **GU:** erectile dysfunction. **Derm:** rash, sweating. **F and E:** sodium retention. **Metab:** weight gain. **Misc:** withdrawal phenomenon.

Interactions
Drug-Drug: Additive sedation with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive hypotension with other **antihypertensives** and **nitrates**. Additive bradycardia with **myocardial depressants**, including **beta blockers**. **MAO inhibitors**, **amphetamines**, **beta blockers**, **prazosin**, or **tricyclic antidepressants** may decrease antihypertensive effect. Withdrawal phenomenon may be increased by discontinuation of **beta blockers**. Epidural clonidine prolongs the effects of epidurally administered **local anesthetics**. May decrease effectiveness of **levodopa**. Increased risk of adverse cardiovascular reactions with **verapamil**.

Route/Dosage
PO (Adults): *Hypertension (initial dose)*—100 mcg (0.1 mg) bid, increase by 100–200 mcg (0.1–0.2 mg)/day q 2–4 days. *Usual maintenance dose* is 200–600 mcg (0.2–0.6 mg)/day in 2–3 divided doses (up to 2.4 mg/day). *Urgent treatment*—200 mcg (0.2 mg) loading dose, then 100 mcg (0.1 mg) q hr until blood pressure is controlled or 800 mcg (0.8 mg) total has been administered; follow with maintenance dosing. *Opioid withdrawal*—300 mcg (0.3 mg)–1.2 mg/day, may be decreased by 50%/day for 3 days, then discontinued or decreased by 100–200 mcg (0.1–0.2 mg)/day.
PO (Geriatric Patients): 100 mcg (0.1 mg) at bedtime initially, increased as needed.
PO (Children): 50–400 mcg (0.05–0.4 mg) twice daily.
Transdermal (Adults): *Hypertension*—Transdermal system delivering 100–300 mcg (0.1–0.3 mg)/24 hr applied every 7 days. Initiate with 100 mcg (0.1 mg)/24 hr system; dosage increments may be made q 1–2 wk when system is changed.
Epidural: (Adults): 30 mcg/hr initially; titrated according to need.
Epidural: (Children): 0.5 mcg/kg/hr initially; titrated according to need.

Copyright © 2008 by F.A. Davis

Availability (generic available)

Tablets: ✤25 mcg (0.025 mg), 100 mcg (0.1 mg), 200 mcg (0.2 mg), 300 mcg (0.3 mg). **Cost:** *Generic*—0.1 mg $21.65/100, 0.2 mg $12.21/100, 0.3 mg $26.65/100. **Transdermal systems:** Catapres-TTS 1, releases 0.1 mg/24 hr, Catapres-TTS 2, releases 0.2 mg/24 hr, Catapres-TTS 3, releases 0.3 mg/24 hr. **Cost:** Catapres-TTS 1 $85.99/4 patches, Catapres-TTS 2 $139.97/4 patches, Catapres-TTS 3 $194.97/4 patches. **Solution for epidural injection:** 100 mcg/ml in 10-ml vials, 500 mcg/ml in 10-ml vials. ***In combination with:*** chlorthalidone (Clorpres). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy.
- Monitor blood pressure and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- **Pain:** Assess location, character, and intensity of pain prior to, frequently during first few days, and routinely throughout administration.
- Monitor for fever as potential sign of catheter infection.
- **Opioid Withdrawal:** Monitor patient for signs and symptoms of opioid withdrawal (tachycardia, fever, runny nose, diarrhea, sweating, nausea, vomiting, irritability, stomach cramps, shivering, unusually large pupils, weakness, difficulty sleeping, gooseflesh).
- ***Lab Test Considerations:*** May cause transient increase in blood glucose levels.
- May cause decreased urinary catecholamine and vanillylmandelic acid (VMA) concentrations; these may increase on abrupt withdrawal.
- May cause weakly positive Coombs' test result.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Catapres (clonidine) with Cataflam (diclofenac).
- Do not confuse clonidine with clonazepam (Klonopin).
- In the perioperative setting, continue clonidine up to 4 hr prior to surgery and resume as soon as possible thereafter. Do not interrupt *transdermal clonidine* during surgery. Monitor blood pressure carefully.
- **PO:** Administer last dose of the day at bedtime. **Transdermal:** Transdermal system should be applied once every 7 days. May be applied to any hairless site; avoid cuts or calluses. Absorption is greater when placed on chest or upper arm and decreased when placed on thigh. Rotate sites. Wash area with soap and water; dry thoroughly before application. Apply firm pressure over patch to ensure contact with skin, especially around edges. Remove old system and discard. System includes a protective adhesive overlay to be applied over medication patch to ensure adhesion, should medication patch loosen.

Patient/Family Teaching

- Instruct patient to take clonidine at the same time each day, even if feeling well. If a dose is missed, take as soon as remembered. If more than 1 oral dose in a row is missed or if transdermal system is late in being changed by 3 or more days, consult health care professional. All routes of clonidine should be gradually discontinued over 2–4 days to prevent rebound hypertension.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Clonidine may cause drowsiness, which usually diminishes with continued use. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- If dry mouth occurs, frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease effect. If dry mouth continues for more than 2 wk, consult health care professional.

Copyright © 2008 by F.A. Davis

- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient to consult health care professional before taking any OTC cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if itching or redness of skin (with transdermal patch), mental depression, swelling of feet and lower legs, paleness or cold feeling in fingertips or toes, or vivid dreams or nightmares occur. May require discontinuation of therapy, especially with depression.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication helps control, but does not cure, hypertension.
- Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- **Transdermal:** Instruct patient on proper application of transdermal system. Do not cut or trim unit. Transdermal system can remain in place during bathing or swimming.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in severity of pain.
- Decrease in the signs and symptoms of opioid withdrawal.

clopidogrel (kloh-**pid**-oh-grel)
Plavix

Classification
Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

Pregnancy Category B

Indications
Reduction of atherosclerotic events (MI, stroke, vascular death) in patients at risk for such events including recent MI, acute coronary syndrome (unstable angina/non–Q-wave MI), stroke, or peripheral vascular disease.

Action
Inhibits platelet aggregation by irreversibly inhibiting the binding of ATP to platelet receptors.
Therapeutic Effects: Decreased occurrence of atherosclerotic events in patients at risk.

Pharmacokinetics
Absorption: Well absorbed following oral administration; rapidly metabolized to an active antiplatelet compound. Parent drug has no antiplatelet activity.
Distribution: Unknown.
Protein Binding: *Clopidogrel*—98%; *active metabolite*—94%.
Metabolism and Excretion: Rapidly and extensively converted by the liver to its active metabolite, which is then eliminated 50% in urine and 45% in feces.
Half-life: 8 hr (active metabolite).

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	3–7 days	5 days†

†Following discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pathologic bleeding (peptic ulcer, intracranial hemorrhage); Lactation.
Use Cautiously in: Patients at risk for bleeding (trauma, surgery, or other pathologic conditions); History of GI bleeding/ulcer disease; Severe hepatic impairment; OB, Lactation, Pedi: Safety not established; use in pregnancy only if clearly indicated.

Adverse Reactions/Side Effects
Incidence of adverse reactions similar to that of aspirin.
CNS: depression, dizziness, fatigue, headache. **EENT:** epistaxis. **Resp:** cough, dyspnea. **CV:** chest pain, edema, hypertension. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, gastritis. **Derm:** pruritus, purpura, rash. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOTIC THROMBOCYTOPENIC PURPURA. **Metab:** hypercholesterolemia. **MS:** arthralgia, back pain. **Misc:** fever, hypersensitivity reactions.

Interactions
Drug-Drug: Concurrent **abciximab**, **eptifibatide**, **tirofiban**, **aspirin**, **NSAIDs**, **heparin**, **heparanoids**, **thrombolytic agents**, **ticlopidine**, or **warfarin** may ↑ risk of bleeding. May ↓ metabolism and ↑ effects

Copyright © 2008 by F.A. Davis

of **phenytoin**, **tolbutamide**, **tamoxifen**, **torsemide**, **fluvastatin**, and many **NSAIDs**.
Drug-Natural Products: ↑ bleeding risk with **anise, arnica, chamomile, clove, fenugreek, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.**

Route/Dosage

Recent MI, Stroke, or Peripheral Vascular Disease

PO (Adults): 75 mg once daily.

Acute Coronary Syndrome

PO (Adults): 300 mg initially, then 75 mg once daily; aspirin 75–325 mg once daily should be given concurrently.

Availability

Tablets: 75 mg, 300 mg. **Cost:** $389.68/90.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- ***Lab Test Considerations:*** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.
- Monitor CBC with differential and platelet count periodically during therapy. Neutropenia and thrombocytopenia may rarely occur.
- May cause ↑ serum bilirubin, hepatic enzymes, total cholesterol, nonprotein nitrogen (NPN), and uric acid concentrations.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- Discontinue clopidogrel 5–7 days before planned surgical procedures.
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses.
- Advise patient to notify health care professional promptly if fever, chills, sore throat, or unusual bleeding or bruising occurs.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to avoid taking OTC medications containing aspirin or NSAIDs without consulting health care professional.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

clorazepate (klor-**az**-e-pate)

Apo-Clorazepate, Gen-XENE, Novo-Clopate, Tranxene, Tranxene-SD

Classification

Therapeutic: anticonvulsants, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category UK

Indications

Management of simple partial seizures. Anxiety disorder, symptoms of anxiety. Acute alcohol withdrawl. **Unlabeled uses:** Anxiety associated with acute myocardial infarction.

Action

Acts at many levels in the CNS to produce anxiolytic effect and CNS depression (by stimulating inhibitory GABA receptors). Produces skeletal muscle relaxation (by inhibiting spinal polysynaptic afferent pathways). Also has anticonvulsant effect (enhances presynaptic inhibition).
Therapeutic Effects: Relief of anxiety. Sedation. Prevention of seizures.

Pharmacokinetics

Absorption: Well absorbed from the GI tract as desmethyldiazepam.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Metabolized by the liver; some conversion to active compounds.
Half-life: 48 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	1–2 hr	up to 24 hr†

†May last longer in geriatric patients

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; OB, Lactation: May cause CNS depression, flaccidity, feeding difficulties, and seizures in infant. In lactation discontinue drug or bottle-feed.

Use Cautiously in: Pre-existing hepatic dysfunction; Patients who may be suicidal or have been addicted to drugs in the past; Debilitated patients (dosage reduction required); Severe pulmonary disease; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on Beers list and is associated with increased risk of falls (↓ dose required or consider short-acting benzodiazepine).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, hangover, headache, mental depression, slurred speech, ataxia, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Alcohol, **antidepressants**, **antihistamines**, and **opioid analgesics**—concurrent use results in ↑ CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ the metabolism of clorazepate, ↑ its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↓ the metabolism and ↓ effectiveness of clorazepate. Sedative effects may be ↓ by **theophylline**.

Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** ↑ CNS depression.

Route/Dosage

Prescribe largest dose at bedtime to avoid daytime sedation. Can be used on prn basis for anxiety.

PO (Adults): *Anxiety*—7.5–15 mg 2–4 times daily *or* 15 mg at bedtime initially. May also be given in a single dose of 11.25–22.5 mg at bedtime. *Alcohol withdrawal*—30 mg initially, then 15 mg 2–4 times daily on 1st day, then gradually decreased over subsequent days. *Anticonvulsant*—7.5 mg 3 times daily; can increase by no more than 7.5 mg/day at weekly intervals (daily dose not to exceed 90 mg).

PO (Geriatric Patients or Debilitated Patients): *Anxiety*—3.75–15 mg/day, may be increased.

PO (Children 9–12 yr): *Anticonvulsant*—7.5 mg twice daily initially, may increase by 7.5 mg/wk (not to exceed 60 mg/day).

Availability

Tablets: 3.75 mg, 7.5 mg, 11.25 mg, 15 mg, 22.5 mg. **Capsules:** 3.75 mg, 7.5 mg, 15 mg.

NURSING IMPLICATIONS

Assessment

- Assess for drowsiness, unsteadiness, and clumsiness. Symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- Conduct regular assessment for continued need for treatment.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect from injury. Institute seizure precautions.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity.
- Geri: Assess risk of falls and institute fall prevention strategies.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function tests evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of sodium iodide ^{123}I and ^{131}I.
- ***Toxicity and Overdose:*** Flumazenil is the antidote for alprazolam toxicity or overdose (flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants).

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Indications, Side Effects)
Risk for falls (Side Effects)

Implementation

- Do not confuse clorazepate with clonazepam.
- **PO:** If gastric irritation is a problem, may be administered with food or fluids. Capsule should be swallowed whole; do not open.
- Avoid administration of antacids within 1 hr of medication, because absorption of clorazepate may be delayed.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip or double up on missed doses. Abrupt withdrawal may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Caution patient to avoid alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to contact health care professional immediately if pregnancy is suspected.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.
- Use lowest effective dose for shortest period of time. Taper by 0.5 mg q 3 days to prevent withdrawal. Some patients may require longer tapering period (months).
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety.
- Control of acute alcohol withdrawal.
- Decrease or cessation of seizure activity without undue sedation.

clotrimazole, See ANTIFUNGALS (TOPICAL).

clotrimazole, See ANTIFUNGALS (VAGINAL).

cloxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

clozapine (kloe-za-peen)
Clozaril, FazaClo

Classification
Therapeutic: antipsychotics

Pregnancy Category B

Indications

Schizoprenia unresponsive to or intolerant of standard therapy with other antipsychotics (treatment refractory). To reduce recurrent suicidal behavior in schizophrenic patients.

Action

Binds to dopamine receptors in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. Produces fewer extrapyramidal reactions and less tardive dyskinesia than standard antipsychotics but carries high risk of hematologic abnormalities. **Therapeutic Effects:** Diminished schizophrenic behavior. Diminished suicidal behavior.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Rapid and extensive distribution; crosses blood-brain barrier and placenta.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized on first pass through the liver.
Half-life: 8–12 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	wks	4–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bone marrow depression; Severe CNS depression/

Copyright © 2008 by F.A. Davis

coma; Uncontrolled epilepsy; Granulocytopenia; Lactation: Discontinue drug or bottle-feed. **Use Cautiously in:** Prostatic enlargement; Angle-closure glaucoma; Malnourished patients or patients with cardiovascular, hepatic, or renal disease (use lower initial dose, titrate more slowly); Diabetes; Seizure disorder; Pedi: Safety not established in children <16 yr; Geri: Increased risk of death of elderly patients with dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness, sedation. **EENT:** visual disturbances. **CV:** MYOCARDITIS, hypotension, tachycardia, ECG changes, hypertension. **GI:** constipation, abdominal discomfort, dry mouth, increased salivation, nausea, vomiting, weight gain. **Derm:** rash, sweating. **Endo:** hyperglycemia. **Hemat:** AGRANULOCYTOSIS, LEUKOPENIA. **Neuro:** extrapyramidal reactions. **Misc:** fever.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **agents having anticholinergic properties,** including **antihistamines**, **quinidine**, **disopyramide**, and **antidepressants**. Concurrent use with **SSRI antidepressants** ↑ blood levels and risk of toxicity (especially **fluvoxamine**). ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. ↑ hypotension with **nitrates**, acute ingestion of **alcohol**, or **antihypertensives**. ↑ risk of bone marrow suppression with **antihypertensives** or **radiation therapy**. Use with **lithium** ↑ risk of adverse CNS reactions, including seizures.

Drug-Natural Products: Caffeine-containing herbs (**cola nut**, **tea**, **coffee**) may increase serum levels and side effects. **St. John's wort** may decrease blood levels and efficacy.

Route/Dosage

PO (Adults): 25 mg 1–2 times daily initially; increase by 25–50 mg/day over a period of 2 wk up to target dose of 300–450 mg/day. May increase by up to 100 mg/day once or twice further (not to exceed 900 mg/day). Treatment should be continued for at least 2 yr in patients with suicidal behavior.

Availability (generic available)

Tablets: 25 mg, 100 mg. **Orally-disintegrating tablets (mint):** 25 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying) and pulse rate before and frequently during initial dose titration.
- Assess weight and BMI initially and throughout therapy.
- Assess fasting blood glucose and cholesterol levels initially and throughout therapy. Refer as appropriate for nutritional/weight management and medical management.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for signs of myocarditis (unexplained fatigue, dyspnea, tachypnea, fever, chest pain, palpitations, other signs and symptoms of heart failure, ECG changes, such as ST-T wave abnormalities, arrhythmias, or tachycardia during first month of therapy). If these occur, clozapine should be discontinued and not restarted.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill-rolling motion of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benzotropine may be used to control these symptoms.
- Although not yet reported for clozapine, monitor for possible tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities, lip smacking or puckering, puffing of cheeks, uncontrolled chewing, rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements. Increasing bulk and fluids in the diet may help to minimize constipation.
- Clozapine lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.

Copyright © 2008 by F.A. Davis

- Transient fevers may occur, especially during first 3 wk of therapy. Fever is usually self-limiting but may require discontinuation of medication. Also, monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** Monitor WBC, absolute neutrophil count (ANC), and differential count before initiation of therapy and WBC and ANC weekly for the first 6 months, then biweekly during therapy and weekly for 4 wk after discontinuation of clozapine. Because of the risk of agranulocytosis, clozapine is available only in a 1-wk supply through the **Clozaril Patient Management System,** which combines WBC testing, patient monitoring, and controlled distribution through participating pharmacies. If WBC is <3000 mm^3 or granulocyte count is <1500 mm^3, withhold clozapine, increase frequency of WBC monitoring according to management system guidelines, and monitor patient for signs and symptoms of infection. If acceptable WBC and ANC levels were maintained during first 6 months of continuous therapy, monitoring may decrease to every 2 wks. If levels are maintained for second 6 months, WBC and ANC may be monitored every 4 wks thereafter.
- ***Toxicity and Overdose:*** Overdose is treated with activated charcoal and supportive therapy. Monitor patient for several days because of risk of delayed effects: Avoid use of epinephrine and its derivatives when treating hypotension, and avoid quinidine and procainamide when treating arrhythmias.

Potential Nursing Diagnoses

Risk for other-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)

Implementation

- **PO:** Administer capsules with food or milk to decrease gastric irritation.
- Leave oral disintegrating tablet in blister until time of use. Do not push tablet through foil. Just before use, peel foil and gently remove disintegrating tablet. Immediately place tablet in mouth and allow to disintegrate and swallow with saliva. If $^1/_2$ tablet dose used, destroy other half of tablet.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Patients on long-term therapy may need to discontinue gradually over 1–2 wk.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Inform patient that cigarette smoking can decrease clozapine levels. Risk for relapse increases if patient begins or increases smoking.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness while taking clozapine.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and OTC medications without consulting health care professional.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if unexplained fatigue, dyspnea, tachypnea, chest pain, palpitations, sore throat, fever, lethargy, weakness, malaise, or flu-like symptoms occur or if pregnancy is planned or suspected.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast-feeding or planning to breast-feed.
- Refer to local support group.

Evaluation/Desired Outcomes

- Decreased positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

Copyright © 2008 by F.A. Davis

HIGH ALERT

codeine (koe-deen)

Paveral

Classification

Therapeutic: allergy, cold, and cough remedies, antitussives, opioid analgesics
Pharmacologic: opioid agonists

Schedule II, III, IV, V (depends on content)

Pregnancy Category C

Indications

Management of mild to moderate pain. Antitussive (in smaller doses). **Unlabeled uses:** Management of diarrhea.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Decreases cough reflex. Decreases GI motility. **Therapeutic Effects:** Decreased severity of pain. Suppression of the cough reflex. Relief of diarrhea.

Pharmacokinetics

Absorption: 50% absorbed from the GI tract. Completely absorbed from IM sites. Oral and parenteral doses are not equal.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; 10% converted to morphine, 5–15% excreted unchanged in urine.
Half-life: 2.5–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	30–45 min	60–120 min	4 hr
IM	10–30 min	30–60 min	4 hr
Subcut	10–30 min	unknown	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Geriatric or debilitated patients (dose reduction required; more susceptible to CNS depression, constipation); Undiagnosed abdominal pain; Geri: Prostatic hyperplasia; OB: Has been used during labor; respiratory depression may occur in the newborn; OB: Pregnancy or lactation (avoid chronic use).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (reduce initial dose to 25% of usual dose). Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics**. Administration of **partial antagonists** (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may decrease analgesia.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

Route/Dosage

PO (Adults): *Analgesic*—15–60 mg q 3–6 hr as needed. *Antitussive*—10–20 mg q 4–6 hr as needed (not to exceed 120 mg/day). *Antidiarrheal*—30 mg up to 4 times daily.
PO (Children 6–12 yr): *Analgesic*—0.5 mg/kg (15 mg/m^2) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—5–10 mg q 4–6 hr as needed (not to exceed 60 mg/day). *Antidiarrheal*—0.5 mg/kg up to 4 times daily.
PO (Children 2–5 yr): *Analgesic*—0.5 mg/kg (15 mg/m^2) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—0.25 mg/kg up to 4 times daily. *Antidiarrheal*—0.5 mg/kg up to 4 times daily.
IM, IV, Subcut (Adults): *Analgesic*—15–60 mg q 4–6 hr as needed.
IM, IV, Subcut (Infants and Children): *Analgesic*—0.5 mg/kg (15 mg/m^2) q 4–6 hr as needed.

Availability (generic available)

Tablets: 15 mg, 30 mg, 60 mg. **Oral solution:** 10 mg/5 ml, 15 mg/5 ml. **Injection:** 30 mg/ml, 60 mg/ml. ***In combination with:*** antihistamines, decongestants, antipyretics, caffeine, butalbital, and nonopioid analgesics. See Appendix B.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids, bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain before and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive codeine for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check dose calculations and route of administration.
- ***High Alert:*** Do not confuse codeine with Cardene (nicardipine) or Lodine (etodolac).
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Medications should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- When combined with nonopioid analgesics (aspirin, acetaminophen) #2 = 15 mg, #3 = 30 mg, #4 = 60 mg codeine. Codeine as an individual drug is a Schedule II substance. In combination with other drugs, tablet form is Schedule III, liquid is Schedule IV, and elixir or cough suppressant is Schedule V (see Appendix I).
- **PO:** Oral doses may be administered with food or milk to minimize GI irritation.
- **IM, Subcut:** Do not administer solution that is more than slightly discolored or contains a precipitate.

IV Administration

- **Direct IV:** Codeine is usually administered IM or subcut, but slow IV injection has been used.
- **Syringe Compatibility:** dimenhydrinate, glycopyrrolate, hydroxyzine.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Codeine may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution ambulatory patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.
- Control of diarrhea.

HIGH ALERT

colchicine (kol-chi-seen)

Classification
Therapeutic: antigout agents

Pregnancy Category D

Indications

Acute attacks of gouty arthritis (larger doses). Prevention of recurrences of gout (smaller doses). **Unlabeled uses:** Treatment of hepatic cirrhosis and familial Mediterranean fever.

Action

Interferes with the functions of WBCs in initiating and perpetuating the inflammatory response to monosodium urate crystals. **Therapeutic Effects:** Decreased pain and inflammation in acute attacks of gout. Prevention of recurrent attacks of gout.

Pharmacokinetics

Absorption: Absorbed from the GI tract, then re-enters GI tract from biliary secretions, when more absorption may occur.
Distribution: Concentrates in WBCs.
Metabolism and Excretion: Partially metabolized by the liver. Secreted in bile back into GI tract; eliminated in the feces. Small amount excreted in the urine.
Half-life: 20 min (plasma), 60 hr (WBCs).

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
PO	12 hr	24–72 hr	unknown
IV	within 6–12 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy; Severe renal (CCr <10 ml/min) or GI disease.
Use Cautiously in: Elderly or debilitated patients (toxicity may be cumulative); Renal impairment (dose reduction suggested if CCr <50 ml/min; total IV dose not >2 mg); Lactation or children (safety not established).

Adverse Reactions/Side Effects

GI: diarrhea, nausea, vomiting, abdominal pain. **GU:** anuria, hematuria, renal damage. **Derm:** alopecia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuritis.

Interactions

Drug-Drug: Additive bone marrow depression may occur with **bone marrow depressants** or **radiation therapy**. Additive adverse GI effects with **NSAIDs**. May cause reversible malabsorption of **vitamin B_{12}**. ↑ toxicity with **clarithromycin**, especially in the elderly.

Route/Dosage

PO (Adults): *Treatment of acute attacks*—0.6–1.2 mg, then 0.6 mg q 1–2 hr *or* 1–1.2 mg q 2 hr until relief, GI side effects, or a total cumulative dose of 8 mg is achieved. *Prophylaxis*—0.6 mg daily (may be used up to 3 times daily or as little as 1–4 times weekly). If surgery is planned, give 3 times daily for 3 days before and 3 days after procedure.
IV (Adults): *Treatment of acute attack*—2 mg initially, then 0.5 mg q 6 hr *or* 1 mg q 6–12 hr, until relief or cumulative dose of 4 mg has been given. Other regimens may use lower doses. *Prophylaxis*—0.5–1 mg 1–2 times daily. Other regimens may use lower doses.

Availability (generic available)

Tablets: 0.6 mg, 1 mg. **Cost:** *Generic*—$18.12/90. **Injection:** 0.5 mg/ml in 2-ml ampules.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- ***High Alert:*** Assess patient for toxicity (weakness, abdominal discomfort, nausea, vomiting, diarrhea, delirium, seizures, sense of suffocation, dilated pupils, difficulty swallowing, ascending paralysis, oliguria), withhold drug and report symptoms immediately.
- Assess involved joints for pain, mobility, and edema throughout therapy. During initiation of therapy, monitor for drug response every 1–2 hr.
- Monitor intake and output ratios. Fluids should be encouraged to promote a urinary output of at least 2000 ml/day.
- ***Lab Test Considerations:*** In patients receiving prolonged therapy, monitor baseline and periodic CBC; report significant ↓ in values. May cause ↓ platelet count, leukopenia, aplastic anemia, and agranulocytosis.
- May cause ↑ in AST and alkaline phosphatase.
- May cause false-positive results for urine hemoglobin.
- May interfere with results of urinary 17-hydroxycorticosteroid concentrations.
- ***Toxicity and Overdose:*** Assess patient for toxicity (weakness, abdominal discomfort, nausea, vomiting, diarrhea). If these symptoms occur, discontinue medication and notify physician or other health care professional. Opioids may be needed to treat diarrhea.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired walking (Indications)

Implementation

- ***High Alert:*** Colchicine overdose can be fatal. Cumulative dose by any route should not exceed 4 mg. Limit IV doses to a maximum of 1-2 mg in patients who have recently received oral colchicine. Cumulative dose should not exceed 2 mg in geriatric and renal patients. After dosing limit has been reached, do not administer any additional colchicine by any route for 21 days. Do not administer oral and IV colchicine concurrently.
- Intermittent therapy with 3 days between courses may be used to decrease risk of toxicity.
- **PO:** Administer oral doses with food to minimize gastric irritation. Oral route is preferred.

IV Administration

- **IV:** Avoid extravasation; may cause necrosis of skin and soft tissue.
- **Direct IV:** ***Diluent:*** May be administered undiluted. If a lower concentration is desired, may dilute to a volume of 10–20 ml with sterile water or 0.9% NaCl for injection. Do not administer solutions that are turbid. ***Concentration:*** 0.5 mg/ml. ***Rate:*** Administer slowly over 2–10 min. Rapid administration may cause cardiac arrhythmias.
- **Y-Site Incompatibility:** Do not dilute colchicine with or inject into IV tubing containing D5W, solutions containing a bacteriostatic agent, or any other solution that might change the pH of the colchicine solution because precipitation will occur.

Patient/Family Teaching

- Review medication administration schedule. If dose is missed, take as soon as remembered unless almost time for next dose. Do not double doses.
- Instruct patients taking prophylactic doses not to increase to therapeutic doses during an acute attack to prevent toxicity. An NSAID or corticosteroid, preferably via intrasynovial injection, should be used to treat acute attacks.
- Advise patient to follow recommendations of health care professional regarding weight loss, diet, and alcohol consumption.
- Instruct patient to report nausea, vomiting, abdominal pain, diarrhea, unusual bleeding, bruising, sore throat, fatigue, malaise, or rash promptly. Medication should be withheld if gastric symptoms indicative of toxicity occur.
- Surgery may precipitate an acute attack of gout. Advise patient to confer with health care professional regarding dose 3 days before surgical or dental procedures.

Evaluation/Desired Outcomes

- Decrease in pain and swelling in affected joints within 12 hr.
- Relief of symptoms within 24–48 hr.
- Prevention of acute gout attacks.

colesevelam

(koe-le-**sev**-e-lam)
Welchol

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

Pregnancy Category B

Indications
Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in patients with primary hypercholesterolemia; may be used alone or in combination with hepatic hydroxymethylglutaryl coenzyme A (HMG-CoA) reductase inhibitor.

Action
Binds bile acids in the GI tract. Result in increased clearance of cholesterol. **Therapeutic Effects:** Decreased cholesterol.

Pharmacokinetics
Absorption: Not absorbed; action is primarily local in the GI tract.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	2 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Bowel obstruction.
Use Cautiously in: Triglycerides >300 mg/dl; Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
GI: constipation, dyspepsia.

Interactions
Drug-Drug: May decrease blood levels of sustained-release form of **verapamil**. May cause ↑ thyroid stimulating hormone (TSH) levels in patients receiving **thyroid hormone replacement therapy**.

Route/Dosage
PO (Adults): 3 tablets twice daily or 6 tablets once daily; may be increased to 7 tablets daily.

Availability
Tablets: 625 mg.

NURSING IMPLICATIONS

Assessment
- Obtain a diet history, especially in regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum total cholesterol, LDL, and triglyceride levels before initiating, and periodically throughout, therapy.

Potential Nursing Diagnoses
Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation
- **PO:** Administer once or twice daily with meals. Colesevelam should be taken with a liquid.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed; do not skip doses or double up on missed doses.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.

Evaluation/Desired Outcomes
- Decrease in serum total choesterol, LDL cholesterol, and apolipoprotein levels.

colestipol (koe-**les**-ti-pole)
Colestid

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

Pregnancy Category UK

Indications
Management of primary hypercholesterolemia. Pruritus associated with elevated levels of bile acids. **Unlabeled uses:** Diarrhea associated with excess bile acids.

Action
Binds bile acids in the GI tract, forming an insoluble complex. Result is increased clearance of cholesterol. **Therapeutic Effects:** Decreased plasma cholesterol and LDL. Decreased pruritus.

Pharmacokinetics
Absorption: Action takes place in the GI tract. No absorption occurs.
Distribution: No distribution.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: After binding bile acids, insoluble complex is eliminated in the feces.
Half-life: Unknown.

TIME/ACTION PROFILE (hypocholesterolemic effects)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	1 mo	1 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Complete biliary obstruction; Some products contain aspartame and should be avoided in patients with phenylketonuria.
Use Cautiously in: History of constipation.
Exercise Extreme Caution in: Pedi: May cause potentially fatal intestinal obstruction in children.

Adverse Reactions/Side Effects

EENT: irritation of the tongue. **GI:** abdominal discomfort, constipation, nausea, fecal impaction, flatulence, hemorrhoids, perianal irritation, steatorrhea, vomiting. **Derm:** irritation, rashes. **F and E:** hyperchloremic acidosis. **Metab:** vitamin A, D, and K deficiency.

Interactions

Drug-Drug: May decrease absorption/effects of orally administered **acetaminophen**, **amiodarone**, **clindamycin**, **clofibrate**, **digoxin**, **diuretics**, **gemfibrozil**, **glipizide**, **corticosteroids**, **imipramine**, **mycophenolate**, **methotrexate**, **methyldopa**, **niacin**, **NSAIDs**, **penicillin**, **phenytoin**, **phosphates**, **propranolol**, **tetracyclines**, **tolbutamide**, **thyroid preparations**, **ursodiol**, **warfarin**, and **fat-soluble vitamins (A, D, E,** and **K)**. May decrease absorption of other **orally administered medications**.

Route/Dosage

PO (Adults): *Granules*—5 g 1–2 times daily, may be increased q 1–2 mo up to 30 g/day in 1–2 doses. *Tablets*—2 g 1–2 times daily, may be increased q 1–2 mo up to 16 g/day in 1–2 doses.

Availability

Granules for suspension (unflavored): 5 g/packet or scoop. **Flavored granules for suspension with aspartame (orange flavor):** 5 g/packet or scoop. **Tablets:** 1 g.

NURSING IMPLICATIONS

Assessment

- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Pruritus:** Assess severity of itching and skin integrity. Dose may be decreased when relief of pruritus occurs.
- **Diarrhea:** Assess frequency, amount, and consistency of stools.
- ***Lab Test Considerations:*** Serum cholesterol and triglyceride levels should be evaluated before initiating, frequently during first few months and periodically throughout therapy. Discontinue medication if paradoxical increase in cholesterol level occurs.
- May cause an increase in AST, ALT, phosphorus, chloride, and alkaline phosphatase and a decrease in serum calcium, sodium, and potassium levels.
- May also cause prolonged PT.

Potential Nursing Diagnoses

Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Parenteral or water-miscible forms of fat-soluble vitamins (A, D, K) and folic acid may be ordered for patients on chronic therapy.
- **PO:** Administer before meals.
- Scoops for powdered preparations may not be exchangable between products.
- Administer other medications 1 hr before or 4–6 hr after the administration of this medication.
- Colestipol tablets should be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip doses or double up on missed doses.
- Instruct patient to take medication before meals. Colestipol can be mixed with water, juice, or carbonated beverages. Slowly stir in a large glass. Rinse glass with small amount of additional beverage to ensure all medication is taken. May also mix with highly fluid soups, cereals, or pulpy fruits (applesauce, crushed pineapple). Allow powder to sit on fluid and hydrate for 1–2 min before mixing. Do not take dry.

Copyright © 2008 by F.A. Davis

- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Explain that constipation may occur. Increase in fluids and bulk in diet, exercise, stool softeners, and laxatives may be required to minimize the constipating effects. Instruct patient to notify health care professional if constipation, nausea, flatulence, and heartburn persist or if stools become frothy and foul smelling.
- Advise patient to notify health care professional if unusual bleeding or bruising; petechiae; or black, tarry stools occur. Treatment with vitamin K may be necessary.

Evaluation/Desired Outcomes

- Decrease in serum LDL cholesterol levels. Therapy is usually discontinued if the clinical response remains poor after 3 mo of therapy.
- Decrease in severity of pruritus. Relief usually occurs 1–3 wk after therapy is initiated.
- Decrease in frequency and severity of diarrhea.

Ortho Evra

Classification
Therapeutic: contraceptive hormones

Pregnancy Category X

Indications
Prevention of pregnancy. Regulation of menstrual cycle. Emergency contraception (some products). Treatment of premenstrual dysphoric disorder (Yaz, Yasmin). Management of acne in women >14 yr who desire contraception, have no health problems, and have failed topical treatment.

Action
Monophasic Oral Contraceptives: Provide a fixed dosage of estrogen/progestin over a 21-day cycle. Ovulation is inhibited by suppression of follicle-stimulating hormone (FSH) and luteinizing hormone (LH). May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. **Biphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. In addition, smaller dose of progestin in phase 1 allows for proliferation of endometrium. Larger amount in phase 2 allows for adequate secretory development.

Copyright © 2008 by F.A. Davis

Triphasic Oral Contraceptives: Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Varying doses of estrogen/progestin may more closely mimic natural hormonal fluctuations. **Extended-cycle Oral Contraceptives:** Provides continuous estrogen/progestin for 84 days (365 days for Lybrel), then off for 7 days, resulting in 4 menstrual periods/year (no periods/year for Lybrel). **Progressive Estrogen Oral Contraceptives:** Contains constant amount of progestin with 3 progressive doses of estrogen. **Progestin-Only Contraceptives/Contraceptive Implant/Intrauterine Levonorgestrel/Medroxyprogesterone Injection** Mechanism not clearly known. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Ovulation may also be suppressed. **Emergency Contraceptive Pills (ECPs):** Inhibit ovulation/fertilization; may also alter tubal transport of sperm/egg and prevent implantation. **Vaginal Ring, Transdermal Patch:** Inhibits ovulation, decreases sperm entry into uterus, and decreases likelihood of implantation. Anti-acne effect Combination of estrogen/progestin may increase sex hormone binding globulin (SHBG) resulting in decreased unbound testosterone, which may be a cause of acne. **Therapeutic Effects:** Prevention of pregnancy. Decreased severity of acne. Decrease in premenstrual disphoric disorder.

Pharmacokinetics

Absorption: *Ethinyl estradiol*—rapidly absorbed; *norethindrone*—65% absorbed; *Desogesrtrel and levonorgestrel*—100% absorbed. Others are well absorbed after oral administration. Slowly absorbed from implant, subcutaneous, or IM injection. Some absorption follows intrauterine implantation.
Distribution: Unknown.
Protein Binding: *Ethinyl estradiol*—97–98%. *Drospirenone*—97%.
Metabolism and Excretion: *Ethinyl estradiol and norethindrone*—undergo extensive first-pass hepatic metabolism. *Mestranol*—is rapidly converted to ethinyl estradol. *Desogestrel*—is rapidly metabolized to 3-keto-desogestgrel, the active metabolite. Most agents are metabolized by the liver.
Half-life: *Ethinyl estradiol*—6–20 hr; *Levonorgestrel*—45 hr; *Norethindrone*—5–14 hr; *Desogestrel (metabolite)*—38 ± 20 hr; *Drospirenone*—30 hr; *Norgestimate (metabolite)—12–20 hr;* others—unknown.

TIME/ACTION PROFILE (prevention of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	1 mo	1 mo†
Implant	1 mo	1 mo	5 yr
Intrauterine system	1 mo	1 mo	3 yr
IM	1 mo	1 mo	3 mo
SC	Unk	1 wk	3 mo

†Only during month of taking contraceptive

Contraindications/Precautions

Contraindicated in: Pregnancy; History of thromboembolic disease (e.g., DVT, PE, MI, stroke); Valvular heart disease; Major surgery with extended periods of immobility; Diabetes with vascular involvement; Headache with focal neurological symptoms; Uncontrolled hypertension; History of breast, endometrial, or estrogen-dependent cancer; Abnormal genital bleeding; Liver disease; Hypersensitivity to parabens (injectable only); *Intrauterine levonorgestrel only*—Intrauterine anomaly, postpartum endometriosis, multiple sexual partners, pelvic inflammatory disease, liver disease, genital actinomycosis, immunosuppression, IV drug abuse, untreated genitourinary infection, history of ectopic pregnancy; Some products contain tartrazine and should be avoided in patients with known hypersensitivity intolerance; Lactation: Avoid use.
Use Cautiously in: History of cigarette smoking or age >30–35 yr (increased risk of cardiovascular or thromboembolic phenomenon); Presence of other cardiovascular risk factors (obesity, hyperglycemia, elevated lipids, hypertension); History of diabetes mellitus, bleeding disorders, concurrent anticoagulant therapy or headaches; Pedi: Should not be used before menarche.

Adverse Reactions/Side Effects

CNS: depression, migraine headache. **EENT:** contact lens intolerance, optic neuritis, retinal thrombosis. **CV:** CEREBRAL HEMORRHAGE, CEREBRAL THROMBOSIS, CORONARY THROMBOSIS, PULMONARY EMBOLISM, edema, hypertension, Raynaud's phenomenon, thromboembolic phenomena, thrombophlebitis. **GI:** abdominal cramps, bloating, cholestatic jaundice, gallbladder disease, liver tumors, nausea, vomiting. **GU:** amenorrhea, breakthrough bleeding, dysmenorrhea, spot-

Copyright © 2008 by F.A. Davis

ting. *Intrauterine levonorgestrel only*—uterine imbedment/uterine rupture. **Derm:** melasma, rash. **Endo:** hyperglycemia. **MS:** *Injectable medroxyprogesterone only*—bone loss. **Misc:** weight change.

Interactions

Drug-Drug: Oral contraceptive efficacy may be ↓ by **penicillins**, **chloramphenicol**, **barbiturates**, chronic **alcohol** use, **carbamazepine oxcarbazepine**, **felbamate**, systemic **corticosteroids**, **phenytoin**, **topiramate**, **primidone**, **modafinil**, **rifampin**, **rifabutin**, some **protease inhibitor antiretrovirals** (including **ritonavir**), or **tetracyclines**. May ↑ effects/risk of toxicity of some **benzodiazepines**, **beta blockers**, **corticosteroids**, **cyclosporine**, and **theophylline**. ↑ risk of hepatic toxicity with **dantrolene** (estrogen only). **Indinavir**, **itraconazole**, **ketoconazole**, **fluconazole**, and **atorvastatin** may ↑ effects/risk of toxicity. **Smoking** ↑ risk of thromboembolic phenomena (estrogen only). May ↓ levels of **acetaminophen**, **temazepam**, **lamotrigine**, **lorazepam**, **oxazepam**, or **morphine**. *Drosperinone—containing products only*—concurrent use with **NSAIDs**, **potassium-sparing diuretics**, **potasssium supplements**, **ACE inhibitors**, or **angiotensin II receptor antagonists** may result in hyperkalemia.

Drug-Natural Products: Concomitant use with **St. John's wort** may ↓ contraceptive efficacy and cause breakthrough bleeding and irregular menses.

Route/Dosage

Monophasic Oral Contraceptives

PO (Adults): On 21-day regimen, take first tablet on first Sunday after menses begins (take on Sunday if menses begins on Sunday) for 21 days, then skip 7 days and begin again. Regimen may also be started on first day of menses, continue for 21 days, then skip 7 days and begin again. Some regimens contain 7 placebo tablets, so that 1 tablet is taken every day for 28 days.

Biphasic Oral Contraceptives

PO (Adults): Given in 2 phases. First phase is 10 days of smaller amount of progestin. Second phase is larger amount of progestin. Amount of estrogen remains constant for same length of time (total of 21 days), then skip 7 days and begin again. Some regimens contain 7 placebo tablets for 28-day regimen.

Triphasic Oral Contraceptives

PO (Adults): Progestin amount varies throughout 21-day cycle. Estrogen component stays the same or may vary. Some regimens contain 7 placebo tablets for 28-day regimen.

Extended-cycle Contraceptive

PO (Adults): *Seasonale and Seasonique* Start taking first active pill on first Sunday after menses start (if first day is Sunday, start then), continue for 84 days of active pill, followed by 7 days of placebo tablets, then resume 84/7 cycle again. For *Lybrel*, begin taking the first pill during the first day of the menstrual cycle and start the next pack the day after the previous pack ends.

Progestin-Only Oral Contraceptives

PO (Adults): Start on first day of menses. Taken daily and continuously.

Progressive Estrogen Oral Contraceptives

PO (Adults): Estrogen amount increases q 7 days throughout 21-day cycle. Progestin component stays the same. Some regimens contain 7 placebo tablets for 28-day regimen.

Emergency Contraceptive

PO (Adults and Adolescents): Given within 72 hr of unprotected intercourse and repeated 12 hr later. *Plan B*—1 tablet followed by 1 more tablet 12 hr later; *Ovral*—2 white tablets followed by 2 more white tablets 12 hr later; *Lo/Ovral*—4 white tablets followed by 4 more white tablets 12 hr later; *Levlen, Nordette*—4 light orange tablets followed by 4 more light orange tablets 12 hr later; *Triphasil, Tri-Levlen*—4 yellow tablets followed by 4 more yellow tablets 12 hr later.

Injectable Contraceptive

medroxyprogesterone (Depo-Provera)

IM (Adults): 150 mg within first 5 days of menses or within 5 days postpartum, if not breastfeeding. If breastfeeding, give 6 wk postpartum; repeat q 3 mo.

medroxyprogesterone (Depo-Sub Q Provera 104)

Subcut (Adults): 104 mg within first 5 days of menses or within 5 days postpartum, if not

Copyright © 2008 by F.A. Davis

breastfeeding. If breastfeeding, give 6 wk postpartum; repeat q 12–14 wk.

Vaginal Ring Contraceptive

Vag (Adults): One ring inserted on or prior to day 5 of menstrual cycle. Ring is left in place for 3 wk, then removed for 1 wk, then a new ring is inserted.

Transdermal Patch

Transdermal (Adults): Patch is applied on day 1 of menstrual cycle (or convenient day in first week), changed weekly thereafter for 3 weeks. Week 4 is patch-free. Cycle is then repeated.

Acne

PO (Adults): Ortho Tri-Cyclen only, taken daily for 21 days, off for 7 days.

Availability

Combination Estrogen/Progestin Oral Contraceptives

Oral contraceptive tablets: Usually in monthly packs with enough (21) active tablets to complete a 28-day cycle. Some contain 7 inert tablets to complete the cycle with or without supplemental iron. **Cost:** *Apri*—$179.93/6 cycles; *Estrostep Fe*—$354.26/6 cycles; *Femcon Fe*—$338.97/6 cycles; *Kariva*—$239.94/6 cycles; *Levora*—$151.94/6 cycles; *Low-Ogestrel*—$151.94/6 cycles; *Necon 0.5/35*—$125.95/6 cycles; *Ovcon 35*—$322.44/6 cycles; *Sprintec*—$143.10/6 cycles; *Tri-Nessa*—$137.94/6 cycles; *Trivora-28*—$139.94/6 cycles; *Yasmin*—$299.90/6 cycles; *Yaz*—$307.96/6 cycles.

Extended-cycle Contraceptive

Tablets: Seasonale– 84 active tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel and 7 inactive tablets, Seasonique-active tablets containing 0.03 mg ethinly estradiol, 0.15 mg levonorgestrel, and 7 inactive tablets containing 0.01 mg ethinyl estradiol, Lybrel—28 active tablets containing 0.09 mg levonorgestrel and 0.02 mg ethinyl estradiol. **Cost:** *Lybrel*—$49.99/28 tablets; *Seasonale*—$181.98/91 tablets; *Seasonique*—$165.98/91 tablets.

Levonorgestrel

Emergency contraceptives: 2 tablets containing 0.75 mg levonorgestrel (Plan B). **Implant:** Rod contains 68 mg etonogestrel. **Intrauterine system:** contains 52 mg levonorgestrel (releases 20 mcg/day).

Medroxyprogesterone

Injectable IM: 150 mg/ml. **Injectable Subcutaneous:** 104 mg/0.65 ml (in pre-filled syringes).

Vaginal Ring Contraceptive

Ring: delivers 0.015 mg ethinyl estradiol and 0.120 mg etonogestrel/day. **Cost:** $289.95/6 rings.

Transdermal Patch

Patch: contains 0.75 mg ethinyl estradiol and 6 mg of norelgestromin; releases 20 mg ethinyl estradiol/150 mg norelgestromin per 24 hr. **Cost:** $299.95/18 patches.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure before and periodically during therapy.
- **Acne:** Assess skin lesion before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor hepatic function periodically during therapy.
- *Estrogens only*—May cause ↑ serum glucose, sodium, triglyceride, VHDL, total cholesterol, prothrombin, and factors VII, VIII, IX, and X levels. May cause ↓ LDL and antithrombin III levels.
- May cause false interpretations of thyroid function tests.
- *Progestins only*—May cause ↑ LDL concentrations. May cause ↓ serum alkaline phosphatase and HDL concentrations.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Oral doses may be administered with or immediately after food to reduce nausea. Chewable tablets may be swallowed whole or chewed; if chewed follow with 8 ounces of liquid.
- For extended-cycle tablets, *Seasonale or Seasonique*—take active tablets for 84 days and followed by the placebo tablets for 7 days; for *Lybrel*—Take 1 pill each day for 28 days, then start the next set of pills daily for the next 28 days.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 seconds) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wks. If more than 14 wks elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection**.

Copyright © 2008 by F.A. Davis

- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously just before use to ensure uniform suspension. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 years. Injectable medroxyprogesterone should be used for >2 years only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.

Patient/Family Teaching

- Instruct patient to take oral medication as directed at the same time each day. Pills should be taken in proper sequence and kept in the original container. Advise patient not to skip pills even if not having sex very often.
- *If single daily dose is missed:* Take as soon as remembered; if not until next day, take 2 tablets and continue on regular dosing schedule. *If 2 days in a row are missed:* Take 2 tablets a day for the next 2 days and continue on regular dosing schedule, using a second method of birth control for the remaining cycle. *If 3 days in a row are missed:* Discontinue medication and use another form of birth control until period begins or pregnancy is ruled out; then begin a new cycle of tablets. *For 28-day dosing schedule:* If schedule is followed for first 21 days and 1 dose is missed of the last 7 tablets, it is important to take the 1st tablet of next month's cycle on the regularly scheduled day.
- Advise patient taking *Seasonale or Sesonique extended-cycle tablets* that withdrawal bleeding should occur during the 7 days following discontinuation of the active tablets. If withdrawal bleeding does not occur, notify health care professional. Advise patient taking *Lybrel* that no withdrawal bleeding should occur.
- For initial use of *Seasonale or Seasonique extended cycle tablets*, caution patient to use a nonhormonal method of contraception until she has taken the first 7 days of active tablets. Each 91-day cycle should start on the same day of the week. If started later than the proper day or 2 or more days are missed, a second nonhormonal method of contraception should be used until she has taken the pink tablet for 7 days. Transient spotting or bleeding may occur. If bleeding is persistent or prolonged, notify health care professional.
- Advise patient taking extended cycle tablets that spotting or light bleeding may occur, especially during first 3 months. Continue medication; notify health care professional if bleeding lasts >7 days.
- Advise patient of the need to use another form of contraception for the first 3 wk when beginning to use *oral contraceptives*.
- Advise patient that a second method of birth control also should be used during each cycle in which any of the following are used: *Oral contraceptives*—ampicillin, corticosteroids, antiretroviral protease inhibitors, barbiturates, carbamazepine, chloramphenicol, dihydroergotamine, corticosteroids (systemic), mineral oil, oral neomycin, oxcarbazapine, penicillin V, phenylbutazone, primidone, rifampin, sulfonamides, tetracyclines, topiramate, or valproic acid.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. If nausea persists or vomiting or diarrhea occur, use a nonhormonal method of contraception and notify health care professional.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding. Women with a strong family history of breast cancer, fibrocystic breast disease, abnormal mammograms or cervical dysplasia should be monitored for breast cancer at least yearly.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.

Copyright © 2008 by F.A. Davis

- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patients to use sunscreen and protective clothing to prevent increased pigmentation.
- Caution patient that oral contraceptives do not protect against HIV or other sexually transmitted diseases.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams including blood pressure; breast, abdomen, and pelvic examinations; and Papanicolaou smears every 6–12 mo.
- **IM, Subcut** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.
- **Transdermal:** Instruct patient on application of patch. First patch should be applied within 24 hrs of menstrual period. If applied after day 1 of menstrual period, a nonhormonal method of contraception should be used for the next 7 days. Day of application becomes *Patch Change Day*. Patches are worn for 1 wk and changed on the same day of each wk for 3 wks. Week 4 is patch-free. Withdrawal bleeding is expected during this time.
- Apply patch to clean, dry, intact, healthy skin on buttock, abdomen, upper outer arm, or upper torso in a place where it won't be rubbed by tight clothing. Do not place on skin that is red, irritated, or cut, and do not place on breasts. Do not apply make-up, creams, lotions, powders, or other topical products to area of patch application.
- To apply patch open foil pouch by tearing along edge using fingers. Peel pouch apart and open flat. Grasp a corner of the patch firmly and remove gently from foil pouch. Use fingernail to lift one corner of the patch and peel patch **and** the plastic liner off the foil liner. Do not remove clear liner as patch is removed. Peel away half of the clear liner without touching sticky surface. Apply the sticky surface and remove the rest of the liner. Press down firmly with palm of hand for 10 seconds; make sure the edges stick well.
- On *Patch Change Day* remove patch and apply new one immediately. Used patch still contains some active hormones; fold in half so it sticks to itself and throw away. Apply new patches to a new spot to prevent skin irritation; may be applied in same anatomic area.
- Following patch-free week, apply a new patch on *Patch Change Day*, the day after Day 28, no matter when the menstrual cycle begins.
- If patch becomes partially or completely detached for less than 1 day, reapply patch or apply new patch. If patch is detached for more than 1 day, apply a new patch immediately and use a nonhormonal form of contraception for the next 7 days. Cycle will now start over with a new *Patch Change Day*. If patch is no longer sticky, apply a new patch; do not use tape or wraps to keep patch in place.
- If patch is not changed on *Patch Change Day* in the first week of the cycle, apply new patch immediately upon remembering and use a nonhormonal method of contraception for next 7 days. If patch change is missed in for 1 or 2 days during Week 2 or 3, apply new patch immediately and apply next patch on usual *Patch Change Day*. No backup contraception is needed. If patch change is missed for more than 2 days during Week 2 or 3, stop the cycle and start a new 4-wk contraceptive cycle by applying new patch immediately and using a nonhormonal method of contraception for the next 7 days. If patch is not removed on *Patch Change Day* in Week 4, remove as soon as remembered and start next cycle on usual *Patch Change Day*. No additional contraception is needed.
- **NuvaRing:** *If a hormonal contraceptive was not used in the past month*, insert *NuvaRing* between Days 1 and 5 of the menstrual cycle (Day 1 = first day of menstrual period), even if bleeding has not finished. Use a nonhormonal method of birth control other than a diaphragm during the first 7 days of ring use. *If switching from a combination estrogen/progesterone oral contraceptive*, insert *NuvaRing* any time during first 7 days after last tablet and no later than the day a new pill cycle would have started. No extra birth control is needed. *If switching from a mini-pill*, start using *NuvaRing* on any day of the month; do not skip days between last pill and first day of *NuvaRing* use. *If switching from an implant*, start using *NuvaRing* on same day implant is removed. *If switching from an injectable contraceptive*, start using *NuvaRing* on the day when next injection

Copyright © 2008 by F.A. Davis

is due. *If switching from a progestin-containing IUD*, start using *NuvaRing* on the same day as IUD is removed. A nonhormonal method of contraception, other than the diaphragm, should be used for the first 7 days of *NuvaRing* use when switching from the mini-pill, implant, injectable contraceptive, or IUD.

- *NuvaRing* comes in a reclosable foil pouch. Instruct patient to wash hands, then remove *NuvaRing* from pouch; keep pouch for ring disposal. Using the position of comfort (lying down, squatting, or standing with one leg up), hold *NuvaRing* between thumb and index finger and press opposite sides of the ring together. Gently push folded ring into vagina. Exact position is not important for function of *NuvaRing*. Most women do not feel *NuvaRing* once it is in place. If discomfort is felt, *NuvaRing* may not be inserted far enough into vagina; use finger to push further into vagina. *There is no danger of NuvaRing being pushed in too far or getting lost*. Once inserted, leave *NuvaRing* in place for 3 wks.
- Remove ring 3 wks after insertion on same day and time of insertion. Remove by hooking finger under forward rim or by holding ring between index and middle finger and pulling out. Place ring in foil pouch and dispose; do not throw in toilet. Menstrual period will usually start 2–3 days after ring is removed and may not have finished before next ring is inserted. To continue contraceptive protection, new ring must be inserted 1 wk after last one was removed, even if menstrual period has not stopped.
- If *NuvaRing* slips out of vagina and has been out less than 3 hrs, contraceptive protection is still in place. *NuvaRing* can be rinsed in cool to tepid water and should be reinserted as soon as possible. If ring is lost, insert a new ring and continue same schedule as lost ring. If *NuvaRing* has been out of vagina for more than 3 hrs, a nonhormonal method of contraception, other than a diaphragm, should be used for the next 7 days.
- *If NuvaRing has been left in for an extra wk or less (4 wks total or less)*, remove and insert a new ring after a 1-wk ring-free break. If *NuvaRing* has been left in place for more than 4 wks, woman should check to be sure she is not pregnant. A nonhormonal method of contraception, other than a diaphragm, must be used for the next 7 days.

Evaluation/Desired Outcomes

- Prevention of pregnancy.
- Regulation of the menstrual cycle.
- Decrease in acne.
- Decrease in symptoms of premenstrual dysphoric disorder.

CORTICOSTEROIDS (INHALATION)

beclomethasone (be-kloe-**meth**-a-sone)
QVAR

budesonide (byoo-**dess**-oh-nide)
Pulmicort

flunisolide (floo-**niss**-oh-lide)
AeroBid, Aerospan

fluticasone (floo-**ti**-ka-sone)
Flovent, Flovent HFA

mometasone (mo-**met**-a-sone)
Asmanex

triamcinolone (trye-am-**sin**-oh-lone)
Azmacort

Classification
Therapeutic: antiasthmatics, corticosteroids
Pharmacologic: corticosteroids (inhalation)

Pregnancy Category B (budesonide), C (all others)

Indications

Maintenance treatment of asthma as prophylactic therapy. May decrease the need for or eliminate use of systemic corticosteroids in patients with asthma.

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** Decreased frequency and severity of asthma attacks. Improves asthma symptoms.

Pharmacokinetics

Absorption: *Beclomethasone*—20%; *budesonide*—39% (Turbuhaler), 6–13% (Flexhal-

Copyright © 2008 by F.A. Davis

er), 6% (Respules); *flunisolide*—40%; *fluticasone*—<7% (aerosol), 18% (powder); *mometasone*—<1%; *triamcinolone*—25%. Action is primarily local after inhalation.
Distribution: 10–25% is deposited in airways if a spacer device is not used. All cross the placenta and enter breast milk in small amounts.
Metabolism and Excretion: *Beclomethasone*—after inhalation, beclomethasone dipropionate is converted to beclomethasone monopropionate, an active metabolite that adds to its potency, primarily excreted in feces (<10% excreted in urine; *budenoside, flunisolide, fluticasone, mometasone*, and *triamcinolone*—metabolized by the liver after absorption from lungs. *Budenoside*—60% excreted in urine, 40% in feces; *flunisolide*—50% excreted in urine, 50% in feces; *fluticasone*—primarily excreted in feces (<5% excreted in urine); *mometasone*—75% excreted in feces; *triamcinolone*—40% excreted in urine, 60% in feces.
Half-life: *Beclomethasone*—2.8 hr; *budesonide*—2–3.6 hr; *flunisolide*—1.8 hr; *fluticasone*—7.8 hr; *mometasone*—5 hr; *triamcinolone*—88 min.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Inhalation	within 24 hr‡	1–4 wk†	unknown

†Improvement in pulmonary function; decreased airway responsiveness may take longer
‡2-8 days for budesonide Respule

Contraindications/Precautions

Contraindicated in: Some products contain chlorofluorocarbon (CFC) propellants, alcohol, or lactose and should be avoided in patients with known hypersensitivity or intolerance; Acute attack of asthma/status asthmaticus.
Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when inhalation therapy is started; additional corticosteroids needed in stress or trauma); Hepatic dysfunction (fluticasone); OB, Lactation: Safety not established; Pedi: Children (prolonged or high-dose therapy may lead to complications).

Adverse Reactions/Side Effects

CNS: headache, agitation, depression, dizziness, fatigue, insomnia, restlessness. **EENT:** dysphonia, hoarseness, cataracts, nasal congestion, pharyngitis, sinusitis. **Resp:** bronchospasm, cough, wheezing. **GI:** diarrhea, dry mouth, dyspepsia, esophageal candidiasis, taste disturbances, nausea. **Endo:** adrenal suppression (increased dose, long-term therapy only), decreased growth (children). **MS:** back pain.
Misc: CHURG-STRAUSS SYNDROME.

Interactions

Drug-Drug: Ketoconazole ↑ levels of budesonide, fluticasone, and mometasone. **Ritonavir** ↑ levels of budesonide and fluticasone; avoid using with fluticasone. **Itraconazole**, **clarithromycin**, and **erythromycin** ↑ levels of budesonide.

Route/Dosage

Beclomethasone

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—40–80 mcg twice daily (not to exceed 320 mcg twice daily); *Previously on inhaled corticosteroids*—40–160 mcg twice daily (not to exceed 320 mcg twice daily).
Inhaln (Children 5–11 yr): *Previously on bronchodilators alone*—40 mcg twice daily (not to exceed 80 mcg twice daily); *Previously on inhaled corticosteroids*—40 mcg twice daily (not to exceed 80 mcg twice daily).

Budesonide (Pulmicort Turbuhaler)

Inhaln (Adults): *Previously on bronchodilators alone*—200–400 mcg (1–2 inhalations) twice daily (not to exceed 2 inhalations twice daily); *Previously on other inhaled corticosteroids*—200–400 mcg (1–2 inhalations) twice daily (not to exceed 4 inhalations twice daily); *Previously on oral corticosteroids*—400–800 mcg (2–4 inhalations) twice daily (not to exceed 4 inhalations twice daily).
Inhaln (Children ≥6 yr): *Previously on bronchodilators alone*—200 mcg (1 inhalation) twice daily (not to exceed 2 inhalations twice daily); *Previously on other inhaled corticosteroids*—200 mcg (1 inhalation) twice daily (not to exceed 2 inhalations twice daily); *Previously on oral corticosteroids*—Not to exceed 400 mcg (2 inhalations) twice daily.

Budesonide (Pulmicort Flexhaler)

Inhaln (Adults): 180–360 mcg twice daily (not to exceed 720 mcg twice daily).
Inhaln (Children 6–17 yr): 180–360 mcg twice daily (not to exceed 360 mcg twice daily).

Copyright © 2008 by F.A. Davis

Budesonide (Pulmicort Respules)

Inhaln (Children 1–8 yr): —*Previously on bronchodilators alone*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 0.5 mg/day); *Previously on other inhaled corticosteroids*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 1 mg/day); *Previously on oral corticosteroids*—1 mg once daily or 0.5 mg twice daily (not to exceed 1 mg/day).

Flunisolide

Aerobid and Aerospan inhalers are not interchangeable; the dosage changes when switching from one product to another

Inhaln (Adults and Children >15 yr [Aerobid/Aerobid-M Inhaler]): 500 mcg (2 inhalations) twice daily (not to exceed 4 inhalations twice daily).

Inhaln (Adults and Children ≥12 yr [Aerospan Inhaler]): 160 mcg (2 inhalations) twice daily (not to exceed 4 inhalations twice daily).

Inhaln (Children 6–15 yr [Aerobid/Aerobid-M Inhaler]): 500 mcg (2 inhalations) twice daily (not to exceed 2 inhalations twice daily).

Inhaln (Children 6–11 yr [Aerospan Inhaler]): 80 mcg (1 inhalation) twice daily (not to exceed 2 inhalations twice daily).

Fluticasone (Aerosol Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—88 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on other inhaled corticosteroids*—88–220 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on oral corticosteroids*—440 mcg twice daily initially, may be ↑ up to 880 mcg twice daily.

Inhaln (Children 4–11 yr): 88 mcg twice daily (not to exceed 88 mcg twice daily).

Fluticasone (Dry Powder Inhaler)

Inhaln (Adults and Children ≥12 yr): *Previously on bronchodilators alone*—100 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; *Previously on other inhaled corticosteroids*—100–250 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; *Previously on oral corticosteroids*—500–1000 mcg twice daily.

Inhaln (Children 4–11 yr): *Previously on bronchodilators alone*—50 mcg twice daily initially, may be ↑ up to 100 mcg twice daily; *Previously on other inhaled corticosteroids*—50 mcg twice daily, may be ↑ up to 100 mcg twice daily.

Mometasone

Inhaln (Adults and Children >12 yr): *Previously on bronchodilators or other inhaled corticosteroids*—220 mcg (1 inhalation) once daily, up to 440 mcg/day as a single dose or 2 divided doses; *Previously on oral corticosteroids*—440 mcg (2 inhalations) twice daily (not to exceed 880 mcg/day).

Triamcinolone

Inhaln (Adults and Children >12 yr): 200 mcg (2 inhalations) 3–4 times daily *or* 400 mcg (4 inhalations) twice daily (not to exceed 16 inhalations/day).

Inhaln (Children 6–12 yr): 100–200 mcg (1–2 inhalations) 3–4 times daily *or* 200–400 mcg (2–4 inhalations) twice daily (not to exceed 12 inhalations/day).

Availability

Beclomethasone

Inhalation aerosol: 40 mcg/metered inhalation in 7.3-g canister (delivers 100 metered inhalations), 80 mcg/metered inhalation in 7.3-g canister (delivers 100 metered inhalations). **Cost:** 40 mcg/metered inhalation $41.32/7.3-g canister; 80 mcg metered inhalation $52.04/7.3-g canister.

Budesonide

Inhalation powder (Turbuhaler): 200 mcg/metered inhalation (delivers 200 metered inhalations). **Inhalation powder (Flexhaler):** 90 mcg/metered inhalation (delivers 60 metered inhalations), 180 mcg/metered inhalation (delivers 120 metered inhalations). **Inhalation suspension (Respules):** 0.25 mg/2 ml in single-dose ampules (5 ampules/envelope), 0.5 mg/2 ml in single-dose ampules (5 ampules/envelope). **Cost:** 0.25 mg/2 ml $158.99/20 ampules, 0.5 mg/2 ml $187.00/30 ampules.

Flunisolide

Inhalation aerosol (Aerobid): 250 mcg/metered inhalation in 7-g canisters (delivers 100 metered inhalations). **Inhalation aerosol-menthol (Aerobid-M):** 250 mcg/metered inhalation in 7-g canisters (delivers 100 metered inhalations). **Inhalation aerosol (Aerospan):** 80 mcg/metered inhalation in 5.1-g can-

Copyright © 2008 by F.A. Davis

isters (delivers 60 metered inhalations) or 8.9-g canisters (delivers 120 metered inhalations).

Fluticasone

Inhalation aerosol (Flovent-HFA): 44 mcg/metered inhalation in 10.6-g canisters (delivers 120 metered inhalations), 110 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations), 220 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations). **Cost:** 44 mcg/inhalation $90.00/inhaler, 110 mcg/inhalation $118.99/inhaler, 220 mcg/inhalation $193.52/inhaler. **Powder for inhalation (Flovent Diskus):** 50 mcg, 100 mcg, 250 mcg. ***In combination with:*** salmeterol (Advair). See Appendix B.

Mometasone

Powder for inhalation (Twisthaler): 220 mcg units in packages of 14, 30, 60 and 120 inhalation units.

Triamcinolone

Inhalation aerosol: 100 mcg/metered inhalation in 20-g canister (delivers 240 metered inhalations).

NURSING IMPLICATIONS

Assessment

- Monitor respiratory status and lung sounds. Pulmonary function tests may be assessed periodically during and for several months after a transfer from systemic to inhalation corticosteroids.
- Assess patients changing from systemic corticosteroids to inhalation corticosteroids for signs of adrenal insufficiency (anorexia, nausea, weakness, fatigue, hypotension, hypoglycemia) during initial therapy and periods of stress. If these signs appear, notify physician or other health care professional immediately; condition may be life-threatening.
- Monitor for withdrawal symptoms (joint or muscular pain, lassitude, depression) during withdrawal from oral corticosteroids.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for infection (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- After the desired clinical effect has been obtained, attempts should be made to decrease dose to lowest amount required to control symptoms. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose. **Inhaln:** Allow at least 1 min between inhalations.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Advise patient not to discontinue medication without consulting health care professional; gradual decrease is required.
- Advise patients using inhalation corticosteroids and bronchodilator to use bronchodilator first and to allow 5 min to elapse before administering the corticosteroid, unless otherwise directed by health care professional.
- Advise patient that inhalation corticosteroids should not be used to treat an acute asthma attack but should be continued even if other inhalation agents are used.
- Patients using inhalation corticosteroids to control asthma may require systemic corticosteroids for acute attacks. Advise patient to use regular peak flow monitoring to determine respiratory status.
- Caution patient to avoid smoking, known allergens, and other respiratory irritants.
- Advise patient to notify physician if sore throat or sore mouth occurs.
- Instruct patient whose systemic corticosteroids have been recently reduced or withdrawn to carry a warning card indicating the need for supplemental systemic corticosteroids in the event of stress or severe asthma attack unresponsive to bronchodilators.
- **Metered-Dose Inhaler:** Instruct patient in the proper use of the metered-dose inhaler. Most inhalers require priming before first use. Shake inhaler well. Exhale completely, and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and

Copyright © 2008 by F.A. Davis

breathe out gently. Allow 1–2 min between inhalations. Rinse mouth with water or mouthwash after each use to minimize fungal infections, dry mouth, and hoarseness. Clean the mouthpiece weekly with clean, dry tissue or cloth. Do not place in water (see Appendix D).

- **Pulmicort Turbuhaler and Flexhaler:** Advise patient to follow instructions supplied. Before first-time use, prime unit by turning cover and lifting off; hold upright with mouthpiece up and twist brown grip fully to right, then fully to left until it clicks. To administer dose, hold upright, twist brown grip fully to right, then fully to left until it clicks. Turn head away from inhaler and exhale (do not blow into inhaler). Do not shake inhaler. Place mouthpiece between lips and inhale deeply and forcefully. Remove inhaler from mouth and exhale (do not exhale into mouthpiece). Repeat procedure if 2nd dose required. Replace cover; rinse mouth with water (do not swallow).
- **Pulmicort Respules:** Administer with a jet nebulizer connected to adequate air flow, equipped with a mouthpiece or face mask. Adjust face mask to avoid exposing eyes to nebulized medication. Wash face after use of face mask. Ultrasonic nebulizers are not adequate for administration and not recommended. Store respules upright, away from heat and protected from light. Do not refrigerate or freeze. Respules are stable for 2 wks at room temperature after opening aluminum foil envelope. Open respules must be used promptly. Unused respules should be returned to aluminum foil envelope.
- **Flovent Diskus:** Do not use with a spacer. Exhale completely and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remover inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. After inhalation, rinse mouth with water and spit out (see Appendix D). Never wash the mouthpiece or any part of the Diskus inhaler. Discard Diskus inhaler device 6 wks (50-mcg strength) or 2 mo (100-mcg and 250-mcg strengths) after removal from protective foil overwrap pouch or after all blisters have been used (whichever comes first).
- **Asmanex Twisthaler:** Advise patient to remove cap while device is in upright position. To administer dose, exhale fully, then place mouthpiece between lips and inhale deeply and forcefully. Remove device from mouth and hold breath for 10 sec before exhaling (do not exhale into mouthpiece). Wipe the mouthpiece dry, if necessary, and replace the cap on the device. Rinse mouth with water. Advise patient to discard twisthaler 45 days from opening or when dose counter reads "00", whichever comes first.

Evaluation/Desired Outcomes

- Management of the symptoms of chronic asthma.
- Improvement in symptoms of asthma.

CORTICOSTEROIDS (NASAL)

beclomethasone (be-kloe-**meth**-a-sone)
Beconase AQ, Rivanase AQ

budesonide (byoo-**dess**-oh-nide)
Rhinocort Aqua

ciclesonide (sye-**kles**-oh-nide)
Omnaris

flunisolide (floo-**niss**-oh-lide)
Nasarel, Rhinalar

fluticasone (floo-**ti**-ka-sone)
Flonase, Veramyst

mometasone (moe-**met**-a-sone)
Nasonex

triamcinolone (trye-am-**sin**-oh-lone)
Nasacort AQ

Classification
Therapeutic: corticosteroids
Pharmacologic: corticosteroids (nasal)

Pregnancy Category B (budesonide), C (all others)

Indications

Seasonal or perennial allergic rhinitis. Nonallergic rhinitis (fluticasone). Treatment of nasal polyps.

Copyright © 2008 by F.A. Davis

Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** ↓ in symptoms of allergic or nonallergic rhinitis. ↓ in symptoms of nasal polyps.

Pharmacokinetics

Absorption: *Beclomethasone*—44% absorbed; *budesonide*—34% absorbed; *flunisolide*—50% absorbed; *ciclesonide, fluticasone, mometasone*—-negligible absorption. Action of all agents is primarily local following nasal use.
Distribution: All agents cross the placenta and enter breast milk in small amounts.
Metabolism and Excretion: Following absorption from nasal mucosa, corticosteroids are rapidly and extensively metabolized by the liver.
Half-life: *Beclomethasone*—2.7 hr; *budesonide*—2–3 hr; *ciclesonide*—unknown; *flunisolide*—1–2 hr; *fluticasone*—7.8 hr; *mometasone*—5.8 hr; *triamcinolone*—3–5.4 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
Beclomethasone	1–3 days	up to 2 wk	unknown
Budesonide	1–2 days	2 wk	unknown
Ciclesonide	1–2 days	2–5 wk	unknown
Flunisolide	few days	up to 3 wk	unknown
Fluticasone	few days	unknown	unknown
Mometasone	within 2 days	1–2 wk	unknown
Triamcinolone	few days	3–4 days	unknown

Contraindications/Precautions

Contraindicated in: Some products contain alcohol, propylene, or polyethylene glycol and should be avoided in patients with known hypersensitivity or intolerance.
Use Cautiously in: Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when intranasal therapy is started); Recent nasal trauma, septal ulcers, or surgery (wound healing may be impaired by nasal corticosteroids); OB: Pregnancy or lactation (safety not established; prolonged or high-dose therapy may lead to complications); Pedi: Children (safety not established; prolonged or high-dose therapy may lead to complications).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** epistaxis, nasal burning, nasal irritation, nasal congestion, pharyngitis, rhinorrhea, sneezing, tearing eyes. **GI:** dry mouth, esophageal candidiasis, nausea, vomiting. **Endo:** adrenal suppression (increased dose, long-term therapy only), growth suppression (children). **Resp:** bronchospasm, cough.

Interactions

Drug-Drug: Ketoconazole ↑ effects of budesonide, ciclesonide, and fluticasone. **Ritonavir** ↑ effects of fluticasone (concomitant use not recommended).

Route/Dosage

Beclomethasone

Intranasal (Adults and Children ≥12 yr): 1–2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).
Intranasal (Children 6–12 yr): 1–2 metered sprays in each nostril twice daily; once adequate control achieved, ↓ dose to 1 spray in each nostril twice daily.

Budesonide

Intranasal (Adults and Children ≥12 yr): 1 spray in each nostril once daily (not to exceed 4 sprays in each nostril once daily).
Intranasal (Children 6–11 yr): 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril once daily).

Ciclesonide

Intranasal (Adults and Children ≥12 yr): 2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day).

Flunisolide

Intranasal (Adults and Children >14 yr): 2 sprays in each nostril twice daily, may be ↑ to 2 sprays in each nostril 3 times daily if greater effect needed after 4–7 days (not to exceed 8 sprays in each nostril/day).
Intranasal (Children 6–14 yr): 1 spray in each nostril 3 times daily or 2 sprays in each nostril twice daily (not to exceed 4 sprays in each nostril/day).

Fluticasone

Intranasal (Adults and Children ≥12 yrs): 2 sprays in each nostril once daily or 1 spray in each nostril twice daily; after several days, attempt to ↓ dose to 1 spray in each nostril once daily. Patients ≥12 yr with seasonal allergic rhi-

Copyright © 2008 by F.A. Davis

nitis may also use 2 sprays in each nostril once daily on an as-needed basis.
Intranasal (Children >4 yr): *Flonase*—1 spray in each nostril once daily (not to exceed 2 sprays in each nostril/day).
Intranasal (Children 2–11 yrs): *Veramyst*—1 spray in each nostril daily; may increase to 2 sprays if no response. Once symptoms are controlled, attempt to ↓ dose to 1 spray/day.

Mometasone

Intranasal (Adults and Children >12 yr): *Treatment of seasonal and perennial allergic rhinitis*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril once daily).
Intranasal (Adults): *Nasal polyps*—2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).
Intranasal (Children 2–11 yr): *Treatment of seasonal and perennial allergic rhinitis* –1 spray in each nostril once daily.

Triamcinolone

Intranasal (Adults and Children >12 yr): 2 sprays in each nostril once daily.
Intranasal (Children 6–11 yr): 1 spray in each nostil once daily (not to exceed 2 sprays in each nostril/day).

Availability

Beclomethasone

Nasal spray: 42 mcg/metered spray in 25-g bottles (delivers 180 metered sprays), ✱50 mcg/metered spray in 25-g bottles (delivers 200 metered sprays), 84 mcg/metered spray in 25-g bottles (200 metered sprays).

Budesonide

Nasal spray: 32 mcg/metered spray in 8.6-g canister (delivers 120 metered sprays). **Cost:** $92.99/bottle.

Ciclesonide

Nasal spray: 50 mcg/metered spray in 12.5-g bottle (delivers 120 metered sprays).

Flunisolide

Nasal solution: 25 mcg/metered spray in 25-ml bottle (delivers 200 metered sprays).

Fluticasone

Nasal spray (Flonase): 50 mcg/metered spray in 16-g bottle (delivers 120 metered sprays). **Cost:** *Generic*—$59.99/bottle. **Nasal spray (Veramyst):** 55 mcg/spray in a 1-g bottle (delivers 120 sprays).

Mometasone

Nasal spray (scent-free): 50 mcg/metered spray in 17-g bottle (delivers 120 metered sprays). **Cost:** $89.24/bottle.

Triamcinolone

Nasal spray: 55 mcg/metered spray in 6.5-g bottle (delivers 30 metered sprays) and 16.5-g bottle (delivers 120 metered sprays). **Cost:** $89.99/16.5-g bottle.

NURSING IMPLICATIONS

Assessment

- Monitor degree of nasal stuffiness, amount and color of nasal discharge, and frequency of sneezing.
- Patients on long-term therapy should have periodic otolaryngologic examinations to monitor nasal mucosa and passages for infection or ulceration.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for infection (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- After the desired clinical effect has been obtained, attempts should be made to decrease dose to lowest amount. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Intranasal:** Patients also using a nasal decongestant should be given decongestant 5–15 min before corticosteroid nasal spray. If patient is unable to breathe freely through nasal passages, instruct patient to blow nose gently in advance of medication administration.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Advise patient to take medication as directed. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Caution patient not to exceed maximal daily dose of nasal spray.
- Instruct patient in correct technique for administering nasal spray (see Appendix D). Most nasal sprays include directions with pictures. Instruct patient to read patient information sheet prior to use. Shake well before use. Warn patient that temporary nasal stinging may occur.
- Instruct patient to gently blow nose to clear nostrils prior to administering dose.
- Instruct patient to notify health care professional if symptoms do not improve within 1 month, if symptoms worsen, or or if sneezing or nasal irritation occur.

Evaluation/Desired Outcomes

- Resolution of nasal stuffiness, discharge, and sneezing in seasonal or perennial allergic rhinitis or nonallergic rhinitis.
- Reduction in symptoms of nasal polyps.

CORTICOSTEROIDS (SYSTEMIC)

short-acting corticosteroids

cortisone (**kor**-ti-sone)
Cortone

hydrocortisone
(hye-droe-**kor**-ti-sone)

budesonide (byoo-**des**-oh-nide)
Entocort EC

dexamethasone
(dex-a-**meth**-a-sone)
DexPak

Classification
Therapeutic: antiasthmatics, corticosteroids
Pharmacologic: corticosteroids (systemic)

Pregnancy Category B (prednisone), C (betamethasone, budesonide, dexamethasone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone), D (cortisone)

Indications

Cortisone, hydrocortisone: Management of adrenocortical insufficiency. **Betamethasone, dexamethasone, hydrocortisone, prednisolone, prednisone, methylprednisolone, triamcinolone:** Used systemically and locally in a wide variety of chronic diseases including: Inflammatory, Allergic, Hematologic, Neoplastic, Autoimmune disorders. **Methylprednisolone, prednisone:** With other immunosuppressants in the prevention of organ rejection in transplantation surgery. Asthma. **Dexamethasone:** Management of cerebral edema: Diagnostic agent in adrenal disorders. **Budesonide:** Treatment of mild to moderate Crohn's disease. **Unlabeled uses:** Short-term administration to high-risk mothers before delivery to prevent respiratory distress syndrome in the newborn (betamethasone, dexamethasone). Adjunctive therapy of hypercalcemia (prednisone, prednisolone, methylprednisolone). Management of acute spinal cord injury (methylprednisolone). Adjunctive management of nausea and vomiting from chemotherapy (dexamethasone, prednisone, prednisolone, methylprednisolone). Management of croup (dexamethasone). Treatment of airway edema prior to extubation (dexamethasone). Facilitation of ventilator weaning in neonates with bronchopulmonary dysplasia (dexamethasone).

Copyright © 2008 by F.A. Davis

Action

In pharmacologic doses, all agents suppress inflammation and the normal immune response. All agents have numerous intense metabolic effects (see Adverse Reactions/Side Effects). Suppress adrenal function at chronic doses of *betamethasone*—0.6 mg/day; *cortisone, hydrocortisone*—20 mg/day; *dexamethasone*—0.75 mg/day; *methylprednisolone, triamcinolone*—4 mg/day; *prednisone/prednisolone*—5 mg/day. **Cortisone, hydrocortisone:** Replace endogenous cortisol in deficiency states. **Cortisone, hydrocortisone:** Have potent mineralocorticoid (sodium-retaining) activity. **Prednisolone, prednisone:** Have minimal mineralocorticoid activity. **Betamethasone, dexamethasone, methylprednisolone, triamcinolone:** Have negligible mineralocorticoid activity. **Budesonide:** Local anti-inflammatory activity in the lumen of the GI tract. **Therapeutic Effects:** Suppression of inflammation and modification of the normal immune response. Replacement therapy in adrenal insufficiency. **Budesonide:** Improvement in symptoms/sequelae of Crohn's disease.

Pharmacokinetics

Absorption: Well absorbed after oral administration (except budesonide). Sodium phosphate and sodium succinate salts are rapidly absorbed after IM administration. Acetate, acetonide, and diacetate salts are slowly but completely absorbed after IM administration. Absorption from local sites (intra-articular, intralesional) is slow but complete. Bioavailability of budesonide is 9–21%.

Distribution: All are widely distributed, cross the placenta, and probably enter breast milk.

Metabolism and Excretion: All are metabolized mostly by the liver to inactive metabolites. *Cortisone* is converted by the liver to hydrocortisone. *Prednisone* is converted by the liver to prednisolone, which is then metabolized by the liver.

Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Budesonide*—2.0–3.6 hr. *Cortisone*—0.5 hr (plasma), 8–12 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Methylprednisolone*—>3.5 hr (plasma), 18–36 hr (tissue). *Prednisolone*—2.1–3.5 hr (plasma), 18–36 hr (tissue). *Prednisone*—3.4–3.8 hr (plasma), 18–36 hr (tissue). *Triamcinolone*—2–>5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (anti-inflammatory activity)

ROUTE	ONSET	PEAK	DURATION
Betamethasone PO	unknown	1–2 hr	3.25 days
Betamethasone IM (acetate/sodium phosphate)	1–3 hr	unknown	1 wk
Budesonide PO	unknown	unknown	unknown
Cortisone PO	rapid	2 hr	1.25–1.5 days
Dexamethasone PO	unknown	1–3 hr	2.75 days
Dexamethasone IM, IV (sodium phosphate)	rapid	unknown	2.75 days
Hydrocortisone PO	unknown	1–2 hr	1.25–1.5 days
Hydrocortisone IM (sodium succinate)	rapid	1 hr	variable
Hydrocortisone IV (sodium succinate)	rapid	unknown	unknown
Methylprednisolone PO	unknown	1–2 hr	1.25–1.5 days
Methylprednisolone IM (acetate)	6–48 hr	4–8 days	1–4 wk
Methylprednisolone IM, IV (sodium succinate)	rapid	unknown	unknown
Prednisolone PO	unknown	1–2 hr	1.25–1.5 days
Prednisone PO	unknown	unknown	1.25–1.5 days
Triamcinolone PO	unknown	1–2 hr	2.25 days
Triamcinolone IM (acetonide)	24–48 hr	unknown	1–6 wk
Triamcinolone Intralesional (hexacetonide)	slow	unknown	4 days–4 wk

Contraindications/Precautions

Contraindicated in: Active untreated infections (may be used in patients being treated for

Copyright © 2008 by F.A. Davis

some forms of meningitis); Lactation (avoid chronic use); Known alcohol, bisulfite, or tartrazine hypersensitivity or intolerance (some products contain these and should be avoided in susceptible patients); Administration of live virus vaccines.

Use Cautiously in: Chronic treatment (will lead to adrenal suppression; use lowest possible dose for shortest period of time); Hypothyroidism; Cirrhosis; Pedi: Children (chronic use will result in decreased growth; use lowest possible dose for shortest period of time); Stress (surgery, infections); supplemental doses may be needed; Potential infections may mask signs (fever, inflammation); OB: Pregnancy (safety not established); Neonates (avoid use of benzyl alcohol containing injectable preparations, use preservative free formulations).

Adverse Reactions/Side Effects

Adverse reactions/side effects are much more common with high-dose/long-term therapy.

CNS: depression, euphoria, headache, increased intracranial pressure (children only), personality changes, psychoses, restlessness. **EENT:** cataracts, increased intraocular pressure. **CV:** hypertension. **GI:** PEPTIC ULCERATION, anorexia, nausea, vomiting. **Derm:** acne, decreased wound healing, ecchymoses, fragility, hirsutism, petechiae. **Endo:** adrenal suppression, hyperglycemia. **F and E:** fluid retention (long-term high doses), hypokalemia, hypokalemic alkalosis. **Hemat:** THROMBOEMBOLISM, thrombophlebitis. **Metab:** weight gain. **MS:** muscle wasting, osteoporosis, aseptic necrosis of joints, muscle pain. **Misc:** cushingoid appearance (moon face, buffalo hump), increased susceptibility to infection.

Interactions

Drug-Drug: ↑ risk of hypokalemia with **thiazide** and **loop diuretics**, or **amphotericin B**. Hypokalemia may ↑ risk of **digoxin** toxicity. May increase requirement for **insulin** or **oral hypoglycemic agents**. **Phenytoin**, **phenobarbital**, and **rifampin** ↑ metabolism; may ↓ effectiveness. **Hormonal contraceptives** may ↓ metabolism. ↑ risk of adverse GI effects with **NSAIDs** (including aspirin). At chronic doses that suppress adrenal function, may ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**. May increase serum concentrations of **cyclosporine** and **tacrolimus**. May ↑ risk of tendon rupture from **fluoroquinolones**. **Antacids** ↓ absorption of prednisone and dexamethasone. Known inhibitors of the CYP3A4 enzyme ncluding **ketoconazole**, **itraconazole**, **ritonavir**, **indinavir**, **saquinavir**, and **erythromycin** may ↑ blood levels and effects of budesonide (↓ dose may be necessary). May ↓ **isoniazid** levels and effectiveness. May antagonize the effects of **anticholinergic agents** in myastenia gravis.

Drug-Food: Grapefruit juice ↑ serum levels and effects of budesonide (avoid concurrent use).

Route/Dosage

Betamethasone

PO (Adults): 0.6–7.2 mg/day as single daily dose or in divided doses.

PO (Children): *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses. *Other uses*—62.5–250 mcg/kg/day (1.875–7.5 mg/m²/day) in 3 divided doses.

IM (Adults): 0.5–9 mg as betamethasone sodium phosphate/acetate suspension. *Prevention of respiratory distress syndrome in newborn*—12 mg daily for 2–3 days before delivery (unlabeled).

IM (Children): *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses every 3rd day or 5.8–8.75 mcg/kg (166–250 mcg/m²)/day as a single dose.

Budesonide

PO (Adults): *Active Crohn's disease*—9 mg once daily in the morning for ≤8 weeks, may repeat 8 wk course for recurring episodes. *Maintenance of remission*—6 mg once daily for up to 3 months, once symptoms are controlled, taper to complete cessation.

Cortisone

PO (Adults): 25–300 mg/day in divided doses q 12–24 hr.

PO (Children): *Adrenocortical insufficiency*—0.7 mg/kg/day (20–25 mg/m²/day) in divided doses q 8 hr. *Other uses*—2.5–10 mg/kg/day (75–300 mg/m²/day) in divided doses q 6–8 hr.

Dexamethasone

PO, IM, IV (Adults): *Anti-inflammatory*—0.75–9 mg daily in divided doses q 6–12 hr. *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Cerebral edema*—10 mg IV, then 4 mg IM or IV q 6 hr until maximal response achieved, then switch to PO regimen and taper over 5–7 days.

Copyright © 2008 by F.A. Davis

PO, IM, IV (Children): *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Anti-inflammatory*—0.08–0.3 mg/kg/day or 2.5–10 mg/m²/day divided q 6–12 hr. *Physiologic replacement*—0.03–0.15 mg/kg/day or 0.6–0.75 mg/m²/day divided q 6–12 hr.
PO (Adults): *Suppression test*—1 mg at 11 PM or 0.5 mg q 6 hr for 48 hr.
IV (Children): *Chemotherapy induced emesis*—5–20 mg given 15–30 min before treatment. *Cerebral edema*—Loading dose 1–2 mg/kg followed by 1–1.5 mg/kg/day divided q 4–6 hr for 5 days (not to exceed 16 mg/day); then taper over 1–6 wk. *Bacterial meningitis*—0.6 mg/kg/day divided q 6 hr x 4 days (start at time of first antibiotic dose).
IV, PO (Adults): *Chemotherapy induced emesis*—10–20 mg given 15–30 min before each treatment or 10 mg q 12 hr on each treatment day. *Delayed nausea/vomiting*—4–10 mg PO 1–2 times/day for 2–4 days *or* 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days *or* 20 mg PO 1 hr before chemotherapy, then 10 mg PO q 12 hr after chemotherapy, then 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days.
IS (Adults): 0.4–6 mg/day.

Hydrocortisone

PO (Adults): 20–240 mg/day in 1–4 divided doses.
PO (Children): *Adrenocortical insufficiency*—0.56 mg/kg/day (15–20 mg/m²/day) as a single dose or in divided doses. *Other uses*—2–8 mg/kg/day (60–240 mg/m²/day) as a single dose or in divided doses.
IM, IV (Adults): 100–500 mg q 2–6 hr (range 100–8000 mg/day).
IM, IV (Children): *Adrenocortical insufficiency*—0.186–0.28 mg/kg/day (10–12 mg/m²/day) in 3 divided doses. *Other uses*—0.666–4 mg/kg (20–120 mg/m²) q 12–24 hr.

Methylprednisolone

PO (Adults): *Multiple sclerosis*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Other uses*—2–60 mg/day as a single dose or in 2–4 divided doses. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.
PO (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.
IM, IV (Adults): *Most uses: methylprednisolone sodium succinate*—40–250 mg q 4–6 hr. *High-dose "pulse" therapy: methylprednisolone sodium succinate*—30 mg/kg IV q 4–6 hr for up to 72 hr. *Status asthmaticus: methylprednisolone sodium succinate*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr for up to 5 days. *Multiple sclerosis: methylprednisolone sodium succinate*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Adjunctive therapy of* Pneumocystis carinii *pneumonia in AIDS patients: methylprednisolone sodium succinate*—30 mg twice daily for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 10 days. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled).
IM, IV (Children): *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled). *Status asthmaticus*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr. *Lupus nephritis*—30 mg/kg IV every other day for 6 doses.
IM (Adults): *Methylprednisolone acetate*—40–120 mg daily, weekly, or every 2 wk.

Prednisolone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 7 days, then 80 mg every other day for 1 mo. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hrs, then 60–80 mg/day in 2 divided doses.
PO (Children): *Anti-inflammatory/Immunosuppressive*—0.1–2 mg/kg/day in 1–4 divided doses. *Nephrotic syndrome*—2 mg/kg/day (60 mg/m²/day) in 1–3 divided doses daily (maximum dose: 80 mg/day) until urine is protein free for 4–6 weeks, followed by 2 mg/kg/

Copyright © 2008 by F.A. Davis

dose (40 mg/m²/dose) every other day in the morning, gradually taper off over 4–6 weeks. *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

Prednisone

PO (Adults): *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 1 wk, then 80 mg every other day for 1 mo. *Adjunctive therapy of* Pneumocystis carinii *pneumonia in AIDS patients*—40 mg twice daily for 5 days, then 40 mg once daily for 5 days, then 20 mg once daily for 10 days.
PO (Children): *Nephrotic syndrome*—2 mg/kg/day initially given in 1–3 divided doses (maximum 80 mg/day) until urine is protein free for 4–6 weeks. Maintenance dose of 2 mg/kg/day every other day in the morning, gradually taper off after 4–6 weeks. *Asthma exacerbation*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum 60 mg/day) in divided doses twice daily.

Triamcinolone

IM (Adults): *Triamcinolone acetonide*—40–80 mg q 4 wk.
IM (Children): *Triamcinolone acetonide*—40 mg q 4 wk or 30–200 mcg/kg (1–6.25 mg/m²) q 1–7 days.

Availability

Betamethasone

Tablets: ♣0.5 mg. **Oral solution (cherry-orange flavor):** 0.6 mg/5 ml. **Effervescent tablets:** ♣0.5 mg. **Extended-release tablets:** ♣1 mg. **Suspension for injection (sodium phosphate and acetate):** 6 mg (total)/ml.

Budesonide

Capsules (enteric-coated): 3 mg.

Cortisone

Tablets: 25 mg.

Dexamethasone

Tablets: 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg. **Elixir (raspberry flavor):** 0.5 mg/5 ml. **Oral solution (cherry flavor):** 0.5 mg/5 ml, 1 mg/ml. **Solution for injection (sodium phosphate):** 4 mg/ml, 10 mg/ml.

Hydrocortisone

Tablets: 5 mg, 10 mg, 20 mg. **Powder for injection (sodium succinate):** 100 mg, 250 mg, 500 mg, 1 g.

Methylprednisolone

Tablets: 2 mg, 4 mg, 8 mg, 16 mg, 32 mg. **Powder for injection (sodium succinate):** 40 mg, 125 mg, 500 mg, 1 g, 2 g. **Suspension for injection (acetate):** 20 mg/ml, 40 mg/ml, 80 mg/ml.

Prednisolone

Tablets: 5 mg. **Orally disintegrating tablets (grape flavor):** 10 mg, 15 mg, 30 mg. **Syrup:** 5 mg/5 ml, 15 mg/5 ml. **Oral solution:** 5 mg/5 ml, 15 mg/5 ml.

Prednisone

Tablets: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg. **Oral solution:** 5 mg/5 ml, 5 mg/ml.

Triamcinolone

Suspension for injection (acetonide): 10 mg/ml, 40 mg/ml . **Suspension for injection (hexacetonide):** 5 mg/ml, 20 mg/ml.

NURSING IMPLICATIONS

Assessment

- These drugs are indicated for many conditions. Assess involved systems before and periodically during therapy.
- Assess patient for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) before and periodically during therapy.
- Monitor intake and output ratios and daily weights. Observe patient for peripheral edema, steady weight gain, rales/crackles, or dyspnea. Notify health care professional if these occur.
- Children should have periodic evaluations of growth.
- **Cerebral Edema:** Assess patient for changes in level of consciousness and headache during therapy.
- **Budesonide:** Assess signs of Crohn's disease (diarrhea, crampy abdominal pain, fever, bleeding from rectum) during therapy.
- ***Lab Test Considerations:*** Monitor serum electrolytes and glucose. May cause hyperglycemia, especially in persons with diabetes. May cause hypokalemia. Patients on prolonged therapy should routinely have CBC, serum electrolytes, and serum and urine glucose evaluated. May ↓ WBCs. May cause hyperglycemia, especially in persons with diabetes. May ↓ serum potassium and calcium and ↑ serum sodium concentrations.

Copyright © 2008 by F.A. Davis

- Guaiac-test stools. Promptly report presence of guaiac-positive stools.
- May ↑ serum cholesterol and lipid values. May ↓ uptake of thyroid ^{123}I or ^{131}I.
- Suppress reactions to allergy skin tests.
- Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal axis suppression in systemic and chronic topical therapy. Dexamethasone Suppression Test To diagnose Cushing's syndrome: Obtain baseline cortisol level; administer dexamethasone at 11 PM and obtain cortisol levels at 8 AM the next day. Normal response is a ↓ cortisol level.
- Alternative method: Obtain baseline 24-hr urine for 17-hydroxycorticosteroid (OHCS) concentrations, then begin 48-hr administration of dexamethasone. Second 24-hr urine for 17-OHCS is obtained after 24 hr of dexamethasone.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

Implementation

- Do not confuse prednisone with methylprednisolone or primidone. Do not confuse hydrocortisone with hydrocodone.
- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- Periods of stress, such as surgery, may require supplemental systemic corticosteroids.
- Patients with mild to moderate Crohn's disease may be switched from oral prednisolone without adrenal insufficiency by gradually decreasing prednisolone doses and adding budesonide.
- **PO:** Administer with meals to minimize GI irritation.
- Tablets may be crushed and administered with food or fluids for patients with difficulty swallowing. Capsules should be swallowed whole; do not crush, break, or chew.
- Use calibrated measuring device to ensure accurate dose of liquid forms.
- Avoid consumption of grapefruit juice during therapy with budesonide or methylprednisolone.
- **IM, Subcut:** Shake suspension well before drawing up. IM doses should not be administered when rapid effect is desirable. Do not dilute with other solution or admix. Do not administer suspensions IV.

Dexamethasone Sodium Phosphate

IV Administration

- **Direct IV:** ***Diluent:*** May be given undiluted. ***Concentration:*** 4–10 mg/ml. ***Rate:*** Administer over 1–4 min if dose is <10 mg.
- **Intermittent Infusion:** ***Diluent:*** High-dose therapy should be added to D5W or 0.9% NaCl solution. Solution should be clear and colorless to light yellow; use diluted solution within 24 hr. ***Concentration:*** Up to 10 mg/ml. ***Rate:*** Administer infusions over 15–30 min.
- **Syringe Compatibility:** granisetron, metoclopramide, palonosetron, ranitidine, sufentanil.
- **Syringe Incompatibility:** doxapram, glycopyrrolate, pantoprazole.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, amphotericin B cholesteryl, amsacrine, aztreonam, bivalirudin, cefepime, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, gallium nitrate, gatifloxacin, gemcitabine, granisetron, heparin, hydromorphone, lansoprazole, levofloxacin, linezolid, lorazepam, melphalan, meperidine, meropenem, methadone, milrinone, morphine, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, potassium, propofol, remifentanil, sargramostim, sodium bicarbonate, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, vinorelbine, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** ciprofloxacin, fenoldopam, idarubicin, midazolam, topotecan.
- **Additive Compatibility:** aminophylline, bleomycin, cimetidine, floxacillin, furosemide, granisetron, lidocaine, meropenem, nafcillin, palonosetron, ranitidine.
- **Additive Incompatibility:** daunorubicin, metaraminol, vancomycin.

Hydrocortisone Sodium Succinate

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute with provided solution (i.e., Act-O-Vials) or 2 ml of

Copyright © 2008 by F.A. Davis

bacteriostatic water or saline for injection. ***Concentration:*** 50 mg/ml. ***Rate:*** Administer each 100 mg over at least 30 sec. Doses 500 mg and larger should be infused over at least 10 min.

- **Intermittent/Continuous Infusion:** ***Diluent:*** May be added to 50–1000 ml of D5W, 0.9% NaCl, or D5/0.9% NaCl. Diluted solutions should be used within 24 hr. ***Concentration:*** 1–5 mg/ml. Concentrations of up to 60 mg/ml have been used in fluid restricted adults. ***Rate:*** Administer over 20–30 min or at prescribed rate.
- **Syringe Compatibility:** thiopental.
- **Syringe Incompatibility:** pantoprazole.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, amsacrine, argatroban, atracurium, atropine, aztreonam, bivalirudin, calcium gluconate, cefepime, chlordiazepoxide, chlorpromazine, cisatracurium, cladribine, cyanocobalamin, cytarabine, digoxin, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, droperidol, edrophonium, enalaprilat, epinephrine, esmolol, conjugated estrogens, ethacrynate, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, foscarnet, furosemide, gallium nitrate, gatifloxacin, gemcitabine, granisetron, heparin, hydralazine, inamrinone, insulin, isoproterenol, kanamycin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, methoxamine, methylergonovine, morphine, neostigmine, nicardipine, norepinephrine, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, pancuronium, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine edisylate, propofol, propranolol, pyridostigmine, remifentanil, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, trimethobenzamide, vecuronium, vinorelbine.
- **Y-Site Incompatibility:** ciprofloxacin, diazepam, idarubicin, lansoprazole, midazolam, phenytoin, sargramostim.
- **Additive Compatibility:** amikacin, aminophylline, amphotericin B, calcium chloride, calcium gluconate, daunorubicin, diphenhydramine, lidocaine, magnesium sulfate, mitomycin, mitoxantrone, potassium chloride, vitamin B complex with C.
- **Additive Incompatibility:** bleomycin.

Methylprednisolone Sodium Succinate

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute with provided solution (Act-O-Vials, Univials, ADD-Vantage vials) or 2 ml of bacteriostatic water (with benzyl alcohol) for injection. Use preservative-free diluent for use in neonates. Acetate injection is not for IV use. ***Concentration:*** Maximum concentration 125 mg/ml. ***Rate:*** Low dose (<1.8 mg/kg or <125 mg/dose): May be administered direct IV push over 1 to several minutes. Moderate dose (>2 mg/kg or 250 mg/dose): give over 15–30 min. High dose (15 mg/kg or >500 mg/dose): give over 30 min. Doses >15 mg/kg or >1 g give over 1 hour.
- **Intermittent/Continuous Infusion:** ***Diluent:*** May be diluted further in D5W, 0.9% NaCl, or D5/0.9% NaCl and administered as intermittent or continuous infusion at the prescribed rate. ***Concentration:*** Maximum concentration 2.5 mg/ml. Solution may form a haze upon dilution.
- **Syringe Compatibility:** granisetron, metoclopramide.
- **Syringe Incompatibility:** pantoprazole.
- **Y-Site Compatibility:** acyclovir, amifostine, amiodarone, amphotericin B cholesteryl sulfate, aztreonam, bivalirudin, cefepime, ceftazidime, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, dopamine, doxorubicin, doxorubicin liposome, enalaprilat, famotidine, fludarabine, gatifloxacin, granisetron, heparin, inamrinone, linezolid, melphalan, meperidine, methotrexate, metronidazole, midazolam, milrinone, morphine, nicardipine, oxaliplatin, pemetrexed, piperacillin/tazobactam, remifentanil, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, topotecan.
- **Y-Site Incompatibility:** allopurinol, amsacrine, ciprofloxacin, docetaxel, etoposide, fenoldopam, filgrastim, gemcitabine, lansoprazole, ondansetron, paclitaxel, propofol, sargramostim, vinorelbine.
- **Additive Compatibility:** cimetidine, granisetron, heparin, ranitidine, theophylline.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Advise patient to take medication as directed. Take missed doses as

Copyright © 2008 by F.A. Davis

soon as remembered unless almost time for next dose. Do not double doses. Stopping the medication suddenly may result in adrenal insufficiency (anorexia, nausea, weakness, fatigue, dyspnea, hypotension, hypoglycemia). If these signs appear, notify health care professional immediately. This can be life threatening.

- Corticosteroids cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections immediately.
- *Prelone* syrup should not be refrigerated, *Pediapred* solution may be refrigerated, *Orapred* solution should be refrigerated.
- Caution patient to avoid vaccinations without first consulting health care professional.
- Review side effects with patient. Instruct patient to inform health care professional promptly if severe abdominal pain or tarry stools occur. Patient also should report unusual swelling, weight gain, tiredness, bone pain, bruising, nonhealing sores, visual disturbances, or behavior changes.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Discuss possible effects on body image. Explore coping mechanisms.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen.
- Advise patient to carry identification describing disease process and medication regimen in the event of emergency in which patient cannot relate medical history.
- Explain need for continued medical follow-up to assess effectiveness and possible side effects of medication. Periodic lab tests and eye exams may be needed.
- **Long-term Therapy:** Encourage patient to eat a diet high in protein, calcium, and potassium, and low in sodium and carbohydrates (see Appendix L). Alcohol should be avoided during therapy.

Evaluation/Desired Outcomes

- Decrease in presenting symptoms with minimal systemic side effects.
- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and neoplasms.
- Management of symptoms in adrenal insufficiency.
- Improvement of symptoms/sequelae of Crohn's disease (decreased frequency of liquid stools, decreased abdominal complaints, improved sense of well being).

Classification
Therapeutic: corticosteroids
Pharmacologic: corticosteroids (topical)

Pregnancy Category C

Indications
Management of inflammation and pruritis associated with various allergic/immunologic skin problems.

Action
Suppress normal immune response and inflammation. **Therapeutic Effects:** Suppression of dermatologic inflammation and immune processes.

Pharmacokinetics
Absorption: Minimal. Prolonged use on large surface areas, application of large amounts, or use of occlusive dressings may ↑ systemic absorption.
Distribution: Remain primarily at site of action.
Metabolism and Excretion: Usually metabolized in skin; some have been modified to resist local metabolism and have a prolonged local effect.
Half-life: *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Triamcinolone*—2–>5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (response depends on condition being treated)

ROUTE	ONSET	PEAK	DURATION
Topical	min–hrs	hrs–days	hrs–days

Contraindications/Precautions
Contraindicated in: Hypersensitivity or known intolerance to corticosteroids or components of vehicles (ointment or cream base, preservative, alcohol); Untreated bacterial or viral infections.
Use Cautiously in: Hepatic dysfunction; Diabetes mellitus, cataracts, glaucoma, or tuberculosis (use of large amounts of high-potency agents may worsen condition); Patients with pre-existing skin atrophy; OB, Lactation: Chronic use at high dosages may result in adrenal suppression in mother and growth suppression in children; Pedi: Children may be more susceptible to adrenal and growth suppression. Clobetasol not recommended for children <12 yr; desoximetasone not recommended for children <10 yr.

Adverse Reactions/Side Effects
Derm: allergic contact dermatitis, atrophy, burning, dryness, edema, folliculitis, hypersen-

Copyright © 2008 by F.A. Davis

sitivity reactions, hypertrichosis, hypopigmentation, irritation, maceration, miliaria, perioral dermatitis, secondary infection, striae. **Misc:** adrenal suppression (increased dose, long-term therapy).

Interactions

Drug-Drug: None significant.

Route/Dosage

Topical (Adults and Children): 1–4 times daily (depends on product, preparation, and condition being treated).
Rect (Adults): hydrocortisone *Retention enema*—100 mg nightly for 21 days or until remission occurs; *aerosol foam*—90 mg 1–2 times/day for 2–3 wk; then adjusted.

NURSING IMPLICATIONS

Assessment

- Assess affected skin before and daily during therapy. Note degree of inflammation and pruritus. Notify physician or other health care professional if symptoms of infection (increased pain, erythema, purulent exudate) develop.
- ***Lab Test Considerations:*** Adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in long-term topical therapy. Children and patients with dose applied to a large area, using an occlusive dressing, or using high-potency products, are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Side Effects)

Implementation

- Choice of vehicle depends on site and type of lesion. Ointments are more occlusive and preferred for dry, scaly lesions. Creams should be used on oozing or intertriginous areas, where the occlusive action of ointments might cause folliculitis or maceration. Creams may be preferred for esthetic reasons even though they may dry skin more than ointments. Gels, aerosols, lotions, and solutions are useful in hairy areas.
- **Topical:** Apply *ointments, creams,* or *gels* sparingly as a thin film to clean, slightly moist skin. Wear gloves. Apply occlusive dressing only if specified by physician or other health care professional.
- Apply *lotion, solution,* or *gel* to hair by parting hair and applying a small amount to affected area. Rub in gently. Protect area from washing, clothing, or rubbing until medication has dried. Hair may be washed as usual but not right after applying medication.
- Use *aerosols* by shaking well and spraying on affected area, holding container 3–6 in. away. Spray for about 2 seconds to cover an area the size of a hand. Do not inhale. If spraying near face, cover eyes.

Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Emphasize importance of avoiding the eyes. If a dose is missed, it should be applied as soon as remembered unless almost time for the next dose.
- Caution patient to use only as directed. Avoid using cosmetics, bandages, dressings, or other skin products over the treated area unless directed by health care professional.
- Advise parents of pediatric patients not to apply tight-fitting diapers or plastic pants on a child treated in the diaper area; these garments work as an occlusive dressing and may cause more of the drug to be absorbed.
- Caution women that medication should not be used extensively, in large amounts, or for protracted periods if they are pregnant or planning to become pregnant.
- Advise patient to consult health care professional before using medicine for condition other than indicated.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen or if symptoms of infection develop.

Evaluation/Desired Outcomes

- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

cromolyn, See MAST CELL STABILIZERS.

cyclobenzaprine

(sye-kloe-**ben**-za-preen)
Amrix, Flexeril

Classification
Therapeutic: skeletal muscle relaxants (centrally acting)

Pregnancy Category B

Indications

Management of acute painful musculoskeletal conditions associated with muscle spasm. **Unlabeled uses:** Management of fibromyalgia.

Action

Reduces tonic somatic muscle activity at the level of the brainstem. Structurally similar to tricyclic antidepressants. **Therapeutic Effects:** Reduction in muscle spasm and hyperactivity without loss of function.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Unknown.
Protein Binding: 93%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 1–3 days.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK†	DURATION
PO	within 1 hr	3–8 hr	12–24 hr
Extended release	unk	unk	24 hr

†Full effects may not occur for 1–2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be used within 14 days of MAO inhibitor therapy; Immediate period after MI; Severe or symptomatic cardiovascular disease; Cardiac conduction disturbances; Hyperthyroidism.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Cardiovascular disease; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects. Pregnancy, lactation, and children <15 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, confusion, fatigue, headache, nervousness. **EENT:** dry mouth, blurred vision. **CV:** arrhythmias. **GI:** constipation, dyspepsia, nausea, unpleasant taste. **GU:** urinary retention.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **disopyramide**, **haloperidol**, and **phenothiazines**. Avoid use within 14 days of **MAO inhibitors** (hyperpyretic crisis, seizures, and death may occur). May blunt the response to **guanadrel**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Acute painful musculoskeletal conditions*—10 mg 3 times daily (range 20–40 mg/day in 2–4 divided doses; not to exceed 60 mg/day) *or* extended-release—15–30 mg once daily. *Fibromyalgia*—5–40 mg at bedtime (unlabeled).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg $18.85/100, 10 mg $18.86/100. **Extended-release capsules:** 15 mg, 30 mg. **Cost:** 15 mg $773.97/90.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse cyclobenzaprine with cyproheptadine.
- **PO:** May be administered with meals to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not take more than the prescribed amount. Taken missed doses within 1 hr of time ordered; otherwise, return to normal dose schedule. Do not double doses.
- Medication may cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.
- Advise patient to notify health care professional if symptoms of urinary retention (distended abdomen, feeling of fullness, overflow incontinence, voiding small amounts) occur.
- Inform patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may help relieve dry mouth.

Evaluation/Desired Outcomes

- Relief of muscular spasm in acute skeletal muscle conditions. Maximum effects may not be evident for 1–2 wk. Use is usually limited to 2–3 wk; however, has been effective for at least 12 wk in the management of fibromyalgia.

HIGH ALERT

cyclophosphamide

(sye-kloe-**fos**-fa-mide)
Cytoxan, Neosar, Procytox

Classification
Therapeutic: antineoplastics, immunosuppressants
Pharmacologic: alkylating agents

Pregnancy Category D

Indications

Alone or with other modalities in the management of: Hodgkin's disease, Malignant lympho-

Copyright © 2008 by F.A. Davis

mas, Multiple myeloma, Leukemias, Mycosis fungoides, Neuroblastoma, Ovarian carcinoma, Breast carcinoma and a variety of other tumors. Minimal change nephrotic syndrome in children. **Unlabeled uses:** Severe active rheumatoid arthritis or Wegener's granulomatosis.

Action

Interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressant action in smaller doses.

Pharmacokinetics

Absorption: Inactive parent drug is well absorbed from the GI tract. Converted to active drug by the liver.
Distribution: Widely distributed. Limited penetration of the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Converted to active drug by the liver; 30% eliminated unchanged by the kidneys.
Half-life: 4–6.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IV	7 days	7–15 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: Active infections; Bone marrow depression; Other chronic debilitating illnesses; Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: PULMONARY FIBROSIS. **CV:** MYOCARDIAL FIBROSIS, hypotension. **GI:** anorexia, nausea, vomiting. **GU:** HEMORRHAGIC CYSTITIS, hematuria. **Derm:** alopecia. **Endo:** gonadal suppression, syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** LEUKOPENIA, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** secondary neoplasms.

Interactions

Drug-Drug: Phenobarbital or **rifampin** may ↑ toxicity of cyclophosphamide. Concurrent **allopurinol** or **thiazide diuretics** may exaggerate bone marrow depression. May prolong neuromuscular blockade from **succinylcholine**. Cardiotoxicity may be additive with other **cardiotoxic agents** (**cytarabine**, **daunorubicin**, **doxorubicin**). May ↓ serum **digoxin** levels. Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May potentiate the effects of **warfarin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Prolongs the effects of **cocaine**.

Route/Dosage

Many regimens are used.
PO (Adults): 1–5 mg/kg/day.
PO (Children): *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. *Maintenance*—2–5 mg/kg (50–150 mg/m²/day) twice weekly.
IV (Adults): 40–50 mg/kg in divided doses over 2–5 days *or* 10–15 mg/kg q 7–10 days *or* 3–5 mg/kg twice weekly *or* 1.5–3 mg/kg/day. Other regimens may use larger doses.
IV (Children): *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. Total dose for 7 days may be given as a single weekly dose. *Maintenance*—10–15 mg/kg every 7–10 days or 30 mg/kg q 3–4 wk.

Availability (generic available)

Tablets: 25 mg, 50 mg. **Injection:** 100 mg, 200 mg, 500 mg, ✱750 mg, 1 g, 2 g.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 ml/day for adults and 1000–2000 ml/day for children. May be administered with mesna.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess nausea, vomiting, and appetite. Weigh weekly. Antiemetics may be given 30 min before administration of medication to minimize GI effects. Anorexia and weight loss can be minimized by feeding frequent light meals.

Copyright © 2008 by F.A. Davis

- Encourage patient to drink 2000–3000 ml/day to promote excretion of uric acid. Alkalinization of the urine may be used to help prevent uric acid nephropathy.
- Assess cardiac and respiratory status for dyspnea, rales/crackles, weight gain, edema. Pulmonary toxicity may occur after prolonged therapy. Cardiotoxicity may occur early in therapy and is characterized by symptoms of CHF.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and periodically during therapy. The nadir of leukopenia occurs in 7–12 days (recovery in 17–21 days). Leukocytes should be maintained at 2500–4000/mm^3. May also cause thrombocytopenia (nadir 10–15 days), and rarely causes anemia.
- Monitor BUN, creatinine, and uric acid before and frequently during therapy to detect nephrotoxicity.
- Monitor ALT, AST, LDH, and serum bilirubin before and frequently during therapy to detect hepatotoxicity.
- Urinalysis should be evaluated before initiating therapy and frequently during therapy to detect hematuria or change in specific gravity indicative of SIADH.
- May suppress positive reactions to skin tests for *Candida*, mumps, *Trichophyton*, and tuberculin purified-protein derivative (PPD). May also produce false-positive results in Papanicolaou smears.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse cyclophosphamide with cyclosporine. Do not confuse Cytoxan (cyclophosphamide) with Cytozar (cytarabine) or Cytotec (misoprostol).
- **PO:** Administer medication on an empty stomach. If severe gastric irritation develops, medication may be given with food.
- Oral solution can be formed by diluting powder for injection in aromatic elixir to a concentration of 1–5 mg of cyclophosphamide/ml. Reconstituted preparations should be refrigerated and used within 2 wk.
- **IV:** Solution for IV administration should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- Prepare IV solution by diluting each 100 mg with 5 ml of sterile water or bacteriostatic water for injection containing parabens. Shake solution gently and allow to stand until clear. Use solution without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 24 hr at room temperature, 6 days if refrigerated.

IV Administration

- **Direct IV:** ***Diluent:*** Administer reconstituted solution undiluted. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer at a rate of 100 mg/min.
- **Intermittent Infusion:** ***Diluent:*** May be further diluted in up to 250 ml of D5W, 0.9% NaCl, 0.45% NaCl, dextrose/saline combinations, LR or dextrose/Ringer's solution. ***Concentration:*** 20–25 mg/ml. ***Rate:*** Administer over 30–60 min.
- **Syringe Compatibility:** bleomycin, cisplatin, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Y-Site Compatibility:** allopurinol, amifostine, amikacin, ampicillin, aztreonam, bleomycin, cefazolin, cefepime, cefoperazone, cefotaxime, cefoxitin, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, cladribine, clindamycin, dexamethasone, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, erythromycin lactobionate, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydromorphone, idarubicin, kanamycin, leucovorin calcium, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, metronidazole, minocycline, mitomycin, morphine, nafcillin, ondansetron, oxacillin,

Copyright © 2008 by F.A. Davis

oxaliplatin, paclitaxel, pemetrexed, penicillin G potassium, piperacillin, piperacillin/tazobactam, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, lansoprazole.
- **Additive Compatibility:** fluorouracil, methotrexate, mitoxantrone, ondansetron.

Patient/Family Teaching

- Instruct patient to take dose in early morning. Emphasize need for adequate fluid intake for 72 hr after therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Report hematuria immediately. If a dose is missed, contact health care professional.
- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; yellow discoloration of skin or eyes; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling; joint pain; shortness of breath; or confusion occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- Advise patient that this medication may cause sterility and menstrual irregularities or cessation of menses. This drug is also teratogenic, and contraceptive measures should continue for at least 4 mo after completion of therapy.
- Discuss with patient the possibility of hair loss. Explore methods of coping. May also cause darkening of skin and fingernails.
- Instruct patient not to receive any vaccinations without advice of health care professional.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant tumors.
- Improvement of hematologic status in patients with leukemia. Maintenance therapy is instituted if leukocyte count remains between 2500 and 4000/mm^3 and if patient does not demonstrate serious side effects.
- Management of minimal change nephrotic syndrome in children.

cycloSPORINE†

(**sye**-kloe-spor-een)
Neoral, Sandimmune, Gengraf

Classification
Therapeutic: immunosuppressants, antirheumatics (DMARD)
Pharmacologic: polypeptides (cyclic)

Pregnancy Category C

†See Appendix C for ophthalmic use

Indications

PO, IV: Prevention and treatment of rejection in renal, cardiac, and hepatic transplantation (with corticosteroids). **PO:** Treatment of severe active rheumatoid arthritis (Neoral only). Treatment of severe recalcitrant psoriasis in adult nonimmunocompromised patients (Neoral only). **Unlabeled uses:** Management of recalcitrant ulcerative colitis. Treatment of steroid resistant nephrotic syndrome. Treatment of severe steroid resistant autoimmune disease. Prevention and treatment of graft vs. host disease in bone marrow transplant patients.

Action

Inhibits normal immune responses (cellular and humoral) by inhibiting interleukin-2, a factor necessary for initiation of T-cell activity.
Therapeutic Effects: Prevention of rejection reactions. Slowed progression of rheumatoid arthritis or psoriasis.

Pharmacokinetics

Absorption: Erratically absorbed (range 10–60%) after oral administration, with significant first-pass metabolism by the liver. Microemulsion (Neoral) has better bioavailability.
Distribution: Widely distributed, mainly into extracellular fluid and blood cells. Crosses the placenta; enters breast milk.
Protein Binding: 90–98%.
Metabolism and Excretion: Extensively metabolized by the liver (first pass); excreted in bile, small amounts excreted unchanged in urine.
Half-life: Children—7 hr; adults—19 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown†	2–6 hr	unknown
IV	unknown	end of infusion	unknown

†Onset of action in rheumatoid arthritis is 4–8 wk and may last 4 wk after discontinuation; for psoriasis, onset is 2–6 wk and lasts 6 wk following discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity to cyclosporine or polyoxyethylated castor oil (vehicle for IV form); Should not be given to pregnant or lactating women unless benefits outweigh risks; Disulfiram therapy or known alcohol intolerance (IV and oral liquid dosage forms contain alcohol); Psoriasis patients receiving immunosuppressants or radiation; Uncontrolled hypertension.

Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Renal impairment (frequent dose changes may be necessary); Active infection; Children (larger or more frequent doses may be required).

Adverse Reactions/Side Effects

CNS: SEIZURES, tremor, confusion, flushing, headache, psychiatric problems. **CV:** hypertension. **GI:** diarrhea, hepatotoxicity, nausea, vomiting, abdominal discomfort, anorexia, pancreatitis. **GU:** nephrotoxicity. **Derm:** hirsutism, acne. **F and E:** hyperkalemia, hypomagnesemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** hyperlipidemia, hyperuricemia. **Neuro:** hyperesthesia, paresthesia. **Misc:** gingival hyperplasia, hypersensitivity reactions, infections.

Interactions

Drug-Drug: ↑ blood levels and/or risk of toxicity with **azithromycin, clarithromycin , amphotericin B, aminoglycosides, amiodarone, anabolic steroids**, some **calcium channel blockers, cimetidine, colchicine, danazol, erythromycin, fluconazole, fluoroquinolones, ketoconazole, itraconazole, metoclopramide, methotrexate, miconazole, NSAIDs, melphalan**, or **hormonal contraceptives**. ↑ nephrotoxicity with **acyclovir, amphotericin B, aminoglycosides, NSAIDs, trimethoprim, ciprofloxacin**, and **vancomycin**. ↑ immunosuppression with other **immunosuppressants** (cyclophosphamide, azathioprine, corticosteroids). **Quinupristin/dalfopristin** ↑ cyclosporine levels. **Barbiturates, phenytoin, rifampin, rifabutin, carbamazepine**, or **sulfonamides** may ↓ effect of cyclosporine. ↑ risk of hyperkalemia with **potassium-sparing diuretics, potassium supplements**, or **ACE inhibitors**. ↑ serum levels/risk of toxicity from **digoxin** (↓ digoxin dose by 50%). Prolongs the action of **neuromuscular blocking agents**. ↑ risk of seizures with **imipenem/cilastatin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of rhabdomyolysis with **HMG-CoA reductase inhibitors**. Concurrent use with **tacrolimus** should be avoided. **Orlistat** ↓ absorption; avoid concurrent use.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. Use with **St. John's wort** may cause ↓ serum levels and organ rejection for transplant patients. Some **HIV protease inhibitors** may ↑ blood levels and the risk of toxicity.

Drug-Food: Concurrent ingestion of **grapefruit or grapefruit juice** ↑ absorption and should be avoided. **Food** ↓ absorption of microemulsion products (Neoral).

Route/Dosage

Doses are adjusted on the basis of serum level monitoring.

Prevention of Transplant Rejection (Sandimmune)

PO (Adults and Children): 14–18 mg/kg/dose 4–12 hr before transplant then 5–15 mg/kg/day divided q 12–24 hr postoperatively, taper by 5% weekly to maintenance dose of 3–10 mg/kg/day.

IV (Adults and Children): 5–6 mg/kg/dose 4–12 hr before transplant, then 2–10 mg/kg/day in divided doses q 8–24 hr; change to PO as soon as possible.

Prevention of Transplant Rejection (Neoral)

PO (Adults and Children): 4–12 mg/kg/day divided q 12 hr (dose varies depending on organ transplanted).

Rheumatoid Arthritis (Neoral only)

PO (Adults and Children): 2.5 mg/kg/day given in 2 divided doses; may increase by 0.5–

Copyright © 2008 by F.A. Davis

0.75 mg/kg/day after 8 and 12 weeks, up to 4 mg/kg/day. Decrease dose by 25–50% if adverse reactions occur.

Severe Psoriasis (Neoral only)

PO (Adults): 2.5 mg/kg/day given in 2 divided doses, for at least 4 wk; then may increase by 0.5 mg/kg/day q 2 wk, up to 4 mg/kg/day. Decrease dose by 25–50% if adverse reactions occur.

Autoimmune Diseases (Neoral only)

PO (Adults and Children): 1–3 mg/kg/day.

Availability (generic available)

Microemulsion soft gelatin capsules (Gengraf, Neoral): 25 mg, 100 mg. **Cost:** *Gengraf*—25 mg $227.97/180, 100 mg $949.52/180; *Neoral*—25 mg $239.96/180, 100 mg $956.36/180. **Microemulsion oral solution (Gengraf, Neoral):** 100 mg/ml. **Cost:** *Neoral*—$301.71/50 ml. **Soft gelatin capsules (Sandimmune):** 25 mg, 100 mg. **Cost:** 25 mg $337.25/180, 100 mg $1,280.00/180. **Oral solution (Sandimmune):** 100 mg/ml. **Cost:** *Neoral*—$363.18/50 ml. **Injection (Sandimmune):** 50 mg/ml in 5-ml ampules.

NURSING IMPLICATIONS

Assessment

- Monitor serum creatinine level, intake and output ratios, daily weight, and blood pressure during therapy. Report significant changes.
- **Prevention of Transplant Rejection:** Assess for symptoms of organ rejection throughout therapy.
- **IV:** Monitor patient for signs and symptoms of hypersensitivity (wheezing, dyspnea, flushing of face or neck) continuously during at least the first 30 min of each treatment and frequently thereafter. Oxygen, epinephrine, and equipment for treatment of anaphylaxis should be available with each IV dose.
- **Arthritis:** Assess pain and limitation of movement prior to and during administration.
- Prior to initiating therapy, perform a physical exam including blood pressure on 2 occasions to determine baseline. Monitor blood pressure every 2 wk during initial 3 mo, then monthly if stable. If hypertension occurs, dose should be reduced.
- **Psoriasis:** Assess skin lesions prior to and during therapy.
- ***Lab Test Considerations:*** Measure serum creatinine, BUN, CBC, magnesium, potassium, uric acid, and lipids at baseline, every 2 wk during initial therapy, and then monthly if stable. Nephrotoxicity may occur; report significant increases.
- May cause hepatotoxicity; monitor for ↑ AST, ALT, alkaline phosphatase, amylase, and bilirubin.
- May cause ↑ serum potassium and uric acid levels and ↓ serum magnesium levels.
- Serum lipid levels may be ↑.
- ***Toxicity and Overdose:*** Evaluate serum cyclosporine levels periodically during therapy. Dose may be adjusted daily, in response to levels, during initiation of therapy. Guidelines for desired serum levels will vary among institutions.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Acute pain (Indications)

Implementation

- Do not confuse cyclosporine with cyclophosphamide or cycloserine.
- Given with other immunosuppressive agents. Protect transplant patients from staff and visitors who may carry infection. Maintain protective isolation as indicated.
- Microemulsion products (Neoral) and other products (Sandimmune) are not interchangeable.
- **PO:** Draw up oral solution in the pipette provided with the medication. Mix oral solution with milk, chocolate milk, apple juice, or orange juice, preferably at room temperature. Stir well and drink at once. Use a glass container and rinse with more diluent to ensure that total dose is taken. Administer oral doses with meals. Wipe pipette dry; do not wash after use.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each 1 ml (50 mg) of IV concentrate immediately before use with 20–100 ml of D5W or 0.9% NaCl for injection. Solution is stable for 24 hr in D5W. In 0.9% NaCl, it is stable for 6 hr in a polyvinylchloride container and 12 hr in a glass container at room temperature. ***Concentration:*** 2.5 mg/ml. ***Rate:*** Infuse slowly over 2–6 hr via infusion pump.
- **Continuous Infusion:** May be administered over 24 hr.
- **Y-Site Compatibility:** lansoprazole, linezolid, propofol, sargramostim.

Copyright © 2008 by F.A. Davis

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, drotrecogin.
- **Additive Incompatibility:** magnesium sulfate.

Patient/Family Teaching

- Instruct patient to take medication at the same time each day and with regard to food, as directed. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered within 12 hr. Do not discontinue medication without advice of health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ, and stress need to notify health care professional immediately if they occur.
- Pedi: Review side effects carefully with parents and teach them how to monitor for hypertension, infection, and kidney disease. Instruct parents to notify health care provider if child develops diarrhea, which decreases absorption of cyclosporine and can result in rejection.
- Instruct patient to avoid grapefruit and grapefruit juice to prevent interaction with cyclosporine.
- Advise patient of common side effects (nephrotoxicity, increased blood pressure, hand tremors, increased facial and body hair, gingival hyperplasia). Pedi: Advise parents that if hair growth is excessive and upsetting to the child, depilatories, or hair removal waxing, can be used.
- Teach patient the correct method for monitoring blood pressure. Instruct patient to notify health care professional of significant changes in blood pressure or if hematuria, increased frequency, cloudy urine, decreased urine output, fever, sore throat, tiredness, or unusual bruising occurs.
- Instruct patient on proper oral hygiene. Meticulous oral hygiene and dental examinations for teeth cleaning and plaque control every 3 mo will help decrease gingival inflammation and hyperplasia.
- Instruct patient to consult health care professional before taking any OTC medications or receiving any vaccinations while taking this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams and lab tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted tissues.
- Decrease in severity of pain.
- Increased ease of joint movement.
- Decrease in progression of psoriasis.

cyproheptadine

(si-proe-**hep**-ta-deen)
Periactin, PMS-Cyproheptadine

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines

Pregnancy Category B

Indications

Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria, Cold urticaria.
Unlabeled uses: Stimulation of appetite.

Action

Antagonizes the effects of histamine at H-receptor sites; does not bind to or inactivate histamine. Also blocks the effects of serotonin, which may result in increased appetite. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness). Decreased cold urticaria.

Pharmacokinetics

Absorption: Apparently well absorbed after oral dosing.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	1–2 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma; Lactation; Known alcohol intolerance (syrup only).

Copyright © 2008 by F.A. Davis

Use Cautiously in: Geri: Appears on Beers list. Geriatric patients are sensitive to anticholinergic effects and have increased risk for side effects; Angle-closure glaucoma; Liver disease; Pregnancy (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, excitation (increased in children). **EENT:** blurred vision. **CV:** arrhythmias, hypotension, palpitations. **GI:** dry mouth, constipation. **GU:** hesitancy, retention. **Derm:** photosensitivity, rashes. **Misc:** weight gain.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. **MAO inhibitors** may intensify and prolong the anticholinergic effects of **antihistamines**.

Route/Dosage

PO (Adults): 4 mg q 8 hr (range 4–20 mg/day in 3 divided doses; up to 0.5 mg/kg/day).
PO (Children 6–14 yr): 2–4 mg q 8–12 hr (not to exceed 16 mg/day).
PO (Children 2–6 yr): 2 mg q 8–12 hr (not to exceed 12 mg/day).

Availability (generic available)

Tablets: 4 mg, ✱4 mg[OTC]. **Syrup:** 2 mg/5 ml, ✱2 mg/5 ml[OTC].

NURSING IMPLICATIONS

Assessment

- Geri: Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- **Allergy:** Assess symptoms (rhinitis, conjunctivitis, hives) prior to and periodically throughout therapy.
- Assess lung sounds and respiratory function prior to and periodically throughout therapy. May cause thickening of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- **Appetite Stimulant:** Monitor food intake and weight routinely.
- ***Lab Test Considerations:*** May cause false-negative reactions on allergy skin tests; discontinue 72 hr prior to testing.
- Increased serum amylase and prolactin concentrations may occur when cyproheptadine is administered with a thyrotropin-releasing hormone.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse cyproheptadine with cyclobenzaprine.
- **PO:** Administer with food, water, or milk to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take cyproheptadine exactly as directed. Missed dose should be taken as soon as remembered. Do not double doses. Syrup should be accurately measured using calibrated medication cup or measuring device.
- Medication may cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to use sunscreen and protective clothing to prevent a photosensitivity reaction.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify dentist if dry mouth persists for >2 wk.
- Geri: Teach patient and family about anticholinergic effects and to contact a health care provider if such effects persist.

Evaluation/Desired Outcomes

- Alleviation of allergic symptoms.
- Alleviation of cold urticaria.
- Improvement of appetite.

HIGH ALERT

cytarabine (sye-**tare**-a-been)

Ara-C, cytosine arabinoside, ✱Cytosar, Cytosar-U, DepoCyt

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Pregnancy Category D

Indications

IV: Used mainly in combination chemotherapeutic regimens for the treatment of leukemias and non-Hodgkin's lymphomas. **IT:** Treatment of lymphomatous meningitis.

Copyright © 2008 by F.A. Davis

Action

Inhibits DNA synthesis by inhibiting DNA polymerase (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Absorption occurs from subcut sites, but blood levels are lower than with IV administration; IT administration results in negligible systemic exposure.
Distribution: Widely distributed; IV- and subcut-administered cytarabine crosses the blood-brain barrier but not in sufficient quantities. Crosses the placenta.
Metabolism and Excretion: Metabolized mostly by the liver; <10% excreted unchanged by the kidneys. Metabolism to inactive drug in the CSF is negligible because the enzyme that metabolizes it is present in very low concentrations in the CSF.
Half-life: *IV, subcut*—1–3 hr; *IT*—100–236 hr.

TIME/ACTION PROFILE (IV, subcut—effects on WBCs; IT—levels in CSF)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV (1st phase)	24 hr	7–9 days	12 days
Subcut, IV (2nd phase)	15–24 days	15–24 days	25–34 days
IT	rapid	5 hr	14–28 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation; Active meningeal infection (IT only).
Use Cautiously in: Active infections; Decreased bone marrow reserve; Renal/hepatic disease; Other chronic debilitating illnesses; OB: Patients with childbearing potential.

Adverse Reactions/Side Effects

CNS: CNS dysfunction (high dose), confusion, drowsiness, headache. **EENT:** corneal toxicity (high dose), hemorrhagic conjunctivitis (high dose). **Resp:** PULMONARY EDEMA (high dose). **CV:** edema. **GI:** nausea, vomiting, hepatitis, hepatotoxicity, severe GI ulceration (high dose), stomatitis. **GU:** urinary incontinence. **Derm:** alopecia, rash. **Endo:** sterility. **Hemat:** *(less with IT use)*— anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **Neuro:** *Intrathecal only*— CHEMICAL ARACHNOIDITIS, abnormal gait. **Misc:** cytarabine syndrome, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. ↑ risk of cardiomyopathy when used in high-dose regimens with **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↓ absorption of **digoxin** tablets. May ↓ the efficacy of **gentamicin** when used to treat *Klebsiella pneumoniae* infections. Recent treatment with **asparaginase** may ↑ risk of pancreatitis. ↑ neurotoxicity with concurrently administered **IT antineoplastics** (IT only).

Route/Dosage

Dose regimens vary widely.
IV (Adults): *Induction dose*—200 mg/m²/day for 5 days q 2 wk as a single agent *or* 2–6 mg/kg/day (100–200 mg/m²/day) as a single daily dose *or* in 2–3 divided doses for 5–10 days or until remission occurs as part of combination chemotherapy. *Maintenance*—70–200 mg/m²/day for 2–5 days monthly. *Refractory leukemias/lymphomas*—3 g/m² q 12 hr for up to 12 doses.
Subcut, IM (Adults): *Maintenance*—1–1.5 mg/kg q 1–4 wk.
IT (Adults): *Depo Cyt Induction*—50 mg (intraventricular or lumbar puncture) every 14 days for 2 doses (weeks 1 and 3); *consolidation*—50 mg (intraventricular or lumbar puncture) every 14 days for 3 doses (weeks 5, 7, and 9), followed by one additional dose at week 13; *maintenance*—50 mg (intraventricular or lumbar puncture) every 28 days for 4 doses (weeks 17, 21, 25, and 29). If drug-related neurotoxicity occurs, dose should be reduced to 25 mg or discontinued (dexamethasone 4 mg PO/IV twice daily for 5 days should be started concurrently with IT cytarabine).

Availability (generic available)

Powder for injection: 100 mg, 500 mg, 1 g, 2 g. **Sustained-release liposome injection for IT use:** 50 ml/5-ml vial.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petec-

Copyright © 2008 by F.A. Davis

hiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may decrease uric acid levels. Alkalinization of urine may increase excretion of uric acid.
- Assess nutritional status. Nausea and vomiting may occur within 1 hr of administration, especially if IV dose is administered rapidly, less severe if medication is infused slowly. Administering an antiemetic prior to and periodically throughout therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor patient for development of *cytarabine* or *ara-C syndrome* (fever, myalgia, bone pain, chest pain, maculopapular rash, conjunctivitis, malaise), which usually occurs 6–12 hr following administration. Corticosteroids may be used for treatment or prevention. If patient responds to corticosteroids, continue cytarabine and corticosteroids.
- Assess patient for respiratory distress and pulmonary edema. Occurs with high doses rarely; may be fatal.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, swelling). Epinephrine, corticosteroids, and resuscitation equipment should be readily available.

IT: Chemical arachnoiditis (nausea, vomiting, headache, fever, back pain, CSF pleocytosis and neck rigidity, neck pain, or meningism) is an expected side effect of IT cytarabine. Incidence and severity of symptoms may be decreased with coadministration of dexamethasone.

- Monitor patients receiving IT therapy continuously for the development of neurotoxicity (myelopathy, personality changes, dysarthria, ataxia, confusion, somnolence, coma). If neurotoxicity develops, decrease amount of subsequent doses and discontinue if neurotoxicity persists. Risk may be increased if cytarabine is administered intrathecally and IV within a few days.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and frequently during therapy. Leukocyte counts begin to drop within 24 hr of administration. The initial nadir occurs in 7–9 days. After a small ↑ in the count, the second, deeper nadir occurs 15–24 days after administration. Platelet counts begin to ↓ 5 days after a dose, with a nadir at 12–15 days. Leukocyte and thrombocyte counts usually begin to ↑ 10 days after the nadirs. Therapy is usually withdrawn if leukocyte count is $<1000/mm^3$ or platelet count is $<50{,}000/mm^3$. Bone marrow aspirations are recommended every 2 wk until remission occurs.
- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, alkaline phosphatase, and LDH) prior to and routinely during therapy.
- May cause ↑ uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse cytarabine with Cytoxan (cyclophosphamide). Do not confuse Cytosar (cytarabine) with Cytovene (ganciclovir) or Cytoxan. Do not confuse high-dose and regular therapy. Fatalities have occurred with high-dose therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix K).
- May be given subcut, direct IV, intermittent IV, continuous IV, or IT.
- **IV, Subcut:** Reconstitute 100-mg vials with 5 ml of bacteriostatic water for injection with benzyl alcohol 0.9% for a concentration of 20 mg/ml. Reconstitute 500-mg vials with 10 ml for a concentration of 50 mg/ml, 1-g vials with 10 ml, and 2-g vials with 20 ml for a concentration of 100 mg/ml. Reconstituted solution is stable for 48 hr. Do not administer a cloudy or hazy solution.

Copyright © 2008 by F.A. Davis

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 100 mg/ml. ***Rate:*** Administer each 100 mg over 1–3 min.
- **Intermittent Infusion:** ***Diluent:*** May be further diluted in 0.9% NaCl, D5W, D10W, D5/0.9% NaCl, Ringer's solution, LR, or D5/LR. ***Concentration:*** Dilute doses in 100 ml of diluent. ***Rate:*** Infuse over 15–30 min.
- **Continuous Infusion:** Rate and concentration for IV infusion are ordered individually.
- **Syringe Compatibility:** metoclopramide.
- **Y-Site Compatibility:** amifostine, amsacrine, aztreonam, cefepime, chlorpromazine, cimetidine, cladribine, dexamethasone phosphate, diphenhydramine, doxorubicin liposome, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, morphine, ondansetron, paclitaxel, pemetrexed, piperacillin/tazobactam, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate complex, ganciclovir, lansoprazole.
- **Additive Compatibility:** methotrexate, mitoxantrone, ondansetron, potassium chloride, sodium bicarbonate, vincristine.
- **Additive Incompatibility:** fluorouracil, heparin, regular insulin, nafcillin, oxacillin, penicillin G sodium. **IT:** Patients receiving *liposomal cytarabine* should be started on dexamethasone 4 mg twice daily PO or IV for 5 days beginning on the day of liposomal cytarabine injection.
- Allow vial to warm to room temperature. Gently agitate or invert vial to resuspend particles immediately before withdrawal from vial. No further reconstitution or dilution is required with *liposomal cytarabine*. Reconstitute *conventional cytarabine* with preservative-free 0.9% NaCl or autologous spinal fluid. Use immediately to prevent bacterial contamination.
- Liposomal cytarabine must be used within 4 hr of withdrawal from the vial. Discard unused portions. Inject directly into CSF via intraventricular reservoir or by direct injection into lumbar sac. Do not use in-line filters.
- Instruct patient to lie flat for 1 hr following IT injection. Monitor for immediate toxic reactions.

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.
- **IT:** Inform patient about the expected side effects (headache, nausea, vomiting, fever) and about early signs of neurotoxicity. Instruct patient to notify health care professional if these signs occur.
- Emphasize the importance of taking dexamethasone with lyposomal cytarabine.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemias.
- Decrease in size and spread of the tumor in non-Hodgkin's lymphomas. Therapy is continued every 2 wk until patient is in complete remission or thrombocyte count or leukocyte count falls below acceptable levels.
- Treatment of lymphomatous meningitis.

daclizumab (da-kliz-yoo-mab)
Zenapax

Classification
Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications
Prevention of acute organ rejection during renal transplantation (with cyclosporine and corticosteroids).

Action
Binds specifically to interleukin-2 (IL-2) receptor sites on activated lymphocytes, acting as an IL-2 receptor antagonist. This prevents further activation of lymphocytes and allograft rejection. **Therapeutic Effects:** Prevention of renal allograft rejection.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Crosses the placenta.
Metabolism and Excretion: Binds to lymphocytes.
Half-life: 20 days.

TIME/ACTION PROFILE (saturation of IL-2 receptors)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	after 5th dose	120 days†

†Post-transplantation

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Geriatric patients; Pregnancy, lactation, or children (has been used in children; increased risk of hypertension and dehydration).

Adverse Reactions/Side Effects
CNS: dizziness, fatigue, headache, insomnia. **Resp:** PULMONARY EDEMA, coughing, dyspnea. **CV:** chest pain, edema, hypertension (↑ in children), hypotension, tachycardia. **GI:** abdominal discomfort, constipation, diarrhea (↑ in children), dyspepsia, epigastric pain, nausea, pyrosis, vomiting (↑ in children). **GU:** dysuria, oliguria, renal tubular necrosis. **Derm:** acne, impaired wound healing, pruritus (↑ in children). **Hemat:** thrombosis. **MS:** arthralgia, back pain, musculoskeletal pain. **Neuro:** tremor. **Misc:** Allergic reactions including ANAPHYLAXIS, fever (↑ in children), post-operative pain (↑ in children), urinary and respiratory tract infection (↑ in children).

Interactions
Drug-Drug: None known.
Drug-Natural Products: Concomitant use with **astragalus**, **echinacea**, and **melatonin** may interfere with immunosuppression.

Route/Dosage
IV (Adults and Children): 1 mg/kg, with 1st dose given no more than 24 hr before transplantation, then q 2 wk for a total of 5 doses.

Availability
Concentrate for injection (must be diluted): 25 mg/5 ml in 5-ml vials.

NURSING IMPLICATIONS

Assessment
- Assess for fluid overload (monitor weight and intake and output, assess for edema and rales/crackles). Notify health care professional if patient has experienced 3% or more weight gain in the previous week. Obtain chest x-ray within 24 hr before beginning therapy. Fluid-overloaded patients are at high risk of developing pulmonary edema. Monitor vital signs and breath sounds closely.
- Monitor for signs of anaphylactic or hypersensitivity reactions (hypotension, bronchospasm, wheezing, laryngeal edema, pulmonary edema, cyanosis, hypoxia, respiratory arrest, cardiac arrhythmia, cardiac arrest, peripheral edema, loss of consciousness, fever, rash, urticaria, diaphoresis, pruritus, and/or injection site reactions) at each dose. Resuscitation equipment should be readily available. If a severe hypersensitivity reaction occurs, therapy with daclizumab should be permanently discontinued.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify health care professional immediately if these symptoms occur; may necessitate discontinuation of therapy.

Potential Nursing Diagnoses
Risk for infection (Side Effects)
Excess fluid volume (Side Effects)

Copyright © 2008 by F.A. Davis

Implementation

- Daclizumab is usually administered concurrently with cyclosporine and corticosteroids.
- Daclizumab should be used only by physicians experienced in the management of organ transplantation.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute daclizumab with 50 ml of 0.9% NaCl. Gently invert bag to mix; do not shake to avoid foaming. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion. Administer within 4 hr or may be refrigerated for up to 24 hr. Discard after 24 hr. ***Rate:*** Administer over 15 min via peripheral or central line.
- **Compatibility:** Do not admix; do not administer in IV line containing other medications. If line must be used for other medications, flush with 0.9% NaCl before and after daclizumab.

Patient/Family Teaching

- Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of daclizumab course.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient to continue to avoid crowds and persons with known infections; this drug also suppresses the immune system.
- Instruct patient not to receive any vaccinations and to avoid contact with persons receiving oral polio vaccine without advice of health care professional.

Evaluation/Desired Outcomes

- Prevention of acute organ rejection.

dalteparin, See HEPARINS (LOW MOLECULAR WEIGHT).

dantrolene (**dan**-troe-leen)
Dantrium

Classification
Therapeutic: skeletal muscle relaxants (direct acting)

Pregnancy Category C

Indications

PO: Treatment of spasticity associated with: Spinal cord injury, Stroke, Cerebral palsy, Multiple sclerosis. Prophylaxis of malignant hyperthermia. **IV:** Emergency treatment of malignant hyperthermia. **Unlabeled uses:** Management of neuroleptic malignant syndrome.

Action

Acts directly on skeletal muscle, causing relaxation by decreasing calcium release from sarcoplasmic reticulum in muscle cells. Prevents intense catabolic process associated with malignant hyperthermia. **Therapeutic Effects:** Reduction of muscle spasticity. Prevention of malignant hyperthermia.

Pharmacokinetics

Absorption: 35% absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Almost entirely metabolized by the liver.
Half-life: 8.7 hr.

TIME/ACTION PROFILE (effects on spasticity)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	unknown	6–12 hr
IV	rapid	rapid	unknown

Contraindications/Precautions

Contraindicated in: No contraindications to IV form in treatment of hyperthermia; Pregnancy and lactation; Situations in which spasticity is used to maintain posture or balance.
Use Cautiously in: Cardiac, pulmonary, or previous liver disease; Women, patients >35 yr (increased risk of hepatotoxicity).

Adverse Reactions/Side Effects

CNS: drowsiness, muscle weakness, confusion, dizziness, headache, insomnia, malaise, nervousness. **EENT:** excessive lacrimation, visual disturbances. **Resp:** pleural effusions. **CV:** changes in BP, tachycardia. **GI:** HEPATOTOXICITY, diarrhea, anorexia, cramps, dysphagia, GI bleeding, vomiting. **GU:** crystalluria, dysuria, frequency, erectile dysfunction, incontinence, nocturia. **Derm:** pruritus, sweating, urticaria. **Hemat:** eosinophilia. **Local:** irritation at IV site, phlebitis. **MS:** myalgia. **Misc:** chills, drooling, fever.

Interactions

Drug-Drug: Additive CNS depression with **CNS depressants**, including **alcohol**, **antihista-**

Copyright © 2008 by F.A. Davis

mines, **opioid analgesics**, **sedative/hypnotics**, and parenteral **magnesium sulfate**. ↑ risk of hepatotoxicity with other **hepatotoxic agents** or **estrogens**. ↑ risk of arrhythmias with **verapamil**.
Drug-Natural Products: Concomitant use of **kava kava, valerian, chamomile, or hops can increase CNS depression.**

Route/Dosage

PO (Adults): *Spasticity*—25 mg/day initially; increase by 25 mg/day q 4–7 days until desired response or total of 100 mg 4 times daily is reached. *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Post-hyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.
PO (Children >5 yr): *Spasticity*—0.5 mg/kg twice daily; increase by 0.5 mg/kg/day q 4–7 days until desired response is obtained or dosage of 3 mg/kg 4 times daily is reached (not to exceed 400 mg/day). *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Post-hyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.
IV (Adults and Children): *Treatment of malignant hyperthermia*—at least 1 mg/kg (up to 3 mg/kg), continued until symptoms decrease or a cumulative dose of 10 mg/kg has been given. If symptoms reappear, dose may be repeated. *Prevention of malignant hyperthermia*—2.5 mg/kg before anesthesia.

Availability (generic available)

Capsules: 25 mg, 50 mg, 100 mg. **Powder for injection:** 20 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess bowel function periodically. Persistent diarrhea may warrant discontinuation of therapy.
- **Muscle Spasticity:** Assess neuromuscular status and muscle spasticity before initiating therapy and periodically during its course to determine response to therapy.
- **Malignant Hyperthermia:** Assess previous anesthesia history of all surgical patients. Also assess for family history of reactions to anesthesia (malignant hyperthermia or perioperative death).
- Monitor ECG, vital signs, electrolytes, and urine output continuously when administering IV for malignant hyperthermia
- Monitor patient for difficulty swallowing and choking during meals on the day of administration.
- ***Lab Test Considerations:*** Monitor liver function frequently during therapy. Liver function abnormalities (↑ AST, ALT, alkaline phosphatase, bilirubin, GGTP) may require discontinuation of therapy.
- Evaluate renal function and CBC before and periodically during therapy in patients receiving prolonged therapy.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Dantrium (dantrolene) with danazol.
- **PO:** If gastric irritation becomes a problem, may be administered with food. Oral suspensions may be made by opening capsules and adding them to fruit juices or other liquid. Drink immediately after mixing.
- Oral dose for spasticity should be divided into 4 doses/day.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each 20 mg with 60 ml of sterile water for injection (without a bacteriostatic agent). Shake until solution is clear. Solution must be used within 6 hr. Administer without further dilution. Protect diluted solution from direct light. ***Concentration:*** 0.333 mg/ml. ***Rate:*** Administer each single dose by rapid continuous IV push through Y-tubing or 3-way stopcock. Follow immediately with subsequent doses as indicated. Medication is very irritating to tissues; observe infusion site frequently to avoid extravasation.
- **Intermittent Infusion:** Prophylactic dose has been administered as an infusion. ***Rate:*** Administer over 1 hr before anesthesia.

Patient/Family Teaching

- Advise patient not to take more medication than the amount prescribed to minimize risk

Copyright © 2008 by F.A. Davis

of hepatotoxicity and other side effects. If a dose is missed, do not take unless remembered within 1 hr. Do not double doses.
- May cause dizziness, drowsiness, visual disturbances, and muscle weakness. Advise patient to avoid driving and other activities requiring alertness until response to drug is known. After IV dose for surgery, patients may experience decreased grip strength, leg weakness, light-headedness, and difficulty swallowing for up to 48 hr. Caution patients to avoid activities requiring alertness and to use caution when walking down stairs and eating during this period.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if rash; itching; yellow eyes or skin; dark urine; or clay-colored, bloody, or black, tarry stools occur or if nausea, weakness, malaise, fatigue, or diarrhea persists. May require discontinuation of therapy.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of follow-up exams to check progress in long-term therapy and blood tests to monitor for side effects.
- **Malignant Hyperthermia:** Patients with malignant hyperthemia should carry identification describing disease process at all times.

Evaluation/Desired Outcomes
- Relief of muscle spasm in musculoskeletal conditions. One wk or more may be required to see improvement; if there is no observed improvement in 45 days, the medication is usually discontinued.
- Prevention of, or decrease in, temperature and skeletal rigidity in malignant hyperthermia.

daptomycin (dap-to-**mye**-sin)
Cubicin

Classification
Therapeutic: anti-infectives
Pharmacologic: cyclic lipopeptide antibacterial agents

Pregnancy Category B

Indications
Complicated skin and skin structure infections caused by aerobic Gram-positive bacteria.

Action
Causes rapid depolarization of membrane potential following binding to bacterial membrane; this results in inhibition of protein, DNA, and RNA synthesis. **Therapeutic Effects:** Death of bacteria with resolution of infection. **Spectrum:** Active against *Stapylococcus aureus* (including methicillin-resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, some *Streptococcus dysgalactiae*, and *Enterococcus faecalis* (vancomycin-susceptible strains).

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 92%.
Metabolism and Excretion: Metabolism not known; mostly excreted by kidneys.
Half-life: 8.1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: CCr <30 ml/min (dose reduction required); Geriatric patients (may have ↓ clinical response with ↑ risk of adverse reactions); Pregnancy (use only if clearly needed; Lactation; Children <18 yr (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness. **Resp:** dyspnea. **CV:** hypertension, hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, constipation, diarrhea, nausea, vomiting, ↑ liver function tests. **GU:** renal failure. **Derm:** pruritus, rash. **Hemat:** anemia. **Local:** injection site reactions. **MS:** ↑ CPK. **Misc:** fever.

Interactions
Drug-Drug: Tobramycin ↑ blood levels. Concurrent **HMG-CoA reductase inhibitors** may ↑ the risk of myopathy.

Route/Dosage
IV (Adults): 4 mg/kg every 24 hr.

Renal Impairment
IV (Adults): *CCr <30 ml/min*—4 mg/kg every 48 hr.

Availability
Powder for injection: 500 mg/vial.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Assess for signs of pseudomembranous colitis (diarrhea, abdominal cramping, fever, and bloody stools) during therapy.
- ***Lab Test Considerations:*** Monitor CPK weekly, more frequently in patients with unexplained ↑. Discontinue daptomycin if CPK >1000 units/L and signs and symptoms of myopathy occur.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute 500-mg vial with 10 ml of 0.9% NaCl. Reconstituted vials are stable for 12 hr at room temperature or 48 hrs if refrigerated. Dilute further in 50 ml of 0.9% NaCl. Solution is stable for 12 hr at room temperature or 48 hr if refrigerated. Do not administer solutions that are cloudy or contain a precipitate. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, argatroban, azithromycin, aztreonam, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, dexamethasone sodium phosphate, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, meropenem, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nicardipine, nitroprusside, norepinephrine, ondansetron, palonosetron, pamidronate, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, imipenem/cilastatin, metronidazole, nesiritide, nitroglycerin, pantoprazole, phenytoin.
- **Solution Incompatibility:** D5W.

Patient/Family Teaching

- Inform patient of purpose of medication.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

darbepoetin (dar-be-**poh**-e-tin)
Aranesp

Classification
Therapeutic: antianemics
Pharmacologic: hormones (rDNA)

Pregnancy Category C

Indications

Anemia associated with chronic renal failure. Chemotherapy-induced anemia in patients with non-myeloid malignancies.

Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate red blood cell counts, decreasing the need for transfusions.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: 30–50% following subcut administration; IV administration results in complete bioavailability.
Distribution: Confined to the intravascular space.
Metabolism and Excretion: Unknown.
Half-life: *Subcut*—49 hr; *IV*—21 hr.

TIME/ACTION PROFILE (increase in RBCs)

ROUTE	ONSET	PEAK	DURATION
IV, subcut	2–6 wks	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled hypertension.
Use Cautiously in: History of hypertension; Underlying hematologic diseases, including hemolytic anemia, sickle-cell anemia, thalassemia and porphyria (safety not established); OB, Pedi, Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, fatigue, headache, weakness. **Resp:** cough, dyspnea, bronchitis. **CV:** ARRHYTHMIAS, CHF, MI, STROKE, THROMBOTIC EVENTS (especially with hemoglobin >12 g/dL), edema, hypertension, hypotension, chest pain, transient ischemic attack, thrombotic events. **GI:** abdominal pain, nausea, diarrhea, vomiting, constipation. **Derm:** pruritus. **Hemat:** pure red cell aplasia. **MS:** myalgia, arthralgia, back pain, limb pain. **Misc:** fever, allergic reactions, flu-like syndrome, sepsis, ↑ mortality and ↑ tumor growth (with hemoglobin ≥12 g/dL).

Interactions

Drug-Drug: None reported.

Route/Dosage

Anemia due to Chronic Renal Failure

(Use lowest dose that will gradually increase hemoglobin level and avoid RBC transfusion).
IV, Subcut (Adults): *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly; adjust dose to attain target hemoglobin of 12 g/dl. Dosage adjustments should be made monthly in increments or decrements of 25% of current dose. Some patients may be dosed every 2 weeks. *Conversion from epoetin to darbepoetin*—weekly epoetin dose <2500 units = 6.25 mcg/week darbepoetin, weekly epoetin dose 2500–4999 units = 12.5 mcg/week darbepoetin, weekly epoetin dose 5000–10,999 units = 25 mcg/week darbepoetin, weekly epoetin dose 11,000–17,999 units = 40 mcg/week darbepoetin, weekly epoetin dose 18,000–33,999 units = 60 mcg/week darbepoetin, weekly epoetin dose 34,000–89,999 units = 100 mcg/week darbepoetin, weekly epoetin dose >90,000 units = 200 mcg/week darbepoetin.

Anemia due to Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed)
Subcut (Adults): 2.25 mcg/kg initially. Adjust dose to attain target hemoglobin. If hemoglobin increases by <1.0 g/dL after 6 weeks of therapy, dose should be increased up to 4.5 mcg/kg. If hemoglobin increases by >1.0 g/dL in 2 weeks or if the hemoglobin >12 g/dL, risk of tumor growth and death increases; decrease dose by approximately 25%. If hemoglobin is >13 g/dL, temporarily withhold until hemoglobin falls to 12 g/dL. Restart at a dose approximately 25%<the previous dose.

Availability

Albumin solution for injection: 25 mcg/ml 1-ml vial, 40 mcg/ml 1-ml vial, 60 mcg/ml 1-ml vial, 100 mcg/ml 1-ml vial, 150 mcg/ml 0.75-ml vial, 200 mcg/ml 1-ml vial, 300 mcg/ml 1-ml vial, 500 mcg/ml 1-ml vial. **Pre-filled syringes:** 60 mcg/0.3 ml, 100 mcg/0.5 ml, 200 mcg/0.4 ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure before and during therapy. Inform physician or other health care professional if severe hypertension is present or if blood pressure begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor response for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. May need to increase heparin dose to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- Monitor for allergic reactions (rash, utricaria). Discontinue darbepoetin if signs of anaphylaxis (dyspnea, laryngeal swelling) occur.
- ***Lab Test Considerations:*** May cause ↑ in WBCs and platelets. May ↓ bleeding times.

Copyright © 2008 by F.A. Davis

- Monitor serum ferritin, transferrin, and iron levels prior to and during therapy to assess need for concurrent iron therapy. Transferrin saturation should be at least 20% and ferritin should be at least 100 ng/ml.
- Monitor hemoglobin before and weekly during initial therapy, for 4 wk after a change in dose, and regularly after target range has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. Hemoglobin increases of more than 1.0 g/dl in any 2-week period or hemoglobin >12 g/dL increases the likelihood of life—threatening cardiovascular complications, cardiac arrest, neurologic events (seizures, stroke), hypertensive reactions, CHF, vascular thrombosis/ischemia/infarction, acute MI, and fluid overload/edema. Decrease dose by 25% and monitor hemoglobin weekly for 4 wk. If hemoglobin continues to increase, temporarily withhold until hemoglobin begins to decrease; then re-initiate at a dose 25% lower than previous dose.
- If increase in hemoglobin is less than 1 g/dl over 4 wks and iron stores are adequate, dose may be increased by 25% of previous dose.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Implementation

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with darbepoetin and continued during therapy. Correct deficiencies of folic acid or vitamin B_{12} prior to therapy.
- Institute seizure precautions in patients who experience greater than a 1.0 g/dl increase in hemoglobin in a 2-wk period or exhibit any change in neurologic status.
- *For conversion from epoetin alfa to darbepoetin,* if epoetin was administered 2-3 times/wk administer darbepoetin once a week. If patient was receiving epoetin once/wk, darbepoetin may be administered once every 2 wks. Route of administration should remain consistent.
- Dose adjustments should not be more frequent than once/month.
- Do not shake vial; inactivation of medication may occur. Do not administer vials containing solution that is discolored or contains particulate matter. Discard vial immediately after withdrawing dose. Do not pool unused portions.
- **Subcut:** This route is often used for patients not requiring dialysis.

IV Administration

- **Direct IV:** Administer undiluted. ***Rate:*** May be administered as direct injection or bolus over 1–3 min into IV tubing or via venous line at end of dialysis session.
- **Y-Site Incompatibility:** Do not administer in conjunction with other drugs or solutions.

Patient/Family Teaching

- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).
- Discuss possible return of menses and fertility in women of childbearing age. Patient should discuss contraceptive options with health care professional.
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Darbepoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer darbepoetin should be taught proper dosage, administration technique, and disposal of equipment. *Information for Patients and Caregivers* should be provided to patient along with medication.

Evaluation/Desired Outcomes

- Increase in hemoglobin not to exceed 12 g/dl with improvement in symptoms of anemia in patients with chronic renal failure.

Copyright © 2008 by F.A. Davis

darifenacin (dar-i-**fen**-a-sin)
Enablex

Classification
Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category C

Indications
Overactive bladder with symptoms (urge incontinence, urgency, frequency).

Action
Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction. **Therapeutic Effects:** Decreased symptoms of overactive bladder.

Pharmacokinetics
Absorption: 15–19% absorbed.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized by the CYP2D6 enzyme system in most individuals; poor metabolizers (7% of Caucasians, 2% of African Americans) have less CYP2D6 activity with less metabolism occurring. Some metabolism via CYP3A4 enzyme system. 60% excreted renally as metabolites, 40% in feces as metabolites.
Half-life: 13–19 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Oral	Unk	7 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment.
Use Cautiously in: Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Bladder outflow obstruction; GI obstructive disorders, decreased GI motility, severe constipation, or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; Lactation or children (safety not established); Pregnancy (use only if maternal benefit outweighs fetal risk).

Adverse Reactions/Side Effects
CNS: dizziness. **EENT:** blurred vision. **GI:** constipation, dry mouth, dyspepsia, nausea. **Metab:** heat intolerance.

Interactions
Drug-Drug: Blood levels and risk of toxicity are ↑ by concurrent use of strong CYP3A4 inhibitors including **ketoconazole**, **itraconazole**, **ritonavir**, **nelfinavir**, **clarithromycin**, and **nefazodone**; daily dose should not exceed 7.5 mg. Concurrent use of moderate inhibitors of CYP3A4 especially those with narrow therapeutic indices, including **flecainide**, **thioridazine**, and **tricyclic antidepressants** should be undertaken with caution.

Route/Dosage
PO (Adults): 7.5 mg once daily, may be increased after 2 wk to 15 mg once daily.

Availability
Extended-release tablets: 7.5 mg, 15 mg.

NURSING IMPLICATIONS

Assessment
- Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.

Potential Nursing Diagnoses
Impaired urinary elimination (Indications)

Implementation
- **PO:** Administer once daily without regard to food. Extended-release tablets must be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching
- Instruct patient to take darifenacin as directed. Advise patient to read the *Patient Information* before starting therapy and with each prescription refill. If a dose is missed, skip dose and take next day; do not take 2 doses in same day.
- Do not share darifenacin with others; may be dangerous.
- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- May cause dizziness and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking Rx, OTC, or herbal products with darifenacin.

Evaluation/Desired Outcomes
- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).

Copyright © 2008 by F.A. Davis

darunavir (da-**ru**na-veer)
Prezista

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Pregnancy Category B

Indications
HIV infection (with other antiretrovirals) in adults who have already received and progressed on other antiretroviral combinations.

Action
Inhibits HIV-1 protease, selectively inhibiting the cleavage of HIV encoded specific polyproteins in infected cells. This prevents the formation of mature virus particles. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics
Absorption: *Without ritonavir*—37% absorbed following oral administration; *with ritonavir*—82%. Food increases absorption by 30%.
Distribution: Unknown.
Protein Binding: 95% bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by CYP3A enzyme system. 41% eliminated unchanged in feces, 8% in urine.
Half-life: 15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.5–4 hr	12 hr

Contraindications/Precautions
Contraindicated in: Concurrent dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, pimozide, or triazolam; OB: Lactation; HIV may be transmitted in human milk; Pedi: Safe use in children not established.
Use Cautiously in: Hepatic impairment; Geri: Consider age-related impairment in hepatic function, concurrent chronic disease states and drug therapy; OB: Use in pregnancy only if maternal benefit outweighs fetal risk.

Adverse Reactions/Side Effects
Based on concurrent use with ritonavir. **GI:** constipation, diarrhea, nausea, vomiting. **Endo:** hyperglycemia. **Metab:** body fat redistribution.

Interactions
Drug-Drug: Darunavir and ritonavir are both inhibitors of CYP3A and are metabolized by CYP3A. Multiple drug-drug interactions can be expected with drugs that share, inhibit, or induce these pathways. Consult product information for more specific details.
Carbamazepine, **phenobarbital**, **rifampin**, and **phenytoin** ↑ metabolism and may ↓ antiretroviral effectiveness, concurrent use is contraindicated. ↓ Metabolism of and may ↑ risk of ergot toxicity with **dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine**; concurrent use is contraindicated. ↓ Metabolism of and may ↑ risk of serious myopathy **lovastatin** and simvastatin **ergonovine**, **ergotamine**; concurrent use is contraindicated. **Atorvastatin** and **pravastatin** may be used in modified doses. ↑ levels and risk of cardiotoxicity with **pimozide**; concurrent use is contraindicated. ↑ levels and risk of excess CNS depression with **midazolam** or **triazolam**; concurrent use is contraindicated. Concurrent use with **efavirenz** results in ↓ darunavir levels and ↑ efavirenz levels; use combination cautiously. Concurrent use with **lopivavir/ritonavir** ↓ darunavir levels and may ↓ antiretroviral effectiveness; although concurrent use is not recommended, additional ritonavir may be required. Concurrent use with **saquinavir** ↓ darunavir levels and may ↓ antiretroviral effectiveness; concurrent use is not recommended. ↑ levels and risk of toxicity with **lidocaine**, **quinidine**, and **amiodarone**; use cautiously and with available blood level monitoring. ↓ levels and may ↓ anticoagulant effect of **warfarin**; monitor INR. ↑ levels and risk of adverse reactions to **trazodone**; use cautiously and decrease dose if necessary. ↑ levels of **clarithromycin**, especially in patients with renal impairment (CCr <60 ml/min); ↓ dose of clarithromycin required. **Ketoconazole** and **itraconazole** may ↑ darunavir levels. Darunavir ↑ levels of **ketoconazole** and **itraconazole**; daily dose of itraconazole or ketoconazole should not be >200 mg. ↓ blood levels and may ↓ antifungal effectiveness of **voriconazole**; avoid concurrent use if possi-

Copyright © 2008 by F.A. Davis

ble. Concurrent use with **rifabutin** ↑ rifabutin levels and ↓ darunavir levels (may be due to ritonavir); rifabutin dose should be decreased to 150 mg every other day. ↑ levels and may ↑ risk of adverse cardiovascular side effects of **felodipione**, **nifedipine**, or **nicardipine**; monitor clinical response carefully. **Dexamethasone** ↓ levels and may ↓ antiretroviral effectiveness. May ↑ systemic levels of **inhaled fluticasone**; choose alternative inhaled corticosteroid. ↑ levels of; and may ↑ risk of toxicity with; **cyclosporine**, **tacrolimus**, **sirolimus**; blood level monitoring recommended. ↓ levels and may precipitate opiate abstinence syndrome from **methadone**. ↑ levels of, and ↑ risk of serious toxicity from, **sildenafil**, **tardalafil**, or **vardenafil**; dose reduction required. ↓ levels and may ↓ antidepressant effectiveness of **sertraline** and **paroxetine**; adjust dose by clinical response.

Drug-Natural Products: St. John's wort ↑ metabolism and may ↓ antiretroviral effectiveness.

Route/Dosage

PO (Adults): 600 mg with ritonavir 100 mg twice daily.

Availability

Tablets: 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for allergy to sulfonamides.
- Monitor patient for development of rash; usually maculopapular and self-limited. Discontinue therapy if severe.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↑ serum AST, ALT, GGT, total bilirubin, alkaline phosphatase, pancreatic amylase, pancreatic lipase, triglycerides, total cholesterol, and uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Must be administered with a meal or light snack along with ritonavir 100 mg to be effective. The type of food is not important. Tablets should be swallowed whole with water or milk; do not chew.

Patient/Family Teaching

- Emphasize the importance of taking darunavir with ritonavir exactly as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. If a dose of darunavir or ritonavir is missed by more than 6 hrs, wait and take next dose at regularly scheduled time. If missed by less than 6 hrs, take darunavir and ritonavir immediately and then take next dose at regularly scheduled time. If a dose is skipped, do not double doses. Advise patient to read Patient Information sheet before starting therapy and with each prescription renewal in case changes have been made.
- Instruct patient that darunavir should not be shared with others.
- Advise patient to avoid taking other Rx, OTC, or herbal products without consulting health care professional. These medications interact with many other drugs.
- Inform patient that darunavir does not cure AIDS or prevent associated or opportunistic infections. Darunavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of darunavir are unknown at this time.
- Inform patient that darunavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during darunavir therapy. Advise female patients to avoid breastfeeding during therapy with darunavir.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.

Copyright © 2008 by F.A. Davis

- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

HIGH ALERT

DAUNOrubicin citrate liposome

(daw-noe-**roo**-bi-sin **sy**-trate **lye**-poe-sohm)
DaunoXome

Classification
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Pregnancy Category D

Indications

Management of advanced Kaposi's sarcoma in HIV-infected patients.

Action

Forms a complex with DNA, which subsequently inhibits DNA and RNA synthesis (cell-cycle phase–nonspecific). Encapsulation in a liposome increases uptake by tumor and decreases systemic toxicity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability. DaunoXome is released from the liposome after uptake by tumor.
Distribution: Widely distributed. Crosses the placenta.
Metabolism and Excretion: Extensively metabolized by the liver. Converted partially to a compound that also has antineoplastic activity (daunorubicinol); 40% eliminated by biliary excretion.
Half-life: *Daunorubicin citrate liposome*—55.4 hr. *Daunorubicinol*—26.7 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

D

Contraindications/Precautions

Contraindicated in: Hypersensitivity to daunorubucin citrate liposome or any other components in the formulation; Pregnant or lactating women.
Use Cautiously in: Active infections or decreased bone marrow reserve; Geriatric patients or patients with other chronic debilitating illnesses; May reactivate skin lesions produced by previous radiation therapy; Hepatic or renal impairment (dosage reduction recommended if serum creatinine >3 mg/dl or serum bilirubin >1.2 mg/dl); Patients who have received previous anthracycline therapy or who have underlying cardiovascular disease (increased risk of cardiotoxicity); Patients with childbearing potential; Children (safety not established for DaunoXome).

Adverse Reactions/Side Effects

CNS: fatigue, headache, depression, dizziness, insomnia, malaise. **EENT:** rhinitis, abnormal vision, sinusitis. **CV:** CARDIOTOXICITY, chest pain, edema. **GI:** abdominal pain, anorexia, constipation, diarrhea, nausea, stomatitis, tenesmus, vomiting. **GU:** red urine, gonadal suppression. **Derm:** alopecia, increased sweating, pruritus. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **MS:** back pain, arthralgia, myalgia. **Neuro:** neuropathy. **Misc:** *DaunoXome*— allergic reactions, chills, fever, back pain, flushing, chest tightness, influenza-like symptoms.

Interactions

Drug-Drug: Additive myelosuppression with other **antineoplastics**. May decrease antibody response to **live-virus vaccines** and increase risk of adverse reactions. **Cyclophosphamide** increases the risk of cardiotoxicity.

Route/Dosage

Other dose regimens are used. In adults, cumulative dose should not exceed 550 mg/m^2 (450 mg/m^2 if previous chest radiation).
IV (Adults): 40 mg/m^2 q 2 wk.

Copyright © 2008 by F.A. Davis

Renal Impairment

IV (Adults): *Serum creatinine >3 mg/dl*—reduce dose by 50%.

Hepatic Impairment

IV (Adults): *Serum bilirubin 1.2–3 mg/dl*—reduce dose by 25%; *serum bilirubin >3 mg/dl*—reduce dose by 50%.

Availability (generic available)

Liposomal dispersion for injection: 2 mg/ml in 25-ml vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess patient for back pain, flushing, and chest tightness. Usually occurs during first 5 min of infusion and subsides with interruption of therapy. Symptoms do not usually recur when infusion is restarted at a slower rate.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess IV site frequently for inflammation or infiltration. Instruct patient to notify nurse immediately if pain or irritation at injection site occurs. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Notify health care professional immediately.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which, although mild, may persist for 24–48 hr. Administration of an antiemetic before and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Encourage fluid intake of 2000–3000 ml/day. Allopurinol and alkalinization of the urine may be used to help prevent urate stone formation.
- Assess patient for evidence of cardiotoxicity, which manifests as CHF (peripheral edema, dyspnea, rales/crackles, weight gain, jugular venous distention) and usually occurs 1–6 mo after initiation of therapy. Chest x-ray, echocardiography, ECGs, and radionuclide angiography determination of ejection fraction may be ordered before and periodically throughout therapy. A 30% decrease in QRS voltage and decrease in systolic ejection fraction are early signs of cardiotoxicity. Patients who receive total cumulative doses >550/mm^2, who have a history of cardiac disease, or who have received mediastinal radiation are at greater risk of developing cardiotoxicity. May be irreversible and fatal, but usually responds to early treatment.
- ***Lab Test Considerations:*** Monitor uric acid levels.
- Monitor CBC and differential before each course of therapy. May cause severe bone marrow depression, especially granulocytopenia. Repeat blood counts before each dose and do not administer if absolute granulocyte count is <750 cells/mm^3.
- Monitor hepatic and renal function before each dose.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse daunorubicin citrate liposome (DaunoXome) with daunorubicin hydrochloride (Cerubidine) or with doxorubicin (Adriamycin, Rubex) or doxorubicin hydorchloride liposome (Doxil). To prevent confusion, orders should include generic and brand name.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with D5W. Do not use an in-line filter for infusion. Reconstituted infusion may be stored for up to 6 hr in refrigerator. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer dose over 1 hr.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics. Period of highest risk is 3–7 days after administration of dose.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping. Regrowth of hair usually begins within 5 wk after discontinuing therapy.
- Inform patient that medication may turn urine reddish color for 1–2 days after administration.
- Inform patient that this medication may cause irreversible gonadal suppression. Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Arrested progression of Kaposi's sarcoma in patients with HIV infection. Therapy is continued until there is evidence of progression (new visceral sites of involvement, progression of visceral disease, development of 10 or more new cutaneous lesions or 25% increase in the number of lesions at baseline, change in character of >25% of lesions from flat to raised, increase in surface area of lesions) or until complications of HIV disease preclude continuation of therapy.

HIGH ALERT

DAUNOrubicin hydrochloride

(daw-noe-**roo**-bi-sin **hye**-dro-**klor**-ide)
Cerubidine

D

Classification
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Pregnancy Category D

Indications

In combination with other antineoplastics in the treatment of leukemias.

Action

Forms a complex with DNA, which subsequently inhibits DNA and RNA synthesis (cell-cycle phase-nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta.
Metabolism and Excretion: Extensively metabolized by the liver. Converted partially to a compound that also has antineoplastic activity (daunorubicinol); 40% eliminated by biliary excretion.
Half-life: *Daunorubicin hydrochloride*—18.5 hr. *Daunorubicinol*—26.7 hr.

ic or renal impairment (dosage reduction recommended if serum creatinine >3 mg/dl or serum bilirubin >1.2 mg/dl); Patients who have received previous anthracycline therapy or who have underlying cardiovascular disease (increased risk of cardiotoxicity); Patients with childbearing potential.

Adverse Reactions/Side Effects

EENT: rhinitis, abnormal vision, sinusitis. **CV:** CARDIOTOXICITY, arrhythmias. **GI:** nausea, vomiting, esophagitis, hepatoxicity, stomatitis. **GU:** red urine, gonadal suppression. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Misc:** chills, fever.

Interactions

Drug-Drug: Additive myelosuppression with other **antineoplastics**. May decrease antibody response to **live-virus vaccines** and increase risk of adverse reactions. **Cyclophosphamide** increases the risk of cardiotoxicity. Increased risk of hepatic toxicity with other **hepatotoxic agents**.

Route/Dosage

Other dose regimens are used. In adults, cumulative dose should not exceed 550 mg/m^2 (450 mg/m^2 if previous chest radiation).

IV (Adults <60 yr): 45 mg/m^2/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Adults ≥60 yr): 30 mg/m^2/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).

IV (Children >2 yr): 25 mg/m^2 once weekly (as part of combination regimen). In children <2 yr or BSA <0.5 m^2, dosage should be determined on a mg/kg basis.

Availability (generic available)

Powder for injection: 20 mg/vial. **Solution for injection:** 5 mg/ml in 4-ml vials (20 mg).

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess IV site frequently for inflammation or infiltration. Instruct patient to notify nurse immediately if pain or irritation at injection site occurs. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Notify physician immediately. Daunorubicin hydrochloride is a vesicant. Standard treatments include local injections of steroids and application of ice compresses.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which, although mild, may persist for 24–48 hr. Administration of an antiemetic before and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Encourage fluid intake of 2000–3000 ml/day. Allopurinol and alkalinization of the urine may be used to help prevent urate stone formation.
- Assess patient for evidence of cardiotoxicity, which manifests as CHF (peripheral edema, dyspnea, rales/crackles, weight gain, jugular venous distention) and usually occurs 1–6 mo after initiation of therapy. Chest x-ray, echocardiography, ECGs, and radionuclide angiography determination of ejection fraction may be ordered before and periodically throughout therapy. A 30% decrease in QRS voltage and decrease in systolic ejection fraction are early signs of cardiotoxicity. Patients who receive total cumulative doses >550/mm^2, who have a history of cardiac disease, or who have received mediastinal radiation are at greater risk of developing cardiotoxicity. May be irreversible and fatal, but usually responds to early treatment.
- ***Lab Test Considerations:*** Monitor uric acid levels.
- *Daunorubicin hydrochloride:* Monitor CBC and differential before and periodically throughout therapy. The leukocyte count nadir occurs 10–14 days after administration. Recovery usually occurs within 21 days after administration of daunorubicin hydrochloride.
- Monitor AST, ALT, LDH, and serum bilirubin. May cause transiently ↑ serum alkaline phosphatase, bilirubin, and AST concentrations.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse daunorubicin hydrochloride (Cerubidine) with daunorubicin citrate liposome (DaunoXome) or with doxorubicin (Adriamycin, Rubex) or doxorubicin hydrochloride liposome (Doxil). To prevent confusion, orders should include generic and brand name.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **IV:** Reconstitute each 20 mg with 4 ml of sterile water for injection for a concentration of 5 mg/ml. Shake gently to dissolve. Reconstituted medication is stable for 24 hr at room temperature, 48 hr if refrigerated. Protect from sunlight.
- Do not use aluminum needles when reconstituting or injecting daunorubicin hydrochloride, as aluminum darkens the solution.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute further in 10–15 ml of 0.9% NaCl. Administer direct IV push through Y-site into free-flowing infusion of 0.9% NaCl or D5W. ***Rate:*** Administer over at least 2–3 min. Rapid administration rate may cause facial flushing or erythema along the vein.
- **Intermittent Infusion:** ***Diluent:*** May also be diluted in 50–100 mL of 0.9% NaCl. ***Rate:*** Administer 50 ml over 10–15 min or 100 ml over 30–45 min.
- **Y-Site Compatibility:** amifostine, etoposide, filgrastim, gemcitabine, granisetron, melphalan, methotrexate, ondansetron, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, aztreonam, cefepime, fludarabine, lansoprazole, piperacillin/tazobactam.
- **Additive Incompatibility:** Manufacturer does not recommend admixing daunorubicin hydrochloride.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics. Period of highest risk is 3–7 days after administration of dose.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping. Regrowth of hair usually begins within 5 wk after discontinuing therapy.
- Inform patient that medication may turn urine reddish color for 1–2 days after administration.
- Inform patient that this medication may cause irreversible gonadal suppression. Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

Copyright © 2008 by F.A. Davis

HIGH ALERT

decitabine (de-sit-a-been)

Dacogen

Classification

Therapeutic: antineoplastics

Pregnancy Category D

Indications

Treatment of various myelodysplastic syndromes (MDS).

Action

Inhibits DNA methyltransferase, causing apoptosis. Has more effect on rapidly replicating cells. **Therapeutic Effects:** Improved hematologic and clinical manifestations of MDS.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 0.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation.
Use Cautiously in: Patients with child-bearing potential (males and females); Impaired hepatic/renal function; Geri: Elderly patients may be more sensitive to effects; Pedi: Safety in children not established.

Adverse Reactions/Side Effects

CNS: confusion, fatigue, insomnia, depression, lethargy. **EENT:** blurred vision. **Resp:** cough. **CV:** atrial fibrillation, pulmonary edema, tachycardia. **GI:** abdominal pain, constipation, diarrhea, stomatitis, vomiting, abnormal liver function tests. **Derm:** petechiae, rash. **F and E:** edema, hypokalemia, hypomagnesemia, ascites. **Hemat:** BLEEDING, anemia, neutropenia, thrombocytopenia. **Local:** injection site irritation. **Metab:** hyperglycemia. **MS:** arthralgia, myalgia. **Misc:** INFECTION, fever, lymphadenopathy.

Interactions

Drug-Drug: ↑ risk of myelosuppression with other **antineoplastics**, **immunosuppressants**, or **radiation therapy**. May ↓ antibody response to and ↑ risk of adverse reactions from **live virus vaccines**.

Route/Dosage

IV (Adults): *First treatment cycle*—15 mg/m² as a continuous infusion over 3 hours repeated every 8 hours for 3 days. *Subsequent cycles*—cycle should be repeated every 6 wks for a minimum of 4 cycles; treatment may be continued as long as the patient continues to benefit. Dose adjustment/delay may be required for hematologic toxicity, renal or hepatic impairment, or infection.

Availability

Lyophilized powder for injection (requires reconstitution): 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- ***Lab Test Considerations:*** Monitor CBC prior to each dosing cycle and periodically as needed. May cause neutropenia, thrombocytopenia, and anemia; occur more frequently in 1st or 2nd cycle. Use early institution of growth factors and antimicrobial agents to prevent infections.
- Obtain liver chemistries and serum creatinine prior to initiation of treatment. May cause hyperbilirubinemia and hypoalbuminemia.
- May cause hyperglycemia, hypomagnesemia, hyponatremia, hypokalemia, and hyperkalemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

Copyright © 2008 by F.A. Davis

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix K).
- Pre-medicate patient with standard antiemetic therapy.
- If hematologic recovery (ANC ≥1,000 cells/mm^3 and platelets ≥50,000 cells/mm^3) from previous treatment cycle requires more than 6, but less than 8 wks—delay dosing for up to 2 wks and temporarily reduce dose to 11 mg/m^2 (33 mg/m^2/day, 99 mg/m^2/cycle) upon restarting therapy.
- If hematologic recovery requires more than 8, but less than 10 wks—Patient should be assessed for disease progression (by bone marrow aspirates); in the absence of progression, delay dose for up to 2 more wks and reduce dose as above upon restarting, then maintain or increase in subsequent cycles as clinically indicated.
- **Intermittent Infusion:** Reconstitute with 10 mL of Sterile Water for injection for a concentration of 5 mg/mL. Immediately after reconstitution, dilute further with 0.9% NaCl, D5W, or LR for a final concentration of 0.1–1.0 mg/mL. Unless used within 15 min of reconstitution, dilute solution must be prepared using cold infusion fluids and refrigerated until administration (maximum of 7 hr). ***Rate:*** Administer over 3 hr.

Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Inform patient that this medication may have teratogenic effects. Advise women to avoid becoming pregnant during treatment and advise men not to father a child during or for 2 months after treatment.

Evaluation/Desired Outcomes

- Improved hematologic and clinical manifestations of MDS.

D

deferoxamine

(de-fer-**ox**-a-meen)
Desferal

Classification
Therapeutic: antidotes
Pharmacologic: heavy metal antagonists

Pregnancy Category C

Indications

Acute toxic iron ingestion. Secondary iron overload syndromes associated with multiple transfusion therapy.

Action

Chelates unbound iron, forming a water-soluble complex (ferrioxamine) in plasma that is easily excreted by the kidneys. **Therapeutic Effects:** Removal of excess iron. Also chelates aluminum.

Pharmacokinetics

Absorption: Poorly absorbed after oral administration. Well absorbed after IM administration and subcut administration.
Distribution: Appears to be widely distributed.
Metabolism and Excretion: Metabolized by tissues and plasma enzymes. Unchanged drug and chelated form excreted by the kidneys; 33% of iron removed is eliminated in the feces via biliary excretion.
Half-life: 1 hr.

TIME/ACTION PROFILE (effects on hematologic parameters)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown
IM	unknown	unknown	unknown
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Severe renal disease; Anuria; OB: Early pregnancy or childbearing potential (however, may be used safely in pregnant patients with moderate-to-severe acute iron intoxication).
Use Cautiously in: Pedi: Children <3 yr (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

EENT: blurred vision, cataracts, ototoxicity. **CV:** hypotension, tachycardia. **GI:** abdominal pain, diarrhea. **GU:** red urine. **Derm:** erythema, flushing, urticaria. **Local:** induration at injection site, pain at injection site. **MS:** leg cramps. **Misc:** allergic reactions, fever, shock after rapid IV administration.

Interactions

Drug-Drug: Ascorbic acid may ↑ effectiveness of deferoxamine but may also ↑ cardiac iron toxicity.

Route/Dosage

Acute Iron Ingestion

IM, IV (Adults and Children ≥3 yr): 1 g (20 mg/kg or 600 mg/m^2), then 500 mg (10 mg/kg or 300 mg/m^2) q 4 hr for 2 doses. Additional doses of 500 mg (10 mg/kg or 300 mg/m^2) q 4–12 hr may be needed (not to exceed 6 g/24 hr).

Chronic Iron Overload

IM, IV (Adults and Children ≥3 yr): 500 mg–1 g daily; additional doses of 2 g should be given IV for each unit of blood transfused.
Subcut (Adults and Children ≥3 yr): 1–2 g/day (20–40 mg/kg/day) infused over 8–24 hr.

Availability (generic available)

Injection: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- In acute poisoning, assess time, amount, and type of iron preparation ingested.
- Monitor signs of iron toxicity: early acute (abdominal pain, bloody diarrhea, emesis), late acute (decreased level of consciousness, shock, metabolic acidosis).
- Monitor vital signs closely, especially during IV administration. Report hypotension, erythema, urticaria, or signs of allergic reaction. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- May cause oculotoxicity or ototoxicity. Report decreased visual acuity or hearing loss. Audiovisual exams should be performed every 3 mo in patients with chronic iron overload.
- Monitor intake and output and urine color. Inform physician or other health care professional if patient is anuric. Chelated iron is excreted primarily by the kidneys; urine may turn red.
- ***Lab Test Considerations:*** Monitor serum iron, total iron binding capacity (TIBC), ferritin levels, and urinary iron excretion before and periodically during therapy.
- Monitor liver function studies to assess damage from iron poisoning.

Potential Nursing Diagnoses

Risk for injury poisoning (Indications)

Implementation

- IM route is preferred unless patient is in shock.
- Reconstitute 500-mg vial with 2 ml of sterile water for injection. Dissolve powder completely before administration. Solution is stable for 1 wk after reconstitution if protected from light.
- Used in conjunction with induction of emesis or gastric aspiration and lavage with sodium bicarbonate, and supportive measures for shock and metabolic acidosis in acute poisoning.
- **Trial Dose:** May be administered between 2 and 4 hr after ingestion of iron and after GI tract has been cleaned out. Monitor urine for color change (orange-rose color indicates significant iron ingestion) until serum iron and total iron binding capacity results are available.
- May be administered IM or by IV infusion over 4 hr.
- **IM:** Administer deep IM and massage well. Rotate sites. IM administration may cause transient severe pain.
- **Subcut:** Subcut route used to treat chronically elevated iron therapy is administered into abdominal subcut tissue via infusion pump for 8–24 hr per treatment.
- **IV:** Reconstitute, then further dilute in D5W, 0.9% NaCl, or LR. ***Rate:*** Maximum infusion rate is 15 mg/kg/hr. Rapid infusion rate may cause hypotension, erythema, urticaria, wheezing, convulsions, tachycardia, or shock.
- May be administered at the same time as blood transfusion in persons with chronically elevated serum iron levels. Use separate site for administration.

Patient/Family Teaching

- Reinforce need to keep iron preparations, all medications, and hazardous substances out of the reach of children.

Copyright © 2008 by F.A. Davis

- Reassure patient that red coloration of urine is expected and reflects excretion of excess iron.
- Advise patient not to take vitamin C preparations without consulting health care professional, because tissue toxicity may increase.
- Encourage patients requiring chronic therapy to keep follow-up appointments for lab tests. Eye and hearing exams may be monitored every 3 mo.

Evaluation/Desired Outcomes

- Return of serum iron concentrations to a normal level (50–150 mcg/100 ml).

desipramine

(dess-**ip**-ra-meen)
Norpramin, ♣Pertofrane

Classification
Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Pregnancy Category C

Indications

Depression. **Unlabeled uses:** Chronic pain syndromes. Anxiety. Insomnia.

Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action (may develop only over several weeks).

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed.
Protein Binding: 90–92%.
Metabolism and Excretion: Extensively metabolized by the liver. One metabolite is pharmacologically active (2-hydroxydesipramine). Undergoes enterohepatic recirculation and secretion into gastric juices. Small amounts enter breast milk.
Half-life: 12–27 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	2–6 wk	days–wks

D

Contraindications/Precautions

Contraindicated in: Angle-closure glaucoma; Recent MI, heart failure, known history of QTc prolongation.
Use Cautiously in: Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (↑ susceptibility to urinary retention); History of seizures (threshold may be ↓); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; OB: Use during pregnancy only if potential maternal benefit outweighs risks to fetus; use during lactation may result in neonatal sedation; Pedi: Safety not established in children <12 yr; Geri: ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, drug-induced hepatitis, paralytic ileus, increased appetite, weight gain. **GU:** urinary retention, decreased libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: Desipramine is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs which compete for metabolism by or alter the activity of this enzyme including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrthythmics** (**propafenone**, **flecainide**, **encainide**); when used concurrently dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir** may result in ↑ effects. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (fluoxetine should be

Copyright © 2008 by F.A. Davis

stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. **Phenytoin** may ↓ levels and effectiveness; ↑ doses of desipramine may be required to treat depression. Concurrent use with **levodopa** may result in delayed / ↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**, **carbamazepine**, and **barbiturates**. Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioid analgesics**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking** may ↑ metabolism and alter effects. **Drug-Natural Products:** Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 100–200 mg/day as a single dose or in divided doses (up to 300 mg/day).
PO (Geriatric Patients): 25–50 mg/day in divided doses (up to 150 mg/day).
PO (Children >12 yr): 25–50 mg/day in divided doses, increased as needed up to 100 mg/day.
PO (Children 6–12 yr): 10–30 mg/day (1–5 mg/kg/day) in divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Obtain weight and BMI initially and periodically throughout therapy.
- Assess FBS and cholesterol levels for overweight/obese individuals.
- Refer as appropriate for nutrition/weight management and medical management.
- Monitor blood pressure and pulse prior to and during initial therapy. Notify physician or other health care professional of decreases in blood pressure (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored prior to and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Pain:** Assess intensity, quality, and location of pain periodically throughout therapy. Use pain scale to monitor effectiveness of medication.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- ***Lab Test Considerations:*** Serum levels may be monitored in patients who fail to respond to usual therapeutic dose.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Impaired oral mucous membrane (Side Effects)
Impaired urinary elimination (Side Effects)
Chronic pain (Indications)
Risk for constipation (Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse despiramine with clomipramine, imipramine, or nortriptyline.
- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May give entire dose at bedtime.
- Taper to avoid withdrawal effects. Reduce dose by half for 3 days then reduce again by half for 3 days, then discontinue.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea; vomiting; diarrhea; headache; trouble sleeping, with vivid dreams; and irritability.

Copyright © 2008 by F.A. Davis

- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in the elderly. Protect patient from falls. Institute fall precautions. Advise patient to make position changes slowly.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluids or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Alert patient that medication may turn urine blue-green in color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects and to improve coping skills.
- Refer to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

desirudin (des-i-**rude**-in)
Iprivask

Classification
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

Pregnancy Category C

D

Indications

Prevention of deep-vein thrombosis (DVT) after hip-replacement surgery.

Action

Selectively inhibits free and clot-bound thrombin. Inhibition of thrombin prevents activation of factors V, VIII, and XII; conversion of fibrinogen to fibrin; platelet adhesion and aggregation.
Therapeutic Effects: Decreased incidence of DVT and subsequent pulmonary embolism after hip-replacement surgery.

Pharmacokinetics

Absorption: Completely absorbed following subcutaneous administration.
Distribution: Binds specifically and directly to thrombin.
Metabolism and Excretion: 40–50% excreted unchanged by kidneys; some metabolism in kidneys and pancreas.
Half-life: 2 hr.

TIME/ACTION PROFILE (effect on aPTT)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	1–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to natural or recombinant hirudins; Active bleeding; Coagulation disorders.
Use Cautiously in: Renal impairment (dosage change recommended if CCr ≤60 ml/min); Geriatric patients (due to age-related renal impairment); Hepatic impairment; Pregnancy (use only if benefits to mother outweigh fetal risk); Lactation, children (safety not established).
Exercise Extreme Caution in: Spinal/epidural anesthesia (increased risk of spinal/epidural hematomas and their sequelae, especially when used with NSAIDs, platelet inhibitors, or other anticoagulants).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

GI: nausea. **Hemat:** BLEEDING, anemia. **Local:** injection site reactions, wound secretion.

Interactions

Drug-Drug: Dextran 40, **systemic corticosteroids**, **thrombolytics**, and other **anticoagulants** ↑ risk of bleeding (discontinue if possible; if not, monitor laboratory and clinical status closely). Agents altering platelet function including **salicylates**, **NSAIDs**, **clopidogrel**, **ticlopidine**, **dipyridamole**, and **glycoprotein IIb/IIIa antagonists** also ↑ risk of bleeding.

Route/Dosage

Subcut (Adults): 15 mg every 12 hr, start 5–15 min prior to surgery, but after regional block (if used), for up to 12 days.

Renal Impairment

Subcut (Adults): *CCr 31–60 ml/min*—start with 5 mg every 12 hr; further doses determined by daily aPTT; *CCr <31 ml/min*—start with 1.7 mg every 12 hr; further doses determined by daily aPTT.

Availability

Lyophilized powder for injection (requires reconstitution with specific diluent): 15.75 mg/vial with 0.6 ml ampule of diluent (contains mannitol, delivers 15 mg dose).

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding (bleeding gums, nosebleed, unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools; bleeding from surgical site). Notify physician if these occur.
- Assess patient for evidence of thrombosis. Symptoms depend on area of involvement. Notify physician immediately; may require urgent treatment.
- Monitor patients with epidural catheters frequently for signs of neurological impairment (midline back pain, numbness or weakness in lower limbs, bowel and/or bladder dysfunction). Notify physician immediately if these occur.
- Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor activated partial thromboplastin time (aPTT) daily in patients with increased risk of bleeding and/or renal impairment. Monitor serum creatinine daily in patients with renal impairment. Peak aPTT should not exceed two times control. Reduce dose or discontinue desirudin until aPTT is <2 times control; resume at a lower dose.
- If a patient is switched from oral anticoagulants to desirudin or from desirudin to oral anticoagulants, measure anticoagulant activity closely.
- Thrombin time is not suitable for monitoring desirudin.
- Monitor CBC. If hematocrit ↓ unexpectedly, assess patient for potential bleeding sites.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Adverse Reactions)

Implementation

- Reconstitute each vial with 0.5 ml of diluent provided for a concentration of 15.75 mg of desirudin/0.5 ml. Shake vial gently until fully reconstituted to a clear colorless solution. Do not administer solutions that are discolored, cloudy, or contain particulate matter. Reconstituted solution should be used immediately, but is stable for 24 hr at room temperature and protected from light. Discard unused solution.
- **Subcut:** Withdraw all reconstituted solution into syringe with a 26- or 27-gauge, 1/2 inch length needle. Inject entire contents subcutaneously which will deliver 15 mg. Patient should be sitting or lying down during administration. Rotate sites between left and right anterolateral and left and right posterolateral thigh or abdominal wall. Inject entire length of needle while pinching skin between thumb and forefinger; continue to pinch skin throughout injection. Do not rub injection site following injection to prevent bruising.
- **Syringe Incompatibility:** Do not mix with other diluents or medications.

Patient/Family Teaching

- Advise patient to report symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take aspirin, NSAIDs, or herbal products during therapy without consulting health care professional.

Evaluation/Desired Outcomes

- Decreased incidence of DVT and subsequent pulmonary embolism after hip-replacement surgery.

Copyright © 2008 by F.A. Davis

desloratadine

(dess-lor-**a**-ta-deen)
Clarinex

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines
Pharmacologic: piperidines

Pregnancy Category C

Indications
Symptoms of allergic rhinitis (seasonal and perennial). Chronic idiopathic urticaria.

Action
Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness, red swollen eyes). Decreased pruritus, reduction in number and size of hives in chronic idiopathic urticaria.

Pharmacokinetics
Absorption: Well absorbed; absorption for orally-disintegrating tablets and oral tablets is identical.
Distribution: Enters breast milk.
Metabolism and Excretion: Extensively metabolized to 3-hydroxydesloratadine, an active metabolite; small percentage of patients may be slow metabolizers.
Half-life: 27 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Lactation.
Use Cautiously in: Patients with hepatic or renal impairment (↓ dose to 5 mg every other day); Geri: Dosing for the elderly should consider ↓ hepatic, renal, or cardiac function, concomitant diseases, other drug therapy and ↑ risk of adverse reactions; Pedi: Children <6 mo (safety not established).

Adverse Reactions/Side Effects
CNS: drowsiness (rare). **EENT:** pharyngitis. **GI:** dry mouth. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions
Drug-Drug: The following interactions may occur, but are less likely to occur with desloratidine than with more sedating antihistamines. **MAO inhibitors** may ↑ and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants** including **alcohol**, **antidepressants**, **opioids**, and **sedative/hypnotics**.

Route/Dosage
PO (Adults and Children ≥12 yr): 5 mg once daily.

Hepatic Impairment

Renal Impairment
PO (Adults and Children ≥12 yr): 5 mg every other day.
PO (Children 6–11 yr): 2.5 mg once daily.
PO (Children 12 mo–5 yr): 1.25 mg once daily.
PO (Children 6–12 mo): 1 mg once daily.

Availability
Tablets: 5 mg. **Cost:** $292.91/90. **Orally-disintegrating tablets (RediTabs) (tutti-frutti):** 2.5 mg, 5 mg. **Cost:** 2.5 mg $319.29/90, 5 mg $307.89/90. **Syrup (bubblegum):** 0.5 mg/mL. **Cost:** $168.58/473 ml. ***In combination with:*** pseudoephedrine (Clarinex-D 12 Hour, Clarinex-D 24 Hour; see Appendix B).

NURSING IMPLICATIONS

Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result on allergy skin testing.

Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation
- **PO:** May be administered without regard to meals.
- Pedi: Use calibrated measuring device to ensure accurate dose of syrup for children.
- *For rapidly disintegrating tablets (Reditabs):* Place on tongue. Tablet disintegrates

Copyright © 2008 by F.A. Davis

rapidly. May be taken with or without water. Administer immediately after opening the blister.

Patient/Family Teaching

- Instruct patients to take desloratidine as directed. Do not increase dose or frequency; does not increase effectiveness and may increase side effects.
- May rarely cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

desmopressin

(des-moe-**press**-in)
DDAVP, DDAVP Rhinal Tube, DDAVP Rhinyle Drops, Octostim, Stimate

Classification
Therapeutic: hormones
Pharmacologic: antidiuretic hormones

Pregnancy Category B

Indications

Intranasal: Management of primary nocturnal enuresis unresponsive to other treatment modalities. **PO, Subcut, IV, Intranasal:** Treatment of diabetes insipidus caused by a deficiency of vasopressin. **Intranasal:** Controls bleeding in certain types of hemophilia and von Willebrand's disease.

Action

An analogue of naturally occurring vasopressin (antidiuretic hormone). Primary action is enhanced reabsorption of water in the kidneys.
Therapeutic Effects: Prevention of nocturnal enuresis. Maintenance of appropriate body water content in diabetes insipidus. Control of bleeding in certain types of hemophilia or von Willebrand's disease.

Pharmacokinetics

Absorption: 5% absorbed following oral administration; some 10–20% absorbed from nasal mucosa.
Distribution: Distribution not fully known. Enters breast milk.
Metabolism and Excretion: Unknown.
Half-life: 75 min.

TIME/ACTION PROFILE (PO, intranasal = antidiuretic effect; IV = effect on factor VIII activity)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	4–7 hr	unknown
Intranasal	1 hr	1–5 hr	8–20 hr
IV	within min	15–30 min	3 hr†

†4–24 hr in mild hemophilia A

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to chlorobutanol; Patients with type IIB or platelet-type (pseudo) von Willebrand's disease.
Use Cautiously in: Angina pectoris; Hypertension; Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, listlessness. **EENT:** *intranasal*— nasal congestion, rhinitis. **Resp:** dyspnea. **CV:** hypertension, hypotension, tachycardia (large IV doses only). **GI:** mild abdominal cramps, nausea. **GU:** vulval pain. **Derm:** flushing. **F and E:** water intoxication/hyponatremia. **Local:** phlebitis at IV site.

Interactions

Drug-Drug: Chlorpropamide, **clofibrate**, or **carbamazepine** may enhance the antidiuretic response to desmopressin. **Demeclocycline**, **lithium**, or **norepinephrine** may diminish the antidiuretic response to desmopressin. Large doses may enhance the effects of **vasopressors**.

Route/Dosage

Primary Nocturnal Enuresis

Intranasal (Adults and Children ≥6 yr): 20 mcg (10 mcg in each nostril) at bedtime (range 10–40 mcg).

Diabetes Insipidus

PO (Adults): 0.05 mg twice daily; adjusted as needed (usual range 0.1–1.2 mg/day in 2–3 divided doses).
PO (Children): 0.05 mg daily initially; adjusted as needed.

Copyright © 2008 by F.A. Davis

Intranasal (Adults): *Using nasal tube delivery system or spray pump (0.1 mg/ml)*—0.1–0.4 ml/day as a single dose or 2–3 divided doses.
Intranasal (Children 3 mo–12 yr): *Using nasal tube delivery system or spray pump (0.1 mg/ml)*—0.05–0.3 ml/day as a single dose or 2 divided doses.
Subcut, IV (Adults): 2–4 mcg/day in 2 divided doses.

Antihemorrhagic

IV (Adults and Children >3 mo): 0.3 mcg/kg repeated as needed.
Intranasal (Adults and Children ≥50 kg): 1 spray (150 mcg) in each nostril.
Intranasal (Adults and Children <50 kg): 1 spray in one nostril (150 mcg).

Availability

Tablets: 0.1 mg, 0.2 mg. **Nasal spray pump:** 10 mcg/spray—5-ml bottle (0.1 mg/ml) contains 50 doses (DDAVP). **Rhinal tube delivery system-nasal solution:** 2.5-ml vials with applicator tubes (0.1 mg/ml). **Nasal solution:** 1.5 mg/ml (150 mcg/dose) in 2.5-ml bottle (contains 25 doses). **Injection:** 4 mcg/ml.

NURSING IMPLICATIONS

Assessment

- Chronic intranasal use may cause tolerance or if administered more frequently than every 24–48 hr IV tachyphylaxis (short-term tolerance) may develop.
- **Nocturnal Enuresis:** Monitor frequency of enuresis throughout therapy.
- **Diabetes Insipidus:** Monitor urine and plasma osmolality and urine volume frequently. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily and assess for edema.
- **Hemophilia:** Monitor plasma factor VIII coagulant, factor VIII antigen, and ristocetin cofactor. May also assess activated partial thromboplastin time (aPTT) for hemophilia A and skin bleeding time for von Willebrand's disease. Assess patient for signs of bleeding.
- Monitor blood pressure and pulse during IV infusion.
- Monitor intake and output and adjust fluid intake (especially in children and elderly) to avoid overhydration in patients receiving desmopressin for hemophilia.
- ***Toxicity and Overdose:*** Signs and symptoms of water intoxication include confusion, drowsiness, headache, weight gain, difficulty urinating, seizures, and coma. Treatment of overdose includes decreasing dose and, if symptoms are severe, administration of furosemide.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)
Excess fluid volume (Adverse Reactions)

Implementation

- IV desmopressin has 10 times the antidiuretic effect of intranasal desmopressin.
- **PO:** Begin oral doses 12 hr after last intranasal dose. Monitor response closely.
- **Diabetes Insipidus:** Parenteral dose for antidiuretic effect is administered through direct IV or subcut.
- **Hemophilia:** Parenteral dose for control of bleeding is administered via IV infusion. If used preoperatively, administer 30 min prior to procedure.

IV Administration

- **Direct IV:** (for diabetes insipidus) ***Diluent:*** Administer undiluted. ***Concentration:*** 4 mcg/ml. ***Rate:*** Administer over 1 min.
- **Intermittent Infusion:** (for hemophilia and von Willebrand's disease) ***Diluent:*** Dilute each dose in 50 ml of 0.9% NaCl for adults and children >10 kg and in 10 ml in children weighing <10 kg. ***Rate:*** Infuse slowly over 15–30 min.
- **Y-Site Compatibility:** No information available. **Intranasal:** If intranasal dose is used preoperatively, administer 2 hr before procedure.

Patient/Family Teaching

- Advise patient to notify health care professional if bleeding is not controlled or if headache, dyspnea, heartburn, nausea, abdominal cramps, vulval pain, or severe nasal congestion or irritation occurs.
- Caution patient to avoid concurrent use of alcohol with this medication.
- **Diabetes Insipidus:** Instruct patient on intranasal administration. Medication is supplied with a flexible calibrated catheter (rhinyle). Draw solution into rhinyle. Insert one

Copyright © 2008 by F.A. Davis

end of tube into nostril; blow on the other end to deposit solution deep into nasal cavity. An air-filled syringe may be attached to the plastic catheter for children, infants, or obtunded patients. Tube should be rinsed under water after each use.
- If nasal spray is used, prime pump prior to first use by pressing down 4 times. Caution patient that nasal spray should not be used beyond the labeled number of sprays; subsequent sprays may not deliver accurate dose. Do not attempt to transfer remaining solution to another bottle.
- Instruct patient to take missed doses as soon as remembered but not if it is almost time for the next dose. Do not double doses.
- Advise patient that rhinitis or upper respiratory infection may decrease effectiveness of this therapy. If increased urine output occurs, patient should contact health care professional for dosage adjustment.
- Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes
- Decreased frequency of nocturnal enuresis.
- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality.
- Control of bleeding in hemophilia.

desonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

desoximetasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

dexamethasone, See CORTICOSTEROIDS (SYSTEMIC).

dexmethylphenidate
(dex-meth-ill-**fen**-i-date)
Focalin, Focalin XR

Classification
Therapeutic: central nervous system stimulants

Schedule II

Pregnancy Category C

Indications
Adjunctive treatment of ADHD.

Action
Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD.

Pharmacokinetics
Absorption: Readily absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; inactive metabolites are renally excreted.
Half-life: 2.2 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	7 days	1 mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hyperexcitable states (marked anxiety, agitation, or tension); Hyperthyroidism; Psychotic personalities, suicidal or homicidal tendencies; Glaucoma; Motor tics, family history or diagnosis of Tourette's syndrome; Concurrent use of MAO inhibitors; Should not be used to treat depression or prevent/treat normal fatigue; Psychoses (may exacerbate symptoms).
Use Cautiously in: History of cardiovascular disease; Hyperthyroidism; Hypertension; Diabetes mellitus; Geri: Geriatric/debilitated patients; Continual use (may result in psychological or physical dependence); Seizure disorders (may lower seizure threshold); OB: Pregnancy, lactation, or children <6 yr (safety not established; use in pregnancy only if clearly needed).

Adverse Reactions/Side Effects
CNS: insomnia, nervousness. **EENT:** visual disturbances. **CV:** tachycardia. **GI:** abdominal pain, anorexia, nausea. **Metab:** growth suppression, weight loss (may occur with prolonged use). **Neuro:** twitching. **Misc:** fever.

Interactions
Drug-Drug: Concurrent use with or use within 14 days following discontinuation of **MAO inhibitors** may result in hypertensive crisis and is contraindicated. May ↓ effects of **antihypertensives**. May ↑ effects of **vasopressors**. May cause serious adverse reactions with **clonidine**. May ↑ effects of **warfarin**, **phe-**

Copyright © 2008 by F.A. Davis

nobarbital, **phenytoin**, some **antidepressants**; dose adjustments may be necessary.

Route/Dosage

Tablets

PO (Adults and Children ≥6 yr): *Patients not previously taking methylphenidate*—2.5 mg twice daily, may be increased weekly as needed up to 10 mg twice daily; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 10 mg twice daily.

Extended-release Capsules

PO (Adults): *Patients not previously taking methylphenidate*—10 mg once daily, may be increased by 10 mg after 1 wk to 20 mg/day; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 20 mg/day given as a single daily dose; *Patients currently taking dexmethylphenidate*—give same daily dose as a single dose.
PO (Children ≥6 yr): *Patients not previously taking methylphenidate*—5 mg once daily, may be increased by 5 mg weekly up to 20 mg/day; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 20 mg/day, given as a single daily dose; *Patients currently taking dexmethylphenidate*—give same daily dose as a single dose.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $69.90/100, 5 mg $89.90/100, 10 mg $129.90/100. **Extended-release capsules:** 5 mg, 10 mg, 15 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy.
- Monitor growth, both height and weight, in children on long-term therapy.
- Dexmethylphenidate has the potential for dependence and abuse. Prolonged use may result in tolerance.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

Implementation

- **PO:** Administer twice daily at least 4 hr apart without regard to meals.
- Administer Focalin XR tablets once daily in the morning. Capsules should be swallowed whole. For patients with difficulty swallowing, capsules can be opened and sprinkled on a spoonful of applesauce. Mixture should be consumed immediately; do not store for future use.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If more than prescribed amount is taken notify health care professional immediately. If a dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6 PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation with high doses may cause extreme fatigue and mental depression.
- Inform patient that sharing this medication may be dangerous.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- Advise patient to consult with health care professional prior to taking other prescription, OTC, or herbal products concurrently with dexmethylphenidate.
- May rarely cause dizziness or drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.

Copyright © 2008 by F.A. Davis

- Emphasize the importance of routine follow-up exams to monitor progress.
- Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Improved attention span, decreased impulsiveness, and hyperactivity in ADHD. If improvement is not seen within 1 month, discontinue dexmethylphenidate.

dexrazoxane (dex-ra-zox-ane)
Totect, Zinecard

Classification
Therapeutic: cardioprotective agents

Pregnancy Category C

Indications
Reducing incidence and severity of cardiomyopathy from doxorubicin in women with metastatic breast cancer who have already received a cumulative dose of doxorubicin >300 mg/m^2. Treatment of extravasation resulting from IV anthracycline chemotherapy.

Action
Acts as an intracellular chelating agent. **Therapeutic Effects:** Diminishes the cardiotoxic effects of doxorubicin. Decreased damage from extravasation of anthracyclines.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism occurs; 42% eliminated in urine.
Half-life: 2.1–2.5 hr.

TIME/ACTION PROFILE (cardioprotective effect)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	unknown

Contraindications/Precautions
Contraindicated in: Any other type of chemotherapy except other anthracyclines (doxorubicin-like agents).
Use Cautiously in: CCr <40 mL/min (dose reduction required); OB: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
Hemat: myelosuppression. **Local:** pain at injection site.

Interactions
Drug-Drug: Myelosuppression may be ↑ by **antineoplastics** or **radiation therapy**. Antitumor effects of concurrent combination chemotherapy with **fluorouracil** and **cyclophosphamide** may be ↓ by dexrazoxane.

Route/Dosage

Cardioprotective
IV (Adults): 10 mg of dexrazoxane/1 mg doxorubicin.

Renal Impairment
IV (Adults): decrease dose by 50%.

Extravasation protection
IV (Adults): 1000 mg/m^2 (maximum 2000 mg) given on days 1 and 2, and followed by a dose of 500 mg/m^2 (maximum 1000 mg) on day 3.

Renal Impairment
IV (Adults CCr <40 mL/min): decrease dose by 50%.

Availability (generic available)
Injection (Zinecard): 250-mg vial, 500-mg vial. **Injection (Totect):** 500-mg vial.

NURSING IMPLICATIONS

Assessment
- **Cardioprotective:** Assess extent of cardiomyopathy (cardiomegaly on x-ray, basilar rales, S gallop, dyspnea, decline in left ventricular ejection fraction) prior to and periodically during therapy.
- **Extravasation protection:** Assess site of extravasation for pain, burning, swelling, and redness.
- ***Lab Test Considerations:*** Monitor CBC and platelet count frequently during therapy. Thrombocytopenia, leukopenia, neutropenia, and granulocytopenia from chemotherapy may be more severe at nadir with dexrazoxane therapy.
- Monitor liver function tests periodically during therapy. May cause reversible ↑ of liver enzymes.

Potential Nursing Diagnoses
Decreased cardiac output (Indications)
Risk for impaired skin integrity (Indications)

Implementation
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equip-

Copyright © 2008 by F.A. Davis

ment in specially designated containers (see Appendix K).
- Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution and diluted solution are stable in an IV bag for 6 hr at room temperature or if refrigerated. Discard unused solutions.

IV Administration

- **Cardioprotective:** Doxorubicin should be administered within 30 min following dexrazoxane administration.
- **Direct IV:** ***Diluent:*** Reconstitute dexrazoxane with 0.167 molar (M/6) sodium lactate injection. ***Concentration:*** 10 mg/ml. ***Rate:*** Administer via slow IV push.
- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may also be diluted with 0.9% NaCl or D5W. Solution is stable for 6 hr at room temperature or refrigerated. ***Concentration:*** 1.3–5 mg/ml. ***Rate:*** May also be administered via rapid IV infusion over 15–30 min.
- **Additive Incompatibility:** Do not mix with other medications. Extravasation Protection. Administer as soon as possible within 6 hr of extravasation. Remove cooling procedures, such as ice packs, at least 15 min before administration to allow sufficient blood flow to area of extravasation.
- **Intermittent Infusion:** ***Diluent:*** Dilute each vial in 50 mL of diluent provided by manufacturer. Add contents of all vials into 1000 mL of 0.9% NaCl for further dilution. Solution is slightly yellow. Use diluted solutions within 2 hrs of dilution. Store at room temperature. ***Rate:*** Administer over 1–2 hrs.

Patient/Family Teaching

- Explain the purpose of the medication to the patient.
- Emphasize the need for continued monitoring of cardiac function.
- Advise patient to notify health care professional if pregnancy is suspected or planned. Dexrazoxane may be teratogenic.

Evaluation/Desired Outcomes

- Reduction of incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer.
- Decrease in late sequalae (site pain, fibrosis, atrophy, and local sensory disturbance) following extravasation of anthracycline chemotherapeutic agents.

dextroamphetamine

(dex-troe-am-**fet**-a-meen)
Dexedrine, Dextrostat

Classification
Therapeutic: central nervous system stimulants
Pharmacologic: amphetamines

Schedule II

Pregnancy Category C

Indications

Narcolepsy. Adjunct management of ADHD. **Unlabeled uses:** Exogenous obesity.

Action

Produces CNS stimulation by releasing norepinephrine from nerve endings. Pharmacologic effects: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation), Contraction of the urinary bladder sphincter. **Therapeutic Effects:** Increased motor activity and mental alertness and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

Pharmacokinetics

Absorption: Well absorbed.
Distribution: Widely distributed; high concentrations in brain and CSF. Crosses the placenta; enters breast milk; potentially embryotoxic.
Metabolism and Excretion: Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.
Half-life: 10–12 hr (6.8 hr in children).

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	3 hr	2–10 hr
PO-ER	unknown	unknown	up to 24 hr

Contraindications/Precautions

Contraindicated in: Pregnancy or lactation; Hyperexcitable states, including hyperthyroidism; Psychotic personalities; Suicidal or homicidal tendencies; Glaucoma; Some products con-

Copyright © 2008 by F.A. Davis

tain tartrazine; avoid in patients with known hypersensitivity.
Use Cautiously in: Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hypertension; Diabetes mellitus; History of substance abuse; Debilitated patients; Continual use (may produce psychological dependence or physical addiction); Geri: Appears on Beers list. Elderly are at increased risk for cardiovascular side effects.

Adverse Reactions/Side Effects

CNS: hyperactivity, insomnia, restlessness, tremor, depression, dizziness, headache, irritability. **CV:** palpitations, tachycardia, arrhythmias, hypertension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, increased libido. **Derm:** urticaria. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: ↑ adrenergic effects with other **adrenergics**. Use with **MAO inhibitors** can result in hypertensive crisis. Alkalinizing the urine (**sodium bicarbonate**, **acetazolamide**) prolongs effect. Acidification of urine (**ammonium chloride**, large doses of **ascorbic acid**) ↓ effect. **Phenothiazines** may decrease the effect of dextroamphetamine. May antagonize the response to **antihypertensives**. ↑ risk of cardiovascular side effects with **beta blockers** or **tricyclic antidepressants**. **Drug-Natural Products: St. John's wort** may increase serious side effects, concurrent use is not recommended. Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect. **St. John's wort** may increase serious side effects, concurrent use is not recommended.

Route/Dosage

Attention-Deficit Hyperactivity Disorder

PO (Adults): 5–40 mg/day in divided doses. Sustained-release capsules should not be used as initial therapy.
PO (Children ≥6 yr): 5 mg 1–2 times daily, increase by 5 mg daily at weekly intervals (maximum: 40 mg/day). Sustained-release capsules should not be used as initial therapy.
PO (Children 3–5 yr): 2.5 mg/day, increase by 2.5 mg daily at weekly intervals (maximum: 40 mg/day).

Narcolepsy

PO (Adults): 5–60 mg/day single dose or in divided doses. Sustained-release capsules should not be used as initial therapy.
PO (Children ≥12 yr): 10 mg/day, increase by 10 mg/day at weekly intervals until response is obtained or 60 mg is reached.
PO (Children 6–12 yr): 5 mg/day, increase by 5 mg/day at weekly intervals until response is obtained or 60 mg is reached.

Exogenous Obesity

PO (Adults and Children >12 yr): 5–30 mg/day in divided doses of 5–10 mg given 30–60 min before meals.

Availability (generic available)

Tablets: 5 mg. **Sustained-release capsules:** 5 mg, 10 mg, 15 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy.
- Geri: Not recommended for use in elderly secondary to risk for hypertension, angina, and MI.
- **ADHD:** Monitor weight biweekly and inform physician of significant loss. Pedi: Monitor height periodically in children; report growth inhibition.
- Assess attention span, impulse control, motor and vocal tics, and interactions with others.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- ***Lab Test Considerations:*** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

Implementation

- Do not confuse Adderall (dextroamphetamine/amphetamine) with Inderal (propranolol).

Copyright © 2008 by F.A. Davis

- Therapy should utilize the lowest effective dose.
- **PO:** Sustained-release capsules should be swallowed whole; do not break, crush, or chew.
- **ADHD:** Pedi: When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer months or may be given on each of the 5 school days with medication-free weekends and holidays.

Patient/Family Teaching

- Instruct patient to take medication at least 6 hr before bedtime to avoid sleep disturbances. Take missed doses as soon as remembered up to 6 hr before bedtime. Do not double doses. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to avoid the intake of large amounts of caffeine.
- Medication may impair judgment. Advise patients to use caution when driving or during other activities requiring alertness.
- Advise patient to notify health care professional if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe.
- Inform patient that periodic holiday from the drug may be ordered to assess progress and decrease dependence.

Evaluation/Desired Outcomes

- Improved attention span. Therapy should be interrupted and needs reassessed periodically.
- Decrease in narcoleptic symptoms.

dextromethorphan

(dex-troe-meth-**or**-fan)

Balminil DM, Benylin Adult, Benylin Pediatric, Broncho-Grippol-DM, Calmylin #1, Children's Hold, Creo-Terpin, Delsym, Dex-Alone, DM Syrup, Drixoral Liquid Cough Caps, ElixSure Children's Cough Syrup, Hold, Koffex, Little Colds Cough Formula Drops, Mediquell, Neo-DM, Ornex•DM, PediCare Infant's Long Acting Cough Drops, Pertussin Cough Suppressant, Pertussin CS, Pertussin ES, Robidex, Robitussin Cough Calmers, Robitussin CoughGels, Robitussin Maximum Strength Cough Suppressant, Robitussin Pediatric, Sedatuss, Simply Cough, Sucrets Cough Control Formula, TheraFlu Thin Strips Long Acting Cough, Triaminic Thin Strips Long Acting Cough, Vicks 44 Cough Relief, Vicks Formula 44 Pediatric Formula

Classification

Therapeutic: allergy, cold, and cough remedies, antitussives

Pregnancy Category C

Indications

Symptomatic relief of coughs caused by minor viral upper respiratory tract infections or inhaled irritants. Most effective for chronic nonproductive cough. A common ingredient in nonprescription cough and cold preparations.

Action

Suppresses the cough reflex by a direct effect on the cough center in the medulla. Related to opioids structurally but has no analgesic properties. **Therapeutic Effects:** Relief of irritating nonproductive cough.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract. Extended-release product is slowly absorbed.
Distribution: Unknown. Probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Metabolized to dextrorphan, an active metabolite. Dextromethorphan and dextrorphan are renally excreted.
Half-life: Unknown.

TIME/ACTION PROFILE (cough suppression)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	3–6 hr†
PO-ER	unknown	unknown	9–12 hr

†Up to 8 hr for gelcaps

= Canadian drug name.

* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients taking MAO inhibitors or SSRIs; Should not be used for chronic productive coughs; Some products contain alcohol and should be avoided in patients with known intolerance.

Use Cautiously in: Cough that lasts more than 1 wk or is accompanied by fever, rash, or headache—health care professional should be consulted; History of drug abuse or drug-seeking behavior (capsules have been abused resulting in deaths); Diabetes (some products contain sucrose); OB: Pregnancy (has been used safely); Pedi: Lactation or children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: *high dose*—dizziness, sedation. **GI:** nausea.

Interactions

Drug-Drug: Use with **MAO inhibitors** may result in serotonin syndrome (nausea, confusion, changes in blood pressure); concurrent use should be avoided. ↑ CNS depression with **antihistamines**, **alcohol**, **antidepressants**, **sedative/hypnotics**, or **opioids**. **Amiodarone**, **fluoxetine**, or **quinidine** may ↑ blood levels and adverse reactions from dextromethorphan.

Route/Dosage

PO (Adults and Children >12 yr): 10–20 mg q 4 hr *or* 30 mg q 6–8 hr *or* 60 mg of extended-release preparation bid (not to exceed 120 mg/day).

PO (Children 6–12 yr): 5–10 mg q 4 hr *or* 15 mg q 6–8 hr *or* 30 mg of extended-release preparation q 12 hr (not to exceed 60 mg/day).

PO (Children 2–6 yr): 2.5–5 mg q 4 hr *or* 7.5 mg q 6–8 hr *or* 15 mg of extended-release preparation q 12 hr (not to exceed 30 mg/day).

Availability

Gelcaps: 30 mg[OTC]. **Lozenges (cherry):** 2.5 mg[OTC], 5 mg[OTC]. **Liquid (cherry, grape):** 3.5 mg/5 ml[OTC], 5 mg/5 mL, 7.5 mg/5 ml[OTC], 15 mg/5 ml[OTC], 30 mg/5 mL[OTC]. **Syrup (cherry, cherry bubblegum):** 7.5 mg/5 mL[OTC], 15 mg/15 ml[OTC], 10 mg/5 ml[OTC]. **Extended-release suspension (orange):** 30 mg/5 ml[OTC]. **Drops (Grape):** 7.5 mg/0.8 mL[OTC], 7.5 mg/1 mL[OTC]. **Orally-disintegrating strips (cherry, grape):** 7.5 mg[OTC], 15 mg[OTC]. ***In combination with:*** antihistamines, decongestants, and expectorants in cough and cold preparations[OTC]. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 ml to decrease viscosity of bronchial secretions.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Do not confuse Benylin (dextromethorphan) with Benadryl (diphenhydramine).
- Dextromethorphan 15–30 mg is equivalent in cough suppression to codeine 8–15 mg.
- **PO:** Do not give fluids immediately after administering to prevent dilution of vehicle. Shake oral suspension well before administration.

Patient/Family Teaching

- Instruct patient to cough effectively: Sit upright and take several deep breaths before attempting to cough.
- Advise patient to minimize cough by avoiding irritants, such as cigarette smoke, fumes, and dust. Humidification of environmental air, frequent sips of water, and sugarless hard candy may also decrease the frequency of dry, irritating cough.
- Caution patient to avoid taking more than the recommended dose or taking alcohol or other CNS depressants concurrently with this medication; fatalities have occurred.
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that any cough lasting over 1 wk or accompanied by fever, chest pain, persistent headache, or skin rash warrants medical attention.

Evaluation/Desired Outcomes

- Decrease in frequency and intensity of cough without eliminating patient's cough reflex.

diazepam (dye-**az**-e-pam)
Apo-Diazepam, Diastat, Diazemuls, Novodipam, PMS-Diazepam, Valium, Vivol

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antianxiety agents, anticonvulsants, sedative/hypnotics, skeletal muscle relaxants (centrally acting)
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications
Adjunct in the management of: Anxiety Disorder, Athetosis, Anxiety relief prior to cardioversion (injection), Stiffman Syndrome, Preoperative sedation, Conscious sedation (provides light anesthesia and anterograde amnesia). Treatment of status epilepticus/uncontrolled seizures (injection). Skeletal muscle relaxant. Management of the symptoms of alcohol withdrawal. **Unlabeled uses:** Anxiety associated with acute myocardial infarction, insomnia.

Action
Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. Produces skeletal muscle relaxation by inhibiting spinal polysynaptic afferent pathways. Has anticonvulsant properties due to enhanced presynaptic inhibition. **Therapeutic Effects:** Relief of anxiety. Sedation. Amnesia. Skeletal muscle relaxation. Decreased seizure activity.

Pharmacokinetics
Absorption: Rapidly absorbed from the GI tract. Absorption from IM sites may be slow and unpredictable. Well absorbed (90%) from rectal mucosa.
Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Highly metabolized by the liver. Some products of metabolism are active as CNS depressants.
Half-life: Neonates: 50–95 hr; Infants 1 month–2 yr: 40–50 hr; Children 2–12 yr: 15–21 hr; Children 12–16 yr: 18–20 hr; Adults: 20–50 hr (up to 100 hr for metabolites).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	up to 24 hr
IM	within 20 min	0.5–1.5 hr	unknown
IV	1–5 min	15–30 min	15–60 min†
Rectal	2–10 min	1–2 hr	4–12 hr

†In status epilepticus, anticonvulsant duration is 15–20 min

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Comatose patients; Pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Pregnancy or lactation; Some products contain alcohol, propylene glycol, or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; OB: Increased risk of congenital malformations; Lactation: Recommend to discontinue drug or bottle-feed.
Use Cautiously in: Hepatic dysfunction; Severe renal impairment; Severe pulmonary impairment; History of suicide attempt or drug dependence; Debilitated patients (dose reduction required); Patients with low albumin; Pedi: Metabolites can accumulate in neonates. Injection contains benzyl alcohol which can cause potentially fatal gasping syndrome in neonates; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on Beers list and is associated with increased risk of falls (↓ dose required or consider short-acting benzodiazepine).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, lethargy, depression, hangover, ataxia, slurred speech, headache, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** hypotension (IV only). **GI:** constipation, diarrhea (may be caused by propylene glycol content in oral solution), nausea, vomiting, weight gain. **Derm:** rashes. **Local:** pain (IM), phlebitis (IV), venous thrombosis. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Alcohol, **antidepressants**, **antihistamines**, and **opioid analgesics—**concurrent use results in additive CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may decrease the metabolism of diazepam, enhancing its actions. May decrease the efficacy of **levodopa**. **Rifampin** or **barbiturates** may increase the metabolism and decrease effectiveness of diazepam.

Copyright © 2008 by F.A. Davis

Sedative effects may be decreased by **theophylline**. Concurrent use of **ritonavir** is not recommended.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can increase CNS depression.

Route/Dosage

Antianxiety
PO (Adults): 2–10 mg 2–4 times daily.
IM, IV (Adults): 2–10 mg, may repeat in 3–4 hrs as needed.
PO (Children >1 mo): 0.12–0.8 mg/kg/day 3–4 times daily.
IM, IV (Children >1 mo): 0.04–0.3 mg/kg/dose q 2–4 hr to a maximum of 0.6 mg/kg within an 8 hr period if necessary.

Precardioversion
IV (Adults): 5–15 mg 5–10 min precardioversion.

Pre-endoscopy
IV (Adults): 2.5–20 mg.
IM (Adults): 5–10 mg 30 min pre-endoscopy.

Pediatric Conscious Sedation for Procedures
PO (Children >1 mo): 0.2–0.3 mg/kg (not to exceed 10 mg/dose) 45–60 min prior to procedure.

Status Epilepticus/Acute Seizure Activity
IV (Adults): 5–10 mg, may repeat q 10–15 min to a total of 30 mg, may repeat regimen again in 2–4 hr (IM route may be used if IV route unavailable); larger doses may be required.
IM, IV (Children ≥5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to a total dose of 10 mg, repeat q 2–4 hr.
IM, IV (Children 1 mo–5 yr): 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 5 mg, repeat in 2–4 hr if needed.
IV (Neonates): 0.1–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 2 mg.
Rect (Adults and Children >12 yr): 0.2 mg/kg; may repeat 4–12 hr later.
Rect (Children 6–11 yr): 0.3 mg/kg; may repeat 4–12 hr later.
Rect (Children 2–5 yr): 0.5 mg/kg; may repeat 4–12 hr later.

Febrile Seizure Prophylaxis
PO (Children >1 mo): 1 mg/kg/day divided q 8 hr at first sign of fever and continue for 24 hr after fever is gone.

Skeletal Muscle Relaxation
PO (Adults): 2–10 mg 3–4 times daily.
PO (Geriatric Patients or Debilitated Patients): 2–2.5 mg 1–2 times daily initially.
PO (Children): 0.12–0.8 mg/kg/day 3–4 times daily.
IM, IV (Adults): 5–10 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).
IM, IV (Geriatric Patients or Debilitated Patients): 2–5 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).
IM, IV (Children ≥5 yr): *Tetanus*—5–10 mg q 3–4 hr.
IM, IV (Children >1 mo): *Tetanus*—1–2 mg q 3–4 hr.

Alcohol Withdrawal
PO (Adults): 10 mg 3–4 times in first 24 hr, decrease to 5 mg 3–4 times daily.
IM, IV (Adults): 10 mg initially, then 5–10 mg in 3–4 hr as needed; larger or more frequent doses have been used.

Psychoneurotic Reactions
IM, IV (Adults): 2–10 mg, may be repeated in 3–4 hr.

Availability (generic available)
Tablets: 2 mg, 5 mg, 10 mg. **Cost:** *Generic*—2 mg $7.99/30, 5 mg $7.99/30, 10 mg $7.99/30.
Oral solution: 5 mg/ml (Intensol), 1 mg/ml.
Solution for injection: 5 mg/ml (contains 10% alcohol and 40% propylene glycol). **Rectal gel delivery system:** 2.5 mg, 10 mg, 20 mg.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure, pulse, and respiratory rate prior to and periodically throughout therapy and frequently during IV therapy.
- Assess IV site frequently during administration; diazepam may cause phlebitis and venous thrombosis.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient. Observe depressed patients closely for suicidal tendencies.
- Conduct regular assessment of continued need for treatment.

Copyright © 2008 by F.A. Davis

- Geri: Assess risk of falls and institute fall prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, behavior) and degree of anxiety.
- Assess level of sedation (ataxia, dizziness, slurred speech prior to and periodically throughout therapy.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity. The initial dose of diazepam offers seizure control for 15–20 min after administration. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasm, associated pain, and limitation of movement prior to and during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.
- ***Lab Test Considerations:*** Evaluate hepatic and renal function and CBC periodically during prolonged therapy.
- ***Toxicity and Overdose:*** Flumazenil is an adjunct in the management of toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.)

Potential Nursing Diagnoses

Anxiety (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)
Ineffective coping

Implementation

- Do not confuse diazepam with lorazepam or ditropan.
- Patient should be kept on bedrest and observed for at least 3 hr following parenteral administration.
- If opioid analgesics are used concurrently with parenteral diazepam, decrease opioid dose by $^1/_3$ and titrate dose to effect.
- Use lowest effective dose. Taper by 2 mg every 3 days to decrease withdrawal symptoms. Some patients may require longer taper periods (mos).
- **PO:** Tablets may be crushed and taken with food or water if patient has difficulty swallowing.
- Mix Intensol preparation with liquid or semisolid food such as water, juices, soda, applesauce, or pudding. Administer entire amount immediately. Do not store.
- **IM:** IM injections are painful and erratically absorbed. If IM route is used, inject deeply into deltoid muscle for maximum absorption.

IV Administration

- **IV:** Resuscitation equipment should be available when diazepam is administered IV.
- **Direct IV:** ***Diluent:*** For IV administration do not dilute or mix with any other drug. If direct IV push is not feasible, administer IV push into tubing as close to insertion site as possible. Continuous infusion is not recommended due to precipitation in IV fluids and absorption of diazepam into infusion bags and tubing. Injection may cause burning and venous irritation; avoid small veins. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer slowly at a rate of 5 mg/min in adults. Infants and children should receive 1–2 mg/min. Rapid injection may cause apnea, hypotension, bradycardia, or cardiac arrest.
- **Syringe Compatibility:** cimetidine.
- **Syringe Incompatibility:** doxapram, glycopyrrolate, heparin, hydromorphone, nalbuphine, pantoprazole, sufentanil.
- **Y-Site Compatibility:** dobutamine, fentanyl, methadone, morphine, nafcillin, sufentanil.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, atracurium, cefepime, dexmedetomidine, diltiazem, fenoldopam, fluconazole, foscarnet, heparin, lansoprazole, linezolid, meropenem, oxaliplatin, pancuronium, potassium chloride, propofol, tirofiban, vecuronium, vitamin B complex with C.
- **Rect:** Do not repeat *Diastat* rectal dose more than 5 times/mo or 1 episode every 5 days. Round dose up to next available dose unit.
- Diazepam injection has been used for rectal administration. Instill via catheter or cannula fitted to the syringe or directly from a 1-ml syringe inserted 4–5 cm into the rectum. A dilution of diazepam injection with propylene glycol containing 1 mg/ml has also been used.
- Do not dilute with other solutions, IV fluids, or medications.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and not to take more than pre-

Copyright © 2008 by F.A. Davis

scribed or increase dose if less effective after a few weeks without checking with health care professional. Abrupt withdrawal of diazepam may cause insomnia, unusual irritability or nervousness, and seizures. Advise patient that sharing of this medication may be dangerous.
- Medication may cause drowsiness, clumsiness, or unsteadiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. ***Geri:*** Advise geriatric patients of increased risk for CNS effects and potential for falls.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional if pregnancy is suspected or planned.
- Emphasize the importance of follow-up examinations to determine effectiveness of the medication.
- Inform patient that psychotherapy is beneficial in addressing source of anxiety and improving coping skills.
- Teach other methods to decrease anxiety, such as exercise, support groups, relaxation techniques.
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.
- Carefully review package insert for Diastat rectal gel with patient/caregiver prior to administration.

Evaluation/Desired Outcomes
- Decrease in anxiety level. Full therapeutic antianxiety effects occur after 1–2 wk of therapy.
- Decreased recall of surgical or diagnostic procedures.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness and more rational ideation when used for alcohol withdrawal.

DICLOFENAC†
(dye-**kloe**-fen-ak)

diclofenac potassium
Cataflam, Apo–Diclo Rapide

diclofenac sodium
Apo-Diclo, Voltaren

diclofenac topical
Solaraze

Classification
Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents

Pregnancy Category B (topical), C (oral)

†For ophthalmic use see Appendix C

Indications
PO: Management of inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis, Ankylosing spondylitis. Primary dysmenorrhea. Relief of mild to moderate pain. **Topical:** Treatment of actinic keratoses.

Action
Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. **Topical:** Clearance of actinic keratosis lesions.

Pharmacokinetics
Absorption: Undergoes first-pass metabolism by liver which results in 50% bioavailability. Oral diclofenac sodium is a delayed-release dosage form. Diclofenac potassium is an immediate-release dosage form. 10% of topically applied diclofenac is systemically absorbed.
Distribution: Crosses the placenta.
Protein Binding: >99%.
Metabolism and Excretion: Metabolized by the liver to several metabolites; 65% excreted in urine, 35% in bile.
Half-life: 2 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (inflammation)	few days–1 wk	2 wk or more	unknown
PO (pain)	30 min	unknown	up to 8 hr
Topical	unknown	30 days*	unknown

*Complete healing of lesions following cessation of therapy

Contraindications/Precautions
Contraindicated in: Hypersensitivity to diclofenac or other components of formulation; Cross-sensitivity may occur with other NSAIDs including aspirin; Active GI bleeding/ulcer disease; Patients undergoing coronary artery bypass graft surgery.
Use Cautiously in: Severe renal/hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial

Copyright © 2008 by F.A. Davis

infarction, and stroke, especially with prolonged use); History of porphyria; History of peptic ulcer disease and/or GI bleeding; Geri: Geriatric patients (dosage reduction recommended; more susceptible to adverse reactions, including GI bleeding); Bleeding tendency or concurrent anticoagulant therapy; OB, Lactation: Pregnancy and lactation (not recommended for use during second half of pregnancy); Pedi: Pregnancy, lactation, and children (safety not established).

Adverse Reactions/Side Effects

For oral diclofenac unless noted.
CNS: dizziness, headache. **CV:** hypertension. **EENT:** tinnitus. **GI:** GI BLEEDING, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, heartburn, liver enzyme elevation, nausea, vomiting. **GU:** acute renal failure, hematuria. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritis, rashes, eczema, photosensitivity. **F and E:** edema. **Hemat:** anemia, prolonged bleeding time. **Local:** *Topical only*— contact dermatitis, dry skin, exfoliation. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Primarily noted for oral administration
Drug-Drug: ↑ adverse GI effects with **aspirin**, other **NSAIDs**, or **corticosteroids**. May ↓ effectiveness of **diuretics**, or **antihypertensives**. May ↑ levels/risk of toxicity from **cyclosporine**, **lithium**, or **methotrexate**. ↑ risk of bleeding with some **cephalosporins**, **thrombolytic agents**, **antiplatelet agents**, or **warfarin**. Concurrent use of oral **NSAIDs** during topical diclofenac therapy should be minimized.
Drug-Natural Products: ↑ bleeding risk with **arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.**

Route/Dosage

Different formulations of oral diclofenac (diclofenac sodium enteric-coated tablets, diclofenac sodium extended-release tablets, and diclofenac potassium immediate-release tablets are not bioequivalent and should not be substituted on a mg-to-mg basis.

Diclofenac Potassium

PO (Adults): *Analgesic/antidysmenorrheal*—100 mg initially, then 50 mg 3 times daily as needed; *Rheumatoid arthritis*—50 mg 3–4 times daily, after initial response reduced to lowest dose that controls symptoms; *Osteoarthritis*—50 mg 2–3 times daily, after initial response reduced to lowest dose that controls symptoms.

Diclofenac Sodium

PO (Adults): *Rheumatoid arthritis (delayed-release [enteric-coated] tablets)*—50 mg 3–4 times daily *or* 75 mg twice daily; after initial response reduce to lowest dose that controls symptoms (usual maintenance dose 25 mg 3 times daily). *Rheumatoid arthritis (extended-release tablets)*—100 mg once daily, if unsatisfactory response, dose may be ↑ to 100 mg twice daily. *Osteoarthritis (delayed-release [enteric-coated] tablets)*—50 mg 2–3 times daily *or* 75 mg twice daily; after initial response, ↓ to lowest dose that controls symptoms. *Osteoarthritis (extended-release tablets)*—100 mg once daily. *Ankylosing spondylitis (delayed-release [enteric-coated] tablets)*—25 mg 4 times daily, with an additional 25 mg given at bedtime, if necessary.
Topical (Adults): Apply to lesions twice daily for 60–90 days.

Availability (generic available)

Diclofenac potassium immediate-release tablets: 50 mg. **Cost:** *Generic*—$59.98/100. **Diclofenac sodium delayed-release (enteric-coated) tablets:** 25 mg, 50 mg, 75 mg. **Cost:** *Generic*—25 mg $42.80/100, 50 mg $37.08/100, 75 mg $44.98/100. **Diclofenac sodium extended-release tablets:** 🍁75 mg, 100 mg. **Cost:** *Generic*—100 mg $208.78/90. **Gel:** 3% in 50- and 100-g tubes. **Cost:** $193.36/50 g, $275.68/100 g. ***In combination with:*** 200 mcg misoprostol (Arthrotec). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at ↑ risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and 30–60 min after administration.
- **Arthritis:** Assess arthritic pain (note type, location, intensity) and limitation of movement before and periodically during therapy.

Copyright © 2008 by F.A. Davis

- **Actinic Keratosis:** Assess lesions prior to and periodically during therapy.
- ***Lab Test Considerations:*** Diclofenac has minimal effect on bleeding time and platelet aggregation.
- May cause ↓ in hemoglobin and hematocrit.
- Monitor liver function tests within 8 wk of initiating diclofenac therapy and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN and serum creatinine periodically during therapy. May cause ↑ BUN and serum creatinine.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- Do not confuse Cataflam (diclofenac) with Catapres (clonidine).
- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Take with food or milk to minimize gastric irritation. May take first 1–2 doses on an empty stomach for more rapid onset. Do not crush or chew enteric-coated or extended-release tablets.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.
- **Topical:** Gel should be applied to intact skin; do not use on open wounds. An adequate amount of gel should be applied to cover the entire lesion.

Patient/Family Teaching

- **PO:** Instruct patient to take diclofenac with a full glass of water and to remain in an upright position for 15–30 min after administration. Take missed doses as soon as possible within 1–2 hr if taking once or twice a day or unless almost time for next dose if taking more than twice a day. Do not double doses.
- Caution patient to avoid concurrent use of alcohol, aspirin, acetaminophen, other NSAIDs, or other OTC medications without consulting health care professional.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct female patients to inform health care professional if they plan or suspect pregnancy.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- **Topical:** Advise patient to minimize use of concurrent NSAIDs during topical therapy.
- Instruct patient to avoid covering lesion with occlusive dressing and to avoid applying sunscreen or cosmetics to the affected area.
- Advise patient that it may take up to 1 mo for complete healing of the lesion to occur.

Evaluation/Desired Outcomes

- Decrease in severity of mild-to-moderate pain.
- Increased ease of joint movement. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum effects.
- Decrease in or healing of lesions in actinic keratosis. Optimal effect may not be seen until 30 days after discontinuation of therapy. Lesions that do not heal should be re-evaluated.

dicloxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

dicyclomine

(dye-**sye**-kloe-meen)
Bentyl, Bentylol, Formulex, Spasmoban

Classification
Therapeutic: antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category UK

Indications

Management of irritable bowel syndrome in patients who do not respond to usual interventions (sedation/change in diet).

Copyright © 2008 by F.A. Davis

Action
May have a direct and local effect on GI smooth muscle, reducing motility and tone. **Therapeutic Effects:** Decreased GI motility.

Pharmacokinetics
Absorption: Well absorbed after oral and IM administration.
Distribution: Unknown.
Metabolism and Excretion: 80% eliminated in urine, 10% in feces.
Half-life: 1.8 hr (initial phase), 9–10 hr (terminal phase).

TIME/ACTION PROFILE (antispasmodic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IM	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Obstruction of the GI or GU tract; Reflux esophagitis; Severe ulcerative colitis (risk of paralytic ileus); Unstable cardiovascular status; Glaucoma; Myasthenia gravis; Infants <6 mo; Lactation.
Use Cautiously in: High environmental temperatures (risk of heat prostration); Hepatic/renal impairment; Autonomic neuropathy; Cardiovascular disease; Prostatic hyperplasia; Geri: Appears on Beers list. Geriatric patients have increased sensitivity to anticholinergics; Pregnancy (safety not established).

Adverse Reactions/Side Effects
CNS: confusion (increased in geriatric patients), drowsiness, light-headedness (IM only). **EENT:** blurred vision, increased intraocular pressure. **CV:** palpitations, tachycardia. **GI:** PARALYTIC ILEUS, constipation, heartburn, decreased salivation, dry mouth, nausea, vomiting. **GU:** erectile dysfunction, urinary hesitancy, urinary retention. **Derm:** decreased sweating. **Endo:** decreased lactation. **Local:** pain/redness at IM site. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions
Drug-Drug: Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **quinidine**, and **disopyramide**. May alter the absorption of **other orally administered drugs** by slowing motility of the GI tract. **Antacids** or **adsorbent antidiarrheals** decrease the absorption of anticholinergics. May increase GI mucosal lesions in patients taking oral **potassium chloride** tablets. Increased risk of adverse cardiovascular reactions with **cyclopropane** anesthesia.

Route/Dosage
PO (Adults): 10–20 mg 3–4 times daily (up to 160 mg/day).
PO (Children ≥2 yr): 10 mg 3–4 times daily, adjusted as tolerated.
PO (Children 6 mo–2 yr): 5–10 mg 3–4 times daily, adjusted as tolerated.
IM (Adults): 20 mg q 4–6 hr, adjusted as tolerated.

Availability
Tablets: ✱10 mg, 20 mg. **Capsules:** 10 mg, 20 mg. **Syrup:** 10 mg/5 ml. **Solution for injection:** 10 mg/ml.

NURSING IMPLICATIONS

Assessment
- Assess patient for symptoms of irritable bowel syndrome (abdominal cramping, alternating constipation and diarrhea, mucus in stools) before and periodically during therapy.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Monitor intake and output ratios; may cause urinary retention.
- ***Lab Test Considerations:*** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.
- ***Toxicity and Overdose:*** Severe anticholinergic symptoms may be reversed with physostigmine or neostigmine.

Potential Nursing Diagnoses
Acute pain (Indications)
Diarrhea (Indications)

Implementation
- **PO:** Administer dicyclomine 30 min–1 hr before meals.
- **IM:** Monitor patient after administration; may cause light-headedness and irritation at injection site.

Patient/Family Teaching
- Instruct patient to take dicyclomine exactly as directed and not to take more than the pre-

Copyright © 2008 by F.A. Davis

scribed amount. Missed doses should be taken as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient receiving dicyclomine to make position changes slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.

Evaluation/Desired Outcomes
- A decrease in the symptoms of irritable bowel syndrome.

diflorasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

HIGH ALERT

digoxin (di-**jox**-in)
Digitek, Lanoxicaps, Lanoxin

Classification
Therapeutic: antiarrhythmics, inotropics
Pharmacologic: digitalis glycosides

Pregnancy Category C

Indications
Treatment of CHF. Tachyarrhythmias: Atrial fibrillation and atrial flutter (slows ventricular rate), Paroxysmal atrial tachycardia.

Action
Increases the force of myocardial contraction. Prolongs refractory period of the AV node. Decreases conduction through the SA and AV nodes. **Therapeutic Effects:** Increased cardiac output (positive inotropic effect) and slowing of the heart rate (negative chronotropic effect).

Pharmacokinetics
Absorption: 60–80% absorbed after oral administration of tablets; 70-85% absorbed after administration of elixir. Absorption from liquid-filled capsules is 90–100%; 80% absorbed from IM sites (IM route not recommended due to pain/irritation).
Distribution: Widely distributed; crosses placenta and enters breast milk.
Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.
Half-life: 36–48 hr (increased in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic or inotropic effects, provided that a loading dose has been given)

ROUTE	ONSET	PEAK	DURATION
Digoxin–PO	30–120 min	2–8 hr	2–4 days†
Digoxin–IM	30 min	4–6 hr	2–4 days†
Digoxin–IV	5–30 min	1–4 hr	2–4 days†

†Duration listed is that for normal renal function; in impaired renal function, duration will be longer

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Uncontrolled ventricular arrhythmias; AV block; Idiopathic hypertrophic subaortic stenosis; Constrictive pericarditis; Known alcohol intolerance (elixir only).
Use Cautiously in: Hypokalemia (greatly increases risk of digoxin toxicity); Hypercalcemia (increases risk of toxicity, especially with mild hypokalemia); Hypomagnesemia (may potentiate digoxin toxicity); Diuretic use (may cause electrolyte abnormalities including hypokalemia and hypomagnesemia); Hypothyroidism; Geri: Geriatric patients (very sensitive to toxic effects, dose adjustments required for age-related decrease in renal function and body weight); MI; Renal impairment (dose reduction required); Obesity (dose should be based on ideal body weight); OB: Pregnancy (although safety has not been established, has been used during pregnancy without adverse effects on the fetus); Lactation: Similar concentrations in serum and breast milk result in subtherapeutic levels in infants, use with caution).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: fatigue, headache, weakness. **EENT:** blurred vision, yellow or green vision. **CV:** ARRHYTHMIAS, bradycardia, ECG changes, A-V block, S-A block. **GI:** anorexia, nausea, vomiting, diarrhea. **Endo:** gynecomastia. **Hemat:** thrombocytopenia. **Metab:** electrolyte imbalances with acute digoxin toxicity.

Interactions

Drug-Drug: Thiazide and **loop diuretics**, **piperacillin**, **ticarcillin**, **amphotericin B**, and **corticosteroids**, and excessive use of **laxatives** may cause hypokalemia which may ↑ risk of toxicity. **Amiodarone**, some **benzodiazepines**, **cyclosporine**, **diphenoxylate**, **indomethacin**, **itraconazole**, **propafenone**, **propantheline**, **quinidine**, **quinine**, **spironolactone**, and **verapamil** may ↑ serum levels and may lead to toxicity (serum level monitoring/dose reduction may be required). Blood levels may be ↓ by oral **aminoglycosides**, some **antineoplastics** (**bleomycin**, **carmustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **methotrexate**, **procarbazine**, **vincristine**), **activated charcoal**, **cholestyramine**, **colestipol**, **kaolin/pectin**, **metoclopramide**, **penicillamine**, **rifampin**, or **sulfasalazine**. In a small percentage (10%) of patients gut bacteria metabolize digoxin to inactive compounds; **macrolide anti-infectives** (**erythromycin**, **azithromycin**, **clarithromycin**), **tetracyclines**, by killing these bacteria, will cause ↑ digoxin levels and toxicity; dose may need to be ↓ for up to 9 weeks. Additive bradycardia may occur with **beta blockers** and other **antiarrhythmics** (**quinidine**, **disopyramide**). Concurrent use of **sympathomimetics** may ↑ risk of arrthythmias. **Thyroid hormones** may ↓ therapeutic effects.

Drug-Natural Products: Licorice and stimulant natural products (**aloe**) may ↑ risk of potassium depletion. **St. John's wort** may ↓ digoxin levels and effect.

Drug-Food: Concurrent ingestion of a **high-fiber meal** may ↓ absorption. Administer digoxin 1 hour before or 2 hours after such a meal.

Route/Dosage

For rapid effect, a larger initial loading/digitalizing dose should be given in several divided doses over 12–24 hr. Maintenance doses are determined for digoxin by renal function. All dosing must be evaluated by individual response. In general, doses required for atrial arrhythmias are higher than those for inotropic effect. When determining dose, consider that bioavailability of gelatin capsules (Lanoxicaps) is greater than that of tablets.

IV (Adults): *Digitalizing dose*—0.5–1 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Children >10 yr): *Digitalizing dose*—8–12 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Children 5–10 yr): *Digitalizing dose*—15–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Children 2–5 yr): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Children 1–24 mo): *Digitalizing dose*—30–50 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Infants—full term): 20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

IV (Infants—premature): *Digitalizing dose*—15–25 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.

PO (Adults): *Digitalizing dose*—0.75–1.5 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—0.125–0.5 mg/day as tablets or 0.350–0.5 mg/day as gelatin capsules, depending on patient's lean body weight, renal function, and serum level.

PO (Geriatric Patients): Daily dosage should not exceed 0.125 mg except when treating atrial fibrillation.

PO (Children >10 yr): *Digitalizing dose*—10–15 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—2.5–5 mcg/kg given daily as a single dose.

Copyright © 2008 by F.A. Davis

PO (Children 5–10 yr): *Digitalizing dose*—20–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—5–10 mcg/kg given daily in 2 divided doses.
PO (Children 2–5 yr): *Digitalizing dose*—30–40 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—7.5–10 mcg/kg given daily in 2 divided doses.
PO (Children 1–24 mo): *Digitalizing dose*—35–60 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—10–15 mcg/kg given daily in 2 divided doses.
PO (Infants—full term): *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—6–10 mcg/kg given daily in 2 divided doses.
PO (Infants—premature): *Digitalizing dose*—20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—5–7.5 mcg/kg given daily in 2 divided doses.

Availability (generic available)

Tablets: 0.125 mg, 0.25 mg. **Cost:** *Lanoxin*—0.125 mg $24.97/90, 0.25 mg $29.97/90; *Generic*—0.125 mg $21.97/90, 0.25 mg $21.97/90. **Capsules:** 0.05 mg, 0.1 mg, 0.2 mg. **Cost:** 0.05 mg $25.99/100, 0.1 mg $33.56/100, 0.2 mg $39.57/100. **Pediatric elixir (lime flavor):** 0.05 mg/ml. **Injection:** 0.25 mg/ml. **Pediatric injection:** 0.1 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor apical pulse for 1 full min before administering. Withhold dose and notify physician if pulse rate is <60 bpm in an adult, <70 bpm in a child, or <90 bpm in an infant. Also notify health care professional promptly of any significant changes in rate, rhythm, or quality of pulse.
- Pedi: Heart rate varies in children depending on age, ask physician to specify at what heart rates digoxin should be withheld.
- Monitor blood pressure periodically in patients receiving IV digoxin.
- Monitor ECG throughout IV administration and 6 hours after each dose. Notify health care professional if bradycardia or new arrhythmias occur.
- Observe IV site for redness or infiltration; extravasation can lead to tissue irritation and sloughing.
- Monitor intake and output ratios and daily weights. Assess for peripheral edema, and auscultate lungs for rales/crackles throughout therapy.
- Before administering initial loading dose, determine whether patient has taken any digitalis preparations in the preceding 2–3 wk.
- Geri: Digoxin has been associated with an increased risk of falls in the elderly. Assess for falls risk and implement prevention strategies per facility protocol.
- ***Lab Test Considerations:*** Evaluate serum electrolyte levels (especially potassium, magnesium, and calcium) and renal and hepatic functions periodically during therapy. Notify health care professional before giving dose if patient is hypokalemic. Hypokalemia, hypomagnesemia, or hypercalcemia may make the patient more susceptible to digitalis toxicity. Pedi: Neonates may have falsely elevated serum digoxin concentrations due to a naturally occurring substance chemically similar to digoxin. Geri: Older adults may be toxic even when serum concentrations are within normal range; assess for clinical symptoms of toxicity even when serum levels are normal.
- ***Toxicity and Overdose:*** Therapeutic serum digoxin levels range from 0.5–2 mg/ml. Serum levels may be drawn 6–8 hr after a dose is administered, although they are usually drawn immediately before the next dose. Bacteria in the GI tract can metabolize a substantial amount of digoxin before it is absorbed. Patients receiving erythromycin or tetracycline, which kill gut bacteria, can develop toxicity on their usual doses of digoxin. Geri: Older adults are at increased risk for toxic effects of digoxin (appears on Beers list) due to age-related decreased renal clearance, which can exist even when serum creatinine levels are normal. Digoxin requirements in the older adult may change and a formerly therapeutic dose can become toxic: Observe for signs and symptoms of toxicity. In adults and older children, the first signs of toxicity usually include abdominal pain, anorexia, nausea, vomiting, visual disturbances,

Copyright © 2008 by F.A. Davis

bradycardia, and other arrhythmias. In infants and small children, the first symptoms of overdose are usually cardiac arrhythmias. If these appear, withhold drug and notify physician or health care professional immediately. If signs of toxicity occur and are not severe, discontinuation of digitalis glycoside may be all that is required. If hypokalemia is present and renal function is adequate, potassium salts may be administered. Do not administer if hyperkalemia or heart block exists. **Correct any other electrolyte abnormalities**. Correction of arrhythmias resulting from digitalis toxicity may be attempted with lidocaine, procainamide, quinidine, propranolol, or phenytoin. Temporary ventricular pacing may be useful in advanced heart block. Treatment of life-threatening arrhythmias may include administration of digoxin immune Fab (Digibind), which binds to the digitalis glycoside molecule in the blood and is excreted by the kidneys.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- ***High Alert:*** Digoxin has a narrow therapeutic range. Medication errors associated with digoxin include miscalculation of pediatric doses and insufficient monitoring of digoxin levels. Have second practitioner independently check original order and dose calculations. Monitor therapeutic drug levels.
- For rapid digitalization, the initial dose is higher than the maintenance dose; 50% of the total digitalizing dose is given initially. The remainder of the dose will be administered in 25% increments at 4-8 hr intervals.
- When changing from parenteral to oral dose forms, dose adjustments may be necessary because of pharmacokinetic variations in percentage of digoxin absorbed: 100 mcg (0.1 mg) digoxin injection or 100 mcg (0.1 mg) liquid-filled capsule = 125 mcg (0.125 mg) tablet or 125 mcg (0.125 mg) of elixir.
- **PO:** Administer oral preparations consistently with regard to meals. Tablets can be crushed and administered with food or fluids if patient has difficulty swallowing. Use calibrated measuring device for liquid preparations; calibrated dropper is not accurate for doses of less than 0.2 mL or 10 mcg. Do not alternate between dose forms; bioavailability of capsules is greater than that of tablets or elixir.
- **IM:** Administer deep into gluteal muscle and massage well to reduce painful local reactions. Do not administer more than 2 ml of digoxin in each IM site. IM administration is not generally recommended.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. May also dilute 1 ml of digoxin in 4 ml of sterile water for injection, D5W, or 0.9% NaCl. Less diluent will cause precipitation. Use diluted solution immediately. ***Rate:*** Administer over at least 5 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, anidulafungin, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, meropenem, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl sulfate complex, caspofungin, diazepam, fluconazole, foscarnet, lansoprazole, phenytoin, propofol, quinu-

Copyright © 2008 by F.A. Davis

pristin/dalfopristin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Teach parents or caregivers of infants and children how to accurately measure medication. Take missed doses within 12 hr of scheduled dose or not taken at all. Do not double doses. Consult health care professional if doses for 2 or more days are missed. Do not discontinue medication without consulting health care professional.
- Teach patient to take pulse and to contact health care professional before taking medication if pulse rate is <60 or >100.
- Pedi: Teach parents or caregivers that changes in heart rate, especially bradycardia, are among the first signs of digoxin toxicity in infants and children. Instruct parents or caregivers in apical heart rate assessment and ask them to notify a health care professional if heart rate is outside of range set by health care professional before administering the next scheduled dose.
- Review signs and symptoms of digitalis toxicity with patient and family. Advise patient to notify health care professional immediately if these or symptoms of CHF occur. Inform patient that these symptoms may be mistaken for those of colds or flu.
- Instruct patient to keep digoxin tablets in their original container and not to mix in pill boxes with other medications; they may look similar to, and may be mistaken for, other medications.
- Advise patient that sharing of this medication can be dangerous.
- Caution patient to avoid concurrent use of OTC and herbal products without consulting health care professional. Advise patient to avoid taking antacids or antidiarrheals within 2 hr of digoxin.
- Advise patient to notify health care professional of this medication regimen before treatment.
- Patients taking digoxin should carry identification describing disease process and medication regimen at all times.
- Geri: Review fall prevention strategies with older adults and their families.
- ***High Alert:*** Emphasize the importance of routine follow-up exams to determine effectiveness and to monitor for toxicity.

Evaluation/Desired Outcomes

- Decrease in severity of CHF.
- Increase in cardiac output.
- Decrease in ventricular response in atrial tachyarrhythmias.
- Termination of paroxysmal atrial tachycardia.

digoxin immune Fab

(di-**jox**-in im-**myoon** fab)
Digibind, DigiFab

Classification
Therapeutic: antidotes
Pharmacologic: antibody fragments

Pregnancy Category C

Indications

Serious life-threatening overdosage with digoxin.

Action

An antibody produced in sheep that binds antigenically to unbound digoxin in serum. **Therapeutic Effects:** Binding and subsequent removal of digoxin, preventing toxic effects in overdose.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed throughout extracellular space.
Metabolism and Excretion: Excreted by the kidneys as the bound complex (digoxin immune Fab plus digoxin).
Half-life: 14–20 hr.

TIME/ACTION PROFILE (reversal of arrhythmias and hyperkalemia; reversal of inotropic effect may take several hr)

ROUTE	ONSET	PEAK	DURATION
IV	30 min (variable)	unknown	2–6 hr

Contraindications/Precautions

Contraindicated in: No known contraindications.
Use Cautiously in: Known hypersensitivity to sheep proteins or products; Children, pregnancy, or lactation (safety not established).

Adverse Reactions/Side Effects

CV: re-emergence of atrial fibrillation, re-emergence of CHF. **F and E:** HYPOKALEMIA.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Prevents therapeutic response to **digoxin**.

Route/Dosage

Digibind—38 mg of digoxin immune Fab will bind 0.5 mg of digoxin. Each vial contains 38 mg of digoxin immune Fab; *DigiFab*—40 mg of digoxin immune Fab will bind 0.5 mg of digoxin. Each vial contains 40 mg of digoxin immune Fab.

Known Amount of Digoxin Ingested (Administered)

IV (Adults and Children): *For digitalis glycoside toxicity due to digoxin tablets, oral solution, or IM digoxin*—dose of digoxin ingested (mg) × 0.8/1000 × 38. *For digitalis glycoside toxicity due to digoxin capsules, IV digoxin*—dose of digoxin ingested (mg)/0.5 × 38.

Known Serum Digoxin Concentrations (SDCs)

IV (Adults and Children): *Digibind*—Dose (mg) =SDC (nanograms/ml) × body weight (kg)/100 × 38; *DigiFab*—SDC (nanograms/ml) × body weight (kg)/100 × 40.

Unknown Amount Ingested/SDCs Unavailable

IV (Adults and Children): *Digibind*—760 mg (20 vials); *DigiFab*—800 mg (20 vials).

Toxicity during chronic digoxin therapy

IV (Adults and Children): *Digibind*—228 mg (6 vials); *DigiFab*—240 mg (6 vials).

Availability

Powder for injection, lyophilized (Digibind): 38 mg/vial. **Powder for injection, lyophilized (DigiFab):** 40 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, blood pressure, and body temperature before and during treatment. Patients with atrial fibrillation may develop a rapid ventricular response as a result of decreased digoxin levels.
- Assess patient for increase in signs of CHF (peripheral edema, dyspnea, rales/crackles, weight gain).
- ***Lab Test Considerations:*** Monitor serum digoxin levels before administration.
- Monitor serum potassium levels frequently during treatment. Before treatment, hyperkalemia usually coexists with toxicity. Levels may decrease rapidly; hypokalemia should be treated promptly.
- Free serum digoxin levels fall rapidly after administration. Total serum concentrations rise suddenly after administration but are bound to the Fab molecule and are inactive. Total serum concentrations will decrease to undetectable levels within several days. Serum digoxin levels are not valid for 5–7 days after administration.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Cardiopulmonary resuscitation equipment and medications should be available during administration.
- Delay redigitalization for several days until the elimination of digoxin immune Fab from the body is complete.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial in 4 ml of sterile water for injection and mix gently. Solution will contain a concentration of 9.5 mg/ml (*Digibind*) or 10 mg/ml (*DigiFab*). May be further diluted with 0.9% NaCl to achieve the concentration below. Reconstituted solution should be used immediately but is stable for 4 hr if refrigerated. For small doses in infants and children, a reconstituted 38-mg vial can be diluted with 34 ml of 0.9% NaCl (*Digibind*) or 36 ml of 0.9% NaCl (*DigiFab*) for a concentration of 1 mg/ml. ***Concentration:*** 1 mg/ml. ***Rate:*** Infuse over 30 min through a 0.22-micron membrane filter. If cardiac arrest is imminent, rapid direct IV injection may be used. Do not use rapid direct injection in other patients because of increased risk of adverse reactions. Small doses in infants and children may be administered with a tuberculin syringe.
- **Incompatibility:** Information unavailable. Do not mix with other drugs or solutions.

Patient/Family Teaching

- Explain the procedure and purpose of the treatment to the patient.

Copyright © 2008 by F.A. Davis

- Instruct patient notify health care provider immediately if signs of delayed allergic reaction (rash, pruritus, urticaria) occur after hospital discharge.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of digoxin toxicity.
- Decreased digoxin or level without major side effects.

diltiazem (dil-**tye**-a-zem)

Apo-Diltiaz, Cardizem, Cardiazem CD, Cardizem LA, Cardizem SR, Cartia XT, Dilacor XR, Diltia XT, Novo-Diltazem, Nu-Diltiaz, Ratio-Diltiazem CD, Syn-Diltiazem, Taztia XT, Tiazac

Classification

Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications

Hypertension. Angina pectoris and vasospastic (Prinzmetal's) angina. Supraventricular tachyarrhythmias and rapid ventricular rates in atrial flutter or fibrillation. **Unlabeled uses:** Management of Raynaud's syndrome.

Action

Inhibits transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Suppression of arrhythmias.

Pharmacokinetics

Absorption: Well absorbed, but rapidly metabolized after oral administration.
Distribution: Unknown.
Protein Binding: 70–80%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system).
Half-life: 3.5–9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–3 hr	6–8 hr
PO–SR	unknown	unknown	12 hr
PO–CD, XR, LA	unknown	14 days†	up to 24 hr
IV	2–5 min	2–4 hr	unknown

†Maximum antihypertensive effect with chronic therapy

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Blood pressure <90 mm Hg; Recent MI or pulmonary congestion; Concurrent use of rifampin.
Use Cautiously in: Severe hepatic impairment (↓ dose recommended); Geri: Geriatric patients (↓ dose/slower IV infusion rate recommended; ↑ risk of hypotension; consider age-related decrease in body mass, decreased hepatic/renal/cardiac function, concurrent drug therapy and other disease states); Severe renal impairment; Serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** abnormal liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: ↑ hypotension may occur when used with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by **NSAIDs**. Serum **digoxin** levels may be increased. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Phenobarbital** and **phenytoin** may ↑ metabolism and ↓ effectiveness. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **quinidine**, or **carbamazepine**.

Copyright © 2008 by F.A. Davis

Cimetidine and **ranitidine** ↑ blood levels and effects. May increase or decrease the effects of **lithium** or **theophylline**.
Drug-Food: Grapefruit juice ↑ serum levels and effect.

Route/Dosage

PO (Adults): 30–120 mg 3–4 times daily or 60–120 mg twice daily as SR capsules or 180–240 mg once daily as CD or XR capsules or LA tablets (up to 360 mg/day).
IV (Adults): 0.25 mg/kg; may repeat in 15 min with a dose of 0.35 mg/kg. May follow with continuous infusion at 10 mg/hr (range 5–15 mg/hr) for up to 24 hr.

Availability (generic available)

Tablets: 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Generic*—30 mg $12.99/90, 60 mg $14.99/90, 90 mg $15.99/90, 120 mg $19.99/90. **Sustained-release capsules:** 60 mg, 90 mg, 120 mg. **Cost:** *Generic*—60 mg $80.30/180, 90 mg $124.76/180, 120 mg $199.13/180. **Extended-release capsules (Cardizem CD, Dilacor XR, Tiazac, Cartia XT, Taztia XT):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** *Generic*—120 mg $69.98/90, 180 mg $79.97/90, 240 mg $106.97/90, 300 mg $126.97/90, 360 mg $128.97/90, 420 mg $120.99/90. **Extended-release tablets (Cardizem LA):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** 120 mg $183.90/90, 180 mg $189.97/90, 240 mg $225.98/90, 300 mg $330.86/90, 360 mg $339.98/90, 420 mg $363.18/90. **Injection:** 5 mg/ml in 5-, 10-, and 25-ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse prior to therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy. May cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels checked and be monitored for signs and symptoms of digoxin toxicity.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Report bradycardia or prolonged hypotension promptly. Emergency equipment and medication should be available. Monitor blood pressure and pulse before and frequently during administration.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ the risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal on discontinuation of therapy.

Potential Nursing Diagnoses

Acute pain (Indications)
Decreased cardiac output (Adverse Reactions)

Implementation

- Do not confuse Cardizem (diltiazem) with Cardene (nicardipine). Do not confuse Cardizem LA with Cardene SR. Do not confuse Tiazac (diltiazem) with Ziac (bisprolol/hydrochlorothiazide).
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew sustained-release capsules or tablets. Empty tablets that appear in stool are not significant. Crush and mix diltiazem with food or fluids for patients having difficulty swallowing.

IV Administration

- **Direct IV:** ***Diluent:*** Administer bolus dose undiluted. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer over 2 min.
- **Continuous Infusion:** ***Diluent:*** Dilute 125 mg in 100 ml, 250 mg in 250 ml, or 250 mg in 500 ml of 0.9% NaCl, D5W, or D5/0.45% NaCl. Infusion is stable for 24 hr at room temperature or if refrigerated. ***Concentration:*** 125 mg/125 ml (1 mg/ml), 250 mg/300 ml (0.83 mg/ml), 250 mg/550 ml (0.45 mg/ml). ***Rate:*** See Route/Dosage section. Titrate

Copyright © 2008 by F.A. Davis

to patient's heart rate and blood pressure response.

- **Y-Site Compatibility:** albumin, amikacin, amiodarone, amphotericin B, argatroban, aztreonam, bivalirudin, bumetanide, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, dexamethasone, digoxin, dobutamine, dopamine, doxycycline, epinephrine, erythromycin lactobionate, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, hydromorphone, imipenem/cilastatin, labetalol, levofloxacin, lidocaine, lorazepam, meperidine, metoclopramide, metronidazole, midazolam, milrinone, morphine, multivitamins, nicardipine, nitroglycerin, nitroprusside, norepinephrine, oxacillin, penicillin G potassium, pentamidine, potassium chloride, potassium phosphate, ranitidine, tacrolimus, theophylline, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium.
- **Y-Site Incompatibility:** diazepam, furosemide, lansoprazole, phenytoin, rifampin.

Patient/Family Teaching

- Advise patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cough and cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of tachyarrhythmias.

dimenhyDRINATE
(dye-men-**hye**-dri-nate)
Apo-Dimenhydrinate, Calm X, Dimetabs, Dinate, Dramamine, Dramanate, Gravol, Hydrate, PMS-Dimenhydrinate, Travel-tabs, Triptone Caplets

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antiemetics, antihistamines

Pregnancy Category B

Indications
Nausea, vomiting, dizziness, and vertigo accompanying motion sickness.

Action
Inhibits vestibular stimulation. Has significant CNS depressant, anticholinergic, antihistaminic, and antiemetic properties. **Therapeutic Effects:** Decreased vestibular stimulation, which may prevent motion sickness.

Pharmacokinetics
Absorption: Well absorbed after oral or IM administration.
Distribution: Probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (anti-motion sickness, antiemetic activity)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	1–2 hr	3–6 hr
Rect	30–45 min	unknown	6–12 hr
IM	20–30 min	1–2 hr	3–6 hr
IV	rapid	unknown	3–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain alcohol or tartrazine; in patients with known intolerance.
Use Cautiously in: Angle-closure glaucoma; Seizure disorders; Prostatic hyperplasia.

Adverse Reactions/Side Effects
CNS: drowsiness, dizziness, headache, paradoxical excitation (children). **EENT:** blurred vision, tinnitus. **CV:** hypotension, palpitations. **GI:** anorexia, constipation, diarrhea, dry mouth. **GU:** dysuria, frequency. **Derm:** photosensitivity. **Local:** pain at IM site.

Interactions
Drug-Drug: ↑ CNS depression with other **antihistamines**, **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. May mask signs or symptoms of ototoxicity in patients receiving **ototoxic drugs** (**aminoglycosides**, **etacrynic acid**). ↑ anticholinergic properties with **tricyclic antidepressants**, **quinidine**, or **disopyramide**. **MAO inhibitors** intensify and prolong the anticholinergic effects of antihistamines.

Route/Dosage
PO (Adults): 50–100 mg q 4 hr (not to exceed 400 mg/day).
PO (Children 6–12 yr): 25–50 mg q 6–8 hr (not to exceed 300 mg/day).
Rect (Adults): 50–100 mg q 6–8 hr.
Rect (Children 8–12 yr): 25–50 mg q 8–12 hr.
Rect (Children 6–8 yr): 12.5–25 mg q 8–12 hr.
IM, IV (Adults): 50 mg q 4 hr as needed.
IM, IV (Children): 1.25 mg/kg (37.5 mg/m^2) q 6 hr as needed (not to exceed 300 mg/day).

Availability (generic available)
Tablets: 50 mg^{OTC}. **Chewable tablets (orange flavor):** 50 mg^{OTC}. **Capsules:** 50 mg^{OTC}. **Extended-release capsules:** 25 mg^{OTC}. **Elixir (cherry flavor):** 12.5 mg/5 ml^{OTC}, 15 mg/5 ml^{OTC}. **Liquid:** 12.5 mg/4 ml^{OTC}. **Suppositories:** 50 mg^{OTC}, 100 mg^{OTC}. **Injection:** 50 mg/ml.

NURSING IMPLICATIONS

Assessment
- Assess nausea, vomiting, bowel sounds, and abdominal pain before and after administration of this drug. Dimenhydrinate may mask the signs of an acute abdomen.
- Monitor intake and output, including emesis. Assess for signs of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, increased urine specific gravity, poor skin turgor).
- ***Lab Test Considerations:*** Will cause false-negative allergy skin test results; discontinue 72 hr before testing.

Potential Nursing Diagnoses
Risk for deficient fluid volume (Indications)
Imbalanced nutrition: less than body requirements (Indications)
Risk for injury (Side Effects)

Implementation
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

- **PO:** Use calibrated measuring device when administering liquid dose.
- **IM:** Administer into well-developed muscle; massage well.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute 50 mg in 0.9% NaCl for injection. ***Concentration:*** 5 mg/ml. ***Rate:*** Inject over 2 min.
- **Syringe Compatibility:** atropine, codeine, droperidol, fentanyl, heparin, hydromorphone, meperidine, metoclopromide, morphine, pentazocine, perphenazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** butorphanol, chlorpromazine, glycopyrrolate, hydroxyzine, midazolam, nalbuphine, pentobarbital, prochlorperazine, promethazine, thiopental.
- **Y-Site Compatibility:** acyclovir, pantoprazole.
- **Y-Site Incompatibility:** aminophylline, heparin, hydrocortisone sodium succinate, phenobarbital, phenytoin, prednisolone, prochlorperazine, promethazine.
- **Solution Compatibility:** D5W, 0.45% NaCl, 0.9% NaCl, Ringer's solution, lactated Ringer's solution, dextrose/saline combinations, or dextrose/Ringer's combinations.

Patient/Family Teaching

- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Inform patient that this medication may cause dry mouth. Frequent oral rinses, good oral hygiene, and sugarless gum or candy may minimize this effect.
- Caution patient to avoid alcohol and other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.

Evaluation/Desired Outcomes

- Prevention or decreased severity of nausea and vomiting, vertigo, or motion sickness.

dinoprostone

(dye-noe-**prost**-one)
Cervidil Vaginal Insert, Prepidil Endocervical Gel, Prostin E Vaginal Suppository

Classification
Therapeutic: cervical ripening agents
Pharmacologic: oxytocics, prostaglandins

Pregnancy Category C

Indications

Endocervical Gel, Vaginal Insert: Used to "ripen" the cervix in pregnancy at or near term when induction of labor is indicated. Vaginal Suppository: Induction of midtrimester abortion, Management of missed abortion up to 28 wk, Management of nonmetastatic gestational trophoblastic disease (benign hydatidiform mole).

Action

Produces contractions similar to those occurring during labor at term by stimulating the myometrium (oxytocic effect). Initiates softening, effacement, and dilation of the cervix (ripening). Also stimulates GI smooth muscle.
Therapeutic Effects: Initiation of labor. Expulsion of fetus.

Pharmacokinetics

Absorption: Rapidly absorbed.
Distribution: Unknown. Action is mostly local.
Metabolism and Excretion: Metabolized by enzymes in lung, kidneys, spleen, and liver tissue.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cervical ripening (gel)	rapid	30–45 min	unknown
Cervical ripening (insert)	rapid	unknown	12 hr
Abortion time (suppository)	10 min	12–24 hr	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins or additives in the gel or suppository; The gel/insert should be avoided in situations in which prolonged uterine contractions should be avoided, including: Previous cesarean section or uterine surgery, Cephalopelvic disproportion, Traumatic delivery or difficult labor, Multiparity (≥6 term pregnancies), Hyperactive or hypertonic uterus, Fetal distress (if delivery is not imminent), Unexplained vaginal bleeding, Placenta previa, Vasa previa, Active herpes geni-

Copyright © 2008 by F.A. Davis

talis, Obstetric emergency requiring surgical intervention, Situations in which vaginal delivery is contraindicated. Presence of acute pelvic inflammatory disease or ruptured membranes; Concurrent oxytocic therapy (wait for 30 min after removing insert before using oxytocin).
Use Cautiously in: Uterine scarring; Asthma; Hypotension; Cardiac disease; Adrenal disorders; Anemia; Jaundice; Diabetes mellitus; Epilepsy; Glaucoma; Pulmonary, renal, or hepatic disease; Multiparity (up to 5 previous term pregnancies).

Adverse Reactions/Side Effects

Endocervical Gel, Vaginal Insert. **GU:** uterine contractile abnormalities, warm feeling in vagina. **MS:** back pain. **Misc:** fever.
Suppository **CNS:** headache, drowsiness, syncope. **Resp:** coughing, dyspnea, wheezing. **CV:** hypotension, hypertension. **GI:** diarrhea, nausea, vomiting. **GU:** UTERINE RUPTURE, urinary tract infection, uterine hyperstimulation, vaginal/uterine pain. **Misc:** allergic reactions including ANAPHYLAXIS, chills, fever.

Interactions

Drug-Drug: Augments the effects of other **oxytocics**.

Route/Dosage

Cervical Ripening

Vag (Adults, Cervical): *Endocervical gel*—0.5 mg; if response is unfavorable, may repeat in 6 hr (not to exceed 1.5 mg/24 hr). *Vaginal insert*—one 10-mg insert.

Abortifacient

Vag (Adults): One 20-mg suppository, repeat q 3–5 hr (not to exceed 240 mg total or longer than 48 hr).

Availability

Endocervical gel (Prepidil): 0.5 mg dinoprostone in 3 g of gel vehicle in a prefilled syringe with catheters. **Vaginal insert (Cervidil):** 10 mg. **Vaginal suppository (Prostin E Vaginal):** 20 mg.

NURSING IMPLICATIONS

Assessment

- **Abortifacient:** Monitor frequency, duration, and force of contractions and uterine resting tone. Opioid analgesics may be administered for uterine pain.
- Monitor temperature, pulse, and blood pressure periodically throughout therapy. Dinoprostone-induced fever (elevation >1.1°C or 2°F) usually occurs within 15–45 min after insertion of suppository. This returns to normal 2–6 hr after discontinuation or removal of suppository from vagina.
- Auscultate breath sounds. Wheezing and sensation of chest tightness may indicate hypersensitivity reaction.
- Assess for nausea, vomiting, and diarrhea in patients receiving suppository. Vomiting and diarrhea occur frequently. Patient should be premedicated with antiemetic and antidiarrheal.
- Monitor amount and type of vaginal discharge. Notify physician or other health care professional immediately if symptoms of hemorrhage (increased bleeding, hypotension, pallor, tachycardia) occur.
- **Cervical Ripening:** Monitor uterine activity, fetal status, and dilation and effacement of cervix continuously throughout therapy. Assess for hypertonus, sustained uterine contractility, and fetal distress. Insert should be removed at the onset of active labor.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Abortifacient:** Warm the suppository to room temperature just before use.
- Wear gloves when handling unwrapped suppository to prevent absorption through skin.
- Patient should remain supine for 10 min after insertion of suppository; then she may be ambulatory.
- **Vaginal Insert:** Place vaginal insert transversely in the posterior vaginal fornix immediately after removing from foil package. Warming of insert and sterile conditions are not required. Use vaginal insert only with a retrieval system. Use minimal amount of water-soluble lubricant during insertion; avoid excess because it may hamper release of dinoprostone from insert. Patient should remain supine for 2 hr after insertion, then may ambulate.
- Vaginal insert delivers dinoprostone 0.3 mg/hr over 12 hr. Remove insert at the onset of

Copyright © 2008 by F.A. Davis

active labor, before amniotomy, or after 12 hr.
- Oxytocin should not be used during or less than 30 min after removal of insert.
- **Endocervical Gel:** Determine degree of effacement before insertion of the endocervical catheter. Do not administer above the level of the internal os. Use a 20-mm endocervical catheter if no effacement is present and a 10-mm catheter if the cervix is 50% effaced.
- Use caution to prevent contact of dinoprostone gel with skin. Wash hands thoroughly with soap and water after administration.
- Bring gel to room temperature just before administration. Do not force warming with external sources (water bath, microwave). Remove peel-off seal from end of syringe; then remove the protective end cap and insert end cap into plunger stopper assembly in barrel of syringe. Aseptically remove catheter from package. Firmly attach catheter hub to syringe tip; click is evidence of attachment. Fill catheter with sterile gel by pushing plunger to expel air from catheter before administration to patient. Gel is stable for 24 mo if refrigerated.
- Patient should be in dorsal position with cervix visualized using a speculum. Introduce gel with catheter into cervical canal using sterile technique. Administer gel by gentle expulsion from syringe and then remove catheter. Do not attempt to administer small amount of gel remaining in syringe. Use syringe for only 1 patient; discard syringe, catheter, and unused package contents after using.
- Patient should remain supine for 15–30 min after administration to minimize leakage from cervical canal.
- Oxytocin may be administered 6–12 hr after desired response from dinoprostone gel. If no cervical/uterine response to initial dose of dinoprostone is obtained, repeat dose may be administered in 6 hr.

Patient/Family Teaching
- Explain purpose of medication and vaginal exams.
- **Abortifacient:** Instruct patient to notify health care professional immediately if fever and chills, foul-smelling vaginal discharge, lower abdominal pain, or increased bleeding occurs.
- Provide emotional support throughout therapy.
- **Cervical Ripening:** Inform patient that she may experience a warm feeling in her vagina during administration.
- Advise patient to notify health care professional if contractions become prolonged.

Evaluation/Desired Outcomes
- Complete abortion. Continuous administration for more than 2 days is not usually recommended.
- Cervical ripening and induction of labor.

diphenhydrAMINE (oral, parenteral)
(dye-fen-**hye**-dra-meen)
Allerdryl, Allergy Medication, AllerMax, Banophen, Benadryl Dye-Free Allergy, Benadryl Allergy, Benadryl, Compoz, Compoz Nighttime Sleep Aid, Diphen AF, Diphen Cough, Diphenhist, Dormin, Genahist, 40 Winks, Hyrexin-50, Insomnal, Maximum Strength Nytol, Maximum Strength Sleepinal, Midol PM, Miles Nervine, Nighttime Sleep Aid, Nytol, Scot-Tussin Allergy DM, Siladril, Silphen, Sleep-Eze 3, Sleepwell 2-night, Sominex, Snooze Fast, Sominex, Tusstat, Twilite, Unisom Nighttime Sleep-Aid

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines, antitussives

Pregnancy Category B

Indications
Relief of allergic symptoms caused by histamine release including: Anaphylaxis, Seasonal and perennial allergic rhinitis, Allergic dermatoses. Parkinson's disease and dystonic reactions from medications. Mild nighttime sedation. Prevention of motion sickness. Antitussive (syrup only).

Action
Antagonizes the effects of histamine at H_1-receptor sites; does not bind to or inactivate histamine. Significant CNS depressant and anticholinergic properties. **Therapeutic Effects:** Decreased symptoms of histamine excess

Copyright © 2008 by F.A. Davis

(sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness, urticaria). Relief of acute dystonic reactions. Prevention of motion sickness. Suppression of cough.

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration but 40–60% of an oral dose reaches systemic circulation due to first-pass metabolism.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: 95% metabolized by the liver.
Half-life: 2.4–7 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	2–4 hr	4–8 hr
IM	20–30 min	2–4 hr	4–8 hr
IV	rapid	unknown	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma; Lactation; Known alcohol intolerance (some liquid products).
Use Cautiously in: Severe liver disease; Angle-closure glaucoma; Seizure disorders; Prostatic hyperplasia; Peptic ulcer; May cause paradoxical excitation in young children; Hyperthyroidism; OB: Safety not established. Lactation: Discontinue drug or bottle-feed; Geri: Appears on Beers list. Geriatric patients are more susceptible to adverse drug reactions and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia); dosage reduction or non-anticholinergic antihistamine recommended.

Adverse Reactions/Side Effects

CNS: drowsiness, dizziness, headache, paradoxical excitation (increased in children). **EENT:** blurred vision, tinnitus. **CV:** hypotension, palpitations. **GI:** anorexia, dry mouth, constipation, nausea. **GU:** dysuria, frequency, urinary retention. **Derm:** photosensitivity. **Resp:** chest tightness, thickened bronchial secretions, wheezing. **Local:** pain at IM site.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **antihistamines**, **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic effects with **tricyclic antidepressants**, **quinidine**, or **disopyramide**. **MAO inhibitors** intensify and prolong the anticholinergic effects of antihistamines.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian, or chamomile, can ↑ CNS depression.**

Route/Dosage

PO (Adults and Children >12 yr): *Antihistaminic/antiemetic/antivertiginic*—25–50 mg q 4–6 hr, not to exceed 300 mg/day. *Antitussive*—25 mg q 4 hr as needed, not to exceed 150 mg/day. *Antidyskinetic*—25–50 mg q 4 hr (not to exceed 400 mg/day). *Sedative/hypnotic*—50 mg 20–30 min before bedtime.
PO (Children 6–12 yr): *Antihistaminic/antiemetic/antivertiginic*—12.5–25 mg q 4–6 hr (not to exceed 150 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 6–8 hr as needed (not to exceed 300 mg/day). *Antitussive*—12.5 mg q 4 hr (not to exceed 75 mg/day). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).
PO (Children 2–6 yr): *Antihistaminic/antiemetic/antivertiginic*—6.25–12.5 mg q 4–6 hr (not to exceed 37.5 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 4–6 hr as needed (not to exceed 300 mg/day). *Antitussive*—6.25 mg q 4 hr (not to exceed 37.5 mg/24 hr). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).
IM, IV (Adults): 25–50 mg q 4 hr as needed (may need up to 100-mg dose, not to exceed 400 mg/day).
IM, IV (Children): 1.25 mg/kg (37.5 mg/m^2) 4 times daily (not to exceed 300 mg/day).

Availability (generic available)

Capsules: 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Tablets:** 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Chewable tablets (grape flavor):** 25 mg$^{Rx, OTC}$. **Elixir (cherry and other flavors):** 12.5 mg/5 ml$^{Rx, OTC}$. **Syrup (cherry and raspberry flavor):** 12.5 mg/5 ml$^{Rx, OTC}$. **Injection:** 10 mg/ml, 50 mg/ml. ***In combination with:*** analgesics, decongestants, and expectorants, in OTC pain, sleep, cough, and cold preparations. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Diphenhydramine has multiple uses. Determine why the medication was ordered and

Copyright © 2008 by F.A. Davis

assess symptoms that apply to the individual patient. Geri: Appears in the Beers list. May cause sedation and confusion due to increased sensitivity to anticholinergic effects. Monitor carefully, assess for confusion, delirium, other anticholinergic side effects and fall risk. Institute measures to prevent falls.

- **Prevention and Treatment of Anaphylaxis:** Assess for urticaria and for patency of airway.
- **Allergic Rhinitis:** Assess degree of nasal stuffiness, rhinorrhea, and sneezing.
- **Parkinsonism and Extrapyramidal Reactions:** Assess movement disorder before and after administration.
- **Insomnia:** Assess sleep patterns.
- **Motion Sickness:** Assess nausea, vomiting, bowel sounds, and abdominal pain.
- **Cough Suppressant:** Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 ml daily to decrease viscosity of bronchial secretions.
- **Pruritus:** Assess degree of itching, skin rash, and inflammation.
- ***Lab Test Considerations:*** Diphenhydramine may decrease skin response to allergy tests. Discontinue 4 days before skin testing.

Potential Nursing Diagnoses

Insomnia (Indications)
Risk for deficient fluid volume (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Benadryl (diphenhydramine) with Benylin (dextromethorphan), desipramine (Norpramin) or with dimenhydrinate (Dramamine).
- When used for insomnia, administer 20 min before bedtime and schedule activities to minimize interruption of sleep.
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- **PO:** Administer with meals or milk to minimize GI irritation. Capsule may be emptied and contents taken with water or food.
- **IM:** Administer 50 mg/ml into well-developed muscle. Avoid subcut injections.

IV Administration

- **Direct IV:** ***Diluent:*** May be further diluted in 0.9% NaCl, 0.45% NaCl, D5W, D10W, dextrose/saline combinations, Ringer's solution, LR, and dextrose/Ringer's combinations. ***Concentration:*** 25 mg/ml. ***Rate:*** Infuse over 10–15 min at a rate not to exceed 25 mg/min.
- **Syringe Compatibility:** atropine, butorphanol, chlorpromazine, cimetidine, dimenhydrinate, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promethazine, ranitidine, scopolamine, sufentanil.
- **Syringe Incompatibility:** haloperidol, pentobarbital, thiopental.
- **Y-Site Compatibility:** abciximab, acyclovir, aldesleukin, amifostine, amsacrine, argatroban, azithromycin, aztreonam, bivalirudin, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, linezolid, melphalan, meperidine, meropenem, methadone, methotrexate, morphine, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, potassium chloride, propofol, remifentanil, sargramostim, sufentanil, tacrolimus, teniposide, thiotepa, vinorelbine, vitamin B complex with C.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, cefepime, foscarnet, lansoprazole.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not exceed recommended amount. Caution patient not to use oral OTC diphenhydramine products with any other product containing diphenhydramine, including products used topically.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Inform patient that this drug may cause dry mouth. Frequent oral rinses, good oral hygiene, and sugarless gum or candy may minimize this effect. Notify health care professional if dry mouth persists for more than 2 wks.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping,

Copyright © 2008 by F.A. Davis

avoidance of nicotine and caffeine) to patients taking diphenhydramine to aid sleep.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid use of alcohol and other CNS depressants concurrently with this medication.
- Pedi: Can cause excitation in children. Caution parents or caregivers about proper dose calculation; overdosage, especially in infants and children, can cause hallucinations, seizures, or death.
- Geri: Instruct older adults to avoid OTC products that contain diphenhydramine due to increased sensitivity to anticholinergic effects and potential for adverse reactions related to these effects.
- Advise patients taking diphenhydramine in OTC preparations to notify health care professional if symptoms worsen or persist for more than 7 days.

Evaluation/Desired Outcomes
- Prevention of, or decreased urticaria in, anaphylaxis or other allergic reactions.
- Decreased dyskinesia in parkinsonism and extrapyramidal reactions.
- Sedation when used as a sedative/hypnotic.
- Prevention of, or decrease in, nausea and vomiting caused by motion sickness.
- Decrease in frequency and intensity of cough without eliminating cough reflex.

diphenoxylate/atropine
(dye-fen-**ox**-i-late/**a**-troe-peen)
Logen, Lomanate, Lomotil, Lonox
difenoxin/atropine
(dye-fen-**ox**-in/**a**-troe-peen)
Motofen

Classification
Therapeutic: antidiarrheals
Pharmacologic: anticholinergics

Schedule V (diphenoxylate/atropine), IV (difenoxin/atropine)

Pregnancy Category C

Indications
Adjunctive therapy in the treatment of diarrhea.

Action
Inhibits excess GI motility. Structurally related to opioid analgesics but has no analgesic properties. Atropine added to discourage abuse.
Therapeutic Effects: Decreased GI motility with subsequent decrease in diarrhea.

Pharmacokinetics
Absorption: Well absorbed from the GI tract.
Distribution: Enters breast milk.
Metabolism and Excretion: *Diphenoxylate*—mostly metabolized by the liver with some conversion to an active antidiarrheal compound (difenoxin). *Difenoxin*—metabolized by the liver. Minimal excretion in urine.
Half-life: *Diphenoxylate*—2.5 hr; *difenoxin*—4.5 hr.

TIME/ACTION PROFILE (antidiarrheal action)

ROUTE	ONSET	PEAK	DURATION
Difenoxin–PO	45–60 min	2 hr	3–4 hr
Diphenoxylate–PO	45–60 min	2 hr	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe liver disease; Infectious diarrhea (due to *Escherichia coli*, *Salmonella*, or *Shigella*); Diarrhea associated with pseudomembranous colitis; Dehydrated patients; Angle-closure glaucoma; Children <2 yr; Known alcohol intolerance (some liquid diphenoxylate/atropine products only).
Use Cautiously in: Patients physically dependent on opioids; Inflammatory bowel disease; Geriatric patients (more sensitive to effects); Children (more sensitive to effects, espcially Down's syndrome patients); Prostatic hyperplasia; Pregnancy, lactation, or children <12 yr (safety not established for difenoxin/atropine in children <12 yr; diphenoxylate/atropine should not be used in children <2 yr).

Adverse Reactions/Side Effects
CNS: dizziness, confusion, drowsiness, headache, insomnia, nervousness. **EENT:** blurred vision, dry eyes. **CV:** tachycardia. **GI:** constipation, dry mouth, epigastric distress, ileus, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic properties with other **drugs having anticholinergic properties**, including **tricyclic antidepressants** and **disopyramide**. Use with **MAO inhibitors** may result in hypertensive crisis.

Drug-Natural Products: Increased anticholinergic effects with **angel's trumpet, jimson weed, and scopolia.**

Route/Dosage

Difenoxin/Atropine

Doses given are in terms of difenoxin—each tablet contains 1 mg difenoxin with 0.025 mg of atropine.

PO (Adults): 2 tablets initially, then 1 tablet after each loose stool or every 3–4 hr as needed (not to exceed 8 tablets/day).

Diphenoxylate/Atropine

Adult doses given are in terms of diphenoxylate—each tablet contains 2.5 mg diphenoxylate with 0.025 mg of atropine; pediatric doses are given in mg of diphenoxylate and in ml of diphenoxylate/atropine liquid; each 5 ml of liquid contains 2.5 mg diphenoxylate with 0.025 mg of atropine.

PO (Adults): 5 mg 3–4 times daily initially, then 5 mg once daily as needed (not to exceed 20 mg/day).

PO (Children): *use liquid only*—0.3–0.4 mg/kg/day in 4 divided doses.

Availability

Difenoxin/Atropine

Tablets: 1 mg difenoxin/0.025 mg atropine.

Diphenoxylate/Atropine

Tablets: 2.5 mg diphenoxylate/0.025 mg atropine. **Liquid (cherry flavor):** 2.5 mg diphenoxylate/0.025 mg atropine per 5 ml.

NURSING IMPLICATIONS

Assessment

- Assess the frequency and consistency of stools and bowel sounds prior to and throughout therapy.
- Assess patient's fluid and electrolyte balance and skin turgor for dehydration.
- ***Lab Test Considerations:*** Liver function tests should be evaluated periodically during prolonged therapy.
- Diphenoxylate/atropine may cause increased serum amylase concentrations.

Potential Nursing Diagnosis

Diarrhea (Indications)
Constipation (Side Effects)

Implementation

- Do not confuse Lomotil with Lamictal (lamotrigine) or Lamisil (terbinafine).
- Risk of dependence increases with high-dose, long-term use. Atropine has been added to discourage abuse.
- **PO:** Diphenoxylate/atropine tablets may be administered with food if GI irritation occurs. Tablets may be crushed and administered with patient's fluid of choice. Use calibrated measuring device for liquid preparations.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Do not take more than the prescribed amount because of the habit-forming potential and risk of overdose in children. If on a scheduled dosing regimen, missed doses should be taken as soon as possible unless almost time for next dose. Do not double doses.
- Medication may cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid alcohol and other CNS depressants concurrently with this medication.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or palpitations occur.

Evaluation/Desired Outcomes

- Decrease in diarrhea. Treatment of acute diarrhea should be continued for 24–36 hr before it is considered ineffective.

dipyridamole

(dye-peer-**id**-a-mole)
Apo-Dipyridamole, Dipridacot, Novodipiradol, Persantine, Persantine IV

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antiplatelet agents, diagnostic agents (coronary vasodilators)
Pharmacologic: platelet adhesion inhibitors

Pregnancy Category B

Indications
PO: Prevention of thromboembolism in patients with prosthetic heart valves (with warfarin). Maintains patency after surgical grafting procedures, including coronary artery bypass (with aspirin). **IV:** As an alternative to exercise in myocardial perfusion scintigraphy (cardiac stress testing with radiotracer imaging).

Action
PO: Decreases platelet aggregation by inhibiting the enzyme phosphodiesterase. **IV:** Produces coronary vasodilation by inhibiting adenosine uptake. **Therapeutic Effects: PO:** Inhibition of platelet aggregation and subsequent thromboembolic events. **IV:** In diagnostic thallium imaging, dipyridamole dilates normal coronary arteries, reducing flow to vessels that are narrowed and causing abnormal thallium distribution.

Pharmacokinetics
Absorption: Moderately absorbed (30–60%) after oral administration.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Metabolized by the liver; excreted in the bile.
Half-life: 10 hr.

TIME/ACTION PROFILE (PO = antiplatelet activity, IV = coronary vasodilation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IV	unknown	6.5 min†	30 min

†From start of infusion

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Hypotensive patients; Geri: Appears on Beers list. Geriatric patients may be more susceptible to orthostatic hypotension. Patients with platelet defects; Pregnancy (although safety not established, has been used without harm during pregnancy); Lactation or children <12 yr (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache, syncope; *IV only*— transient cerebral ischemia, weakness. **Resp:** *IV only*— bronchospasm. **CV:** *IV only*— MI, hypotension, arrhythmias, flushing. **GI:** nausea, diarrhea, GI upset, vomiting. **Derm:** rash.

Interactions
Drug-Drug: Additive effects with **aspirin** on platelet aggregation. Risk of bleeding may be ↑ when used with **anticoagulants**, **thrombolytic agents**, **NSAIDs**, **cefoperazone**, **cefotetan**, **valproic acid**, or **sulfinpyrazone**. ↑ risk of hypotension with **alcohol**. **Theophylline** may negate the effects of dipyridamole during diagnostic thallium imaging.

Route/Dosage
PO (Adults): 225–400 mg/day in 3–4 divided doses.
IV (Adults): 570 mcg/kg; maximum dose 60 mg.

Availability (generic available)
Tablets: 25 mg, 50 mg, 75 mg, ✱100 mg. **Injection:** 5 mg/ml in 2-ml and 10-ml vials. ***In combination with:*** aspirin (Aggrenox). See Appendix B.

NURSING IMPLICATIONS

Assessment
- **PO:** Monitor blood pressure and pulse before instituting therapy and regularly during period of dosage adjustment. Geri: Assess geriatric patients for orthostatic hypotension.
- **IV:** Monitor vital signs during and for 10–15 min after infusion. Obtain ECG in at least 1 lead. If severe chest pain or bronchospasm occurs, administer IV aminophylline 50–250 mg at a rate of 50–100 mg over 30–60 sec. If hypotension is severe, place patient in a supine position with head tilting down. If chest pain is unrelieved with aminophylline 250 mg, administer nitroglycerin SL. If chest pain is still unrelieved, treat as myocardial infarction.
- ***Lab Test Considerations:*** Bleeding time should be monitored periodically throughout therapy.

Potential Nursing Diagnoses
Decreased cardiac output (Indications)
Acute pain (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- **PO:** Administer with a full glass of water at least 1 hr before or 2 hr after meals for faster absorption. If GI irritation occurs, may be administered with or immediately after meals. Tablets may be crushed and mixed with food if patient has difficulty swallowing. Pharmacist may make a suspension.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in at least a 1:2 ratio of 0.45% NaCl, 0.9% NaCl, or D5W for a total volume of 20–50 ml. Undiluted dipyridamole may cause venous irritation. ***Rate:*** Infuse over 4 min.
- **Y-Site Compatibility:** No information available.

Patient/Family Teaching

- **PO:** Instruct patient to take medication at evenly spaced intervals as directed. Take missed doses as soon as remembered unless the next scheduled dose is within 4 hr. Do not double doses. Benefit of medication may not be apparent to patient; encourage patient to continue taking medication as directed.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid the use of alcohol, as it may potentiate the hypotensive effects. Tobacco products should also be avoided because nicotine causes vasoconstriction.
- Advise patient to consult health care professional before taking OTC medications concurrently with this medication. Aspirin should be taken only if directed and only in dose prescribed. Advise patient to discuss alternatives for pain relief or fever.
- Instruct patient to notify health care professional if unusual bleeding or bruising occurs. Concurrent use of aspirin or warfarin may increase risk of bleeding but is commonly used with specific indications.
- Advise patient to notify health care professional of medication regimen and whether using concurrent aspirin or warfarin therapy.
- **IV:** Instruct patient to notify health care professional immediately if dyspnea or chest pain occurs.

Evaluation/Desired Outcomes

- Prevention of postoperative thromboembolic complications associated with prosthetic heart valves.
- Maintenance of patency after surgical graft procedures.
- Coronary vasodilation in thallium myocardial perfusion imaging.

disopyramide

(dye-soe-**peer**-a-mide)
Norpace, Norpace CR, Rythmodan, Rythmodan-LA

Classification
Therapeutic: antiarrhythmics (class I)

Pregnancy Category C

Indications

Suppression/prevention of unifocal and multifocal PVCs, paired PVCs, and ventricular tachycardia. **Unlabeled uses:** Treatment/prevention of supraventricular tachyarrhythmias.

Action

Decreases myocardial excitability and conduction velocity. Has anticholinergic properties. Little effect on heart rate but has a direct negative inotropic effect. **Therapeutic Effects:** Suppression of ventricular arrhythmias.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed; enters breast milk.
Metabolism and Excretion: Metabolized by the liver; 10% excreted unchanged in the feces, 50% excreted unchanged by the kidneys.
Half-life: 8–18 hr (increased in hepatic or renal impairment).

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–3.5 hr	2.5 hr	1.5–8.5 hr
PO-CR	0.5–3.5 hr	4.9 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cardiogenic shock; 2nd-degree and 3rd-degree heart block; Sick sinus syndrome (without a pacemaker).
Use Cautiously in: CHF or left ventricular dysfunction (dosage reduction recommended); Hepatic or renal insufficiency (dosage reduction recommended if CCr ≤40 ml/min); Prostatic enlargement; Myasthenia gravis; Glaucoma; Geri: Appears on Beers list. May induce heart failure in elderly patients; Children, pregnancy, or lactation (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **EENT:** blurred vision, dry eyes, dry throat. **CV:** CHF, arrhythmias, AV block, dyspnea, edema, hypotension. **GI:** constipation, dry mouth, abdominal pain, flatulence, nausea. **GU:** urinary hesitancy, urinary retention. **Endo:** hypoglycemia. **Misc:** impaired temperature regulation.

Interactions

Drug-Drug: May potentiate anticoagulant effect of **warfarin**. **Rifampin**, **phenobarbital**, and **phenytoin** may decrease blood levels and effectiveness. **Cimetidine** or **erythromycin** may decrease metabolism and increase blood levels. May have additive toxic cardiac effects when used with other **antiarrhythmics** (prolonged conduction and decreased cardiac output), especially **verapamil—**avoid using disopyramide for 48 hr before or 24 hr after. Anticholinergic side effects may be additive with other **drugs having anticholinergic properties**, including **antihistamines** and **tricyclic antidepressants**. Increased risk of arrhythmias with **pimozide**.

Drug-Natural Products: Increased anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

PO (Adults >50 kg): 150 mg q 6 hr (as immediate-release capsules) or 300 mg q 12 hr (as CR or LA dosage form; not to exceed 800 mg/day).

PO (Adults <50 kg or Patients with Poor Left Ventricular Function): 100 mg q 6–8 hr (as immediate-release capsules) or 200 mg q 12 hr (as CR or LA dosage form).

PO (Children 12–18 yr): 6–15 mg/kg daily, in divided doses q 6 hr.

PO (Children 4–12 yr): 10–15 mg/kg daily in divided doses q 6 hr.

PO (Children 1–4 yr): 10–20 mg/kg daily in divided doses q 6 hr.

PO (Children <1 yr): 10–30 mg/kg daily in divided doses q 6 hr.

Renal Impairment

PO (Adults): *CCr >40 ml/min or patients with hepatic impairment*—100 mg q 6 hr; *CCr 30–40 ml/min*—100 mg q 8 hr; *CCr 15–30 ml/min*—100 mg q 12 hr; *CCr <15 ml/min*—100 mg q 24 hr as immediate-release dosage form.

Availability (generic available)

Capsules: 100 mg, 150 mg. **Extended-release capsules:** 100 mg, 150 mg. **Extended-release tablets:** ✱150 mg. **Injection:** ✱10 mg/ml.

D

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and ECG before and routinely throughout therapy. Check pulse before administering medication; withhold and notify physician or other health care professional if <60 or >120 bpm or if changes in rhythm.
- Monitor intake and output ratios and daily weight; assess for edema and urinary retention daily.
- Assess patient for signs of congestive heart failure (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention). Notify physician or other health care professional if these occur.
- ***Lab Test Considerations:*** Renal and hepatic functions and serum potassium levels should be evaluated periodically throughout therapy.
- May cause elevated serum BUN, cholesterol, and triglyceride levels.
- May cause decreased blood glucose concentrations.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired oral mucous membrane (Side Effects)

Implementation

- When changing from quinidine sulfate or procainamide to disopyramide, regular maintenance dose of disopyramide may be given 6–12 hr after last dose of quinidine sulfate or 3–6 hr after last dose of procainamide.
- Extended-release form (CR or LA formulations) is indicated for maintenance therapy only. When changing from regular form to extended-release forms, give the first dose of extended-release form 6 hr after the last regular dose.
- **PO:** Administer medication on an empty stomach, 1 hr before or 2 hr after meals. CR and LA forms must be swallowed whole; do not break open, crush, or chew.

Copyright © 2008 by F.A. Davis

- Pharmacist may prepare a suspension with 100-mg capsules and cherry syrup.

Patient/Family Teaching

- Advise patient to take medication around the clock, exactly as directed. Do not discontinue medication without consulting health care professional. If a dose is missed, take as soon as remembered unless within 4 hr of next dose. Do not double doses.
- Medication may cause dizziness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help relieve dry mouth.
- Caution patient to avoid extremes of temperature, because this medication may cause impairment of body temperature regulation. Patient should use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional before taking OTC medications or alcohol concurrently with this medication.
- If constipation becomes a problem, advise patient that increasing bulk and fluids in the diet and exercising may minimize constipation.
- Instruct patient to notify health care professional if dry mouth, difficult urination, constipation, or blurred vision persists.

Evaluation/Desired Outcomes

- Suppression of PVCs and ventricular tachycardia.
- Prevention of further arrhythmias.

DIURETICS (POTASSIUM-SPARING)

amiloride (a-**mill**-oh-ride)
Apo-Amiloride, Midamor

spironolactone
(speer-oh-no-**lak**-tone)
Aldactone, Novospiroton

triamterene (trye-**am**-ter-een)
Dyrenium

Classification
Therapeutic: diuretics
Pharmacologic: potassium-sparing diuretics

Pregnancy Category B (amiloride), C (spironolactone, triamterene)

Indications

Counteract potassium loss caused by other diuretics. Used with other agents (thiazides) to treat edema or hypertension. Primary hyperaldosteronism (spironolactone only). **Unlabeled uses: Spironolactone:** Management of CHF (low doses).

Action

Inhibition of sodium reabsorption in the kidney while saving potassium and hydrogen ions (spironolactone achieves this effect by antagonizing aldosterone receptors). **Therapeutic Effects:** Weak diuretic and antihypertensive response when compared with other diuretics. Conservation of potassium.

Pharmacokinetics

Absorption: *Amiloride*—30–90% absorbed; *spironolactone*—>90% absorbed; *triamterene*—30–70% absorbed.
Distribution: *Amiloride* and *triamterene*—widely distributed; all crosses the placenta and enter breast milk.
Protein Binding: *spironolactone* >90%.
Metabolism and Excretion: *Amiloride*—50% eliminated unchanged in urine, 40% excreted in the feces; *spironolactone*—converted by the liver to its active diuretic compound (canrenone); *triamterene*—80% metabolized by the liver, some excretion of unchanged drug.
Half-life: *Amiloride*—6–9 hr; *spironolactone*—78–84 min (spironolactone); 13–24 hr (canrenone); *triamterene*—1.7–2.5 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Amiloride	2 hr†	6–10 hr†	24 hr†
Spironolactone	unknown	2–3 days‡	2–3 days‡
Triamterene	2–4 hr†	1–several days‡	7–9 hr†

†Single dose
‡Multiple doses

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperkalemia; Anuria; Acute renal insufficiency; Sig-

Copyright © 2008 by F.A. Davis

nificant renal dysfunction (CCr ≤30 ml/min or SCr >2.5 mg/dl).

Use Cautiously in: Hepatic dysfunction; Geri: Elderly (presence of age-related renal dysfunction may lead to ↑ risk of hyperkalemia); Diabetes (↑ risk of hyperkalemia); History of gout or kidney stones (triamterene only); Concurrent use of potassium supplements or potassium-containing salt substitutes; OB, Lactation, Pedi, Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness; *spironolactone only*— clumsiness, headache. **CV:** arrhythmias. **GI:** *amiloride*— constipation, nausea, vomiting. **GU:** *spironolactone-*— erectile dysfunction; *triamterene-*— nephrolithiasis. **Derm:** *triamterene*— photosensitivity. **Endo:** *spironolactone*— breast tenderness, gynecomastia, irregular menses, voice deepening. **F and E:** hyperkalemia, hyponatremia. **Hemat:** *spironolactone*— agranulocytosis; *triamterene-*— hemolytic anemia, thrombocytopenia. **MS:** muscle cramps. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. Use with **ACE inhibitors**, **angiotensin II receptor antagonists**, **NSAIDS**, **potassium supplements**, **cyclosporine**, or **tacrolimus** ↑ risk of hyperkalemia. May ↑ levels/risk of toxicity from **lithium**. Effectiveness may be ↓ by **NSAIDs**. Spironolactone may ↑ effects of **digoxin**.

Route/Dosage

Amiloride

PO (Adults): *HTN*—5–10 mg/day (up to 20 mg).

PO (Children 1–17 yr): 0.4–0.625 mg/kg/day (maximum = 20 mg/day) (unlabeled use).

Spironolactone

PO (Adults): *Edema*—25–200 mg/day in 1–2 divided doses. *HTN*—50–100 mg/day in 1–2 divided doses. *Diuretic-induced hypokalemia*—25–100 mg/day in 1–2 divided doses. *Diagnosis of primary hyperaldosteronism*—100–400 mg/day in 1–2 divided doses. *CHF*—12.5–25 mg/day (unlabeled use).

PO (Children 1–17 yr): *Diuretic, HTN* 1 mg/kg/day in 1–2 divided doses (should not exceed 3.3 mg/kg/day or 100 mg/day) (unlabeled use). *Diagnosis of primary hyperaldosteronism*—125–375 mg/m²/day in 1–2 divided doses (unlabeled use).

PO (Neonates): 1–3 mg/kg/day in 1–2 divided doses.

Triamterene

PO (Adults): *HTN*—100 mg twice daily (not to exceed 300 mg/day; lower doses in combination products).

PO (Children): *HTN*—1–2 mg/kg/day in 2 divided doses; should not exceed 4 mg/kg/day or 300 mg/day.

Availability

Amiloride

Tablets: 5 mg. ***In combination with:*** hydrochlorothiazide (Moduret, Novamilor). See Appendix B.

Spironolactone

Tablets: 25 mg, 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide (Aldactazide, Apo-Spirozide, Spirazide). See Appendix B.

Triamterene

Capsules: 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide (Apo-Triazide, Dyazide, Maxzide, Novo-Triamzide, Nu-Triazide, ro-Triazide, Riva-Zide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios and daily weight during therapy.
- If medication is given as an adjunct to antihypertensive therapy, monitor blood pressure before administering.
- Monitor response of signs and symptoms of hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia). Assess patient frequently for development of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, ECG changes, cardiac arrhythmias). Patients who have diabetes mellitus or kidney disease and geriatric patients are at increased risk of developing these symptoms.
- Periodic ECGs are recommended in patients receiving prolonged therapy.
- ***Lab Test Considerations:*** Serum potassium levels should be evaluated before and

Copyright © 2008 by F.A. Davis

routinely during therapy. Withhold drug and notify physician or other health care professional if patient becomes hyperkalemic.
- Monitor BUN, serum creatinine, and electrolytes before and periodically during therapy. May cause ↑ serum magnesium, BUN, creatinine, potassium, and urinary calcium excretion levels. May also cause ↓ sodium levels.
- Discontinue potassium-sparing diuretics 3 days before a glucose tolerance test because of risk of severe hyperkalemia.
- *Spironolactone* may cause false ↑ of plasma cortisol concentrations. Spironolactone should be withdrawn 4–7 days before test.
- Monitor platelet count and total and differential leukocyte count periodically during therapy in patients taking *triamterene*.

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Implementation

- **PO:** Administer in AM to avoid interrupting sleep pattern.
- Administer with food or milk to minimize gastric irritation and to increase bioavailability.
- *Triamterene* capsules may be opened and contents mixed with food or fluids for patients with difficulty swallowing.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Caution patient to avoid salt substitutes and foods that contain high levels of potassium or sodium unless prescribed by health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult with health care professional before taking any OTC decongestants, cough or cold preparations, or appetite suppressants concurrently with this medication because of potential for increased blood pressure.
- Advise patients taking *triamterene* to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if muscle weakness or cramps; fatigue; or severe nausea, vomiting, or diarrhea occurs.
- Emphasize the need for follow-up exams to monitor progress.
- **Hypertension:** Reinforce need to continue additional therapies for hypertension (weight loss, restricted sodium intake, stress reduction, moderation of alcohol intake, regular exercise, and cessation of smoking). Medication helps control, but does not cure, hypertension.
- Teach patient and family the correct technique for checking blood pressure weekly.

Evaluation/Desired Outcomes

- Increase in diuresis and decrease in edema while maintaining serum potassium level in an acceptable range.
- Decrease in blood pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

DIURETICS (THIAZIDE)

chlorothiazide
(klor-oh-**thye**-a-zide)
Diuril, Sodium Diuril

chlorthalidone (thiazide–like)
(klor-**thal**-i-doan)
Apo-Chlorthalidone, Thalitone

hydrochlorothiazide
(hye-droe-klor-oh-**thye**-a-zide)
Apo-Hydro, Bio-Hydrochlorothiazide, DOM-Hydrochlorothiazide, Esedrix, Microzide, Novo-Hydrazide, Nu-Hydro, Oretic, PHL-Hydrochlorothiazide, PMS-Hydrochlorothiazide, Urozide

Classification
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide diuretics

Pregnancy Category B (chlorthalidone, hydrochlorothiazide), C (chlorothiazide)

Indications

Management of mild to moderate hypertension. Treatment of edema associated with: CHF, Renal

Copyright © 2008 by F.A. Davis

dysfunction, Cirrhosis, Glucocorticoid therapy, Estrogen therapy.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients and diuresis with mobilization of edema.

Pharmacokinetics

Absorption: All are rapidly absorbed after oral administration.
Distribution: All cross the placenta and enter breast milk.
Metabolism and Excretion: All are excreted mainly unchanged by the kidneys.
Half-life: *Chlorothiazide*—1–2 hr; *chlorthalidone*—35–50 hr; *hydrochlorothiazide*—6–15 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Chlorothiazide PO	2 hr	4 hr	6–12 hr
Chlorothiazide IV	15 min	30 min	2 hr
Chlorthalidone	2 hr	2 hr	48–72 hr
Hydrochlorothiazide†	2 hr	3–6 hr	6–12 hr

†Onset of antihypertensive effect is 3–4 days and does not become maximal for 7–14 days of dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity with other thiazides or sulfonamides may exist); Some products contain tartrazine and should be avoided in patients with known intolerance; Anuria; Lactation.
Use Cautiously in: Renal or hepatic impairment; OB: Pregnancy (jaundice or thrombocytopenia may be seen in the newborn); Pedi: Avoid use of hydrochlorothiazide oral solution in neonates (contains sodium benzoate, a metabolite of benzyl alcohol, which causes fetal gasping syndrome).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, weakness. **CV:** hypotension. **GI:** anorexia, cramping, hepatitis, nausea, pancreatitis, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **Hemat:** thrombocytopenia. **Metab:** hypercholesterolemia, hyperuricemia. **MS:** muscle cramps.

Interactions

Drug-Drug: Additive hypotension with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Additive hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. ↓ excretion of **lithium**. **Cholestyramine** or **colestipol** ↓ absorption. Hypokalemia ↑ risk of **digoxin** toxicity. **NSAIDs** may ↓ effectiveness.

Route/Dosage

When used as a diuretic in adults, generally given daily, but may be given every other day or 2–3 days/week.

Chlorothiazide

PO (Adults): 125 mg–2 g/day in 1–2 divided doses.
PO (Children >6 mos): 20 mg/kg/day in 1–2 divided doses (maximum dose = 1 g/day).
PO (Neonates ≤6 mo): 10–20 mg/kg q 12 hr (maximum dose = 375 mg/day).
IV (Adults): 500 mg–1 g/day in 1–2 divided doses.
IV (Children >6 mos): 4 mg/kg/day in 1–2 divided doses (maximum dose = 20 mg/kg/day) (unlabeled use).
IV (Neonates ≤6 mo): 1–4 mg/kg q 12 hr (maximum dose = 20 mg/kg/day) (unlabeled use).

Chlorthalidone

PO (Adults): 12.5–100 mg once daily (daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities).

Hydrochlorothiazide

PO (Adults): 12.5–100 mg/day in 1–2 divided doses (up to 200 mg/day); not to exceed 50 mg/day for hypertension; daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities.
PO (Children >6 mo): 1–3 mg/kg/day in 2 divided doses (not to exceed 37.5 mg/day).
PO (Children <6 mo): 1–3 mg/kg/day in 2 divided doses.

Copyright © 2008 by F.A. Davis

Availability

Chlorothiazide

Tablets: 250 mg, 500 mg. **Oral suspension:** 250 mg/5 ml. **Powder for injection:** 500 mg.

Chlorthalidone

Tablets: 25 mg, 50 mg, 100 mg. ***In combination with:*** atenolol (Tenoretic), clonidine (Clorpres). See Appendix B.

Hydrochlorothiazide

Tablets: 25 mg, 50 mg. **Capsules:** 12.5 mg. **Oral solution:** 10 mg/ml, 100 mg/ml. ***In combination with:*** numerous antihypertensive agents. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, intake, output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- If hypokalemia occurs, consideration may be given to potassium supplements or ↓ dose of diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor blood pressure before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels before and periodically throughout therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause ↑ in serum bilirubin, calcium, creatinine, and uric acid, and ↓ in serum magnesium, potassium, sodium, and urinary calcium concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation. Tablets may be crushed and mixed with fluid to facilitate swallowing.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute chlorothiazide with at least 18 ml of sterile water for injection. Shake to dissolve. Stable for 24 hr at room temperature. May be given undiluted or may be diluted further with D5W or 0.9% NaCl. ***Concentration:*** Up to 28 mg/ml. ***Rate:*** If administered undiluted may give by direct IV over 3–5 min. If diluted, may run over 30 min.

Patient/Family Teaching

- Instruct patient to take this medication at the same time each day. If a dose is missed, take as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient on use of calibrated dropper for measuring hydrochlorothiazide concentrated oral solution.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix L).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patients to continue taking the medication even if feeling better. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise,

Copyright © 2008 by F.A. Davis

smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly blood pressure.
- Advise patient to consult health care professional before taking OTC medication, especially cough or cold preparations, concurrently with this therapy.

Evaluation/Desired Outcomes
- Decrease in blood pressure.
- Increase in urine output.
- Decrease in edema.

divalproex sodium, See VALPROATES.

HIGH ALERT

DOBUTamine
(doe-**byoo**-ta-meen)
Dobutrex

Classification
Therapeutic: inotropics
Pharmacologic: adrenergics

Pregnancy Category B

Indications
Short-term (<48 hr) management of heart failure caused by depressed contractility from organic heart disease or surgical procedures.

Action
Stimulates beta$_1$ (myocardial)-adrenergic receptors with relatively minor effect on heart rate or peripheral blood vessels. **Therapeutic Effects:** Increased cardiac output without significantly increased heart rate.

Pharmacokinetics
Absorption: Administered by IV infusion only, resulting in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolized by the liver and other tissues.
Half-life: 2 min.

TIME/ACTION PROFILE (inotropic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	10 min	brief (min)

Contraindications/Precautions
Contraindicated in: Hypersensitivity to dobutamine or bisulfites; Idiopathic hypertrophic subaortic stenosis.
Use Cautiously in: History of hypertension (increased risk of exaggerated pressor response); MI; Atrial fibrillation (pretreatment with digitalis glycosides recommended); History of ventricular atopic activity (may be exacerbated); Hypovolemia (correct before administration); Pregnancy or lactation (safety not established); Children (has been used safely in children, although risk of tachycardia is increased).

Adverse Reactions/Side Effects
CNS: headache. **Resp:** shortness of breath. **CV:** hypertension, increased heart rate, premature ventricular contractions, angina pectoris, arrhythmias, hypotension, palpitations. **GI:** nausea, vomiting. **Local:** phlebitis. **Misc:** hypersensitivity reactions including skin rash, fever, bronchospasm or eosinophilia, nonanginal chest pain.

Interactions
Drug-Drug: Use with **nitroprusside** may have a synergistic effect on ↑ cardiac output. **Beta blockers** may negate the effect of dobutamine. ↑ risk of arrhythmias or hypertension with some **anesthetics** (**cyclopropane**, **halothane**), **MAO inhibitors**, **oxytocics**, or **tricyclic antidepressants**.

Route/Dosage
IV (Adults and Children): Start with low infusion rates (0.5–1 mcg/kg/min), titrated at intervals of a few minutes, guided by the patient's response (range 2–20 mcg/kg/min, up to 40 mcg/kg/min).

Availability
Injection: 12.5 mg/ml in 20-, 40-, and 100-ml vials. **Premixed infusion:** 250 mg/250 ml, 500 mg/500 ml, 500 mg/250 ml, 1000 mg/250 ml.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure, heart rate, ECG, pulmonary capillary wedge pressure (PCWP),

Copyright © 2008 by F.A. Davis

cardiac output, CVP, and urinary output continuously during the administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, blood pressure, or ECG changes for adjusting dose or discontinuing medication.
- Palpate peripheral pulses and assess appearance of extremities routinely throughout dobutamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- ***Lab Test Considerations:*** Monitor potassium concentrations during therapy; may cause hypokalemia.
- Monitor electrolytes, BUN, creatinine, and prothrombin time weekly during prolonged therapy.
- ***Toxicity and Overdose:*** If overdose occurs, reduction or discontinuation of therapy is the only treatment necessary because of the short duration of dobutamine.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not confuse dobutamine with dopamine. If available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dobutamine therapy.
- Administer into a large vein and assess administration site frequently. Extravasation may cause pain and inflammation.

IV Administration

- **Continuous Infusion:** ***Diluent:*** Vials must be diluted before use. Dilute 250–1000 mg in 250–500 ml of D5W, 0.9% NaCl, 0.45% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed infusions stable for 48 hr at room temperature and 7 days if refrigerated. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.25–5 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure precise amount delivered. Titrate to patient response (heart rate, presence of ectopic activity, blood pressure, urine output, CVP, PCWP, cardiac index). Dose should be titrated so heart rate does not increase by >10% of baseline.
- **Y-Site Compatibility:** amifostine, amikacin, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, digoxin, cladribine, dexmeditomidine, diazepam, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gentamicin, granisetron, haloperidol, hydromorphone, inamrinone, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanil, streptokinase, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alteplase, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, amphotericin B, cefazolin, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, ertapenem, foscarnet, ganciclovir, hydrocortisone sodium succinate, indomethacin, ketorolac, lansoprazole, micafungin, pantoprazole, pemetrexed, penicillin G potassium, phenytoin, phytonadione, piperacillin/tazobactam, sodium bicarbonate, thiopental, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, warfarin.

Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; or numbness, tingling, or burning of extremities occurs.
- Instruct patient to notify nurse immediately of pain or discomfort at the site of administration.

Copyright © 2008 by F.A. Davis

- **Home Care Issues:** Instruct caregiver on proper care of IV equipment.
- Instruct caregiver to report signs of worsening CHF (shortness of breath, orthopnea, decreased exercise tolerance), abdominal pain, and nausea or vomiting to health care professional promptly.

Evaluation/Desired Outcomes

- Increase in cardiac output.
- Improved hemodynamic parameters.
- Increased urine output.

HIGH ALERT

docetaxel (doe-se-**tax**-el)

Taxotere

Classification

Therapeutic: antineoplastics
Pharmacologic: taxoids

Pregnancy Category D

Indications

Breast cancer (locally advanced/metastatic breast cancer or with doxorubicin and cyclophosphamide as adjuvant treatment of node-positive disease). Non–small-cell lung cancer (locally advanced/metastatic) after failure on platinum regimen or with platinum as initial therapy). Advanced metastatic hormone-refractory prostate cancer (with prednisone). Squamous cell carcinoma of the head and neck (inoperable, locally advanced) with cisplatin and fluorouracil.

Action

Interferes with normal cellular microtubule function required for interphase and mitosis.
Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver; metabolites undergo fecal elimination.
Half-life: 11.1 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	5–9 days	7 days

D

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polysorbate 80; Known alcohol intolerance; Neutrophil count <1500/mm^3; Liver impairment (serum bilirubin >upper limit of normal, ALT and/or AST >1.5 times upper limit of normal, with alkaline phosphatase >2.5 times upper limit of normal); OB: Pregnancy or lactation.
Use Cautiously in: OB: Patients with childbearing potential.

Adverse Reactions/Side Effects

CNS: fatigue, weakness. **Resp:** bronchospasm. **CV:** ASCITES, CARDIAC TAMPONADE, PERICARDIAL EFFUSION, PULMONARY EDEMA, peripheral edema. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, rashes, dermatitis, desquamation, edema, erythema, nail disorders. **Hemat:** anemia, thrombocytopenia, leukopenia. **Local:** injection site reactions. **MS:** myalgia, arthralgia. **Neuro:** neurosensory deficits, peripheral neuropathy. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS.

Interactions

Drug-Drug: ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. **Cyclosporine**, **ketoconazole**, **erythromycin**, or **troleandomycin** may significantly alter the effects of docetaxel.

Route/Dosage

IV (Adults): *Breast cancer*—60–100 mg/m^2 every 3 wk; *Breast cancer adjuvant therapy*—75 mg/m^2 every 3 wk for 6 cycles (with doxorubicin and cyclophosphamide); *Non–small-cell lung cancer*—75 mg/m^2 every 3 wk (alone or with platinum); *Prostate cancer*—75 mg/m^2 every 3 wk (with oral prednisone); *Squamous cell cancer*—75 mg/m^2 every 3 wks for 4 cycles (with cisplatin and fluorouracil).

Availability

Injection concentrate: 20 mg/0.5 ml polysorbate 80 with diluent (13% ethanol), 80 mg/2 ml polysorbate 80 with diluent (13% ethanol).

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and after administration.
- Assess infusion site for patency. Docetaxel is not a vesicant. If extravasation occurs, discontinue docetaxel immediately and aspirate the IV needle. Apply cold compresses to the site for 24 hr.
- Monitor for hypersensitivity reactions continuously during infusion. These are most common after the first and second doses of docetaxel. Reactions may consist of bronchospasm, hypotension, and/or erythema. Mild to moderate reactions may be treated symptomatically and infusion slowed or stopped until reaction subsides. Severe reactions require discontinuation of therapy and symptomatic treatment. Do not readminister docetaxel to patients with previous severe reactions. Severe edema may also occur. Weigh patients before each treatment. Fluid accumulation may result in edema, ascites, and pleural or pericardial effusions. Pretreatment with corticosteroids (such as dexamethasone 8 mg PO twice daily for 5 days, starting 1 day before docetaxel) is recommended to minimize edema and hypersensitivity reactions. PO furosemide may be used to treat edema.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess patient for rash. May occur on feet or hands but may also occur on arms, face, or thorax, usually with pruritus. Rash usually occurs within 1 wk after infusion and resolves before next infusion.
- Assess for development of neurosensory deficit (paresthesia, dysesthesia, pain, burning). May also cause weakness. Pyridoxine may be used to minimize symptoms. Severe symptoms may require dose reduction or discontinuation.
- Assess patient for arthralgia and myalgia, which are usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- ***Lab Test Considerations:*** Monitor CBC and differential before each treatment. Frequently causes neutropenia (<2000 neutrophils/mm^3); may require dose adjustment. If the neutrophil count is less than 1500/mm^3, dose should be held. Neutropenia is reversible and not cumulative. The nadir is 8 days, with a duration of 7 days. May also cause thrombocytopenia and anemia.
- Monitor liver function studies (AST, ALT, alkaline phosphatase, bilirubin) before each cycle. Doses are usually held if levels are elevated.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse Taxotere (docetaxel) with Taxol (paclitaxel).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **Continuous Infusion:** ***Diluent:*** Before dilution, allow vials to stand at room temperature for 5 min. Withdraw entire contents of diluent vial and transfer to vial of docetaxel. Rotate vial gently for 15 sec to mix. Do not shake. Solution should be clear but may contain foam at top. Allow to stand for a few minutes to allow foam to dissipate. All foam need not dissipate before continuing preparation. ***Concentration:*** To prepare the solution for infusion, withdraw the required amount of 10 mg/ml solution into syringe and inject into 250 ml of 0.9% NaCl or D5W for a concentration of 0.3–0.9 mg/ml. Rotate infusion container to mix infusion thoroughly. Do not administer solutions that are cloudy or contain a precipitate. Solution does not require an in-line filter. Dilute solutions are stable for 8 hr if refrigerated or at room temperature. ***Rate:*** Administer over 1 hr.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampi-

Copyright © 2008 by F.A. Davis

cillin/sulbactam, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, clindamycin, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, famotidine, fluconazole, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, leucovorin, lorazepam, LR, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, metronidazole, minocycline, morphine, ondansetron, oxaliplatin, palonosetron, pemetrexed, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, doxorubicin liposome, methylprednisolone, nalbuphine.
- **Additive Incompatibility:** Information unavailable. Do not admix with other drugs or solutions.

Patient/Family Teaching

- Advise patient to notify health care professional if fever >101°F; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor.
- Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Fatigue is a frequent side effect of docetaxel. Advise patient that frequent rest periods and pacing of activities may minimize fatigue.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, swelling of the feet, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking.
- Discuss with patient the possibility of hair loss. Complete hair loss usually begins after 1 or 2 treatments and is reversible after discontinuation of therapy. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy in women with advanced breast cancer.
- Decrease in size or spread of malignancy in locally advanced or metastatic non–small-cell lung cancer.
- Decreased size or spread of advanced metastatic hormone-refractory prostate cancer.

docosanol (doe-**koe**-sa-nole)
Abreva

Classification
Therapeutic: antivirals (topical)

Pregnancy Category B

Indications
Treatment of recurrent oral-facial herpes simplex (cold sores, fever blisters).

Action
Prevents herpes simplex virus from entering cells by preventing viral particles from fusing with cell membranes. **Therapeutic Effects:** Reduced healing time. Decreased duration of symptoms (pain, burning, itching, tingling).

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Topical	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to docosanol or any other components of the formula-

Copyright © 2008 by F.A. Davis

tion (benzyl alcohol, mineral oil, propylene glycol, or sucrose).
Use Cautiously in: Children <12 yr (safety not established); Pregnancy (use only if clearly needed).

Adverse Reactions/Side Effects
All local reactions occured at site of application
Local: acne, skin, itching, rash.

Interactions
Drug-Drug: None significant.

Route/Dosage
Topical (Adults and Children ≥12 yr): Apply small amount 5 times daily to sores on lips or face until healed.

Availability
Cream: 10% cream in 2 g tubes[OTC].

NURSING IMPLICATIONS

Assessment
- Assess skin lesions prior to and periodically throughout therapy.

Potential Nursing Diagnoses
Impaired skin integrity, impaired (Indications)
Risk for infection, high risk for (Indications)
Deficient knowledge, related to disease processes and medication regimen (Patient/Family Teaching)

Implementation
- **Topical:** Cream should be applied to lesions 5 times daily starting at the first sign of a sore or blister.

Patient/Family Teaching
- Instruct patient on correct technique for application of docosanol. Cream should only be applied to lips and face. Avoid application in or near eyes. Emphasize handwashing following application, or touching lesions to prevent spread to others or to other areas of the body.
- Advise patient to begin application of docosanol at the first sign of a sore or blister, even during prodromal stage (feeling of burning, itching, tingling, or numbness).
- Inform patient that docosanol reduces duration of herpes simplex virus episodes but does not cure virus. Viral reactivation may be triggered by ultraviolet radiation or sun exposure, stress, fatigue, chilling, and windburn. Other possible triggers include fever, injury, menstruation, dental work, and infectious diseases (cold, flu).
- Advise patient to notify health care professional if lesions do not heal in 14 days or if fever, rash, or swollen lymph nodes occur.

Evaluation/Desired Outcomes
- Reduction in duration of symptoms (pain, burning, itching, tingling) of herpes simplex virus episodes.

DOCUSATE (dok-yoo-sate)

docusate calcium
DC Softgels, Dioctocal, Pro-Cal-Sof, Sulfolax, Surfak

docusate sodium
Colace, Correctol Stool Softener, Soft Gels, Diocto, Docu, Docusoft S, DOK, DOS Softgels, DOS, DOSS, DSS, Dulcolax Stool Softener, Ex-Lax Stool Softener, Fleet Sof-Lax, Modane Soft, Phillips Liqui-Gels, Regulax-SS, Regulex, Silace, Soflax, Stool Softener, Therevac SB

Classification
Therapeutic: laxatives
Pharmacologic: stool softeners

Pregnancy Category C

Indications
PO: Prevention of constipation (in patients who should avoid straining, such as after MI or rectal surgery). **Rect:** Used as enema to soften fecal impaction.

Action
Promotes incorporation of water into stool, resulting in softer fecal mass. May also promote electrolyte and water secretion into the colon.
Therapeutic Effects: Softening and passage of stool.

Pharmacokinetics
Absorption: Small amounts may be absorbed from the small intestine after oral administration. Absorption from the rectum is not known.
Distribution: Unknown.
Metabolism and Excretion: Amounts absorbed after oral administration are eliminated in bile.
Half-life: Unknown.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (softening of stool)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr (up to 3–5 days)	unknown	unknown
Rectal	2–15 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen.

Use Cautiously in: Excessive or prolonged use may lead to dependence; Should not be used if prompt results are desired; OB, Lactation: Has been used safely.

Adverse Reactions/Side Effects

EENT: throat irritation. **GI:** mild cramps. **Derm:** rashes.

Interactions

Drug-Drug: None significant.

Route/Dosage

Docusate Calcium

PO (Adults): 240 mg once daily.

Docusate Sodium

PO (Adults and Children >12 yr): 50–400 mg in 1–4 divided doses.
PO (Children 6–12 yr): 40–150 mg in 1–4 divided doses.
PO (Children 3–6 yr): 20–60 mg in 1–4 divided doses.
PO (Children <3 yr): 10–40 mg in 1–4 divided doses.
Rect (Adults): 50–100 mg or 1 unit containing 283 mg docusate sodium, soft soap, and glycerin.

Availability (generic available)

Docusate Calcium

Capsules: 240 mg[OTC].

Docusate Sodium

Tablets: 100 mg[OTC]. **Capsules:** 50 mg[OTC], 100 mg[OTC], 120 mg[OTC], 240 mg[OTC], 250 mg[OTC]. **Syrup:** 20 mg/5 ml[OTC]. **Liquid:** 150 mg/15 ml[OTC]. **Enema:** 283 mg/5 ml[OTC]. ***In combination with:*** stimulant laxatives[OTC]. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- This medication does not stimulate intestinal peristalsis.
- **PO:** Administer with a full glass of water or juice. May be administered on an empty stomach for more rapid results.
- Oral solution may be diluted in milk or fruit juice to decrease bitter taste.
- Do not administer within 2 hr of other laxatives, especially mineral oil. May cause increased absorption.

Patient/Family Teaching

- Advise patients that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake (6–8 full glasses/day), and increasing mobility. Normal bowel habits are variable and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.
- Advise patient not to take docusate within 2 hr of other laxatives.

Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 24–48 hr. Therapy may take 3–5 days for results. Rectal dose forms produce results within 2–15 min.

dofetilide (doe-fetil-ide)

Tikosyn

Classification

Therapeutic: antiarrhythmics (class III)

Pregnancy Category C

Indications

Maintenance of normal sinus rhythm (delay in time to recurrence of atrial fibrillation/atrial

Copyright © 2008 by F.A. Davis

flutter [AF/AFl]) in patients with AF/AFl lasting more than one week, and who have been converted to normal sinus rhythm. For the conversion of atrial fibrillation and atrial flutter to normal sinus rhythm.

Action

Blocks cardiac ion channels responsible for transport of potassium. Increases monophasic action potential duration. Increases effective refractory period. **Therapeutic Effects:** Prevention of recurrent AF/AFl. Conversion of AF/AFl to normal sinus rhythm.

Pharmacokinetics

Absorption: Well absorbed (>90%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 80% excreted by kidneys via cationic renal secretion, mostly as unchanged drug; 20% excreted as inactive metabolites; some metabolism in the liver via cytochrome P450 system (CYP3A4 isoenzyme).
Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within hours	2-3 hr†	12-24 hr

†Steady state levels are achieved after 2–3 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital or acquired prolonged QT syndromes; Baseline QT interval or QTc of >440 msec (500 msec in patients with ventricular conduction abnormalities); Creatinine clearance (CCr) <20 ml/min; Concurrent use of verapamil or agents which inhibit the renal cation transport system including cimetidine, ketoconazole, trimethoprim, megestrol or prochlorperazine; Concurrent use of hydrochlorothiazide; OB: Lactation (use should be avoided).
Use Cautiously in: Underlying electrolyte abnormalities (increased risk of serious arrhythmias; correct prior to administration); CCr 20–60 ml/min (dosage reduction recommended); Severe hepatic impairment; OB: Pregnancy (use only when benefit to patient outweighs potential risk to fetus); Pedi: Children <18 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** VENTRICULAR ARRHYTHMIAS, chest pain, QT interval prolongation.

Interactions

Drug-Drug: Hydrochlorothiazide ↑ dofetilide levels and the risk of QT prolongation with arrhythmias; concurrent use is contraindicated. Concurrent use of renal cation transport inhibitors including **cimetidine**, **trimethoprim**, and **ketoconazole** increases blood levels and the risk of serious arrhythmias and is contraindicated. **Amiloride**, **metformin**, **megestrol**, **prochlorperazine**, and **triamterene** may have similar effects. **Phenothiazines**, **tricyclic antidepressants**, some **macrolides** (including **erythromycin** and **telithromycin**, and **fluoroquinolones** may prolong QT interval and ↑ risk of arrhythmias; concurrent use is not recommended. Blood levels and risk of arrhythmias are also ↑ by **verapamil**; concurrent use is contraindicated and a 2-day washout period is recommended). Inhibitors of the cytochrome P450 system (CYP450 3A4 isoenzyme) including **macrolide anti-infectives**, **azole antifungals**, **protease inhibitor antiretrovirals**, **SSRI antidepressants**, **amiodarone**, **cannabinoids**, **diltiazem**, **nefazodone**, **quinine**, and **zafirlukast** may also ↑ blood levels and the risk of arrhythmias and concurrent use should be undertaken with caution. Should not be used concurrently with other **class I or III antiarrhythmics** due to increased risk of arrhythmias. **Phenothiazines** and **tricyclic antidepressants** also prolong QT interval and should not be used concurrently with dofetilide. Hypokalemia or hypomagnesemia from **potassium-depleting diuretics** increases the risk of arrhythmias; correct abnormalities prior to administration. Concurrent use of **digoxin** may also increase the risk of arrhythmias.
Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

Dosing should be adjusted according to renal function and assessment of QT interval.
PO (Adults): *Starting dose*—500 mcg twice daily; *maintenance dose*—250 mcg twice daily (not to exceed 500 mcg twice daily).

Renal Impairment

PO (Adults): CCr 40–60 ml/min *Starting dose*—250 mcg twice daily; *maintenance dose*—125 mcg twice daily; CCr 20–40 ml/min *Starting dose*—125 mcg twice daily; *maintenance dose*—125 mcg once daily.

Availability

Capsules: 125 mcg, 250 mcg, 500 mcg.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and blood pressure continuously during initiation of therapy and for at least 3 days, then periodically during therapy. Evaluate QTc prior to initiation of therapy and every 3 months during therapy. If QTc exceeds 440 msec (500 msec in patients with ventricular conduction abnormalities), discontinue dofetilide and monitor patient until QTc returns to baseline.
- Assess the patient's medication history including OTC, Rx, and natural/herbal products, with emphasis on those that interact with dofetilide (see Interactions).
- ***Lab Test Considerations:*** Creatinine clearance must be calculated for all patients prior to administration and every 3 months during therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- Dolfetilide must be initiated or reinitiated in a setting that provides continuous ECG monitoring and has personnel trained in the management of serious ventricular arrhythmias. Due to the potential for life-threatening ventricular arrhythmias, dofetilide is usually used for patients with highly symptomatic AF/AFl.
- Patients with AF should be anticoagulated according to usual protocol prior to electrical or pharmacological cardioversion.
- Make sure patient has an adequate supply of dofetilide prior to discharge to prevent interruption of therapy.
- Patients should not be discharged from the hospital within 12 hrs of electrical or pharmacological conversion to normal sinus rhythm.
- **PO:** Administer at the same time each day without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. If a dose is missed, do not double next dose. Take next dose at usual time.
- Patient should read the patient package insert prior to initiation of therapy and reread it each time therapy is renewed. Emphasize the need for compliance with therapy, the potential for drug interactions, and the need for periodic monitoring to minimize the risk of serious arrhythmias.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient not to take OTC medications with dofetilide without consulting health care professional.
- Advise patient to consult health care professional immediately if they faint, become dizzy, or have fast heartbeats. If health care professional is unavailable instruct patient to go to nearest hospital emergency department, take remaining dofetilide capsules, and show them to the doctor or nurse. If symptoms associated with altered electrolyte balance such as excessive or prolonged diarrhea, sweating, or vomiting or loss of appetite or thirst occur health care professional should also be notified immediately.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Prevention of recurrent AF/AFl.
- Conversion of AF/AFl to normal sinus rhythm.
- If patients do not convert to normal sinus rhythm within 24 hr of initiation of therapy, electrical conversion should be considered.

dolasetron (dol-**a**-se-tron)
Anzemet

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Pregnancy Category B

Indications

Prevention of nausea and vomiting associated with emetogenic chemotherapy. Prevention and treatment of postoperative nausea/vomiting.

Copyright © 2008 by F.A. Davis

Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea/vomiting associated with emetogenic chemotherapy or surgery.

Pharmacokinetics
Absorption: Well absorbed but rapidly metabolized to hydrodolasetron, the active metabolite.
Distribution: Unknown.
Metabolism and Excretion: 61% of hydrodolasetron is excreted unchanged by the kidneys.
Half-life: *Hydrodolasetron*—8.1 hr (shorter in children).

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	up to 24 hr
IV	unknown	15–30 min	up to 24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Patients with risk factors for prolongation of cardiac conduction intervals (hypokalemia, hypomagnesemia, concurrent diuretic or antiarrhythmic therapy, congenital QT syndrome, cumulative high-dose anthracycline therapy); Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: headache (increased in cancer patients), dizziness, fatigue, syncope. **CV:** bradycardia, ECG changes, hypertension, hypotension, tachycardia. **GI:** diarrhea, dyspepsia. **GU:** oliguria. **Derm:** pruritus. **Misc:** chills, fever, pain.

Interactions
Drug-Drug: Concurrent **diuretic** or **antiarrhythmic** therapy or cumulative **high-dose anthracycline therapy** may ↑ risk of conduction abnormalities. Blood levels and effects of hydrodolasetron are ↑ by **atenolol** and **cimetidine**. Blood levels and effects of hydrodolasetron are ↓ by **rifampin**.

Route/Dosage

Prevention of Chemotherapy-Induced Nausea/Vomiting
PO (Adults): 100 mg given within 1 hr before chemotherapy.
PO (Children 2–16 yr): 1.8 mg/kg given within 1 hr before chemotherapy (not to exceed 100 mg).
IV (Adults and Children ≥2 yr): 1.8 mg/kg given 30 min before chemotherapy (usual dose in adults is 100 mg; not to exceed 100 mg in children).

Prevention/Treatment of Postoperative Nausea/Vomiting
PO (Adults): 100 mg given within 2 hr before surgery.
PO (Children 2–16 yr): 1.2 mg/kg (up to 100 mg/dose) given within 2 hr before surgery.
IV (Adults): 12.5 mg given 15 min before cessation of anesthesia (prevention) or as soon as nausea or vomiting begins (treatment).
IV (Children 2–16 yr): 0.35 mg/kg (up to 12.5 mg) given 15 min before cessation of anesthesia (prevention) or as soon as nausea or vomiting begins (treatment).

Availability
Tablets: 50 mg, 100 mg. **Injection:** 12.5 mg/0.625 ml ampules, 20 mg/ml in 5-ml vials.

NURSING IMPLICATIONS

Assessment
- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Monitor vital signs after administration. IV administration may be followed by severe hypotension, bradycardia, and syncope.

Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)

Implementation
- **PO:** Administer within 1 hr before chemotherapy or 2 hr before surgery.
- Injectable dolasetron may be mixed in apple or apple-grape juice for oral dosing for pediatric patients. May be stored at room temperature for 2 hr before use.

IV Administration
- **IV:** Administer 30 min before chemotherapy, 15 min before cessation of anesthesia, or postoperatively if nausea and vomiting occur shortly after surgery.
- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer over at least 30 sec.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 0.9% NaCl, D5W, dextrose/saline combinations, D5/LR, LR, or 10% mannitol solution. Solution is clear and colorless. Stable for 24 hr at room temperature or 48 hr if

Copyright © 2008 by F.A. Davis

refrigerated after dilution. ***Concentration:*** Dilute doses in 50 ml diluent. ***Rate:*** Administer each dose as an IV infusion over up to 15 min.

- **Y-Site Compatibility:** azithromycin, dexmeditomidine, fenoldopam, oxaliplatin.
- **Y-Site Incompatibility:** Manufacturer recommends not admixing with other medications.

Patient/Family Teaching

- Advise patient to notify health care professional if nausea or vomiting occurs.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.
- Prevention and treatment of postoperative nausea and vomiting.

donepezil (doe-**nep**-i-zill)
Aricept, Aricept ODT

Classification
Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Pregnancy Category C

Indications

Mild to moderate dementia associated with Alzheimer's disease.

Action

Inhibits acetylcholinesterase thus improving cholinergic function by making more acetylcholine available. **Therapeutic Effects:** May temporarily lessen some of the dementia associated with Alzheimer's disease. Enhances cognition. Does not cure the disease.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96%.
Metabolism and Excretion: Partially metabolized by the liver (CYP2D6 and CYP3A4 enyzmes) and partially excreted by kidneys (17% unchanged). Two metabolites are pharmacologically active.
Half-life: 70 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	several wk	6 wk†

†Return to baseline after discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity to donepezil or piperidine derivatives.
Use Cautiously in: Patients with underlying cardiac disease, especially sick sinus syndrome or supraventricular conduction defects; Patients with a history of ulcer disease or those currently taking NSAIDs; Patients with a history of seizures; Patients with a history of asthma or obstructive pulmonary disease; OB, Lactation, Pedi: Safety not established; assumed to be secreted in breast milk. Discontinue drug or bottle-feed.

Adverse Reactions/Side Effects

CNS: headache, abnormal dreams, depression, dizziness, drowsiness, fatigue, insomnia, syncope, sedation (unusual). **CV:** atrial fibrillation, hypertension, hypotension, vasodilation. **GI:** diarrhea, nausea, anorexia, vomiting, weight gain (unusual). **GU:** frequent urination. **Derm:** ecchymoses. **Metab:** hot flashes, weight loss. **MS:** arthritis, muscle cramps.

Interactions

Drug-Drug: Exaggerates muscle relaxation from **succinylcholine**. Interferes with the action of **anticholinergics**. ↑ cholinergic effects of **bethanechol**. May ↑ risk of GI bleeding from **NSAIDs**. **Quinidine** and **ketoconazole** ↓ metabolism of donepezil. **Rifampin**, **carbamazepine**, **dexamethasone**, **phenobarbital**, and **phenytoin** induce the enzymes that metabolize donepezil and may ↓ its effects.
Drug-Natural Products: Jimson weed and scopolia may antagonize cholinergic effects.

Route/Dosage

Mild to Moderate Alzheimer's Disease

PO (Adults): 5 mg once daily; after 4–6 wk may increase to 10 mg once daily (dose should not exceed 5 mg/day in frail, elderly females).

Copyright © 2008 by F.A. Davis

Severe Alzheimer's Disease

PO (Adults): 10 mg once daily (dose should not exceed 10 mg/day).

Availability

Tablets: 5 mg, 10 mg. **Cost:** 5 mg $464.97/90, 10 mg $455.97/90. **Orally-disintegrating tablets:** 5 mg, 10 mg. **Cost:** 5 mg $174.65/30, 10 mg $166.85/30.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Administer Mini-Mental Status Exam (MMSE) initially and periodically as a screening tool to rate cognitive functioning.
- Administer Clock Drawing Test initially and periodically as a screening tool to measure severity of dementia.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired environmental interpretation syndrome (Indications)
Risk for injury (Indications)

Implementation

- **PO:** Administer in the evening just before going to bed. May be taken without regard to food.
- *Oral disintegrating tablets* should be allowed to dissolve on tongue; follow with water.

Patient/Family Teaching

- Emphasize the importance of taking donepezil daily, as directed. Missed doses should be skipped and regular schedule returned to the following day. Do not take more than prescribed; higher doses do not increase effects but may increase side effects.
- Inform patient/family that it may take weeks before improvement in baseline behavior is observed.
- Caution patient and caregiver that donepezil may cause dizziness.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, diarrhea, or changes in color of stool occur or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress; atypical antipsychotics may be used as an adjunct to improve behavior.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

DOPamine (dope-a-meen)

Intropin, Revimine

Classification

Therapeutic: inotropics, vasopressors
Pharmacologic: adrenergics

Pregnancy Category C

Indications

Adjunct to standard measures to improve: Blood pressure, Cardiac output, Urine output in treatment of shock unresponsive to fluid replacement.

Action

Small doses (0.5–3 mcg/kg/min) stimulate dopaminergic receptors, producing renal vasodilation. Larger doses (2–10 mcg/kg/min) stimulate dopaminergic and beta$_1$-adrenergic receptors, producing cardiac stimulation and renal vasodilation. Doses greater than 10 mcg/kg/min stimulate alpha-adrenergic receptors and may cause renal vasoconstriction. **Therapeutic Effects:** Increased cardiac output, increased blood pressure, and improved renal blood flow.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed but does not cross the blood-brain barrier.
Metabolism and Excretion: Metabolized in liver, kidneys, and plasma.
Half-life: 2 min.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	up to 10 min	<10 min

Contraindications/Precautions

Contraindicated in: Tachyarrhythmias; Pheochromocytoma; Hypersensitivity to bisulfites (some products).

Use Cautiously in: Hypovolemia; Myocardial infarction; Occlusive vascular diseases; Geri: Older patients may be more susceptible to adverse effects; OB, Pedi: Pregnancy, lactation, and children (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **EENT:** mydriasis (high dose). **Resp:** dyspnea. **CV:** arrhythmias, hypotension, angina, ECG change, palpitations, vasoconstriction. **GI:** nausea, vomiting. **Derm:** piloerection. **Local:** irritation at IV site.

Interactions

Drug-Drug: Use with **MAO inhibitors**, **ergot alkaloids** (**ergotamine**), **doxapram**, **guanadrel**, or some **antidepressants** results in severe hypertension. Use with IV **phenytoin** may cause hypotension and bradycardia. Use with **general anesthetics** may result in arrhythmias. **Beta blockers** may antagonize cardiac effects.

Route/Dosage

IV (Adults): *Dopaminergic (renal vasodilation) effects*—0.5–3 mcg/kg/min. *Beta-adrenergic (cardiac stimulation) effects*—2–10 mcg/kg/min. *Alpha-adrenergic (increased peripheral vascular resistance) effects*—10 mcg/kg/min; infusion rate may be increased as needed.

IV (Children): 5–20 mcg/kg/min, depending on desired response (0.5–3 mcg/kg/min has been used to improve renal blood flow).

Availability (generic available)

Injection for dilution: 40 mg/ml, 80 mg/ml, 160 mg/ml. **Premixed injection:** 200 mg/250 ml, 400 mg/250 ml, 800 mg/250 ml, 800 mg/500 ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, heart rate, pulse pressure, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, blood pressure, or ECG changes for adjusting dose or discontinuing medication.
- Monitor urine output frequently throughout administration. Report decreases in urine output promptly.
- Palpate peripheral pulses and assess appearance of extremities routinely during dopamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- If hypotension occurs, administration rate should be increased. If hypotension continues, more potent vasoconstrictors (norepinephrine) may be administered.
- ***Toxicity and Overdose:*** If excessive hypertension occurs, rate of infusion should be decreased or temporarily discontinued until blood pressure is decreased. Although additional measures are usually not necessary because of short duration of dopamine, phentolamine may be administered if hypertension continues.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse dopamine with dobutamine. If both are available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dopamine therapy.
- Extravasation may cause severe irritation, necrosis, and sloughing of tissue. Administer into a large vein and assess administration site frequently. If extravasation occurs, affected area should be infiltrated liberally with 10–15 ml of 0.9% NaCl containing 5–10 mg of phentolamine. Reduce proportionally for pediatric patients. Infiltration within 12 hr of extravasation produces immediate hyperemic changes.

Copyright © 2008 by F.A. Davis

IV Administration

- **Continuous Infusion:** ***Diluent:*** Dopamine vials must be diluted before use. Dilute 200–800 mg of dopamine in 250–500 ml of 0.9% NaCl, D5W, D5/LR, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed solution is stable for 24 hr. Discard solutions that are cloudy, discolored, or contain a precipitate. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.8–3.2 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Infusion must be administered via infusion pump to ensure precise amount delivered. Titrate to response (blood pressure, heart rate, urine output, peripheral perfusion, presence of ectopic activity, cardiac index). Decrease rate gradually when discontinuing to prevent marked decreases in blood pressure.
- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, foscarnet, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanil, sargramostim, streptokinase, tacrolimus, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alteplase, amphotericin B cholesteryl sulfate, ampicillin, cefazolin, chloramphenicol, diazepam, ganciclovir, indomethacin, insulin, lansoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; numbness, tingling, or burning of extremities occurs.
- Instruct patient to inform nurse immediately of pain or discomfort at the site of administration.

Evaluation/Desired Outcomes

- Increase in blood pressure.
- Increase in peripheral circulation.
- Increase in urine output.

doxazosin (dox-**ay**-zoe-sin)
Cardura

Classification
Therapeutic: antihypertensives
Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category C

Indications
Hypertension (alone or with other agents). Symptomatic benign prostatic hyperplasia (BPH).

Action
Dilates both arteries and veins by blocking postsynaptic alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Lowering of blood pressure.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Probably enters breast milk; rest of distribution unknown.
Protein Binding: 98–99%.
Metabolism and Excretion: Extensively metabolized by the liver.
Half-life: 22 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	2–6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Hepatic dysfunction and impaired renal function; Geri: Appears on Beers list. Geriatric patients are at increased risk for hypotension and renal impairment; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache, depression, drowsiness, fatigue, nervousness, weakness. **EENT:** abnormal vision, blurred vision, conjunctivitis, epistaxis. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, edema, palpitations. **GI:** abdominal discomfort, constipation, diarrhea, dry mouth, flatulence, nausea, vomiting. **GU:** decreased libido, sexual dysfunction. **Derm:** flushing, rash, urticaria. **MS:** arthralgia, arthritis, gout, myalgia.

Interactions

Drug-Drug: ↑ risk of hypotension with acute ingestion of **alcohol**, **sildenafil**, **vardenafil**, other **antihypertensives**, or **nitrates**. May ↓ antihypertensive effect of **clonidine**.

Route/Dosage

PO (Adults): *Hypertension*—1 mg once daily, may be gradually increased at 2-wk intervals to 2–16 mg/day; incidence of postural hypotension greatly increased at doses >4 mg/day. *BPH*—1 mg once daily, may be gradually increased to 8 mg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 4 mg, 8 mg. **Cost:** *Generic*—1 mg $49.97/90, 2 mg $43.97/90, 4 mg $59.97/90, 8 mg $62.99/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse 2–6 hr after first dose, with each increase in dose, and periodically during therapy. Report significant changes.
- Assess patient for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- **BPH:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) prior to and periodically during therapy.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Cardura (doxazosin) with Cardene (nicardipine) or Ridaura (auranofin).
- Administer daily dose at bedtime.
- **Hypertension:** May be administered concurrently with a diuretic or other antihypertensive.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Doxazosin may cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies or herbal products.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.
- **Hypertension:** Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation,

Copyright © 2008 by F.A. Davis

moderation of alcohol consumption, regular exercise, and stress management).

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.
- Decrease in urinary symptoms of BPH.

doxepin (dox-e-pin)
Sinequan, Triadapin, Zonalon

Classification
Therapeutic: antianxiety agents, antidepressants, antihistamines (topical)
Pharmacologic: tricyclic antidepressants

Pregnancy Category C

Indications

PO: Depression. **Topical:** Short-term control of pruritus associated with: Eczematous dermatitis, Lichen simplex chronicus. **Unlabeled uses:** POChronic pain syndromes: Pruritus, Dermatitis, Anxiety, Insomnia.

Action

PO Prevents the reuptake of norepinephrine and serotonin by presynaptic neurons; resultant accumulation of neurotransmitters potentiates their activity. Also possesses significant anticholinergic properties. **Topical:** Antipruritic action due to antihistaminic properties. **Therapeutic Effects:** PORelief of depression. Decreased anxiety. **Topical:** Decreased pruritus.

Pharmacokinetics

Absorption: Well absorbed from the GI tract, although much is metabolized on first pass through the liver. Some systemic absorption follows topical application.
Distribution: Widely distributed. Enters breast milk; probably crosses the placenta.
Metabolism and Excretion: Metabolized by the liver. Some conversion to active antidepressant compound. May re-enter gastric juice via secretion from enterohepatic circulation, where more absorption may occur.
Half-life: 8–25 hr.

TIME/ACTION PROFILE (antidepressant activity)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	up to 6 wk	days–weeks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known intolerance; Untreated angle-closure glaucoma; Period immediately after myocardial infarction; history of QTc prolongation, heart failure, cardiac arrhythmia.
Use Cautiously in: Geri: Pre-existing cardiovascular disease (increased risk of adverse reactions); Prostatic enlargement (more susceptible to urinary retention); Seizures; OB: Use during pregnancy only if potential maternal benefit outweighs risks to fetus; use during lactation may result in neonatal sedation. Recommend discontinuing drug or bottle-feed; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Pedi: Safety not established in children <12 yr; Geri: Appears on Beers list and is associated with increased falls risk secondary to anticholinergic and sedative effects. Geriatric patients should have initial dosage reduction.

Adverse Reactions/Side Effects

CNS: fatigue, sedation, agitation, confusion, hallucinations. **EENT:** blurred vision, increased intraocular pressure. **CV:** hypotension, arrhythmias, ECG abnormalities. **GI:** constipation, dry mouth, hepatitis, increased appetite, weight gain, nausea, paralytic ileus. **GU:** urinary retention, decreased libido. **Derm:** photosensitivity, rashes. **Hemat:** blood dyscrasias. **Misc:** hypersensitivity reactions.

Interactions

Apply to both topical and oral use
Drug-Drug: Doxepin is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs that compete for metabolism by this enzyme including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** (**propafenone**, **flecainide**); when used concurrently, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of doxepin. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to doxepin). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Concurrent use with **levodopa** may result in delayed / ↓ absorption of levodopa or

Copyright © 2008 by F.A. Davis

hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioid analgesics**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Smoking** may increase metabolism and alter effects.
Drug-Natural Products: Concomitant use of **kava kava, valerian, or chamomile can increase CNS depression. Increased anticholinergic effects with jimson weed and scopolia.**

Route/Dosage

PO (Adults): *Antidepressant/anti-anxiety*—25 mg 3 times daily, may be increased as needed (up to 150 mg/day in outpatients or 300 mg/day in inpatients; some patients may require only 25–50 mg/day). Once stabilized, entire daily dose may be given at bedtime. *Antipruritic*—10 mg at bedtime initially, may be increased up to 25 mg.
PO (Geriatric Patients): *Antidepressant*—25–50 mg/day initially, may be increased as needed.
Topical (Adults): Apply 4 times daily (wait 3–4 hr between applications) for up to 8 days.

Availability (generic available)

Capsules: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Oral concentrate:** 10 mg/ml. **Topical cream:** 5%.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse rate prior to and during initial therapy. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored prior to and periodically during therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- Assess weight and BMI initially and throughout treatment. Obtain FBS and cholesterol levels in overweight/obese individuals.
- Geri: Assess falls risk and institute fall prevention strategies. Assess for anticholinergic effects.
- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Anxiety:** Assess degree and manifestations of anxiety prior to and during therapy.
- **Pain:** Assess the type, location, and severity of pain prior to and periodically during therapy. Use pain scale to assess effectiveness of therapy.
- **Topical:** Assess pruritic area prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor WBC and differential blood counts, hepatic function, and serum glucose periodically. May cause ↑ serum bilirubin and alkaline phosphatase levels. May cause bone marrow depression. Serum glucose may be ↑ or ↓.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse doxepin with doxycycline.
- May be given as a single dose at bedtime to minimize sedation during the day. Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months.
- To avoid withdrawal, taper by 50% for 3 days, then 50% again for 3 days, then discontinue.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation. Capsules may be opened and mixed with foods or fluids if patient has difficulty swallowing.
- Oral concentrate must be diluted in at least 120 ml of water, milk, or fruit juice. Do not mix with carbonated beverages or grape juice. Use calibrated measuring device to ensure accurate amount.
- **Topical:** Apply thin film of doxepin cream only to affected areas, and rub in gently. Apply only to affected skin; not for ophthalmic, oral, or intravaginal use.

Patient/Family Teaching

- Inform patient that systemic side effects may occur with oral or topical use.

Copyright © 2008 by F.A. Davis

- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls. Institute fall precautions. Advise patient to change positions slowly.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention occurs or if dry mouth or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- **PO:** Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- Refer appropriate individuals for weight management.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite is possible and may lead to undesired weight gain.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects.
- Refer patient to psychotherapy to improve coping skills and to local support group.
- **Topical:** Instruct patient to apply a thin film of medication exactly as directed; do not use more medication than directed, apply to a larger area than directed, use more often than directed, or use longer than 8 days.
- Inform patient that topical preparation may cause burning, stinging, swelling, increased itching, or worsening of eczema. Notify health care professional if these symptoms become bothersome.
- Caution patient not to use occlusive dressings; may increase systemic absorption.
- Advise patient to notify health care professional if excessive drowsiness occurs with topical application. Number of applications per day, amount of cream applied, or area of application may be reduced. May require discontinuation of therapy.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in anxiety.
- Decrease in chronic pain. Patients may require 2–6 wk of oral therapy before full therapeutic effects of medication are evident.
- Decrease in pruritus associated with eczema.

doxercalciferol, See VITAMIN D COMPOUNDS.

HIGH ALERT

DOXOrubicin hydrochloride

(dox-oh-**roo**-bi-sin hye-droe-**klor**-ide)
Adriamycin PFS, Adriamycin RDF, Rubex

Classification
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Pregnancy Category D

Indications

Alone or with other modalities in the treatment of various solid tumors including: Breast, Ovarian, Bladder, Bronchogenic carcinoma, Malignant lymphomas, and leukemias.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive proper-

Copyright © 2008 by F.A. Davis

ties. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues.
Metabolism and Excretion: Mostly metabolized by the liver. Converted by liver to an active compound. Excreted predominantly in the bile, 50% as unchanged drug. Less than 5% eliminated unchanged in the urine.
Half-life: 16.7 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: History of cardiac disease or high cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (reduce dose if serum bilirubin >1.2 mg/dl); Children, geriatric patients, mediastinal radiation, concurrent cyclophosphamide (risk of cardiotoxicity); Patients with childbearing potential.

Adverse Reactions/Side Effects

Resp: recall pneumonitis. **CV:** CARDIOMYOPATHY, ECG changes. **GI:** diarrhea, esophagitis, nausea, stomatitis, vomiting. **GU:** red urine. **Derm:** alopecia, photosensitivity. **Endo:** sterility, prepubertal growth failure with temporary gonadal impairment (children only). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site, tissue necrosis. **Metab:** hyperuricemia. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have an ↑ risk of recall pneumonitis at variable times following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and the incidence and severity of neutropenia and stomatitis are ↑ (problem is diminished if doxorubicin is administered first). Hematologic toxicity is ↑ and prolonged by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and decrease effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dosage ↓ of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide** or hepatitis from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.
IV (Adults): 60–75 mg/m² daily, repeat q 21 days; or 25–30 mg/m² daily for 2–3 days, repeat q 3–4 wk or 20 mg/m²/wk. Total cumulative dose should not exceed 550 mg/m² without monitoring of cardiac function or 400 mg/m² in patients with previous chest radiation or other cardiotoxic chemotherapy.
IV (Children): 30 mg/m²/day for 3 days every 4 wk.

Hepatic Impairment

IV (Adults): Serum bilirubin 1.2–3mg/dl—50% of usual dose; serum bilirubin 3.1–5 mg/dl—25% of usual dose.

Availability (generic available)

Powder for injection: 10-mg, 20-mg, 50-mg, 100-mg, 150-mg vials. **Injection:** 2 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia

Copyright © 2008 by F.A. Davis

may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 ml/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify physician or other health care professional if emesis exceeds guidelines to prevent dehydration.
- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable CHF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x-ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to and periodically during therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m^2.
- Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. Apply ice packs and elevate and rest extremity for 24–48 hr to reduce swelling, then resume normal activity as tolerated. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible débridement is indicated.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dosing is recommended if lesions are painful or interfere with nutrition.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to, and periodically during, therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. Increased dosing interval and/or decreased dose is recommended if ANC is <1000 cells/mm^3 and/or platelet count is <50,000 cells/mm^3.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to, and periodically during, therapy. Dose reduction is required for bilirubin >1.2 mg/dl or serum creatinine >3 mg/dl.
- May cause ↑ serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse doxorubicin hydrochloride (Adriamycin, Rubex) with doxorubicin hydrochloride liposome (Doxil) or with daunorubicin hydrochloride (Cerubidine) or daunorubicin citrate liposome (DaunoXome) or with idarubicin. Do not confuse adriamycin with idamycin. Clarify orders that do not include generic and brand names.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers (see Appendix K).
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute each 10 mg with 5 ml of 0.9% NaCl (nonbacteriostatic) for injection. Shake to dissolve completely. Do not add to IV solution. Reconstituted medication is stable for 24 hr at room temperature and 48 hr if refrigerated. Protect from sunlight. ***Concentration:*** 2 mg/ml. ***Rate:*** Adminis-

Copyright © 2008 by F.A. Davis

ter each dose over 3–5 minutes through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Facial flushing and erythema along involved vein frequently occur when administration is too rapid.

- **Syringe Compatibility:** bleomycin, cisplatin, cyclophosphamide, droperidol, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vincristine.
- **Syringe Incompatibility:** furosemide, heparin.
- **Y-Site Compatibility:** amifostine, aztreonam, bleomycin, chlorpromazine, cimetidine, cisplatin, cladribine, cyclophosphamide, dexamethasone, diphenhydramine, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, gemcitabine, granisetron, hydromorphone, leucovorin calcium, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, mitomycin, morphine, ondansetron, oxaliplatin, paclitaxel, prochlorperazine edisylate, promethazine, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinblastine, vincristine, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, cefepime, ganciclovir, lansoprazole, pemetrexed, piperacillin/tazobactam, propofol.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days posttreatment.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in solid tumors.
- Improvement of hematologic status in leukemias.

HIGH ALERT

DOXOrubicin hydrochloride liposome

(dox-oh-**roo**-bi-sin hye-droe-**klor**-ide **lye**-poe-sohm)

Doxil

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Pregnancy Category D

Copyright © 2008 by F.A. Davis

Indications

AIDS-related Kaposi's sarcoma (KS) in patients who cannot tolerate conventional therapy. Ovarian carcinoma. Multiple myeloma with bortezomib in patients who have not previously received bortezomib and have received at least one prior therapy.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive properties. Encapsulation in a liposome increases uptake by tumors, prolongs action, and may decrease some toxicity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues (↑ concentrations delivered to KS lesions due to liposomal carrier).
Metabolism and Excretion: Mostly metabolized by the liver with conversion to an active compound. Excreted mostly in bile, 50% as unchanged drug. <5% eliminated unchanged in the urine.
Half-life: 55 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation.
Use Cautiously in: Pre-existing cardiac disease or ↑ cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (dose reduction required if serum bilirubin >1.2 mg/dl); Geri, Pedi: Children, geriatric patients, prior mediastinal radiation, concurrent cyclophosphamide (increased risk of cardiotoxicity); OB: Patients with childbearing potential.

Adverse Reactions/Side Effects

CNS: weakness. **CV:** CARDIOMYOPATHY. **GI:** nausea, diarrhea, increased alkaline phosphatase, moniliasis, stomatitis, vomiting. **Derm:** alopecia, palmar-plantar erythrodysesthesia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Misc:** ANAPHYLACTOID ALLERGIC REACTIONS, acute infusion-related reactions, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have ↑ risk of recall pneumonitis following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and incidence and severity of neutropenia and stomatitis are ↑ (problem is less if doxorubicin is administered first). Hematologic toxicity is ↑ by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and ↓ effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dose reduction of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide** or hepatitis from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.
IV (Adults): *AIDS-related KS*—20 mg/m² every 3 wk; *metastatic ovarian cancer*—40–50 mg/m² every 4 wk; *Multiple myeloma*—30 mg/m² on day 4 after following borezomib for up to 8 cycles.

Availability

Liposomal dispersion for injection: 20 mg/10 ml in 10-ml and 25 ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for acute infusion-related reactions consisting of flushing, shortness of breath, facial swelling, headache, chills, chest pain, back pain, chest or throat tightness, fever, tachycardia, pruritus, rash, cyanosis, syncope, bronchospasm, asthma, apnea, which may be accompanied by hypotension. Reac-

Copyright © 2008 by F.A. Davis

tions usually resolve over 1 day and are usually limited to first dose. Slowing infusion rate may minimize this reaction. Reaction is thought to be due to liposome.

- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue doxorubicin and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 ml/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable CHF (peripheral edema, dyspnea, rales/crackles, weight gain); occurs more frequently in patients receiving a cumulative dose of ≥550 mg/m^2. Chest x-ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to, and periodically during, therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m^2.
- Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. Apply ice packs and elevate and rest extremity for 24–48 hr to reduce swelling, then resume normal activity as tolerated. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible débridement is indicated.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dose is recommended if lesions are painful or interfere with nutrition.
- Monitor for skin toxicity with prolonged use; palmar-plantar erythrodysesthesia usually occurs after 6 wk of treatment and consists of swelling, pain, and erythema of the hands and feet. This may progress to desquamation but usually regresses after 2 wk. In severe cases, modification and delay of future doses of doxorubicin liposome may be necessary.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to, and periodically during, therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. ↑ dosing interval and/or ↓ dose is recommended if ANC is <1000 cells/mm^3 and/or platelet count is <50,000 cells/mm^3.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dl or serum creatinine >3 mg/dl.
- May cause ↑ serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all am-

Copyright © 2008 by F.A. Davis

biguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse doxorubicin hydrochloride liposome (Doxil) with doxorubicin hydrochloride (Adriamycin, Rubex) or with daunorubicin hydrochloride (Cerubidine) or daunorubicin citrate liposome (DaunoXome). Clarify orders that do not include generic and brand names.

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute dose, up to 90 mg, in 250 ml of D5W. Do not dilute with other diluents or diluents containing a bacteriostatic agent. Solution is not clear, but a translucent red liposomal dispersion. Do not use in-line filters. Refrigerate diluted solutions and administer within 24 hr of dilution. ***Concentration:*** 0.36 mg/ml. ***Rate:*** Initial rate of infusion should be 1 mg/min to minimize risk of infusion reactions. If no reactions occur, increase rate to complete administration within 1 hr. Do not administer as a bolus or undiluted solution. Rapid infusion may increase infusion-related reactions.
- **Y-Site Compatibility:** acyclovir, allopurinol, aminophylline, ampicillin, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefoxitin, ceftizoxime, ceftriaxone, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, etoposide, famotidine, fluconazole, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, leucovorin, lorazepam, magnesium sulfate, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, ondansetron, piperacillin, potassium chloride, prochlorperazine, ranitidine, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate complex, buprenorphine, cefoperazone, ceftazidime, docetaxel, mannitol, meperidine, metoclopramide, mitoxantrone, morphine, ofloxacin, paclitaxel, piperacillin/tazobactam, promethazine, sodium bicarbonate.
- **Additive Incompatibility:** Do not admix with other solutions or medications.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.

Copyright © 2008 by F.A. Davis

- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days posttreatment.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies.
- Arrested progression of KS in patients with HIV infection.

doxycycline, See TETRACYCLINES.

droperidol (droe-**per**-i-dole)
Inapsine

Classification
Therapeutic: sedative/hypnotics
Pharmacologic: butyrophenones

Pregnancy Category C

Indications
Used to produce tranquilization and as an adjunct to general and regional anesthesia. **Unlabeled uses:** Useful in decreasing postoperative or postprocedure nausea and vomiting.

Action
Similar to haloperidol—alters the action of dopamine in the CNS. **Therapeutic Effects:** Tranquilization. Suppression of nausea and vomiting in selected situations.

Pharmacokinetics
Absorption: Well absorbed following IM administration.
Distribution: Appears to cross the blood-brain barrier and placenta.
Metabolism and Excretion: Mainly metabolized by the liver. Only 10% excreted unchanged by the kidneys.
Half-life: 2.2 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION*
IM, IV	3–10 min	30 min	2–4 hr

*Listed as duration of tranquilization; alterations in consciousness may last up to 12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Known intolerance; Angle-closure glaucoma; Bone marrow depression; CNS depression; Severe liver or cardiac disease; Known or suspected QT prolongation.
Use Cautiously in: Geriatric, debilitated, or severely ill patients (smaller doses should be used); Diabetic patients; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures (may lower seizure threshold); Severe liver disease; Pregnancy, lactation, and children <2 yr (although safety not established, droperidol has been used during cesarean section without respiratory depression in the newborn); Age >65 yr, concurrent benzodiazepines, volatile anesthetics, IV opioids (may increase risk of serious arrhythmias); use lower initial doses.
Exercise Extreme Caution in: Patients with risk factors for prolonged QT syndrome (CHF, bradycardia, diuretic use, cardiac hypertrophy, hypokalemia, hypomagnesema) or other drugs known to prolong QT interval.

Adverse Reactions/Side Effects
CNS: SEIZURES, extrapyramidal reactions, abnormal EEG, anxiety, confusion, dizziness, excessive sedation, hallucinations, hyperactivity, mental depression, nightmares, restlessness, tardive dyskinesia. **CV:** ARRHYTHMIAS (including torsades de pointes), QT prolongation. **EENT:** blurred vision, dry eyes. **Resp:** bronchospasm, laryngospasm. **CV:** hypotension, tachycardia. **GI:** constipation, dry mouth. **Misc:** chills, facial sweating, shivering.

Interactions
Drug-Drug: Additive hypotension with **antihypertensives** or **nitrates**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and other **sedatives**. Concurrent use of **drugs known to prolong QT interval** (↑ risk of potentially life-threatening arrhythmias).

Copyright © 2008 by F.A. Davis

Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Premedication/Use Without Premedication in Diagnostic Procedures

IV, IM (Adults): 2.5–initially, 30–60 min prior to induction of anesthesia; additional doses of 1.25 mg IV may be needed, but should be undertaken with caution.
IM, IV (Children 2–12 yr): 0.1 mg/kg maximum initial dose.

Adjunct to General Anesthesia

IV (Adults): 2.5 mg, additional doses of 1.25 mg IV may be needed, but should be undertaken with caution.
IM, IV (Children 2–12 yr): 0.1 mg/kg maximum initial dose.

Adjunct in Regional Anesthesia

IM, IV (Adults): 2.5 mg.

Antiemetic

IV (Adults): 0.5–1.25 mg q 4 hr as needed (unlabeled).

Availability (generic available)

Injection: 2.5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and heart rate frequently during therapy. Report significant changes immediately. Hypotension may be treated with parenteral fluids if hypovolemia is a causal factor. Vasopressors (norepinephrine, phenylephrine) may be needed. Avoid use of epinephrine, because droperidol reverses its pressor effects and may cause paradoxical hypotension.
- Assess 12-lead ECG in all patients prior to administration to determine if prolonged QT interval is present. Do not administer to patients with a prolonged QT interval. Monitor ECG prior to, during, and for 2–3 hr after treatment to monitor for arrhythmias.
- Assess patient for level of sedation following administration.
- Observe patient for extrapyramidal symptoms (dystonia, oculogyric crisis, extended neck, flexed arms, tremor, restlessness, hyperactivity, anxiety) throughout therapy. Notify physician or other health care professional should these occur. An anticholinergic antiparkinsonian agent may be used to treat these symptoms.
- **Nausea and Vomiting:** Assess nausea, vomiting, hydration status, bowel sounds, and abdominal pain prior to and following administration.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 2.5 mg/ml. ***Rate:*** Administer each dose slowly over 30–60 sec.
- **Intermittent Infusion:** ***Diluent:*** May be added to D5W, 0.9% NaCl, or LR. ***Rate:*** Administer by slow IV infusion. Titrate according to patient response.
- **Syringe Compatibility:** atropine, bleomycin, butorphanol, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, dimenhydrinate, diphenhydramine, doxorubicin, fentanyl, glycopyrrolate, hydroxyzine, meperidine, metoclopramide, midazolam, mitomycin, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, vinblastine, vincristine.
- **Syringe Incompatibility:** fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, ondansetron, pentobarbital.
- **Y-Site Compatibility:** amifostine, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, cisatracurium, cladribine, cisplatin, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, doxorubicin liposome, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, hydrocortisone sodium succinate, idarubicin, linezolid, melphalan, meperidine, metoclopramide, mitomycin, ondansetron, oxaliplatin, paclitaxel, potassium chloride, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine, vitamin B complex with C.
- **Y-Site Incompatibility:** allopurinol sodium, amphotericin B cholesteryl sulfate complex, cefepime, fluorouracil, foscarnet, furosemide, lansoprazole, leucovorin calcium, nafcillin, pemetrexed, piperacillin/tazobactam.
- **Additive Incompatibility:** barbiturates.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Medication causes drowsiness. Advise patient to call for assistance during ambulation and transfer.

Evaluation/Desired Outcomes

- General quiescence and reduced motor activity.
- Decreased nausea and vomiting.

drotrecogin (dro-tre-**coe**-gin)
Xigris

Classification
Therapeutic: anti-infectives
Pharmacologic: activated protein C, human

Pregnancy Category C

Indications
To reduce mortality in adult patients with sepsis.

Action
Probably acts by suppressing widespread inflammation associated with sepsis. **Therapeutic Effects:** Decrease mortality due to sepsis.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (activity)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Patients with a high risk of bleeding, including those with: active internal bleeding, recent (within 3 months) stroke, recent (within 2 months) intracranial or intraspinal injury or severe head trauma, any trauma associated with an increased risk of life-threatening bleeding, presence of an epidural catheter, intracranial neoplasm/mass lesion/cerebral herniation. Patients not expected to survive due to pre-existing medical condition(s); HIV-positive patients with CD-4 cell counts ≤50/mm^3; Chronic dialysis patients; Patients who have undergone bone marrow, lung, liver, pancreas, or small bowel transplantation; OB: Lactation.
Use Cautiously in: Concurrent therapeutic heparin therapy (≥15 units/kg/hr), recent (within 3 days) thrombolytic therapy, recent (within 7 days) oral anticoagulants or glycoprotein IIb/IIIa inhibitors, recent (within 7 days) aspirin therapy >650 mg/day or other platelet inhibitors; Platelet count <30,000 x 10^6/L; Prothrombin time—INR >3.0; Recent (within 6 wk) GI bleeding; Recent (within 3 mos) ischemic stroke; Intracranial arteriovenous malformation or aneurysm; Known bleeding diathesis; Chronic severe hepatic disease; Any other serious bleeding risk; Surgical procedures (discontinue 2 hr before; resume 12 hr after if hemostasis is achieved); OB: Pregnancy (use only if clearly needed); Pedi: Children (safety not established).

Adverse Reactions/Side Effects
Hemat: BLEEDING.

Interactions
Drug-Drug: Risk of serious bleeding may be ↑ by **antiplatelet agents**, **anticoagulants**, **thrombolytic agents**, or **other agents that may affect coagulation**.
Drug-Natural Products: Risk of bleeding may be ↑ by **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

Route/Dosage
IV (Adults): 24 mcg/kg/hr for 96 hr.

Availability
Powder for intravenous infusion (requires reconstitution): 5-mg vial, 20-mg vial.

NURSING IMPLICATIONS

Assessment
- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools, urine, or nasogastric aspirate) throughout therapy. If clinically important bleeding occurs, stop drotrecogin infusion immediately. Assess other agents used that may affect coagulation. Once hemostasis is

Copyright © 2008 by F.A. Davis

achieved, reinstitution of drotrecogin may be reconsidered.
- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- ***Lab Test Considerations:*** Most patients with severe sepsis have coagulopathy prolonging activated partial thromboplastin time (aPTT) and prothrombin time (PT). Drotrecogin may also affect aPTT, but has minimal effect on PT. Use PT to monitor coagulation status of patients receiving drotrecogin.

Potential Nursing Diagnoses
Ineffective tissue perfusion, impaired (Indications)

Implementation
- Drotrecogin should be discontinued 2 hr prior to invasive surgical procedures or procedures with a risk of bleeding. Once hemostasis is achieved, drotrecogin may be started 12 hr after the procedure.

IV Administration
- **Intermittent Infusion:** Calculate dose and number of 5-mg or 20-mg vials needed (vials contain excess to facilitate delivery). Reconstitute 5-mg vials with 2.5 ml and 20-mg vials with 10 ml sterile water for injection for a concentration of 2 mg/ml. Add sterile water slowly to vial; avoid inverting or shaking. Gently swirl until powder is completely dissolved. ***Diluent:*** Reconstituted solution must be diluted further with 0.9% NaCl. Withdraw amount of reconstituted solution needed from vial and add to infusion bag of 0.9% NaCl; direct stream to side of the bag to avoid agitating solution. Gently invert bag to mix. Reconstituted solution must be used within 3 hr and IV administration must be completed within 14 hr of preparation of IV solution. Do not administer if discolored or contains particulate matter. If infusion is interrupted, restart at initial infusion rate and continue to complete recommended infusion. ***Concentration:*** 100–1000 mcg/ml. When using low concentrations (<200 mcg/ml) at low flow rates (<5 ml/hr), prime infusion set for approximately 15 min at a flow rate of 5 ml/hr. ***Rate:*** Administer at a rate of 24 mcg/kg/hr for 96 hr. Do not use bolus dosing or dose escalation.
- **Y-Site Incompatibility:** Administer via a dedicated IV line or a dedicated lumen of a multilumen central venous catheter
- **Solution Compatibility:** May be administered only with 0.9% NaCl, LR, dextrose, or dextrose/saline combinations.

Patient/Family Teaching
- Explain purpose of medication to patient.

Evaluation/Desired Outcomes
- Reduction of mortality in adult patients with severe sepsis.

duloxetine (do-lox-e-teen)
Cymbalta

Classification
Therapeutic: antidepressants
Pharmacologic: selective serotonin and norepinephrine reuptake inhibitors—SSNRIs

Pregnancy Category C

Indications
Major depressive disorder. Management of diabetic peripheral neuropathic pain. Generalized anxiety disorder (DPNP). **Unlabeled uses:** Stress urinary incontinence. Neuropathic pain/chronic pain. Fibromyalgia. Generalized Anxiety Disorder (GAD).

Action
Inhibits serotonin and norepinephrine reuptake in the CNS. Both antidepressant and pain inhibition are centrally mediated. **Therapeutic Effects:** Decreased depressive symptomatology. Decreased neuropathic pain. Decreased symptoms of anxiety.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: Highly (>90%) protein-bound.
Metabolism and Excretion: Mostly metabolized, primarily by the CYP2D6 and CYP1A2 enzyme pathways.
Half-life: 12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor therapy; Uncontrolled angle-closure glaucoma; End stage renal disease;

Copyright © 2008 by F.A. Davis

Chronic hepatic impairment or substantial alcohol use (increased risk of hepatitis); Lactation: May enter breast milk; discontinue or bottle-feed.

Use Cautiously in: History of suicide attempt or ideation; History of mania (may activate mania/hypomania); Concurrent use of other centrally-acting drugs (↑ risk of adverse reactions); History of seizure disorder; Controlled angle-closure glaucoma; Diabetic patients and those with renal impairment (consider lower initial dose with gradual increase); OB: Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents (safe use in children/adolescents not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, fatigue, drowsiness, insomnia, activation of mania, dizziness, nightmares. **EENT:** blurred vision, ↑ intraocular pressure. **CV:** ↑ blood pressure. **GI:** ↓ appetite, constipation, dry mouth, nausea, diarrhea, ↑ liver enzymes, gastritis, hepatitis, vomiting. **GU:** dysuria, abnormal orgasm, erectile dysfunction, ↓ libido, urinary hesitation. **Derm:** ↑ sweating, pruritus, rash. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (do not use within 14 days of discontinuing MAOI. Wait at least 5 days after stopping duloxetine to start MAOI). ↑ risk of hepatotoxicity with chronic **alcohol** abuse. Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. **Drugs that inhibit CYP1A2**, including **fluvoxamine** and some **fluoroquinolones** ↑ levels of duloxetine and should be avoided. **Drugs that inhibit CYP2D6**, including **paroxetine**, **fluoxetine**, and **quinidine**, ↑ levels of duloxetine and may increase the risk of adverse reactions. Duloxetine also inhibits CYP2D6 and may ↑ levels of drugs metabolized by CYP2D6, including **tricyclic antidepressants**, **phenothiazines**, and **class 1C antiarrhythmics** (**propafenone** and **flecainide**); concurrent use should be undertaken with caution. ↑ risk of serious arrhythmias with **thioridazine**; avoid concurrent use.

Drug-Natural Products: Use with **St. John's wort** ↑ **of serotonin syndrome.**

Route/Dosage

PO (Adults): *Antidepressant*—20–30 mg twice daily; *for neuropathic pain or generalized anxiety disorder*—60 mg once daily.

Renal Impairment

PO (Adults): start with lower dose and increase gradually.

Availability

Capsules: 20 mg, 30 mg, 60 mg. **Cost:** 20 mg $320.96/90, 30 mg $345.99/90, 60 mg $347.98/90.

NURSING IMPLICATIONS

Assessment

- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Monitor blood pressure before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- **Depression:** Assess mental status (orientation, mood, and behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies in both adults and children, especially in early therapy or during dose changes. Restrict amount of drug available to patient.
- **Pain:** Assess intensity, quality, and location of pain periodically during therapy. Use pain scale. May require several weeks for effects to be seen.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, bilirubin, CPK, and alkaline phosphatase.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for suicide (Adverse Reactions)
Chronic pain (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- **PO:** May be administered without regard to meals. Capsules should be swallowed whole. Do not crush, chew, or open and sprinkle contents on food or liquids; may affect enteric coating.

Patient/Family Teaching

- Instruct patient to take duloxetine as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; must be decreased gradually.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. If these symptoms occur, notify health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if signs of liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) occur.
- Advise patient to avoid taking alcohol during duloxetine therapy.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Refer patient/family to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Patients may notice improvement within 1–4 wks, but should be advised to continue therapy as directed. Therapy is usually continued for several months.
- Decrease in neuropathic pain associated with diabetic peripheral neuropathy.

dutasteride (doo-**tas**-te-ride)
Avodart

Classification
Therapeutic: benign prostatic hyperplasia (BPH) agents
Pharmacologic: androgen inhibitors

Pregnancy Category X

Indications

Management of the symptoms of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland.

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in the prostate gland and other tissues. 5-Alpha-dihydrotestosterone is partly responsible for prostatic hyperplasia. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms.

Pharmacokinetics

Absorption: Well absorbed (60%) following oral administration; also absorbed through skin.
Distribution: 11.5% of serum concentration partitions into semen.
Protein Binding: 99% bound to albumin; 96.6 % bound to alpha-1 glycoprotein.
Metabolism and Excretion: Mostly metabolized by the liver via the CYP3A4 metabolic pathway; metabolites are excreted in feces.
Half-life: 5 wk.

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1-2 wk	unknown

†Symptoms may only improve over 3–12 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other 5-alpha-reductase inhibitors may occur; Women; Children.
Use Cautiously in: Hepatic impairment.

Adverse Reactions/Side Effects

GU: decreased libido, ejaculation disorders, erectile dysfunction. **Endo:** gynecomastia.

Interactions

Drug-Drug: Blood levels and effects may be increased by **ritonavir**, **ketoconazole**, **vera-**

Copyright © 2008 by F.A. Davis

pamil, **diltiazem**, **cimetidine**, **ciprofloxacin**, or other **CYP3A4 enzyme inhibitors**.

Route/Dosage

PO (Adults): 0.5 mg once daily.

Availability

Soft gelatin capsules: 0.5 mg. **Cost:** $269.97/90.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before, and periodically throughout, therapy.
- Digital rectal examinations should be performed before and periodically throughout therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, decrease by about 20% within the 1st mo of therapy and stabilize at about 50% of the pretreatment level within 6 mo. New baseline PSA concentrations should be established at 3 and 6 mo of therapy and evaluated periodically throughout therapy.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- **PO:** Administer once daily with or without meals. Do not crush, break, or chew capsule.

Patient/Family Teaching

- Instruct patient to take dutasteride at the same time each day as directed, even if symptoms improve or are unchanged. If a dose is missed, take as soon as remembered later in the day or omit dose. Do not make up by taking double doses the next day.
- Caution patient that sharing of dutasteride may be dangerous.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function.
- Caution patient that dutasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking dutasteride and should not handle dutasteride because of the potential for absorption.
- Advise patient to avoid donating blood for at least 6 mo after last dose of dutasteride to prevent a pregnant female from receiving dutasteride through a blood transfusion.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of BPH.

This page has been left intentionally blank.

Copyright © 2008 by F.A. Davis

econazole, See ANTIFUNGALS (TOPICAL).

efavirenz (e-fav-i-renz)
Sustiva

Classification
Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

Pregnancy Category D

Indications
HIV infection (in combination with one or more other antiretroviral agents).

Action
Inhibits HIV reverse transcriptase, which results in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics
Absorption: 50% absorbed when ingested following a high-fat meal.
Distribution: 99.5–99.75% bound to plasma proteins; enters CSF.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: *Following single dose*—52–76 hr. *Following multiple doses*—40–55 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	3–5 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent midazolam, triazolam, ergot derivatives, or voriconazole.
Use Cautiously in: History of mental illness or substance abuse (↑ risk of psychiatric symptomatology); History of hepatic impairment (including hepatitis B or C infection or concurrent therapy with hepatotoxic agents); Pedi: Children (increased incidence of rash); OB: Pregnancy or lactation (use in pregnancy only if other options have been exhausted; breastfeeding not recommended in HIV-infected patients).

Adverse Reactions/Side Effects
CNS: abnormal dreams, depression, dizziness, drowsiness, fatigue, headache, impaired concentration, insomnia, nervousness, psychiatric symptomatology. **GI:** nausea, abdominal pain, anorexia, diarrhea, dyspepsia, flatulence. **GU:** hematuria, renal calculi. **Derm:** RASH, increased sweating, pruritus. **Neuro:** hypoesthesia.

Interactions
Drug-Drug: ↑ levels of **midazolam, triazolam,** or **ergot alkaloids** when used concurrently; may result in potentially serious adverse reactions including arrhythmias, CNS, and respiratory depression. Induces (stimulates) the hepatic cytochrome P450 3A4 enzyme system and would be expected to influence the effects of other drugs that are metabolized by this system; efavirenz itself is also metabolized by this system. ↑ risk of CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**. Concurrent use with **ritonavir** ↑ levels of both agents and the likelihood of adverse reactions, especially hepatotoxicity. May alter the effectiveness of **hormonal contraceptives**. Significantly ↓ **voriconazole** levels; concurrent use is contraindicated. ↓ **indinavir** blood levels (indinavir dosage ↑ recommended). ↓ **saquinavir** blood levels (avoid using saquinavir as the only protease inhibitor with efavirenz). May alter the effects of **warfarin**.
Drug-Natural Products: Use with **St. John's wort** may cause ↓ levels and effectiveness, including development of drug resistance.
Drug-Food: Ingestion following a high-fat meal increases absorption by 50%.

Route/Dosage
PO (Adults and Children >40 kg): 600 mg once daily.
PO (Children 32.5–40 kg): 400 mg once daily.
PO (Children 25–32.5 kg): 350 mg once daily.
PO (Children 20–25 kg): 300 mg once daily.
PO (Children 15–20 kg): 250 mg once daily.
PO (Children 10–15 kg): 200 mg once daily.

Availability
Capsules: 50 mg, 100 mg, 200 mg. **Tablets:** 600 mg. ***In combination with:*** emtricitabine and tenofovir (Atripla) (See Appendix B).

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for rash, especially during 1st month of therapy. Onset is usually within 2 wk and resolves with continued therapy within 1 mo. May range from mild maculopapular with erythema and pruritus to exfoliative dermatitis and Stevens-Johnson syndrome. Occurs more often and may be more severe in children. If rash is severe or accompanied by blistering, desquamation, mucosal involvement, or fever, therapy must be discontinued immediately. Efavirenz may be reinstated concurrently with antihistamines or corticosteroids in patients discontinuing due to rash.
- Assess patient for CNS and psychiatric symptoms (dizziness, impaired concentration, somnolence, abnormal dreams, insomnia) during therapy. Symptoms usually begin during 1st or 2nd day of therapy and resolve after 2–4 wk. Administration at bedtime may minimize symptoms. Concurrent use with alcohol or psychoactive agents may cause additive CNS symptoms.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor liver function tests in patients with a history of hepatitis B or C. May cause ↑ serum AST, ALT, and GGT concentrations. If moderate to severe liver function test abnormalities occur, efavirenz doses should be held until levels return to normal. Discontinue if liver function abnormalities recur when therapy is resumed.
- May cause ↑ in total cholesterol and serum triglyceride levels.
- May cause false-positive urine cannabinoid results.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food. Avoid taking with a high-fat meal.

Patient/Family Teaching

- Emphasize the importance of taking efavirenz as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that efavirenz should not be shared with others.
- May cause dizziness, impaired concentration, or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking other medications, prescription or OTC, or herbal products without consulting health care professional.
- Inform patient that efavirenz does not cure AIDS or prevent associated or opportunistic infections. Efavirenz does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of efavirenz are unknown at this time.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during efavirenz therapy and to notify health care professional if they become pregnant while taking efavirenz.
- Instruct patient to notify health care professional immediately if rash occurs.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

eletriptan (e-le-**trip**-tan)
Relpax

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Pregnancy Category C

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-hydroxy-tryptamine receptor sites in intracranial blood ves-

Copyright © 2008 by F.A. Davis

sels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics

Absorption: 50% absorbed after oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver via the CYP3A4 enzyme system.
Half-life: 4 hr.

TIME/ACTION PROFILE (decreased migraine pain)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 hr	2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hemiplegic or basilar migraine; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Severe hepatic impairment; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Should not be used within 72 hr of potent CYP3A4 inhibitors including ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, and nelfinavir.
Use Cautiously in: Geriatric patients; Pregnancy, lactation, or children <18 yr (safety not established; use during pregnancy only if potential benefits justify potential risk to fetus).
Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women, or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, weakness. **CV:** chest tightness/pressure. **GI:** abdominal pain, dry mouth, dysphagia, nausea. **Neuro:** paresthesia.

Interactions

Drug-Drug: Blood levels and risk of adverse reactions are increased by potent **CYP3A4 inhibitors** (including **ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, and **nelfinavir**); use within 72 hr is contraindicated. Concurrent use (within 24 hr of each other) with ergot-containing drugs (**dihydroergotamine**) may result in prolonged vasospastic reactions and should be avoided.

Route/Dosage

PO (Adults): 20 or 40 mg; may be repeated in 2 hr if initial response is inadequate (not to exceed 80 mg/24 hr or treatment of 3 headaches/mo).

Availability

Tablets: 20 mg, 40 mg. **Cost:** 20 mg $113.61/6, 40 mg $113.99/6.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, character, duration, and associated symptoms (photophonia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Administer at the first sign of a headache. If after the initial dose, headache improves but then returns, dose may be repeated at least 2 hr after initial dose. If initial dose is ineffective, second dose is unlikely to be effective.

Patient/Family Teaching

- Instruct patient that eletriptan should only be used during a migraine attack. Eletriptan is used for treatment of a migraine attack, not for prevention.
- Instruct patient to take eletriptan at the first sign of a migraine, but may be administered at any time during attack. Allow at least 2 hr between doses and do not use more than 80 mg/day or 3 attacks/mo.
- Caution patient not to take eletriptan within 24 hr of other vascular headache suppressants.
- Advise patient that lying down in a darkened room after eletriptan administration may further help relieve headache.
- Advise patient to notify health care professional if she plans or suspects pregnancy, or if breastfeeding.
- Advise patient to notify health care professional before next dose of eletriptan if pain or

Copyright © 2008 by F.A. Davis

tightness in the chest occurs. If chest pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care provider at next visit.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during therapy.

Evaluation/Desired Outcomes
- Relief of migraine attack.

emtricitabine
(em-tri-**si**-ti-been)
Emtriva

Classification
Therapeutic: antiretrovirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

Pregnancy Category B

Indications
HIV infection (with other antiretrovirals).

Action
Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics
Absorption: Rapidly and extensively absorbed; 93% bioavailable.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism, 86% renally excreted, 14% fecal excretion.
Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	24 hr

*Normal renal function

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation: Lactation (breast-feeding is not recommended in HIV-infected patients); Pedi: Children <18 yr (safety not established).
Use Cautiously in: Geri: Elderly (may be at ↑ risk for adverse effects); Hepatitis B infection (may exacerbate following discontinuation); Renal impairment; OB: Pregnancy (use only if clearly needed).

Adverse Reactions/Side Effects
CNS: dizziness, headache, insomnia, weakness, depression, nightmares. **GI:** abdominal pain, diarrhea, nausea, SEVERE HEPATOMEGALY WITH STEATOSIS, dyspepsia, vomiting. **Derm:** rash, skin discoloration. **F and E:** LACTIC ACIDOSIS. **MS:** arthralgia, myalgia. **Neuro:** neuropathy, paresthesia. **Resp:** cough, rhinitis. **Misc:** fat redistribution.

Interactions
Drug-Drug: None noted.

Route/Dosage
PO (Adults ≥18 yr): 200 mg once daily.

Renal Impairment
PO (Adults ≥18 yr): *CCr 30–49 ml/min*—200 mg every 48 hr; *CCr 15–29 ml/min*—200 mg every 72 hr; *CCr <15 ml/min*—200 mg every 96 hr.

Availability
Capsules: 200 mg. **Oral solution (cotton candy flavor):** 10 mg/mL in 270-ml bottles. ***In combination with:*** efavirenz and emtricitabine (Atripla); tenofovir (Truvada). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- May cause lactic acidosis and severe hepatomegaly with steatosis. These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Test patients for chronic hepatitis B virus (HBV) before initiating therapy. Emtricitabine is not indicated for treatment of HBV. Exacerbations of HBV have occurred upon discontinuation of emtricitabine.

Copyright © 2008 by F.A. Davis

- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ AST, ALT, bilirubin, creatine kinase, serum amylase, serum lipase, and triglycerides. May cause ↑ or ↓ serum glucose. May cause ↓ neutrophil count.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food.

Patient/Family Teaching

- Emphasize the importance of taking emtricitabine exactly as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, but not if almost time for next dose; do not double doses.
- Instruct patient that emtricitabine should not be shared with others.
- Inform patient that emtricitabine does not cure AIDS or prevent associated or opportunistic infections. Emtricitabine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of emtricitabine are unknown at this time.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur. These symptoms may occur more frequently in patients that are female, obese, or have been taking medications like emtricitabine for a long time.
- Inform patient that redistribution of body fat (central obesity, dorsocervical fat enlargement or buffalo hump, peripheral and facial wasting, breast enlargement, cushingoid appearance) and skin discoloration (hyperpigmentation on palms and soles) may occur.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.
- Advise patient to notify health care professional if she plans or suspects pregnancy or is breastfeeding.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

enalapril/enalaprilat, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

enfuvirtide (en-foo-veer-tide)
Fuzeon

Classification
Therapeutic: antiretrovirals
Pharmacologic: fusion inhibitors

Pregnancy Category B

Indications

Management of HIV infection in combination with other antiretrovirals in patients with evidence of progressive HIV-1 replication despite ongoing treatment.

Action

Prevents entry of HIV-1 into cells by interfering with the fusion of the virus with cellular membranes. **Therapeutic Effects:** Decreased replication of the HIV virus. Slowed progression of HIV infection with decreased occurrence of sequelae. Improved CD4 cell count.

Pharmacokinetics

Absorption: 84% absorbed following subcutaneous administration.
Distribution: 5.5 L.
Protein Binding: 92% bound to plasma proteins.
Metabolism and Excretion: Broken down into component amino acids and then recycled in body pool.
Half-life: 3.8 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	Unknown	8 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation (breast feeding not recommended in HIV-infected patients).

Use Cautiously in: Pregnancy (use only if clearly indicated); Children <6 yr (safety not established).

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** conjunctivitis. **Resp:** cough, pneumonia, sinusitis. **GI:** diarrhea, nausea, abdominal pain, anorexia, dry mouth, pancreatitis, weight loss. **Local:** injection site reactions. **MS:** myalgia, limb pain. **Misc:** hypersensitivity reactions, herpes simplex.

Interactions

Drug-Drug: None noted.

Route/Dosage

Subcut (Adults): 90 mg twice daily.

Subcut (Children 6–16 yr): 2 mg/kg twice daily (not to exceed 90 mg/dose).

Availability

Lyophilized powder for subcut administration: 108 mg/vial (to deliver a 90 mg/1 ml concentration).

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess patient for injection site reactions (pain, discomfort, induration, erythema, nodules and cysts, pruritus, ecchymosis). These are common, may require analgesics and limitation of physical activities.
- Assess patient for signs and symptoms of pneumonia (cough with fever, rapid breathing, dyspnea) during therapy. Notify health care professional immediately if these appear. Patients at higher risk for pneumonia include patients with low initial CD4 cell count, high initial viral load, IV drug use, smoking, and prior history of lung disease.
- Monitor patient for signs of hypersensitivity reactions (rash, fever, nausea and vomiting, chills, rigors, hypotension, elevated serum liver transaminases). If these occur, discontinue and do not restart enfuvirtide.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause eosinophilia, ↑ serum amylase, lipase, triglycerides, ALT, AST, creatine phosphokinase, and GGT.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Reconstitute vial with 1.1 ml of sterile water for injection and gently tap vial for 10 sec and roll between hands to avoid foaming and ensure all particles come in contact with the liquid and no drug remains on vial wall. Allow vial to stand until powder goes completely into solution; may take up to 45 min or roll vial gently between hands until completely dissolved. Solutions should be clear and colorless; do not administer solutions that are discolored or contain bubbles or particulate matter. Inject immediately or refrigerate for up to 24 hr after reconstitution. Bring to room temperature and inspect solution before administering. Discard any unused drug.
- **Subcut:** Administer in the upper arm, abdomen, or anterior thigh. Rotate sites; do not inject into sites with previous injection site reactions, moles, scars, bruises, or within 2 inches of the navel.
- **Syringe Incompatibility:** Do not mix other medications in the same syringe.

Patient/Family Teaching

- Instruct patient on the correct technique for administering enfuvirtide. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container. First injection should be administered under supervision of a health care professional and technique should be re-evaluated periodically. Instruct patient to contact www.FUZEON.com or 1-877-4-FUZEON (1-877-438-9366) for more information.
- Emphasize the importance of administering enfuvirtide exactly as directed. It must always be used in combination with other antiretrovirals. Do not take more than prescribed amount and do not stop taking without consulting health care professional. If a dose is missed, take as soon as remembered then return to regular schedule. If close to time for the next dose, wait and administer next dose

Copyright © 2008 by F.A. Davis

as regularly scheduled; do not administer two doses at same time. If too much is administered, notify health care professional promptly.
- Instruct patient that enfuvirtide should not be shared with others.
- Inform patient that enfuvirtide does not cure AIDS or prevent opportunistic infections. Enfuvirtide does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood. Advise patient that the long-term effects of enfuvirtide are unknown at this time.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if she plans or suspects pregnancy or if breastfeeding.
- Instruct patient to notify health care professional if signs of injection site infection (oozing, increasing heat, swelling, redness, or pain), pneumonia, or hypersensitivity occur.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes
- Decreased replication of the HIV virus.
- Slowed progression of HIV infection with decreased occurrence of sequelae.
- Improved CD4 count.

enoxaparin, See HEPARINS (LOW MOLECULAR WEIGHT).

entacapone (en-tak-a-pone)
Comtan

Classification
Therapeutic: antiparkinson agents
Pharmacologic: catechol-O-methyltransferase inhibitors

Pregnancy Category C

Indications
With levodopa/carbidopa to treat idiopathic Parkinson's disease when signs and symptoms of end-of-dose "wearing-off" (so-called fluctuating patients) occur.

Action
Acts as a selective and reversible inhibitor of the enzyme catechol *O*-methyltransferase (COMT). Inhibition of this enzyme prevents the breakdown of levodopa, increasing availability to the CNS. **Therapeutic Effects:** Prolongs duration of response to levodopa with end-of-dose motorfluctuations. Decreased signs and symptoms of Parkinson's disease.

Pharmacokinetics
Absorption: 35% absorbed following oral administration; absorption is rapid.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Minimal amounts excreted unchanged; highly metabolized followed by biliary excretion.
Half-life: *Initial phase*—0.4–0.7 hr; *second phase*—2.4 hr.

TIME/ACTION PROFILE (inhibition of COMT)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	up to 8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent nonselective MAO inhibitor therapy.
Use Cautiously in: Hepatic impairment; Concurrent use of drugs that are metabolized by COMT; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: NEUROLEPTIC MALIGNANT SYNDROME, dizziness, hallucinations, syncope. **Resp:** pulmonary infiltrates, pleural effusion, pleural thickening. **CV:** hypotension. **GI:** abdominal pain, diarrhea, nausea (during initiation), retroperitoneal fibrosis. **GU:** brownish-orange discoloration of urine. **MS:** RHABDOMYOLYSIS. **Neuro:** dyskinesia.

Interactions
Drug-Drug: Concurrent use with selective **MAO inhibitors** is not recommended; both agents inhibit the metabolic pathways of catecholamines. Concurrent use of drugs that are metabolized by COMT such as **isoproterenol**, **epinephrine**, **norepinephrine**, **dopamine**, **dobutamine**, and **methyldopa** may ↑ risk of

Copyright © 2008 by F.A. Davis

tachycardia, increased blood pressure, and arrhythmias. **Probenecid**, **cholestyramine**, **erythromycin**, **rifampin**, **ampicillin**, and **chloramphenicol** may interfere with biliary elimination of entacapone; concurrent use should be undertaken with caution.

Route/Dosage

PO (Adults): 200 mg with each dose of levodopa/carbidopa up to a maximum of 8 times daily.

Availability

Tablets: 200 mg. ***In combination with:*** levodopa/carbidopa (Stalevo), see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) prior to and during therapy. Dyskinesia may increase with therapy.
- Monitor patient for development of diarrhea. Usually occurs within 4 to 12 wk of start of therapy, but may occur as early as the first week and as late as months after initiation of therapy.
- Monitor patient for signs similar to neuroleptic malignant syndrome (elevated temperature, muscular rigidity, altered consciousness, elevated CPK). Symptoms have been associated with rapid dose reduction or withdrawal of other dopaminergic drugs. Withdrawal should be gradual.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

Implementation

- **PO:** Always administer entacapone with levodopa/carbidopa. Entacapone has no antiparkinsonism effects of its own.

Patient/Family Teaching

- Encourage patient to take entacapone as directed. Missed doses should be taken as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur.
- May cause dizziness or hallucinations. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Inform patient that nausea may occur, especially at initiation of therapy. Therapy may cause change in urine color to brownish orange.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decreased signs and symptoms of Parkinson's disease.

entecavir (en-**tek**-aveer)
Baraclude

Classification
Therapeutic: antivirals
Pharmacologic: nucleoside analogues

Pregnancy Category C

Indications

Chronic hepatitis B infection with evidence of active disease.

Action

Phosphorylated intracellularly to active form which acts as an analogue of guanosine, interfering with viral DNA synthesis. **Therapeutic Effects:** Decreased hepatic damage due to chronic hepatitis B infection.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Extensive tissue distribution.
Metabolism and Excretion: 62–73% excreted unchanged by kidneys.
Half-life: Plasma—128–149 hr; intracellular—15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation.
Use Cautiously in: Renal impairment (dose reduction recommended if CCr <50 mL/min; Liver transplant recipients (careful monitoring of renal function recommended); Elderly patients (may have age-related decrease in renal

Copyright © 2008 by F.A. Davis

function); Children <16 yr (safety not established); Pregnancy (use only if clearly needed, considering benefits and risks).

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **GI:** dyspepsia, nausea. **F and E:** LACTIC ACIDOSIS.

Interactions

Drug-Drug: Concurrent use of drugs which may impair renal function may ↑ blood levels and risk of toxicity.

Route/Dosage

PO (Adults and Children >16 yr): 0.5 mg once daily; *history of lamivudine resistance*—1 mg once daily

Renal Impairment

PO (Adults and Children >16 yr): *CCr 30–50 mL/min*—0.25 mg once daily, *history of lamivudine resistance*—0.5 mg once daily; *CCr 10– <30 mL/min*—0.15 mg once daily, *history of lamivudine resistance*—0.3 mg once daily; *CCr <10 mL/min*—0.05 mg once daily, *history of lamivudine resistance*—0.1 mg once daily.

Availability

Tablets: 0.5 mg, 1 mg. **Oral solution (orange):** 0.05 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during and for several months following discontinuation of therapy. Exacerbations may occur when therapy is discontinued.
- ***Lab Test Considerations:*** Monitor liver function closely during and for several months following discontinuation of therapy. May cause ↑ AST, ALT, bilirubin, amylase, lipase, creatinine and serum glucose. May cause ↓ serum albumin.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach at least 2 hr before or after a meal. Oral solution is ready to use and should not be diluted or mixed with water or any other liquid. Hold spoon in a vertical position and fill gradually to mark corresponding to the prescribed dose. Rinse dosing spoon with water after each daily dose. Store in outer carton at room temperature. After opening, solution can be used until expiration date on bottle.

Patient/Family Teaching

- Instruct patient to read the *Patient Information* with each refill and to take entecavir as directed. Take missed doses as soon as possible unless almost time for next dose. Do not run out of entecavir, get more when supply runs low. Do not double doses. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Inform patient that hepatitis exacerbation may occur upon discontinuation of therapy. Caution patient not to share medication with others.
- Inform patient that entecavir does not cure HBV disease, but may lower the amount of HBV in the body, lower the ability of HBV to multiply and infect new liver cells, and may improve the condition of the liver. Entecavir does not reduce the risk of transmission of HBV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HBV to others.
- Advise patient to notify health care professional promptly if signs of lactic acidosis (weakness or tiredness; unusual muscle pain; trouble breathing; stomach pain with nausea and vomiting; feeling cold, especially in arms or legs; dizziness, fast or irregular heartbeat) or hepatotoxicity (jaundice, dark urine, light-colored bowel movements, anorexia, nausea, lower stomach pain) occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products with entecavir.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Copyright © 2008 by F.A. Davis

- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decreased hepatic damage due to chronic hepatitis B infection.

EPIDURAL LOCAL ANESTHETICS

bupivacaine (byoo-**pi**-vi-kane)
Marcaine, Sensorcaine

ropivacaine (**roe**-pi-vi-kane)
Naropin

Classification
Therapeutic: epidural local anesthetics, anesthetics—topical/local

Pregnancy Category B (ropivacaine), C (bupivacaine)

Indications

Local or regional anesthesia or analgesia for surgical, obstetric, or diagnostic procedures.

Action

Local anesthetics inhibit initiation and conduction of sensory nerve impulses by altering the influx of sodium and efflux of potassium in neurons, slowing or stopping pain transmission. Epidural administration allows action to take place at the level of the spinal nerve roots immediately adjacent to the site of administration. The catheter is placed as close as possible to the dermatomes (skin surface areas innervated by a single spinal nerve or group of spinal nerves) that, when blocked, will produce the most effective spread of analgesia for the site of injury.
Therapeutic Effects: Decreased pain or induction of anesthesia; low doses have minimal effect on sensory or motor function; higher doses may produce complete motor blockade.

Pharmacokinetics

Absorption: Systemic absorption follows epidural administration, but amount absorbed depends on dose.
Distribution: Agents are lipid soluble, which selectively keeps them in the epidural space and limits systemic absorption. If systemic absorption occurs, these agents are widely distributed and cross the placenta.
Metabolism and Excretion: Small amounts that may reach systemic circulation are mostly metabolized by the liver. Very little excreted unchanged in the urine.
Half-life: *Bupivacaine*—1.5–5 hr (after epidural use); *ropivacaine*—4.2 hr (after epidural use).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
Epidural	10–30 min	unknown	2-8 hr†

†Duration of anesthetic block

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity with other amide local anesthetics may occur (lidocaine, mepivacaine, prilocaine); Bupivacaine contains bisulfites and should be avoided in patients with known intolerance; OB: Obstetrical paracervical block anesthesia (bupivacaine only).
Use Cautiously in: Concurrent use of other local anesthetics; Liver disease; Concurrent use of anticoagulants (including low-dose heparin and low-molecular-weight heparins/heparinoids); ↑ the risk of spinal/epidural hematomas; Pedi: Children (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, anxiety, dizziness, headache, irritability. **EENT:** blurred vision, tinnitus. **CV:** CARDIOVASCULAR COLLAPSE, arrhythmias, bradycardia, hypotension, tachycardia. **GI:** nausea, vomiting. **GU:** urinary retention. **Derm:** pruritus. **F and E:** metabolic acidosis. **Neuro:** circumoral tingling/numbness, tremor. **Misc:** allergic reactions, fever.

Interactions

Drug-Drug: Additive toxicity may occur with concurrent use of other **amide local anesthetics** (including **lidocaine**, **mepivacaine**, and **prilocaine**). Use of bupivacaine solution containing epinephrine with **MAO inhibitors** may cause hypertension. **Fluvoxamine**, **amiodarone**, **ciprofloxacin**, and **propofol** may ↑ effects of ropivacaine.

Route/Dosage

Solutions containing preservatives should not be used for caudal or epidural blocks.

Bupivacaine

Epidural: (Adults and Children >12 yr): 10–20 ml of 0.25% (partial to moderate block), 0.5% (moderate to complete block), or 0.75% (complete block) solution. Administer in increments of 3–5 ml allowing sufficient time to detect toxic signs/symptoms of inadvertent IV

Copyright © 2008 by F.A. Davis

or IT administration. A test dose of 2–3 ml of 0.5% with epinephrine solution is recommended prior to epidural blocks.

Ropivacaine

Surgical Anesthesia

Epidural: (Adults): *Lumbar epidural* —15–30 ml of 0.5% solution or 15–25 ml of 0.75% solution or 15–20 ml of 1% solution; *Lumbar epidural for cesarean section* —20–30 ml of 0.5% solution or 15–20 ml of 0.75% solution; *Thoracic epidural* —5–15 ml of 0.5–0.75% solution.

Labor Pain

Epidural: (Adults): *Lumbar epidural* —10–20 ml of 0.2% solution initially, then continuous infusion of 6–14 ml/hr of 0.2% solution with incremental injection of 10–15 ml/hr of 0.2% solution.

Postoperative Pain

Epidural: (Adults): *Lumbar or thoracic epidural* —Continuous infusion of 6–14 ml/hr of 0.2% solution.

Availability

Bupivacaine

Solution for injection (preservative-free): 0.25%, 0.5%, 0.75%. ***In combination with:*** epinephrine 1:200,000

Ropivacaine

Solution for injection (preservative-free): 0.2%, 0.5%, 0.75%, 1%.

NURSING IMPLICATIONS

Assessment

- **Systemic Toxicity:** Assess for systemic toxicity (circumoral tingling and numbness, ringing in ears, metallic taste, dizziness, blurred vision, tremors, slow speech, irritability, twitching, seizures, cardiac dysrhythmias) each shift. Report to physician or other health care professional.
- **Orthostatic Hypotension:** Monitor blood pressure, heart rate, and respiratory rate continuously while patient is receiving this medication. Mild hypotension is common because of the effect of local anesthetic block of nerve fibers on the sympathetic nervous system, causing vasodilation. Significant hypotension and bradycardia may occur, especially when rising from a prone position or following large dose increases or boluses. Treatment of unresolved hypotension may include hydration, decreasing the epidural infusion rate, and/or removal of local anesthetic from analgesic solution.
- **Unwanted Motor and Sensory Deficit:** The goal of adding low-dose local anesthetics to epidural opioids for pain management is to provide analgesia, not to produce anesthesia. Patients should be able to ambulate if their condition allows, and epidural analgesic should not hamper this important recovery activity. However, many factors, including location of the epidural catheter, local anesthetic dose, and variability in patient response, can result in patients experiencing unwanted motor and sensory deficits. Pain is the first sensation lost, followed by temperature, touch, proprioception, and skeletal muscle tone.
- Assess for sensory deficit every shift. Ask patient to point to numb and tingling skin areas (numbness and tingling at the incision site is common and usually normal). Notify physician or other health care professional of unwanted motor and sensory deficits
- Unwanted motor and sensory deficits often can be corrected with simple treatment. For example, a change in position may relieve temporary sensory loss in an extremity. Minor extremity muscle weakness is often treated by decreasing the epidural infusion rate and keeping the patient in bed until the weakness resolves. Sometimes removing the local anesthetic from the analgesic solution is necessary, such as when signs of local anesthetic toxicity are detected or when simple treatment of motor and sensory deficits has been unsuccessful.

Potential Nursing Diagnoses

Acute pain, acute (Indications)
Impaired physical mobility (Side Effects)

Implementation

- See Route and Dosage section.

Patient/Family Teaching

- Instruct patient to notify nurse if signs or symptoms of systemic toxicity occur.
- Advise patient to request assistance during ambulation until orthostatic hypotension and motor deficits are ruled out.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in postoperative pain without unwanted sensory or motor deficits.

HIGH ALERT

epinephrine (e-pi-**nef**-rin)
Adrenalin, Ana-Guard, Asthma-Haler Mist, AsthmaNefrin (racepinephrine), EpiPen, microNefrin, Nephron, Primatene, Sus-Phrine, S-2

Classification
Therapeutic: antiasthmatics, bronchodilators, vasopressors
Pharmacologic: adrenergics

Pregnancy Category C

See Appendix C for ophthalmic use

Indications

Subcut, IV, Inhaln: Management of reversible airway disease due to asthma or COPD. **Subcut, IV:** Management of severe allergic reactions. **IV, Intracardiac, Intratracheal, Intraosseous (part of advanced cardiac life support [ACLS] and pediatric advanced life support [PALS] guidelines):** Management of cardiac arrest (unlabeled). **Inhaln:** Management of upper airway obstruction and croup (racemic epinephrine). **Local/Spinal:** Adjunct in the localization/prolongation of anesthesia.

Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Affects both $beta_1$ (cardiac)-adrenergic receptors and $beta_2$ (pulmonary)-adrenergic receptor sites. Produces bronchodilation. Also has alpha-adrenergic agonist properties, which result in vasoconstriction. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. **Therapeutic Effects:** Bronchodilation. Maintenance of heart rate and blood pressure. Localization/prolongation of local/spinal anesthetic.

Pharmacokinetics

Absorption: Well absorbed following subcut administration; some absorption may occur following repeated inhalation of large doses.
Distribution: Does not cross the blood-brain barrier; crosses the placenta and enters breast milk.
Metabolism and Excretion: Action is rapidly terminated by metabolism and uptake by nerve endings.
Half-life: Unknown.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	1 min	unknown	1–3 hr
Subcut	5–10 min	20 min	<1–4 hr
IM	6–12 min	unknown	<1–4 hr
IV	rapid	20 min	20–30 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines; Cardiac arrhythmias; Some products may contain bisulfites or fluorocarbons (in some inhalers) and should be avoided in patients with known hypersensitivity or intolerance.
Use Cautiously in: Cardiac disease (angina, tachycardia, MI); Hypertension; Hyperthyroidism; Diabetes; Cerebral arteriosclerosis; Glaucoma (except for ophthalmic use); Elderly patients (more susceptible to adverse reactions; may require dosage reduction); Pregnancy (near term) and lactation; Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler).

Adverse Reactions/Side Effects

CNS: nervousness, restlessness, tremor, headache, insomnia. **Resp:** paradoxical bronchospasm (excessive use of inhalers). **CV:** angina, arrhythmias, hypertension, tachycardia. **GI:** nausea, vomiting. **Endo:** hyperglycemia.

Interactions

Drug-Drug: Concurrent use with other **adrenergic agents** will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. **Tricyclic antidepressants** enhance pressor response to epinephrine.
Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

Subcut, IM (Adults): *Anaphylactic reactions/asthma*—0.1–0.5 mg (single dose not to exceed 1 mg); may repeat q 10–15 min for anaphylactic shock or q 20 min–4 hr for asthma.
Subcut (Children >1 month): *Anaphylactic reactions/asthma*—0.01 mg/kg (not to exceed 0.5 mg/dose) q 15 min for 2 doses, then q 4 hr.
IV (Adults): *Severe anaphylaxis*—0.1–0.25 mg q 5–15 min; may be followed by 1–4 mcg/

Copyright © 2008 by F.A. Davis

min continuous infusion; *cardiopulmonary resuscitation (ACLS guidelines)*—1 mg q 3–5 min; *bradycardia (ACLS guidelines)*—2–10 mcg/min).
IV (Children): *Severe anaphylaxis*—0.1 mg (less in younger children); may be followed by 0.1 mcg/kg/min continuous infusion (may be increased up to 1.5 mcg/kg/min); *symptomatic bradycardia/pulseless arrest (PALS guidelines)*—0.01 mg/kg, may be repeated q 3–5 min higher doses (up to 0.1–0.2 mg/kg) may be considered; may also be given by the intraosseous route. May also be given by the endotracheal route in doses of 0.1–0.2 mg/kg diluted to a volume of 3–5 ml with normal saline followed by several positive pressure ventilations.
Inhaln (Adults): *Metered-dose inhaler*—1 inhalation (160–250 mcg), may be repeated after 1–2 min; additional doses may be repeated q 3 hr; *inhalation solution*—1 inhalation of 1% solution; may be repeated after 1–2 min; additional doses may be given q 3 hr; *racepinephrine*—Via hand nebulizer, 2–3 inhalations of 2.25% solution; may repeat in 5 min with 2–3 more inhalations, up to 4–6 times daily.
Inhaln (Children >1 month): 0.25–0.5 mL of 2.25% racemic epinephrine solution diluted in 3 ml normal saline.
IV, Intratracheal (Neonates): 0.01–0.03 mg/kg q 3–5 min as needed.
IM (Children >1 month <30 kg): 0.15 mg (EpiPen Jr); >30 kg: 0.3 mg (EpiPen).
Intracardiac (Adults): 0.3–0.5 mg.
Endotracheal (Adults): *Cardiopulmonary resuscitation (ACLS guidelines)*—2–2.5 mg.
Topical (Adults and Children ≥6 yr): *Nasal decongestant*—Apply 1% solution as drops, spray, or with a swab.
Intraspinal (Adults and Children): 0.2–0.4 ml of 1:1000 solution.
With Local Anesthetics (Adults and Children): Use 1:200,000 solution with local anesthetic.

Availability (generic available)

Inhalation aerosol: 0.125% (≥300 inhalations/15 ml)[OTC], 0.5% (≥300 inhalations/15 ml)[OTC], 300 mcg/spray (≥300 inhalations/15 ml)[OTC]. **Inhalation solution:** 1%[OTC]. **Injection:** 0.1 mg/ml (1:10,000), 1 mg/ml (1:1000).
Auto-injector (EpiPen): 0.15 mg/0.3 ml (1:2000), 0.3 mg/0.3 ml (1:1000). **Cost:** 0.15 mg $56.48/syringe, 0.3 mg $58.99/syringe.
Topical solution: 0.1%.

NURSING IMPLICATIONS

Assessment

- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before and periodically throughout therapy to determine effectiveness of medication.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.
- Observe patient for drug tolerance and rebound bronchospasm. Patients requiring more than 3 inhalation treatments in 24 hr should be under close supervision. If minimal or no relief is seen after 3–5 inhalation treatments within 6–12 hr, further treatment with aerosol alone is not recommended
- Assess for hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- **Vasopressor:** Monitor blood pressure, pulse, ECG, and respiratory rate frequently during IV administration. Continuous ECG monitoring, hemodynamic parameters, and urine output should be monitored continuously during IV administration.
- Monitor for chest pain, arrhythmias, heart rate >110 bpm, and hypertension. Consult physician for parameters of pulse, blood pressure, and ECG changes for adjusting dosage or discontinuing medication.
- **Shock:** Assess volume status. Hypovolemia should be corrected prior to administering epinephrine IV.
- **Nasal Decongestant:** Assess patient for nasal and sinus congestion prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or at higher than recommended doses.

Copyright © 2008 by F.A. Davis

- May cause an ↑ in blood glucose and serum lactic acid concentrations.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased blood pressure, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting, Treatment includes discontinuing adrenergic bronchodilator and other beta-adrenergic agonists and symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously, because they may induce bronchospasm.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- ***High Alert:*** Patient harm or fatalities have occurred from medication errors with epinephrine. Epinephrine is available in various concentrations, strengths, and percentages and is used for different purposes. Packaging labels may be easily confused or the products incorrectly diluted. Dilutions should be prepared by a pharmacist. IV doses should be expressed in milligrams not ampules, concentration, or volume. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration, and infusion pump settings.
- Medication should be administered promptly at the onset of bronchospasm.
- Use a tuberculin syringe with a 26-gauge ½-in. needle for subcut injection to ensure that correct amount of medication is administered.
- Tolerance may develop with prolonged or excessive use. Effectiveness may be restored by discontinuing for a few days and then readministering.
- Do not use solutions that are pinkish or brownish or that contain a precipitate.
- For anaphylactic shock, volume replacement should be administered concurrently with epinephrine. Antihistamines and corticosteroids may be used in conjunction with epinephrine.
- **IM, Subcut:** Medication can cause irritation of tissue. Rotate injection sites to prevent tissue necrosis. Massage injection sites well after administration to enhance absorption and to decrease local vasoconstriction. Avoid IM administration in gluteal muscle.

IV Administration

- **Direct IV:** ***Diluent:*** The 1:10,000 solution can be administered undiluted. Dilute 1 mg (1 ml) of a 1:1000 solution in 9 ml of 0.9% NaCl to prepare a 1:10,000 solution. ***Concentration:*** 0.1 mg/ml (1:10,000). ***Rate:*** Administer each 1 mg (10 ml) of a 1:10,000 solution over at least 1 min; more rapid administration may be used during cardiac resuscitation. Follow each dose with 20 ml IV saline flush.
- **Continuous Infusion:** ***Diluent:*** Dilute 1 mg (1 ml) of a 1:1000 solution in 250 ml of D5W or 0.9% NaCl. Protect from light. Infusion stable for 24 hr. ***Concentration:*** 4 mcg/ml. ***Rate:*** See Route/Dosage section. Titrate to response (blood pressure, heart rate, respiratory rate).
- **Y-Site Compatibility:** amikacin, amiodarone, anidulafungin, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, tacrolimus, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vitamin B complex with C, voriconazole, warfarin.
- **Y-Site Incompatibility:** acyclovir, aminophylline, ampicillin, diazepam, ganciclovir,

Copyright © 2008 by F.A. Davis

micafungin, phenytoin, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.
- **Inhaln:** When using epinephrine inhalation solution, 10 drops of 1% base solution should be placed in the reservoir of the nebulizer.
- The 2.25% inhalation solution of racepinephrine must be diluted for use in the combination nebulizer/respirator.
- Allow 1–2 min to elapse between inhalations of epinephrine inhalation solution, epinephrine inhalation aerosol, or epinephrine bitartrate inhalation aerosol to make certain the second inhalation is necessary.
- When epinephrine is used concurrently with corticosteroid or ipratropium inhalations, administer bronchodilator first and other medications 5 min apart to prevent toxicity from inhaled fluorocarbon propellants.
- **Endotracheal:** Epinephrine can be injected directly into the bronchial tree via the endotracheal tube if the patient has been intubated. Perform 5 rapid insufflations; forcefully administer 10 ml containing 2–2.5 mg epinephrine (1 mg/ml) directly into tube; follow with 5 quick insufflations.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- **Inhaln:** Review correct administration technique (aerosolization, IPPB, metered-dose inhaler) with patient. See Appendix D for administration with metered-dose inhaler. Wait 1–5 min before administering next dose. Mouthpiece should be washed after each use.
- Do not spray inhaler near eyes.
- Instruct patient to save inhaler; refill canisters may be available.
- Advise patients to use bronchodilator first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications, unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Advise patient to maintain adequate fluid intake (2000–3000 ml/day) to help liquefy tenacious secretions.
- Advise patient to consult health care professional if respiratory symptoms are not relieved or worsen after treatment or if chest pain, headache, severe dizziness, palpitations, nervousness, or weakness occurs.
- Instruct patient to notify health care professional if contents of one canister are used up in less than 2 wk.
- **Auto-injector:** Instruct patients using auto-injector for anaphylactic reactions to remove gray safety cap, placing black tip on thigh at right angle to leg. Press hard into thigh until auto-injector functions, hold in place several seconds, remove, and discard properly. Massage injected area for 10 sec. Pedi: Teach parents or caregivers signs and symptoms of anaphlyaxis, how to use auto-injector safely, and to get the child to a hospital as soon as possible. Instruct parents or caregivers to teach child how to manage his or her allergy, how to self inject, and what to do in an emergency. For children too young to self-inject and who will be separated from parent, tell parents to always discuss allergy and use of auto-injector with responsible adult.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.
- Reversal of signs and symptoms of anaphylaxis.
- Increase in cardiac rate and output, when used in cardiac resuscitation.
- Increase in blood pressure, when used as a vasopressor.

Copyright © 2008 by F.A. Davis

- Localization of local anesthetic.
- Decrease in sinus and nasal congestion.

HIGH ALERT

epirubicin (ep-i-roo-bi-sin)
Ellence

Classification
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Pregnancy Category D

Indications
A component of adjuvant therapy for evidence of axillary tumor involvement following resection of primary breast cancer.

Action
Inhibits DNA and RNA synthesis by forming a complex with DNA. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly and widely distributed; concentrates in RBCs.
Metabolism and Excretion: Extensively and rapidly metabolized by the liver and other tissues.
Half-life: 35 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	10–14 days	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity to epirubicin, other anthracyclines, or related compounds; Baseline neutrophil count <1500 cells/mm^3; Severe myocardial insufficiency or recent MI; Previous anthracyclines up to the maximum cumulative dose; Severe hepatic dysfunction; OB: Pregnancy or lactation; Concurrent cimetidine therapy.
Use Cautiously in: Severe renal impairment (serum creatinine >5 mg/dl); lower doses should be considered; Hepatic impairment (dose reduction recommended for bilirubin >1.2 mg/dl or AST >2–4 times upper limit of normal); Female patients ≥70 yr (increased risk of toxicity); Depressed bone marrow reserve; OB: Patients with childbearing potential; Pedi: Pediatric patients (safety not established; increased risk of acute cardiotoxicity and chronic CHF).

Adverse Reactions/Side Effects
CNS: lethargy. **CV:** CARDIOTOXICITY (dose-related). **GI:** nausea, vomiting, anorexia, diarrhea, mucositis. **Derm:** alopecia, flushing, itching, photosensitivity, radiation-recall reaction, rash, skin/nail hyperpigmentation. **Endo:** gonadal suppression. **Hemat:** LEUKOPENIA, anemia, thrombocytopenia, treatment-related leukemia/myelodysplastic syndromes. **Local:** injection site reactions, phlebitis at IV site, tissue necrosis. **Metab:** hot flashes, hyperuricemia. **Misc:** ANAPHYLAXIS, INFECTION.

Interactions
Drug-Drug: Cimetidine increases blood levels and the risk of serious toxicity; concurrent use should be avoided. Additive hematologic and gastrointestinal toxicity with other **antineoplastics** or **radiation therapy**. May decrease the antibody response to **live-virus vaccines** and increase the risk of adverse reactions.

Route/Dosage
IV (Adults): 100–120 mg/m^2 repeated in 3–4 wk cycles (total dose may be given on day 1 or split and given in equally divided doses on day 1 and day 8 of each cycle (combination regimens may employ concurrent 5-fluorouracil and cyclophosphamide).

Hepatic Impairment
IV (Adults): *Bilirubin 1.2—3 mg/dl or AST 2–4 times upper limit of normal*—use 50% of recommended starting dose; *bilirubin >3 mg/dl or AST >4 times upper limit of normal*—use 25% of recommended starting dose.

Availability
Solution for injection (red): 50-mg/25-ml single-use vial, 200-mg/100-ml single-use vial.

NURSING IMPLICATIONS

Assessment
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

Copyright © 2008 by F.A. Davis

- Severe nausea and vomiting may occur. Parenteral antiemetic agents should be administered 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify physician or other health care professional if emesis exceeds guidelines to prevent dehydration.
- Cardiac function, measured by ECG and a multigated radionuclide angiography (MUGA) scan or an ECHO, should be measured prior to therapy. Repeated evaluations of left ventricular ejection fraction should be performed during therapy. Monitor for development of signs of cardiac toxicity, which may occur early (ST-T wave changes, sinus tachycardia, and extrasystoles) or late (may occur months to years after termination of therapy). Delayed cardiac toxicity is characterized by cardiomyopathy, tachycardia, peripheral edema, dyspnea, rales/crackles, weight gain, hepatomegaly, ascites, pleural effusion. Toxicity is usually dependent on cumulative dose.
- Assess injection site frequently for redness, irritation, or inflammation. Burning or stinging during infusion may indicate infiltration and infusion should be discontinued and restarted in another vein. Epirubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if epirubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein.
- Assess oral mucosa frequently for development of stomatitis (pain, burning, erythema, ulcerations, bleeding, infection). Increased dosing interval and/or decreased dosing is recommended if lesions are painful or interfere with nutrition.
- ***Lab Test Considerations:*** Monitor CBC and differential before and during each cycle of therapy. Epirubicin should not be administered to patients with a baseline neutrophil count <1500 cells/mm^3. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Severe thrombocytopenia and anemia may also occur.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dl, AST 2–4 times the upper limit of normal, or serum creatinine >5 mg/dl.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Epirubicin should be administered only under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Prophylactic anti-infective therapy with trimethoprim/sulfamethoxazole or a fluoroquinolone and antiemetic therapy should be administered prior to administration of epirubicin.
- Do not administer subcut or IM.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Administer undiluted. Solution is clear red. Use epirubicin within 24 hr of penetration of rubber stopper. Discard unused solution. ***Concentration:*** 2 mg/ml. ***Rate:*** Administer initial dose of 100–120 mg/m^2 over 15–20 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Lower doses may be infused for shorter periods, but not less than over 3 min. Do not administer via direct IV push. Facial flushing and erythema along involved vein frequently occur when administration is too rapid. Venous sclerosis may result from injection into a small vein or repeated injections into the same vein. Avoid veins over joints or in extremities with compromised venous or lymphatic drainage.
- **Syringe Incompatibility:** Do not mix in syringe with other drugs or with alkaline solutions, fluorouracil, heparin, ifosfamide.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** oxaliplatin.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. Patients usually recover by the third week of therapy.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to avoid taking cimetidine, OTC or Rx, during therapy, and to consult health care professional prior to taking other Rx, OTC, or herbal products.
- Instruct patient to notify health care professional immediately if vomiting, dehydration, fever, evidence of infection, symptoms of CHF, or pain at injection site occurs. Patients should be informed of the risk of irreversible cardiac damage and treatment-related leukemia.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 month after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy. May cause hyperpigmentation of the skin and nails. Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in patients with axillary node tumor involvement following resection of primary breast cancer.

eplerenone (e-**ple**-re-none)
Inspra

Classification
Therapeutic: antihypertensives
Pharmacologic: aldosterone antagonists

Pregnancy Category B

Indications

Hypertension (alone, or with other agents).

Action

Blocks the effects of aldosterone by attaching to mineralocorticoid receptors. **Therapeutic Effects:** Lowering of blood pressure.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); <5% excreted unchanged by the kidneys.
Half-life: 4–6 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	Unknown	4 wk	Unknown

Contraindications/Precautions

Contraindicated in: Serum potassium >5.5 mEq/L; Type 2 diabetes with microalbuminuria (increased risk of hyperkalemia); Serum creatinine >2.0 mg/dL in males or >1.8 mg/dL in females; CCr <50 ml/min; Concurrent use of potassium-sparing diuretics; Concurrent use of strong inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole); Lactation.
Use Cautiously in: Severe hepatic impairment; Concurrent use of ACE inhibitors or angiotensin II receptor antagonists (increased risk of hyperkalemia); Pregnancy (use only if clearly needed); Children (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: dizziness, fatigue. **GI:** abnormal liver function tests, abdominal pain, diarrhea. **GU:** albuminuria. **Endo:** abnormal vaginal bleeding, gynecomastia. **F and E:** HYPERKALEMIA. **Metab:** hypercholesterolemia, hypertriglyceridemia. **Misc:** flu-like symptoms.

Interactions

Drug-Drug: Concurrent use of strong inhibitors of the CYP3A4 enzyme system (**ketoconazole**, **itraconazole**) significantly ↑ effects of eplenerone and should be avoided. Concurrent use of weak inhibitors of the CYP3A4 enzyme system (**erythromycin**, **saquinavir**, **fluconazole**, **verapamil**) may ↑ effects of eplerenone; initial dose of eplerenone should be ↓ by 50%. **NSAIDs** may ↓ antihypertensive effects. Concurrent use of **ACE inhibitors** or **Angiotensin II receptor blockers** may ↑ risk of hyperkalemia.

Route/Dosage

PO (Adults): 50 mg once daily initially; may be increased to 50 mg twice daily; *patients receiving concurrent weak CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)*—25 mg once daily initially.

Availability

Tablets: 25 mg, 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure periodically during therapy.
- Monitor prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause hyperkalemia. Monitor serum potassium levels every 2 wk for the first 1–2 mo, then monthly thereafter.
- May cause ↓ serum sodium and ↑ serum triglyceride, cholesterol, ALT, GGT, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily. May be increased to twice daily if response is inadequate.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, discontinuation of smoking, moderation of alochol consumption, regular exercise, stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on correct technique for monitoring blood pressure. Advise them to monitor blood pressure at least weekly, and notify health care professional of significant changes.
- Inform patient not to use potassium supplements, salt substitutes containing potassium, or other Rx or OTC medications without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of treatment regimen prior to treatment or surgery.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.

epoetin (e-**poe**-e-tin)

Epogen, EPO, ✱Eprex, erythropoietin, Procrit

Classification
Therapeutic: antianemics
Pharmacologic: hormones

Pregnancy Category C

Indications

Anemia associated with chronic renal failure. Anemia secondary to zidovudine (AZT) therapy in HIV-infected patients. Anemia from chemotherapy in patients with nonmyeloid malignancies. Reduction of need for transfusions after surgery.

Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate RBCs, decreasing the need for transfusions.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 4–13 hr.

TIME/ACTION PROFILE (increase in RBCs)

ROUTE	ONSET†	PEAK	DURATION
IV, subcut	7–10 days	within 2 mos	2 wk‡

†Increase in reticulocytes
‡After discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity to albumin or mammalian cell-derived products; Uncontrolled hypertension; Patients with erythropoietin levels >200 mU/ml.
Use Cautiously in: History of seizures; History of porphyria; Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache. **CV:** hypertension, thrombotic events such as myocardial infarction or stroke (↑ in hemodialysis patients or hemoglobin ≥12 g/dL). **Derm:** transient rashes. **Endo:** restored fertility, resumption of menses. **Misc:** ↑ mortality and ↑ tumor growth (with hemoglobin ≥12 g/dL).

Interactions

Drug-Drug: May increase the requirement for **heparin** anticoagulation during hemodialysis.

Route/Dosage

(Use lowest dose that will gradually increase hemoglobin level and avoid RBC transfusion).

Anemia of Chronic Renal Failure

Subcut, IV (Adults): 50–100 units/kg 3 times weekly initially, then adjust dose based on hematocrit.
Subcut, IV (Children): 50 units/kg 3 times weekly initially, then adjust dose based on hematocrit.

Anemia Secondary to AZT Therapy

Subcut, IV (Adults): 100 units/kg 3 times weekly for 8 wk; if inadequate response, may increase by 50–100 units/kg every 4–8 wk, up to 300 units/kg 3 times weekly.

Anemia from Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed)

Subcut (Adults): 150 units/kg 3 times weekly; may increase after 8 wk up to 300 units/kg 3 times weekly.

Surgery

Subcut (Adults): 300 units/kg/day for 10 days before surgery, day of surgery, and 4 days after *or* 600 units/kg 21, 14, and 7 days before surgery and on day of surgery.

Availability

Injection: 2000 units/ml, 3000 units/ml, 4000 units/ml, 10,000 units/ml, 20,000 units/ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure before and during therapy. Inform physician or other health care professional if severe hypertension is present or if blood pressure begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. Heparin dose may need to be increased to prevent clotting. Patients with underlying vascular disease should be monitored for impaired circulation.
- ***Lab Test Considerations:*** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Serum ferritin, transferrin, and iron levels should also be monitored to assess need for concurrent iron therapy. Transferrin saturation should be at least 20% and ferritin should be at least 100 mg/ml.
- **Anemia of Chronic Renal Failure:** Monitor hematocrit before and twice weekly during initial therapy, for 2–6 wk after a change in dose, and regularly after target range (30–36%) has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. If hemoglobin exceeds 12 g/dL or increases more than 1 g/dL in a 2-wk period, risk of life—threatening cardiovascular complications and seizures increases. Decrease dose by 25% and monitor hemoglobin twice weekly for 2–6 wk. If increase in hemoglobin continues and exceeds 12 g/dL, dose should be withheld until hemoglobin begins to decrease; epoetin is then re-initiated at a

Copyright © 2008 by F.A. Davis

lower dose. If hemoglobin increase of 1 g/dL is not achieved after a 4-wk period and iron stores are adequate, dose may be incrementally increased at 4–wk intervals until desired response is attained.

- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure. Increases in BUN, creatinine, uric acid, phosphorus, and potassium may occur.
- **Anemia Secondary to Zidovudine Therapy:** Before initiating therapy, determine serum erythropoietin level before transfusion. Patients receiving zidovudine with endogenous serum erythropoietin levels >500 mU/ml may not respond to therapy. Monitor hematocrit weekly during dosage adjustment. If response does not reduce transfusion requirements or increase hematocrit effectively after 8 wk of therapy, dose may be increased by 50–100 units/kg 3 times weekly. Evaluate response and adjust dose by 50–100 units/kg every 4–8 wk thereafter. If a satisfactory response is not obtained with a dose of 300 units/kg 3 times weekly, it is unlikely that a higher dose will produce a response. Once the desired response is attained, maintenance dose is titrated based on variations of zidovudine dose and intercurrent infections. If hemoglobin exceeds 13 g/dL, discontinue dose until hemoglobin drops to 12 g/dL, then decrease dose by 25%.
- **Anemia from Chemotherapy:** Monitor hemoglobin weekly until stable. Patients with lower baseline serum erythropoietin levels may respond more rapidly; not recommended if levels >200 mU/ml. If response is not adequate after 8 wk of therapy, dose may be increased up to 300 units/kg 3 times weekly. If no response is obtained to this dose, it is unlikely that higher doses will produce a response. If hemoglobin exceeds 12 g/dL or increases >1 g/dL in any 2–wk period, risk of life—threatening cardiovascular complications, tumor growth and death increases; decrease dose by 25%. If hemoglobin exceeds 13 g/dL, hold dose until it falls to 12 g/dL, then decrease dose by 25%.
- **Surgery:** Determine that hematocrit is >10 to ≤13 g/dL before therapy.

Potential Nursing Diagnoses

Activity intolerance (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

IV Administration

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with epoetin and continued throughout therapy
- Institute seizure precautions in patients who experience greater than a 4-point increase in hematocrit in a 2-wk period or exhibit any change in neurologic status. Risk of seizures is greatest during the first 90 days of therapy.
- Do not shake vial; inactivation of medication may occur. Discard vial immediately after withdrawing dose from single-use 1-ml vial. Refrigerate multidose 2-ml vial; stable for 21 days after initial entry.
- **Subcut:** This route is often used for patients not requiring dialysis
- May be admixed in syringe immediately before administration with 0.9% NaCl with benzyl alcohol 0.9% in a 1:1 ratio to prevent injection site discomfort.
- **Direct IV:** ***Diluent:*** Administer undiluted or dilute with an equal amount of 0.9% NaCl. ***Concentration:*** 1,000–40,000 units/ml. ***Rate:*** May be administered as direct injection or bolus over 1–3 minutes into IV tubing or via venous line at end of dialysis session.

Patient/Family Teaching

- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).
- Discuss possible return of menses and fertility in women of childbearing age. Patient should discuss contraceptive options with health care professional.
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- **Anemia of Chronic Renal Failure:** Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Epoetin will re-

Copyright © 2008 by F.A. Davis

sult in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer epoetin should be taught proper dosage, administration technique, and disposal of equipment. *Information for Home Dialysis Patients* should be provided to patient along with medication.

Evaluation/Desired Outcomes
- Increase in hematocrit to 30–36% with improvement in symptoms of anemia in patients with chronic renal failure.
- Increase in hematocrit in anemia secondary to zidovudine therapy.
- Increase in hematocrit in patients with anemia resulting from chemotherapy.
- Reduction of need for transfusions after surgery.

eprosartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

HIGH ALERT

eptifibatide (ep-ti-fib-a-tide)
Integrilin

Classification
Therapeutic: antiplatelet agents
Pharmacologic: glycoprotein IIb/IIIa inhibitors

Pregnancy Category B

Indications
Acute coronary syndrome (unstable angina/non–Q-wave MI), including patients who will be managed medically and those who will undergo percutaneous coronary intervention (PCI) that may consist of percutaneous transluminal angioplasty (PCTA) or atherectomy. Treatment of patients undergoing PCI. Usually used concurrently with aspirin and heparin.

Action
Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces.
Therapeutic Effects: Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia, reducing the need for repeat urgent cardiac intervention.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: 50% excreted by the kidneys.
Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	following bolus	brief†

†Inhibition is reversible following cessation of infusion

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active internal bleeding or history of bleeding within previous 30 days; Severe uncontrolled hypertension (systolic BP >200 mm Hg and/or diastolic BP >110 mm Hg); Major surgical procedure within 6 wk; History of hemorrhagic stroke or other stroke within 30 days; Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Platelet count <100,000/mm^3; Severe renal insufficiency (serum creatinine ≥4 mg/dl) or dependency on renal dialysis.
Use Cautiously in: Geri: ↑ risk of bleeding; Renal insufficiency (↓ infusion rate if CCr <50 ml/min); OB, Pedi: Pregnancy, lactation, or children (safety not established; use in pregnancy only if clearly needed).

Adverse Reactions/Side Effects
Noted for patients receiving heparin and aspirin in addition to eptifibatide. **CV:** hypotension. **Hemat:** BLEEDING (including GI and intracranial bleeding, hematuria, and hematomas).

Interactions
Drug-Drug: ↑ risk of bleeding with other drugs that affect hemostasis (**heparins**, **warfarin**, **NSAIDs**, **thrombolytic agents**, **abciximab**, **dipyridamole**, **ticlopidine**, **clopidogrel**, some **cephalosporins**, **valproates**).
Drug-Natural Products: ↑ bleeding risk with **arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo,** and **Panax ginseng.**

Route/Dosage

Acute Coronary Syndrome
IV (Adults ≤121 kg): 180 mcg/kg as a bolus dose, followed by 2 mcg/kg/min until hospital discharge or surgical intervention (up to 72 hr).

Copyright © 2008 by F.A. Davis

Percutaneous Coronary Intervention

IV (Adults): 180 mcg/kg as a bolus dose, immediately before PCI, followed by 2 mcg/kg/min infusion; a second bolus of 180 mcg/kg is given 10 min after first bolus; infusion should continue for 18–24 or hospital discharge (minimum of 12 hr)

Renal Impairment

IV (Adults CCr <50 mL/min): 180 mcg/kg bolus followed by 1 mcg/kg/min infusion; second bolus of 180 mcg/kg is given 10 min after first bolus for patients undergoing PCI.

Availability

Solution for injection: 20 mg/10 ml, 75 mg/100 ml, 200 mg/100 ml.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common sites are arterial access site for cardiac catheterization or GI or GU tract. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and NG tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue eptifibatide and heparin immediately.
- ***Lab Test Considerations:*** Prior to eptifibatide therapy, assess hemoglobin or hematocrit, platelet count, serum creatinine, and PT/aPTT. Activated clotting time (ACT) should also be measured in patients undergoing PCI.
- Maintain the aPTT between 50 and 70 sec unless PCI is to be performed. Maintain ACT between 300 and 350 sec during PCI.
- Arterial sheath should not be removed unless aPTT <45 sec.
- If platelet count decreases to <100,000 and is confirmed, eptifibatide and heparin should be discontinued and condition monitored and treated.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- ***High Alert:*** Accidental overdose of antiplatelet medications has resulted in patient harm or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with eptifibatide.
- After PCI, femoral artery sheath may be removed during eptifibatide treatment only after heparin has been discontinued and its effects mostly reversed.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

IV Administration

- **Direct IV:** ***High Alert: Diluent:*** Withdraw appropriate loading dose from bolus vial (20 mg/10ml vial) into a syringe. Administer undiluted. ***Concentration:*** 2 mg/ml. ***Rate:*** Administer over 1–2 min.
- **Continuous Infusion:** ***Diluent:*** Administer undiluted directly from the 100-ml vial via an infusion pump. ***Concentration:*** 0.75 mg/ml or 2 mg/ml (depends on vial used). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** alteplase, amiodarone, argatroban, atropine, bivalirudin, daptomycin, dobutamine, ertapenem, heparin, lidocaine, meperidine, metoprolol, micafungin, midazolam, morphine, nitroglycerin, palonosetron, potassium chloride, verapamil.
- **Y-Site Incompatibility:** furosemide.
- **Solution Compatibility:** 0.9% NaCl, D5/0.9% NaCl.

Patient/Family Teaching

- Inform patient of the purpose of eptifibatide.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Inhibition of platelet aggregation, resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat urgent cardiac intervention.

ergocalciferol, See VITAMIN D COMPOUNDS.

Copyright © 2008 by F.A. Davis

ergonovine (er-goe-**noe**-veen)
ergometrine, Ergotrate

Classification
Therapeutic: none assigned
Pharmacologic: oxytocics

Pregnancy Category UK

Indications
Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or involution. **Unlabeled uses:** As a diagnostic agent to provoke coronary artery spasm.

Action
Directly stimulates uterine and vascular smooth muscle. **Therapeutic Effects:** Uterine contraction.

Pharmacokinetics
Absorption: Well absorbed after oral or IM administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown. Probably metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (uterine contractions)

ROUTE	ONSET	PEAK	DURATION
PO	5–15 min	unknown	≥3 hr
IM	2–5 min	unknown	≥3 hr
IV	immediate	unknown	45 min

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Avoid chronic use; Should not be used to induce labor.
Use Cautiously in: Hypertensive or eclamptic patients (increased susceptibility to hypertensive and arrhythmogenic side effects); Severe hepatic or renal disease; Sepsis; Third stage of labor.

Adverse Reactions/Side Effects
CNS: dizziness, headache. **EENT:** tinnitus. **Resp:** dyspnea. **CV:** arrhythmias, chest pain, hypertension, palpitations. **GI:** nausea, vomiting. **Derm:** sweating. **Misc:** allergic reactions.

Interactions
Drug-Drug: Excessive vasoconstriction may result when used with other **vasopressors**, such as **dopamine** or **nicotine**. May ↑ the risk of adverse reactions with **bromocriptine**.

Route/Dosage

Oxytocic
PO, SL (Adults): 0.2–0.4 mg q 6–12 hr (usual course is 48 hr).
IM, IV (Adults): 200 mcg (0.2 mg) q 2–4 hr for up to 5 doses.

Provocative Agent for Coronary Artery Spasm
IV (Adults): 50 mcg (0.05 mg) q 5 min until chest pain occurs or a total dose of 400 mcg (0.4 mg) has been given (unlabeled).

Availability
Tablets: 0.2 mg. **Injection:** 0.2 mg/ml, ✱0.25 mg/ml.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure, pulse, and respirations every 15–30 min until transfer to the postpartum unit, then every 1–2 hr. Report hypertension, chest pain, arrhythmias, headache, or change in neurologic status.
- Monitor amount and type of vaginal discharge. Report symptoms of hemorrhage (increased bleeding, hypotension, pallor, tachycardia) immediately.
- Palpate uterine fundus; note position and consistency. Notify physician or other health care professional if fundus fails to contract in response to ergonovine. Assess patient for severe cramping; dose may be decreased.
- Assess for signs of ergotism (cold, numb fingers and toes; nausea; vomiting; diarrhea; headache; muscle pain; weakness).
- If patient fails to respond to ergonovine, check serum calcium level. Correction of hypocalcemia may restore responsiveness.
- ***Lab Test Considerations:*** May cause ↓ serum prolactin level, which inhibits synthesis of breast milk.
- ***Toxicity and Overdose:*** Toxicity, initially manifested as ergotism, may cause seizures and gangrene. Seizures are treated with anticonvulsants. Vasodilators and heparin may be ordered to improve circulation to extremities.

Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

Implementation
- Do not administer solution that is discolored or contains a precipitate.
- **PO:** Administration is usually limited to 48 hr postpartum, by which time the danger of hemorrhage from uterine atony has passed.
- Tablets may be administered SL.

Copyright © 2008 by F.A. Davis

- **IM:** The preferred route is IM. Firm uterine contractions are produced within a few minutes. Dose may need to be repeated every 2–4 hr for full therapeutic effect.

IV Administration

- **Direct IV:** The IV route is reserved for severe uterine bleeding. ***Diluent:*** Dilute with 5 mL of 0.9% NaCl. ***Rate:*** Administer slow IV push over at least 1 min through Y-site injection of an IV of D5W or 0.9% NaCl.

Patient/Family Teaching

- Review symptoms of toxicity with patient. Instruct the patient to report occurrence of these immediately.
- Inform patient that uterine cramping demonstrates effectiveness of therapy.
- Explain need for pad count to determine degree of bleeding. Instruct patient to report immediately an increase in degree of bleeding or passage of clots.
- Instruct patient to report breastfeeding difficulties.
- Caution patient not to smoke while receiving ergonovine; nicotine is also a vasoconstrictor.

Evaluation/Desired Outcomes

- Uterine contraction and cramping in the prevention or cessation of uterine hemorrhage after delivery or abortion.
- Vasoconstriction of the coronary arteries when used as a diagnostic agent.

ergotamine (er-**got**-a-meen)
Ergomar

dihydroergotamine
(dye-hye-droe-er-**got**-a-meen)
D.H.E. 45, Migranal

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: ergot alkaloids

Pregnancy Category X

Indications

Treatment of vascular headaches including: Migraine with or without aura, Cluster headaches.

Action

Vasoconstriction of dilated blood vessels by stimulating alpha-adrenergic and serotonergic (5-HT) receptors. Larger doses may produce alpha-adrenergic blockade and vasodilation.
Therapeutic Effects: Constriction of dilated carotid artery bed with resolution of vascular headache.

Pharmacokinetics

Absorption: *Ergotamine*—Unpredictably absorbed (60%) from the GI tract (may be enhanced by caffeine). Sublingual absorption is very poor. *Dihydroergotamine*—Rapidly absorbed after IM and subcut administration, 32% absorbed from nasal mucosa.
Distribution: Ergotamine crosses the blood-brain barrier and enters breast milk.
Protein Binding: *Dihydroergotamine*—90%; *ergotamine*—93–98%.
Metabolism and Excretion: Both ergotamine and dihydroergotamine are 90% metabolized by the liver (CYP3A4 enzyme system). Some metabolites are active.
Half-life: *Ergotamine*—1.5–2.5 hr. *Dihydroergotamine*—9–10 hr.

TIME/ACTION PROFILE (relief of headache)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr (variable)	1–5 hr	unknown
Nasal	within 30 min	unknown	unknown
SL	unknown	unknown	unknown
IM, subcut	15–30 min	15 min–2 hr	8 hr
IV	<5 min	15 min–2 hr	8 hr

Contraindications/Precautions

Contraindicated in: Peripheral vascular disease; Ischemic heart disease; Uncontrolled hypertension; Severe renal or liver disease; Malnutrition; Known alcohol intolerance (dihydroergotamine injection only); OB, Lactation: Pregnancy and lacation; Concurrent use of CYP3A4 inhibitors (protease inhibitors and macrolide anti-infectives).
Use Cautiously in: Illnesses associated with peripheral vascular pathology such as diabetes mellitus; Concurrent administration of other vasconstrictor agents; Pedi: Children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness. **EENT:** rhinitis (nasal). **CV:** MI, hypertension, angina pectoris, arterial spasm, intermittent claudication. **GI:** abdominal pain, nausea, vomiting, altered taste *(nasal)*, diarrhea, polydipsia. **MS:** extremity stiffness, muscle

Copyright © 2008 by F.A. Davis

pain, stiff neck, stiff shoulders. **Neuro:** leg weakness, numbness or tingling in fingers or toes. **Misc:** fatigue.

Interactions

Drug-Drug: Concurrent use of potent inhibitors of the CYP3A4 enzyme system, including protease inhibitors (**ritonavir**, **nelfinavir**, and **indinavir**) some macrolide anti-infectives (**erythromycin**, **clarithromycin**, and **troleandomycin**) and some azole antifungals (**ketoconazole**, **itraconazole**) may produce serious life-threatening peripheral ischemia and is contraindicated. Concurrent use with **beta blockers**, **hormonal contraceptives**, or **nicotine** (heavy smoking) may ↑ risk of peripheral vasoconstriction. Dihydroergotamine antagonizes the antianginal effects of **nitrates**. Concurrent use with **vasoconstrictors** may have ↑ effects (avoid concurrent use). Concurrent use with **almotriptan**, **frovatriptan**, **naratriptan**, **rizatriptan**, **sumatriptan**, and **zolmitriptan** may result in prolonged vasoconstriction (allow 24 hr between use).

Route/Dosage

Ergotamine

PO, SL (Adults): 1–2 mg initially, then 1–2 mg q 30 min until attack subsides or a total of 6 mg has been given. Should not be used more than twice weekly, with at least 5 days between courses; 1–2 mg PO at bedtime daily for 10–14 days have been used to terminate series of cluster headaches.

Dihydroergotamine

IM, Subcut (Adults): 1 mg; may repeat in 1 hr to a total of 3 mg (not to exceed 3 mg/day or 6 mg/wk).
IV (Adults): 0.5 mg; may repeat in 1 hr (not to exceed 2 mg/day or 6 mg/wk). For chronic intractable headache, 0.5–1 mg q 8 hr may be given until relief is obtained (not to exceed 6 mg/wk).
Intranasal (Adults): 1 spray (0.5 mg) in each nostril, repeat after 15 min (2 mg total dose); not to exceed 3 mg/24 hr or 4 mg/wk.

Availability

Ergotamine

Sublingual tablets: 2 mg. ***In combination with:*** caffeine, barbiturates, and belladonna alkaloids in preparations for vascular headaches. See Appendix B.

Dihydroergotamine

Injection: 1 mg/ml (contains alcohol). **Nasal spray:** 4 mg/1 ml in 1-ml ampules with nasal spray applicator. ***In combination with:*** *Ergotamine*—caffeine, barbiturates, and belladonna alkaloids in preparations for vascular headaches. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess frequency, location, duration, and characteristics (pain, nausea, vomiting, visual disturbances) of chronic headaches. During acute attack, assess type, location, and intensity of pain before and 60 min after administration.
- Monitor blood pressure and peripheral pulses periodically during therapy. Report any increases in blood pressure.
- Assess for signs of ergotism (cold, numb fingers and toes; nausea; vomiting; headache; muscle pain; weakness).
- Assess for nausea and vomiting. Ergotamine stimulates the chemoreceptor trigger zone. Metoclopramide or a phenothiazine antiemetic may be given orally as prophylaxis 1 hr before administration of dihydroergotamine IV. Oral administration may decrease risk of extrapyramidal reactions and other side effects encountered with IV administration.
- ***Toxicity and Overdose:*** Toxicity is manifested by severe ergotism (chest pain, abdominal pain, persistent paresthesia in the extremities) and gangrene. Vasodilators, dextran, or heparin may be ordered to improve circulation.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse Cafergot (ergotamine/caffeine) with Carafate (sucralfate).
- Administer as soon as patient reports prodromal symptoms or headache. **SL:** Allow tablet to dissolve under tongue. Do not allow patient to eat, drink, or smoke while tablet is dissolving.

IV Administration

- **Direct IV:** ***Diluent:*** Dihydroergotamine may be administered undiluted. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer over 1 min.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take ergotamine at the first sign of an impending headache and not to exceed the maximum dose prescribed.
- Encourage patient to rest in a quiet, dark room after taking ergotamine.
- Review symptoms of toxicity. Instruct patient to report these promptly.
- Caution patient not to smoke and to avoid exposure to cold; these vasoconstrictors may further impair peripheral circulation.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, which may precipitate vascular headaches.
- Instruct female patients to inform health care professional if they plan or suspect pregnancy. Ergotamine should not be taken during pregnancy.
- **Subcut, IM:** Inject at the first sign of a headache and repeat at 1-hr intervals up to 3 doses. Once minimal effective dose is determined, adjust dose for subsequent attacks.
- **Intranasal:** Instruct patient in proper use of nasal spray. Prime nasal sprayer 4 times before dose. Administer 1 spray to each nostril followed in 15 min by an additional spray in each nostril for a total of 4 sprays. Do not tilt head or sniff after spray. Do not use more than amount instructed. Discard ampule within 8 hr of opening. Do not refrigerate. Assembly may be used for 4 treatments; then discard.
- Advise patient not to use *Migranal* to prevent a headache if there are no symptoms or if headache is different from typical migraine.
- Instruct patient to notify health care professional if numbness or tingling in fingers or toes; pain, tightness, or discomfort in chest; muscle pain or cramps in arms or legs; weakness in legs; temporary speeding or slowing of heart rate; or swelling or itching occurs.

Evaluation/Desired Outcomes

- Relief of pain from vascular headaches.

erlotinib (er-lo-ti-nib)
Tarceva

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Pregnancy Category D

E

Indications

Locally advanced/metastatic non-small cell lung cancer which has not responded to previous chemotherapy.

Action

Inhibits the enzyme tyrosine kinase which is associated with human epidermal growth factor receptor (EGFR); blocks growth stimulation signals in cancer cells. **Therapeutic Effects:** Decreased spread of lung cancer with increased survival.

Pharmacokinetics

Absorption: 60% absorbed; bioavailability increased to 100% with food.
Distribution: Unknown.
Protein Binding: 93% protein bound.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme).
Half-life: 36 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Pregnancy or lactation.
Use Cautiously in: Hepatic impairment; Previous chemotherapy/radiation, pre-existing lung disease, metastatic lung disease (may ↑ risk of interstitial lung disease); Patients with childbearing potential; Children (safety not established).

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** conjunctivitis, corneal ulceration. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea, cough. **GI:** diarrhea, abdominal pain, anorexia, nausea, stomatitis, vomiting, ↑ liver transaminases. **Derm:** rash, dry skin, pruritus.

Interactions

Drug-Drug: Strong inhibitors of CYP3A4, including **atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin,** or **voriconazole** ↑ erlotinib

Copyright © 2008 by F.A. Davis

levels and the risk of toxicity; dosage reduction should be considered. Strong inducers of CYP3A4, including **rifampin** ↓ levels of erlotinib and may ↓ response; alternative therapy or ↑ dose should be considered. May ↑ risk of bleeding with **warfarin**.

Route/Dosage

PO (Adults): 150 mg daily taken at least 1 hr before or 2 hr after food.

Availability

Tablets: 25 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status prior to and periodically during therapy. If dyspnea, cough or fever occur, discontinue erlotinib, assess for interstitial lung disease, and institute treatment as needed.
- Assess for diarrhea. Usually responds to loperamide but may require dose reduction or discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor liver function tests (AST, ALT, bilirubin, alkaline phosphatase) periodically during therapy. Dose reduction or discontinuation of therapy should be considered if severe changes in liver function occur.
- Monitor INR regularly in patients taking warfarin. May cause ↑ INR.

Potential Nursing Diagnoses

Ineffective breathing pattern (Side Effects)

Implementation

- **PO:** Administer at least 1 hr before or 2 hrs after food.

Patient/Family Teaching

- Instruct patient to take erlotinib as directed.
- Caution patient to use contraceptive during and for at least 2 wks after completion of therapy.
- Advise patient to notify health care professional if severe or persistent diarrhea, nausea, anorexia, vomiting, onset or worsening of unexplained dyspnea or cough, or eye irritation occur.

Evaluation/Desired Outcomes

- Decrease in spread of non-small cell lung cancer with increased survival.

ertapenem (er-ta-**pen**-em)
Invanz

Classification
Therapeutic: anti-infectives
Pharmacologic: carbapenems

Pregnancy Category B

Indications

Moderate to severe: complicated intra-abdominal infections, complicated skin and skin structure infections, community acquired pneumonia, complicated urinary tract infections (including pyelonephritis), acute pelvic infections including postpartum endomyometritis, septic abortion, and post surgical gynecologic infections. Prophylaxis of surgical site infection following elective colorectal surgery.

Action

Therapeutic Effects: Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following aerobic gram-positive organisms *Staphylococcus aureus* (methicillin-susceptible strains only), *Staphylococcus epidermidis, Streptococcus agalactiae*, *S. pneumoniae* (penicillin-susceptible strains only), and *S. pyogenes*. Also active against the following gram-negative aerobic organisms *Escherichia coli*, *Haemophilus influenzae* (beta-lactamase negative strains), *Klebsiella pneumonia*, *Moraxella catarrhalis,* and *Providencia rettgeri*. Addition anaerobic spectrum includes *Bacteroides fragilis*, *B. distasonis*, *B. ovatus*, *B. thetaiotamicron*, *B. uniformis*, *B. vulgatis, Clostridium clostrioforme*, *Eubacterium lentum*, *Peptostreptococcus*, *Porphyromonas asaccharolytica*, and *Prevotella bivia*.

Pharmacokinetics

Absorption: 90% after IM administration; IV administration results in complete bioavailability.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly excreted by the kidneys.
Half-life: 1.8 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins, cephalos-

Copyright © 2008 by F.A. Davis

porins and other carbapenems; Hypersensitivity to lidocaine (may be used as a diluent for IM administration).
Use Cautiously in: History of multiple hypersensitivity reactions; Seizure disorders; Geri: Geriatric patients (↑ sensitivity and age-related ↓ in renal function); Renal impairment; OB, Pedi: Pregnancy, lactation, or children <18 yr (safety not established, use during lactation only when benefits outweigh risks, use in pregnancy only if clearly needed).

Adverse Reactions/Side Effects
CNS: SEIZURES, headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **GU:** vaginitis. **Local:** phlebitis at IV site, pain at IM site. **Misc:** hypersensitivity reaction including ANAPHYLAXIS.

Interactions
Drug-Drug: Probenecid decreases excretion and increases blood levels.

Route/Dosage
IV, IM (Adults and Children 13 yrs or older): 1 g once daily for up to 14 days (IV) or 7 days (IM).
IV, IM (Children 3 months-12 yrs): 15 mg/kg twice daily (not to exceed 1 g/day) for up to 14 days (IV) or 7 days (IM).

Renal Impairment
IM, IV (Adults): *CCr ≤30 ml/min/1.73m²*—500 mg once daily.

Availability
Powder for injection: 1 g/vial.

NURSING IMPLICATIONS

Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins or carbapenems. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, serum alkaline phosphatase levels.
- May cause ↑ platelet and eosinophil counts.

Potential Nursing Diagnoses
Risk for infection (Indications, Side Effects)

Implementation
- **IM:** Reconstitute 1-g vial with 3.2 ml of 1% lidocaine without epinephrine. Shake well to form solution. Immediately withdraw contents and inject deep into large muscle mass. Use reconstituted solution within 1 hr.

IV Administration
- **Intermittent Infusion:** ***Diluent:*** Reconstitute 1-g vial with 10 ml of sterile water for injection or 0.9% NaCl and shake well. Further dilute in 50 ml of 0.9% NaCl. Administer within 6 hr of reconstitution. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amphotericin B liposome, argatroban, azithromycin, aztreonam, bumetanide, calcium chloride, calcium gluconate, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dolasetron, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin, esmolol, famotidine, fenoldopam, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydromorphone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, milrinone, morphine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, pancuronium, pantoprazole, phenylephrine, potassium chloride, potassium phosphate, procainamide, propranolol, ranitidine, sodium bicarbonate, tacrolimus, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, anidulafungin, caspofungin, diazepam, dobutamine, droperidol, hydralazine, hydroxyzine, midazolam, nicardipine, ondansetron, phe-

Copyright © 2008 by F.A. Davis

nytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, verapamil.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with antidiarrheals.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

ERYTHROMYCIN†

(eh-rith-roe-**mye**-sin)

erythromycin base
Apo-Erythro-EC, E-Base, E-Mycin, Erybid, Eryc, Ery-Tab, Erythromid, Novo-rythro, PCE

erythromycin estolate
Ilosone, Novo-rythro

erythromycin ethylsuccinate
Apo-Erythro-ES, E.E.S, EryPed

erythromycin gluceptate

erythromycin lactobionate
Erythrocin

erythromycin stearate
Erythrocin, Novo-rythro

erythromycin (topical)
Akne-Mycin, Del-Mycin, A/T/S, E/Gel, Emgel, Erycette, Erygel, Ery-Max, Erysol, ETS, Sans-Acne, Staticin, Theramycin Z, T-Stat

Classification
Therapeutic: anti-infectives
Pharmacologic: macrolides

Pregnancy Category B

†See Appendix C for ophthalmic use

Indications

IV, PO: Infections caused by susceptible organisms including: Upper and lower respiratory tract infections, Otitis media (with sulfonamides), Skin and skin structure infections, Pertussis, Diphtheria, Erythrasma, Intestinal amebiasis, Pelvic inflammatory disease, Nongonococcal urethritis, Syphilis, Legionnaires' disease, Rheumatic fever. Useful when penicillin is the most appropriate drug but cannot be used because of hypersensitivity, including: Streptococcal infections, Treatment of syphilis or gonorrhea. **Topical:** Treatment of acne.

Action

Suppresses protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci, including: Streptococci, Staphylococci. Gram-positive bacilli, including: *Clostridium*, *Corynebacterium*. Several gram-negative pathogens, notably: *Neisseria*, *Legionella pneumophila*. *Mycoplasma* and *Chlamydia* are also usually susceptible.

Pharmacokinetics

Absorption: Variable absorption from the duodenum after oral administration (dependent on salt form). Absorption of enteric-coated products is delayed. Minimal absorption may follow topical or ophthalmic use.
Distribution: Widely distributed. Minimal CNS penetration. Crosses placenta; enters breast milk.
Protein Binding: 70–80%; 96% for estolate.
Metabolism and Excretion: Partially metabolized by the liver, excreted mainly unchanged in the bile; small amounts excreted unchanged in the urine.
Half-life: Neonates: 2.1 hr; Adults: 1.4–2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	1–4 hr	6–12 hr
IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic dysfunction (estolate salt); Concurrent pimozide; Known alcohol intolerance (most topicals); Tartrazine sensitivity (some products contain tartrazine—FDC yellow dye #5); OB: Estolate salt is contraindicated in pregnancy due to potential for hepatic dysfunction; Products

Copyright © 2008 by F.A. Davis

containing benzyl alcohol should be avoided in neonates.
Use Cautiously in: Liver/renal disease; OB: Salts other than the estolate may be used in pregnancy to treat chlamydial infections or syphilis; Geri: ↑ risk of ototoxicity if parenteral dose >4 g/day, ↑ risk of QTc prolongation.

Adverse Reactions/Side Effects

CNS: seizures (rare). **EENT:** ototoxicity. **CV:** QTC PROLONGATION (may result in Torsades de Pointes), VENTRICULAR ARRHYTHMIAS,. **GI:** nausea, vomiting, abdominal pain, cramping, diarrhea, drug-induced hepatitis, infantile hypertrophic pyloric stenosis, drug-induced pancreatitis (rare). **Derm:** rashes. **Local:** phlebitis at IV site. **Misc:** allergic reactions, superinfection.

Interactions

Drug-Drug: Concurrent use with **pimozide** ↑ risk of serious arrhythmias (concurrent use contraindicated); similar effects may occur with **diltiazem**, **verapamil**, **ketoconazole**, **itraconazole**, **nefazodone**, and **protease inhibitors**; avoid concurrent use. ↑ blood levels and effects of **silfenafil**, **tadalafil** and **vardenafil**; use lower doses. Concurrent **rifabutin** or **rifampin** may ↓ effect of erythromycin and ↑ risk of adverse GI reactions. ↑ levels and risk of toxicity from **alfentanil**, **alprazolam**, **buspirone**, **clozapine**, **bromocriptine**, **theophylline**, **carbamazepine**, **cyclosporine**, **cylostazol diazepam**, **disopyramide**, **ergot alkaloids**, **felodipine**, **warfarin**, **methylprednisolone**, **midazolam**, **quinidine**, **rifabutin**, **tacrolimus**, **triazolam**, or **vinblastine**. Concurrent **HMG-CoA reductase inhibitors** ↑ risk of myopathy/rhabdomyolysis. May ↑ serum **digoxin** levels in a few patients. **Theophylline** may ↓ blood levels. Beneficial effects may be ↓ by **clindamycin** or **lincomycin**.

Route/Dosage

250 mg of erythromycin base, estolate, or stearate = 400 mg of erythromycin ethylsuccinate.

Most Infections

PO (Adults): *Base, estolate, stearate*—250 mg q 6 hr, *or* 333 mg q 8 hr, *or* 500 mg q 12 hr. *Ethylsuccinate*—400 mg q 6 hr *or* 800 mg q 12 hr.
PO (Children >1 mo): *Base and ethylsuccinate*—30–50 mg/kg/day divided q 6–8 hr (maximum 2 g/day as base or 3.2 g/day as ethylsuccinate) *Estolate.*—30–50 mg/kg/day divided q 6–12 hr (maximum 2 g/day). *Stearate*—30–50 mg/kg/day divided q 6 hr (maximum 2 g/day).
PO (Neonates): *Ethylsuccinate*—20–50 mg/kg/day divided q 6–12 hrs.
IV (Adults): *Gluceptate and lactobionate only*—250–500 mg (up to 1 g) q 6 hr.
IV (Children >1 mo): *Gluceptate and lactobionate only*—15–50 mg/kg/day divided q 6 hr, maximum 4 g/day.

Acne

Topical (Adults and Children >12 yr): 2% ointment, gel, or solution bid.

Availability (generic available)

Erythromycin Base

Enteric-coated tablets: 250 mg, 333 mg. **Tablets with polymer-coated particles:** 333 mg, 500 mg. **Film-coated tablets:** 500 mg. **Delayed-release capsules:** 250 mg.

Erythromycin Estolate

Tablets: 500 mg. **Capsules:** 250 mg. **Oral suspension (orange flavor):** 125 mg/5 ml. **Oral suspension (cherry flavor):** 250 mg/5 ml.

Erythromycin Ethylsuccinate

Chewable tablets (fruit flavor): 200 mg. **Tablets:** 400 mg. **Oral suspension (fruit flavor, cherry):** 200 mg/5 ml. **Oral suspension (orange, banana flavors):** 400 mg/5 ml. **Drops (fruit flavor):** 100 mg/2.5 ml.

Erythromycin Gluceptate

Powder for injection: 500 mg, 1 g.

Erythromycin Lactobionate

Powder for injection: 500 mg, 1 g.

Erythromycin Stearate

Film-coated tablets: 250 mg.

Topical Preparations

Topical ointment: 2%. **Topical gel:** 2%. **Topical solution:** 2%. ***In combination with:*** sulfisoxazole (Eryzole, Pediazole) and benzoyl peroxide (Benzamycin). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.

Copyright © 2008 by F.A. Davis

- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- ***Lab Test Considerations:*** Monitor liver function tests periodically on patients receiving high-dose, long-term therapy.
- May cause ↑ serum bilirubin, AST, ALT, and alkaline phosphatase concentrations.
- May cause false ↑ of urinary catecholamines.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse erythromycin with azithromycin. Do not confuse Erythrocin (erythromycin) with Ethmozine (morizocine).
- **PO:** Administer around the clock. *Erythromycin film-coated tablets (base and stearate)* are absorbed better on an empty stomach, at least 1 hr before or 2 hr after meals; may be taken with food if GI irritation occurs. *Enteric-coated erythromycin (base and estolate)* may be taken without regard to meals. *Erythromycin ethylsuccinate* is best absorbed when taken with meals. Take each dose with a full glass of water.
- Use calibrated measuring device for liquid preparations. Shake well before using.
- Chewable tablets should be crushed or chewed and not swallowed whole.
- Do not crush or chew delayed-release capsules or tablets; swallow whole. *Erythromycin base delayed-release capsules* may be opened and sprinkled on applesauce, jelly, or ice cream immediately before ingestion. Entire contents of the capsule should be taken.

IV Administration

- **IV:** ***Diluent:*** Add 10 ml of sterile water for injection without preservatives to 250- or 500-mg vials and 20 ml to 1-g vial. Solution is stable for 7 days after reconstitution if refrigerated
- **Intermittent Infusion:** ***Concentration:*** Dilute to a final concentration of 1–5 mg/ml in 0.9% NaCl or D5W. ***Rate:*** Administer slowly over 20–60 min to avoid phlebitis. Assess for pain along vein; slow rate if pain occurs; apply ice and notify physician or other health care professional if unable to relieve pain.
- **Continuous Infusion:** May also be administered as an infusion in a dilution of 1 g/liter of 0.9% NaCl, D5W, or LR over 4 hr.

Erythromycin Gluceptate

- **Syringe Incompatibility:** heparin.
- **Additive Compatibility:** calcium gluconate, heparin, hydrocortisone sodium succinate, potassium chloride, sodium bicarbonate.
- **Additive Incompatibility:** pentobarbital, secobarbital.

Erythromycin Lactobionate

- **Syringe Incompatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, amiodarone, bivalirudin, cyclophosphamide, dexmedetomidine, diltiazem, enalaprilat, esmolol, famotidine, fenoldopam, foscarnet, heparin, hydromorphone, idarubicin, labetalol, lorazepam, magnesium sulfate, meperidine, midazolam, morphine, multivitamins, nicardipine, perphenazine, tacrolimus, theophylline, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** cefepime, ceftazidime.
- **Additive Compatibility:** cimetidine, hydrocortisone sodium succinate, pentobarbital, potassium chloride, ranitidine, sodium bicarbonate.
- **Additive Incompatibility:** heparin, metoclopramide, vitamin B complex with C.
- **Topical:** Cleanse area before application. Wear gloves during application.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout day. Advise patient that sharing of this medication may be dangerous.
- May cause nausea, vomiting, diarrhea, or stomach cramps; notify health care professional if these effects persist or if severe abdominal pain, yellow discoloration of the skin or eyes, darkened urine, pale stools, or unusual tiredness develops. May cause infantile hypertrophic pyloric stenosis in infants; notify health care professional if vomiting and irritability occur.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if symptoms do not improve.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Improvement of acne lesions.

escitalopram

(ess-sit-**al**-o-pram)
Lexapro

Classification
Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category C

Indications

Major depressive disorder. Generalized anxiety disorder (GAD). **Unlabeled uses:** Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety discorder (social phobia). Premenstrual dysphoric disorder (PMDD).

Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed following oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (primarily CYP3A4 and CYP2C19 isoenzymes); 7% excreted unchanged by kidneys.
Half-life: Increased in geriatric patients and patients with hepatic impairment.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1–4 wk	Unknown	Unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent MAO inhibitors; Concurrent use of citalopram.

Use Cautiously in: History of mania (may activate mania/hypomania); History of seizures; Patients at risk for suicide; Hepatic impairment (dose reduction recommended); Geri: Hepatic impairment or geriatric patients (↓ doses recommended); Severe renal impairment; OB: Neonates exposed to SSRI in 3rd trimester may develop drug discontinuation syndrome including respiratory distress, feeding difficulty, and irritability. Weigh risks and benefits; Lactation: May cause adverse effects in infant; risk/benefit should be considered; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment in children/adolescents (unlabeled for pediatric use).

Adverse Reactions/Side Effects

CNS: insomnia, dizziness, drowsiness, fatigue. **GI:** diarrhea, nausea, abdominal pain, constipation, dry mouth, indigestion. **GU:** anorgasmia, decreased libido, ejaculatory delay, erectile dysfunction. **Derm:** increased sweating. **Endo:** syndrome on inappropriate secretion of antidiuretic hormone (SIADH). **F and E:** hyponatremia. **Metab:** increased appetite.

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between escitalopram and **MAO inhibitors**. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Concurrent use with **sumatriptan** or other **5-HT$_3$ agonist vascular headache suppressants** may result in weakness, hyperreflexia, and incoordination. **Cimetidine** ↑ blood levels of escitalopram. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Carbamazepine** may ↓ blood levels. May ↑ blood levels of **metoprolol**. Concurrent use with **tricyclic antidepressants** should be undertaken with caution because of altered pharmacokinetics.
Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 10 mg once daily, may be increased to 20 mg once daily after one week.

Hepatic Impairment
PO (Adults): 10 mg once daily.

Copyright © 2008 by F.A. Davis

PO (Geriatric Patients): 10 mg once daily.

Availability

Tablets: 5 mg, 10 mg, 20 mg. **Cost:** 5 mg $214.97/90, 10 mg $228.97/90, 20 mg $239.97/90. **Oral solution (peppermint):** 1 mg/ml in 240-ml bottles. **Cost:** $131.64/240 ml.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes and level of anxiety during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased for children or adolescents. After starting therapy, children and adolescents should be seen by health care professional at least weekly for 4 wks, every 2 wks for next 4 wks, and on advice of health care professional thereafter.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).

Potential Nursing Diagnoses

Ineffective coping (Indications)
Post-trauma syndrome (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not administer escitalopram and citalopram concomitantly. Taper to avoid potential withdrawal reactions. Reduce dose by 50% for 3 days, then again by 50% for 3 days, then discontinue.
- **PO:** Administer as a single dose in the morning or evening without regard to meals.

Patient/Family Teaching

- Instruct patient to take escitalopram as directed. Take missed doses on the same day as soon as remembered and consult health care professional. Resume regular dosing schedule next day. Do not double doses. Do not stop abruptly, should be discontinued gradually.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol and other CNS-depressant drugs during therapy and to consult a health care professional before taking other Rx or OTC medications or herbal products.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected or if they plan to breastfeed an infant.
- Caution patients that escitalopram should not be used for at least 14 days after discontinuing MAO inhibitors, and at least 14 days should be allowed after stopping escitalopram before starting an MAO inhibitor.
- Emphasize importance of follow-up exams to monitor progress.
- Encourage patient participation in psychotherapy to improve coping skills.
- Refer patient/family to local support groups.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects. Full antidepressant effects occur in 4–6 wks.
- Decrease in anxiety.

HIGH ALERT

esmolol (es-moe-lole)
Brevibloc

Classification
Therapeutic: antiarrhythmics (class II)
Pharmacologic: beta blockers

Pregnancy Category C

Indications

Management of sinus tachycardia and supraventricular arrhythmias.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, or uterine)-receptor sites. **Therapeutic Effects:** Decreased heart rate. Decreased AV conduction.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly and widely distributed.
Metabolism and Excretion: Metabolized by enzymes in RBCs and liver.
Half-life: 9 min.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	within minutes	unknown	1–20 min

Contraindications/Precautions

Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block; Known alcohol intolerance.

Use Cautiously in: Geri: Geriatric patients (increased sensitivity to the effects of beta blockers); Thyrotoxicosis (may mask symptoms); Diabetes mellitus (may mask symptoms of hypoglycemia); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB, Pedi: Pregnancy, lactation, or children (safety not established; neonatal bradycardia, hypotension, hypoglycemia, and respiratory depression may occur rarely).

Adverse Reactions/Side Effects

CNS: fatigue, agitation, confusion, dizziness, drowsiness, weakness. **CV:** hypotension, peripheral ischemia. **GI:** nausea, vomiting. **Derm:** sweating. **Local:** injection site reactions.

Interactions

Drug-Drug: General anesthesia, IV **phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

IV (Adults): *Antiarrhythmic*—500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 500 mcg/kg over 1 min, then increase infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 500 mcg/kg over 1 min and increase infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr). As therapeutic end point is achieved, eliminate loading doses and decrease dose increments to 25 mg/kg/min. *Intraoperative antihypertensive/antiarrhythmic*—250–500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 250–500 mcg/kg over 1 min, then increase infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 250–500 mcg/kg over 1 min and increase infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr).

IV (Children): *Antiarrhythmic*—50 mcg/kg/min, may be increased q 10 min up to 300 mcg/kg/min.

Availability

Solution for injection (prediluted for use as loading dose): 10 mg/ml in 10-ml vials, 20 mg/ml in 5-ml vials. **Solution for injection (must be diluted to prepare continuous infusion):** 250 mg/ml in 10-ml ampules. **Premixed infusion:** 2000 mg/100 ml, 2500 mg/250 ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, ECG, and pulse frequently during dose adjustment period and periodically during therapy. The risk of hypotension is greatest within the first 30 min of initiating esmolol infusion.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Assess infusion site frequently throughout therapy. Concentrations >10 mg/ml may cause redness, swelling, skin discoloration, and burning at the injection site. Do not use butterfly needles for administration. If venous irritation occurs, stop the infusion and resume at another site.
- ***Toxicity and Overdose:*** Monitor patients receiving esmolol for signs of overdose

Copyright © 2008 by F.A. Davis

(bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician immediately if these signs occur: IV glucagon and symptomatic care are used in the treatment of esmolol overdose. Because of the short action of esmolol, discontinuation of therapy may relieve acute toxicity.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Esmolol is available in different concentrations; fatalities have occurred when loading dose vial is confused with concentrated solution for injection, which contains 2,500 mg in 10 ml (250 mg/ml) and must be diluted. Before administering, have second practitioner independently check original order, dose calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse Brevibloc (esmolol) with Brevital (methohexital). If both are available as floor stock, store in separate areas.
- To convert to other antiarrhythmics following esmolol administration, administer the 1st dose of the antiarrhythmic agent and decrease the esmolol dose by 50% after 30 min. If an adequate response is maintained for 1 hr following the 2nd dose of the antiarrhythmic agent, discontinue esmolol.

IV Administration

- **Direct IV:** ***Diluent:*** The 10 mg/ml and 20 mg/ml vials should be used for the loading dose. These vials are already diluted. No further dilution is needed. *The 250 mg/ml ampule should not be used for the loading dose.* ***Concentration:*** 10 mg/ml or 20 mg/ml (depends upon the vial used). ***Rate:*** Administer over 1 min.
- **Continuous Infusion:** ***Diluent:*** Remove 10 ml from a 250 ml bag of D5W, D5/0.45% NaCl, D5/0.9% NaCl, 0.45% NaCl, 0.9% NaCl, or LR and add 2500 mg (10 ml) from the 250 mg/ml ampule. Alternatively, remove 20 ml from a 500 ml bag of an appropriate diluent and add 5000 mg (20 ml) from two 250 mg/ml ampules. Admixed solution is stable for 24 hr at room temperature. Premixed infusions are already diluted and ready to use. Solution is clear, colorless to light yellow. ***Concentration:*** 10 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titration of dose is based on desired heart rate or undesired decrease in blood pressure. Esmolol infusions should not be abruptly discontinued; the infusion rate should be tapered.
- **Y-Site Compatibility:** amikacin, aminophylline, amiodarone, atropine, atracurium, aztreonam, bivalirudin, bumetanide, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisatracurium, clindamycin, cyclosporine, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, heparin, hydrocotrisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, methyldopate, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, morphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate, dexamethoasone sodium phosphate, diazepam, furosemide, ganciclovir, ketorolac, lansoprazole, pantoprazole, warfarin.

Patient/Family Teaching

- May cause drowsiness. Caution patients receiving esmolol to call for assistance during ambulation or transfer.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

esomeprazole

(es-o-**mep**-ra-zole)
Nexium

Classification
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications

GERD including: erosive esophagitis. Hypersecretory conditions, including Zollinger-Ellison syndrome. With amoxicillin and clarithromycin to eradicate *Helicobacter pylori* in duodenal ulcer disease or history of duodenal ulcer disease. Decrease risk of gastric ulcer during continuous NSAID therapy.

Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers. Decreased incidence of gastric ulcer during continuous NSAID therapy.

Pharmacokinetics

Absorption: 90% absorbed following oral administration; food decreases absorption.
Distribution: Unknown.
Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver (cytochrome P450 [CY P450] system, primarily CY P2 C19 isoenzyme); <1% excreted unchanged in urine.
Half-life: 1.0–1.5 hr.

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.6 hr	24 hr
IV	rapid	end of infusion	24 hr

*Resolution of symptoms takes 5–8 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Lactation (not recommended).

Use Cautiously in: Severe hepatic impairment (daily dose should not exceed 20 mg); Geri: Increased risk of hip fractures in patients using high-doses for >1 year; OB: Pregnancy (use only if clearly needed); Pedi: Children <18 yr (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **GI:** abdominal pain, constipation, diarrhea, dry mouth, flatulence, nausea.

Interactions

Drug-Drug: May ↓ absorption and effects of drugs where gastric pH is a determinant of bioavailability, including **digoxin**, **ketoconazole**, and **iron salts**. May ↑ risk of bleeding with **warfarin** (monitor INR and PT).

Route/Dosage

Gastroesophageal Reflux Disease

PO (Adults): *Healing of erosive esophagitis*—20 mg or 40 mg once daily for 4–8 wks; *maintenance of healing of erosive esophagitis*—20 mg once daily; *symptomatic GERD*—20 mg once daily for 4 wks (additional 4 wks may be considered for nonresponders).
PO (Children 12–17 yrs): *Short-term treatment of GERD*—20 mg or 20 mg once daily up to 8 wks.
IV (Adults): 20 or 40 mg once daily.

H. pylori Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

PO (Adults): 40 mg once daily for 10 days with amoxicillin 1000 mg twice daily for 10 days and clarithromycin 500 mg twice daily for 10 days.

Decrease Gastric Ulcer During Continuous NSAID Therapy

PO (Adults): 20 or 40 mg once daily for up to 6 mo.

Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

PO (Adults): 40 mg twice daily.

Severe Hepatic Impairment

PO, IV (Adults): Daily dose should not exceed 20 mg.

Availability

Delayed-release capsules: 20 mg, 40 mg.
Cost: 20 mg $430.97/90, 40 mg $425.97/90.
Delayed-release oral suspension packets: 20 mg, 40 mg. **Powder for injection (re-**

Copyright © 2008 by F.A. Davis

quires reconstitution): 20 mg/vial, 40 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause ↑ serum creatinine, uric acid, total bilirubin, alkaline phosphatase, AST, and ALT.
- May alter hemoglobin, WBC, platelets, serum sodium, potassium, and thyroxine levels.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Antacids may be used while taking esomeprazole.
- **PO:** Administer at least 1 hr before meals. Capsules should be swallowed whole.
- **Delayed-release capsules:** For patients with difficulty swallowing, place 1 tbsp of applesauce in an empty bowl. Open capsule and carefully empty the pellets inside onto applesauce. Mix pellets with applesauce and swallow immediately. Applesauce should not be hot and should be soft enough to swallow without chewing. Do not store applesauce mixture for future use. Tap water, orange juice, apple juice, and yogurt have also been used. Do not crush or chew pellets.
- **For patients with an NG tube,** delayed-release capsules can be opened and intact granules emptied into a 60-ml syringe and mixed with 50 ml of water. Replace plunger and shake syringe vigorously for 15 sec. Hold syringe with tip up and check for granules in tip. Attach syringe to NG tube and administer solution. After administering, flush syringe with additional water. Do not administer if granules have dissolved or disintegrated. Administer immediately after mixing.
- **Delayed-release oral suspension:** Mix contents of packet with 1 tablespoon (15 ml) of water, leave 2-3 min to thicken, stir and drink within 30 minutes.
- **For delayed-release oral suspension nasogastric or gastric tube:** Add 15 ml of water to a syringe and then add contents of packet. Shake the syringe, leave 2–3 min to thicken. Shake the syringe and inject through the nasogastric or gastric tube within 30 min.
- **Direct IV:** Reconstitute each vial with 5 mL of 0.9% NaCl, LR, or D5W. Do not administer solutions that are discolored or contain a precipitate. Stable at room temperature for up to 12 hr. ***Rate:*** Administer over at least 3 min.
- **Intermittent Infusion:** Dilute reconstituted solution to a volume of 50 ml. Solutions diluted with 0.9% NaCl or LR are stable for 12 hr and those diluted with D5W are stable for 6 hr at room temperature. ***Rate:*** Administer over 10–30 min.
- **Y-Site Incompatibility:** Do not administer with other medications or solutions. Flush line with 0.9% NaCl, LR, or D5W before and after administration.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on X-ray examination or endoscopy.
- Decrease in symptoms of GERD. Sustained resolution of symptoms usually occurs in 5–8 days. Therapy is continued for 4–8 wk after initial episode.
- Decreased incidence of gastric ulcer during continuous NSAID therapy.
- Eradication of *H. Pylori* in duodenal ulcer disease.
- Decrease in symptoms of hypersecretory conditions, including Zollinger-Ellison.

estradiol vaginal tablet
Vagifem

estradiol vaginal ring
Femring, Estring

Classification
Therapeutic: hormones
Pharmacologic: estrogens

Pregnancy Category X

Indications

PO, IM, Topical, Transdermal: Replacement of estrogen (HRT) to diminish moderate to severe vasomotor symptoms of menopause and of various estrogen deficiency states including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Treatment and prevention of postmenopausal osteoporosis (not vaginal dose forms). **PO:** Inoperable metastatic postmenopausal breast or prostate carcinoma. **Vag:** Management of atrophic vaginitis that may occur with menopause (low dose), bothersome systemic symptoms of menopause (higher dose). Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote growth and development of female sex organs and the maintenance of secondary sex characteristics in women. Metabolic effects include reduced blood cholesterol, protein synthesis, and sodium and water retention. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states, including menopause. Treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
Distribution: Widely distributed. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver and other tissues. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.
Half-life: Gel: 36 hr.

TIME/ACTION PROFILE (estrogenic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	unknown	unknown	unknown
TD	unknown	unknown	3–4 days (Estraderm), 7 days (Climara)
Topical	unknown	unknown	uknown
Vaginal ring	unknown	unknown	90 days
Vaginal tablet	unknown	unknown	3–4 days

Contraindications/Precautions

Contraindicated in: Thromboembolic disease; Undiagnosed vaginal bleeding; OB: Pregnancy (may result in harm to the fetus); Lactation.
Use Cautiously in: Underlying cardiovascular disease; Severe hepatic or renal disease; May increase the risk of endometrial carcinoma; History of porphyria.

Adverse Reactions/Side Effects

CNS: headache, dizziness, lethargy. **EENT:** intolerance to contact lenses, worsening of myopia or astigmatism. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, increased appetite, jaundice, vomiting. **GU:** *women*— amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosions, loss of libido, vaginal candidiasis; *men*— impotence, testicular atrophy. **Derm:** oily skin, acne, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercal-

Copyright © 2008 by F.A. Davis

cemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

Interactions

Drug-Drug: May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates** or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Symptoms of Menopause, Atrophic Vaginitis, Female Hypogonadism, Ovarian Failure/Osteoporosis

PO (Adults): 0.45–2 mg daily or in a cycle.
IM (Adults): 1–5 mg monthly (estradiol cypionate) *or* 10–20 mg (estradiol valerate) monthly.
Topical: Emulsion *(Estrasorb)* **(Adults):** Apply two 1.74 g pouches (4.35 mg estradiol) daily.
Gel **(Adults):** Apply contents of one packet *(Divigel)* or one actuation from pump *(EstroGel, Elestrin)* daily.
Spray *EvaMist* **(Adults):** 1 spray daily, may be increased to 2–3 sprays daily.
Transdermal (Adults): *Alora, Estraderm*—50- or 100-mcg/24-hr transdermal patch applied twice weekly. *Climara*—50–100-mcg/24-hr patch applied weekly. *FemPatch*—25-mcg/24-hr patch applied q 7 days. *Vivelle*—37.5–100-mcg/24 hr transdermal patch applied twice weekly. *Menostar*—14-mcg/24-hr patch applied q 7 days. Progestin may be administered for 10–14 days of each month.
Vag (Adults): *Cream*—2–4 g (0.2–0.4 mg estradiol) daily for 1–2 wk, then decrease to 1–2 g/day for 1–2 wk; then maintenance dose of 1 g 1–3 times weekly for 3 wk, then off for 1 wk; then repeat cycle once vaginal mucosa has been restored; *Vaginal ring (Estring)*—2-mg (releases 7.5 mcg estradiol/24 hr) q 3 mo; *Vaginal ring (Femring)*—12.4 mg (releases 50 mcg estradiol/24 hr) q 3 mo or 24.8 mg (releases 100 mcg estradiol/24 hr) q 3 mo (*Femring* requires concurrent progesterone) *Vaginal tablet*—25-mcg once daily for 2 wk, then twice weekly.

Postmenopausal Breast Carcinoma

PO (Adults): 10 mg 3 times daily.

Prostate Carcinoma

PO (Adults): 1–2 mg 3 times daily.
IM (Adults): 30 mg q 1–2 wk (estradiol valerate).

Availability

Tablets: 0.45 mg, 0.5 mg, 0.9 mg, 1 mg, 1.8 mg, 2 mg. **Cost:** *Generic*—0.5 mg $22.17/100, 1 mg $15.52/100, 2 mg $33.30/100. **Injection (valerate in oil):** 10 mg/ml, 20 mg/ml, 40 mg/ml. **Injection (cypionate in oil):** 5 mg/ml. **Topical emulsion:** 4.35 mg/1.74 g pouch in boxes of 14 pouches in a one-month supply carton of 56 pouches. **Topical gel packet:** 0.25 g packet, 0.5 g packet, 1 g packet. **Topical gel pump (0.06%):** 0.87 g/actuation, 1.25 g/actuation. **Transdermal Spray:** metered dose pump contains 8.1 mL, delivers 56 sprays of 1.53 mg each. **Transdermal system:** 14 mcg/24-hr release rate, 25 mcg/24-hr release rate, 37.5 mcg/24-hr release rate, 50 mcg/24-hr release rate, 60 mcg/24–hr release rate, 75 mcg/24-hr release rate, 100 mcg/24-hr release rate. **Cost:** *Generic*—25 mcg/24–hr release rate $36.99/4 patches, 37.5 mcg/24–hr release rate $39.35/4 patches, 50 mcg/24–hr release rate $29.97/4 patches, 60 mcg/24–hr release rate $39.99/4 patches, 75 mcg/24–hr release rate $35.99/4 patches, 100 mcg/24–hr release rate $31.46/4 patches. **Vaginal cream:** 100 mcg/g. **Vaginal ring (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **Vaginal ring (Femring):** 12.4 mg (releases 50 mcg/day over 90 days), 24.8 mg (releases 100 mcg/day over 90 days). **Vaginal tablet:** 25 mcg. **Cost:** $75.81/18 tablets.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL, phospholipids, and triglycerides and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.

Copyright © 2008 by F.A. Davis

- May cause false interpretations of thyroid function tests, false ↑ in norepinephrine platelet-induced aggregability, and false ↓ in metyrapone tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- Do not confuse Estraderm (estradiol) with Testaderm (testosterone).
- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **Transdermal:** When switching from PO form, begin transdermal therapy 1 wk after the last dose or when symptoms reappear.
- **Topical:** In a comfortable position, apply *Estrasorb* to clean, dry skin of thighs each morning. Open each foil pouch individually. Cut or tear the first pouch at the notches near the top of the pouch. Apply the contents of the pouch to the top of the left thigh; push entire contents from bottom through neck of pouch. Using one or both hands rub the emulsion into the thigh and calf for 3 min until completely absorbed. Rub any excess remaining on hands into buttocks. Repeat procedure with second pouch on right leg. Allow application sites to dry completely before covering with clothing to prevent transfer. Wash hands with soap and water to remove residual estradiol.
- Apply *Divigel* individual-use once-daily packets of quick drying gel to an area measuring 5 inches by 7 inches (size of 2 palm prints) on the thigh. Do not wash area for at least 1 hr after gel has dried.
- Spray *EvaMist* on inside of forearm at the same time each day. Do not massage or rub the spray into the skin. Allow to dry for 2 min before dressing and 30 min before washing. Never spray *EvaMist* around breast or vagina Do not use more than 56 doses, even if fluid remains in pump.
- **IM:** Injection has oil base. Roll syringe to ensure even dispersion. Administer deep IM. Avoid IV administration.

Patient/Family Teaching

- Instruct patient on correct method of administration. Instruct patient to take medication as directed. Take missed doses as soon as remembered as long as it is not just before next dose. If a dose of *EvaMist* is missed, apply if more than 12 hr before next dose; if less than 12 hrs, omit dose and return to regular schedule. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient that cigarette smoking during estrogen therapy may cause increased risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy

Copyright © 2008 by F.A. Davis

or without concurrent progestins, endometrial biopsy may be recommended, if uterus is intact.

- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.
- Instruct patient to use applicator provided with vaginal tablet. Insert as high up in the vagina as comfortable, without using force.
- **Vaginal Ring:** Instruct patient to press ring into an oval and insert into the upper third of the vaginal vault. Exact position is not critical. Once ring is inserted, patient should not feel anything. If discomfort is felt, ring is probably not in far enough; gently push farther into vagina. Leave in place continuously for 90 days. Ring does not interfere with sexual intercourse. If straining at defecation makes ring move to lower vagina, push up with finger. If expelled totally, rinse ring with lukewarm water and reinsert. To remove, hook a finger through the ring and pull it out.
- **Transdermal:** Instruct patient to wash and dry hands first. Apply disc to intact skin on hairless portion of abdomen (do not apply to breasts or waistline). Press disc for 10 sec to ensure contact with skin (especially around edges). Avoid areas where clothing may rub disc loose. Change site with each administration to prevent skin irritation. Do not reuse site for 1 wk; disc may be reapplied if it falls off.

Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.

estrogens, conjugated (equine) (ess-troe-jenz)

C.E.S., Congest, Premarin

estrogens, conjugated (synthetic, A)

Cenestin

estrogens, conjugated (synthetic, B)

Enjuvia

Classification

Therapeutic: hormones
Pharmacologic: estrogens

Pregnancy Category X

Indications

PO: Treatment of moderate to severe vasomotor symptoms of menopause. Estrogen deficiency states, including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Prevention of postmenopausal osteoporosis. Advanced inoperable metastatic breast and prostatic carcinoma. **IM, IV:** Uterine bleeding resulting from hormonal imbalance. **Vag:** Management of atrophic vaginitis. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote the growth and development of female sex organs and the maintenance of secondary sex characteristics in women. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states and treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
Distribution: Widely distributed. Crosses placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by liver and other tissues. Enterohepatic recirculation occurs, with more absorption from GI tract.
Half-life: Unknown.

TIME/ACTION PROFILE (estrogenic effects†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	24 hr
IM	delayed	unknown	6–12 hr
IV	rapid	unknown	6–12 hr

†Tumor response may take several weeks

Contraindications/Precautions

Contraindicated in: Thromboembolic disease (e.g. DVT, PE, MI, stroke); Undiagnosed vaginal bleeding; History of breast cancer; History of es-

Copyright © 2008 by F.A. Davis

trogen-dependent cancer; Liver dysfunction; OB: Pregnancy (may result in harm to the fetus); OB: Lactation.
Use Cautiously in: Long-term use (more than 4–5 yr); may increase risk of myocardial infarction, stroke, invasive breast cancer, pulmonary emboli, deep vein thrombosis and dementia in postmenopausal women; Underlying cardiovascular disease; Hypertriglyceridemia; May increase the risk of endometrial carcinoma.

Adverse Reactions/Side Effects

(systemic use) **CNS:** headache, dizziness, insomnia, lethargy, mental depression. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, increased appetite, jaundice, vomiting. **GU:** *women*— amenorrhea, breakthrough bleeding, dysmenorrhea, cervical erosion, loss of libido, vaginal candidiasis; *men*— impotence, testicular atrophy. **Derm:** acne, oily skin, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

Interactions

Drug-Drug: May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates**, **carbamazepine**, or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions. **Erythromycin**, **clarithromycin**, **itraconazole**, **ketoconazole**, and **ritonavir** may ↑ risk of adverse effects.
Drug-Natural Products: Grapefruit juice may ↑ risk of adverse effects.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Ovariectomy, Primary Ovarian Failure

PO (Adults): 1.25 mg daily administered cyclically (3 wk on, 1 wk off).

Osteoporosis/Menopausal Symptoms

PO (Adults): 0.3–1.25 mg daily or in a cycle.

Female Hypogonadism

PO (Adults): 0.3–0.625 mg daily administered cyclically (3 wk on, 1 wk off).

Inoperable Breast Carcinoma—Men and Postmenopausal Women

PO (Adults): 10 mg 3 times daily.

Inoperable Prostate Carcinoma

PO (Adults): 1.25–2.5 mg 3 times daily.

Uterine Bleeding

IM, IV (Adults): 25 mg, may repeat in 6–12 hr if necessary.

Atrophic Vaginitis

PO (Adults): 0.3–1.25 mg daily.
Vag (Adults): 1.25–2.5 mg (2–4 g cream) daily for 3 wk, off for 1 wk, then repeat.

Availability (generic available)

Tablets: 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. **Cost:** *Premarin*—0.3 mg $166.63/100, 0.45 mg $139.97/100, 0.625 mg $136.95/100, 0.9 mg $139.97/100, 1.25 mg $126.46/100. **Powder for injection:** 25 mg/vial. **Vaginal cream:** 0.625 mg/g. **Cost:** $85.99/42.5-g tube. ***In combination with:*** medroxyprogesterone (Prempro and Premphase [compliance package]). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL and triglycerides, and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Copyright © 2008 by F.A. Davis

- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **IM:** To reconstitute, withdraw at least 5 ml of air from dry container and then slowly introduce the sterile diluent (bacteriostatic water for injection) against the container side. Gently agitate container to dissolve; do not shake vigorously. Solution is stable for 60 days if refrigerated. Do not use if precipitate is present or if solution is darkened.
- IV is preferred parenteral route because of rapid response.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute as for IM. Inject into distal port tubing of free-flowing IV of 0.9% NaCl, D5W, or lactated Ringer's solution. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer slowly (no faster than 5 mg/min) to prevent flushing.
- **Y-Site Compatibility:** heparin, potassium chloride, vitamin B complex with C.
- **Additive Incompatibility:** ascorbic acid or acidic solutions.

Patient/Family Teaching

- Instruct patient to take oral medication as directed. Take missed doses as soon as remembered, but not just before next dose. Do not double doses.
- Explain dosage schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding. Bleeding is anticipated during the week when conjugated estrogens are withheld.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities; headache; chest pain; blurred vision), depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding to health care professional.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended if uterus is intact.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.

Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.

estropipate (ess-troe-**pi**-pate)
Ogen, Ortho-Est, piperazine estrone sulfate

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: hormones
Pharmacologic: estrogens

Pregnancy Category X

Indications

PO: As part of HRT in the treatment of vasomotor symptoms of menopause. Treatment of various estrogen deficiency states, including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Adjunctive therapy of postmenopausal osteoporosis. **Vag:** Management of atrophic vaginitis. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote the growth and development of female sex organs and the maintenance of secondary sex characteristics in women. Metabolic effects include reduced blood cholesterol, protein synthesis, and sodium and water retention. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
Distribution: Widely distributed. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver and other tissues. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.
Half-life: Unknown.

TIME/ACTION PROFILE (estrogenic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Thromboembolic disease; Undiagnosed vaginal bleeding; Pregnancy (may result in harm to the fetus); Lactation.
Use Cautiously in: Underlying cardiovascular disease; Severe hepatic or renal disease; May increase the risk of endometrial carcinoma.

Adverse Reactions/Side Effects

(systemic use) **CNS:** headache, dizziness, lethargy, mental depression. **EENT:** intolerance to contact lenses, worsening of myopia or astigmatism. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, increased appetite, jaundice, vomiting. **GU:** *women*— amenorrhea, breakthrough bleeding, dysmenorrhea, cervical erosion, loss of libido, vaginal candidiasis; *men*— erectile dysfunction, testicular atrophy. **Derm:** acne, oily skin, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

Interactions

Drug-Drug: May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates** or **rifampin** may ↓ effectiveness. **Smoking** ↑ the risk of adverse cardiovascular reactions.

Route/Dosage

Vasomotor Symptoms of Menopause/Atrophic Vaginitis/Osteoporosis

PO (Adults): 0.75–6 mg daily or in a cycle.
Vag (Adults): 3–6 mg (2–4 g of 0.15% cream) daily for 3 wk, then off for 1 wk, then repeat cycle.

Female Hypogonadism/Ovarian Failure

PO (Adults): 1.5–9 mg daily or in a cycle.

Availability (generic available)

Tablets: 0.75 mg, 1.5 mg, 3 mg, 6 mg estropipate. **Vaginal cream:** 1.5 mg/g.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure before and periodically throughout therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause increased HDL, phospholipids, and triglycerides, and decreased serum LDL and total cholesterol concentrations.
- May cause increased serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May decrease serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.

Copyright © 2008 by F.A. Davis

- Monitor hepatic function before and periodically throughout therapy.
- May cause false interpretations of thyroid function tests, false increases in norepinephrine platelet-induced aggregability, and false decreases in metyrapone tests.

Potential Nursing Diagnoses
Sexual dysfunction (Indications)

Implementation
- **PO:** Administer PO doses with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.

Patient/Family Teaching
- Instruct patient to take oral medication as directed. If a dose is missed, take as soon as remembered as long as it is not just before next dose. Do not double doses.
- Explain medication schedule to women on 21-day cycle followed by 7 days of not taking medication. Encourage patient to take medication at the same time each day.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, or tenderness in extremities; headache; chest pain; blurred vision), mental depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding to health care professional.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended, if uterus is intact.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.

Evaluation/Desired Outcomes
- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Prevention of osteoporosis.

eszopiclone (es-**zop**-i-klone)
Lunesta

Classification
Therapeutic: sedative/hypnotics
Pharmacologic: cyclopyrrolones

Schedule IV

Pregnancy Category C

Indications
Insomnia.

Action
Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decreased latency and increased maintenance of sleep.

Pharmacokinetics
Absorption: Rapidly absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 and CYP2E1 enzyme systems); metabolites are renally excreted, <10% excreted unchanged in urine.

Copyright © 2008 by F.A. Davis

Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	6 hr

Contraindications/Precautions

Contraindicated in: No known contraindications.

Use Cautiously in: Geri: Geriatric/debilitated patients (may have ↓ metabolism or increased sensitivity; use lower initial dose); Conditions that may alter metabolic or hemodynamic function; Severe hepatic impairment (use lower initial dose); OB, Pedi: Lactation and children <18 yr (safety not established); Pregnancy (safety not established; use only if maternal benefit justifies fetal risk).

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, depression, hallucinations, headache, sleep-driving. **CV:** chest pain, peripheral edema. **GI:** dry mouth, unpleasant taste. **Derm:** rash.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, **antidepressants**, **opioids**, **sedative/hypnotics** and **antipsychotics**. ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system**, including **ketoconazole**, **itraconazole**, **clarithromycin**, **nefazodone**, **ritonavir** and **nelfinavir**. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system**, including **rifampicin**.

Route/Dosage

PO (Adults): 2 mg immediately before bedtime, may be raised to 3 mg if needed (3 mg dose is more effective for sleep maintenance); *geriatric patients*—1 mg immediately before bedtime for patients with difficulty falling asleep, 2 mg for patients who difficulty staying asleep.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—1 mg immediately before bedtime.

PO (Adults receiving concurrent CYP3A4 inhibitors): 1 mg immediately before bedtime, may be raised to 2 mg if needed.

Availability

Tablets: 1 mg, 2 mg, 3 mg. **Cost:** 1 mg $136.69/30, 2 mg $139.97/30, 3 mg $139.98/30.

NURSING IMPLICATIONS

E

Assessment

- Assess sleep patterns prior to and during administration. Continued insomnia after 7–10 days of therapy may indicate primary psychiatric or mental illness.
- Assess mental status and potential for abuse prior to administration. Prolonged use (>7–10 days) may lead to physical and psychological dependence. Limit amount of drug available to the patient.

Potential Nursing Diagnoses

Insomnia (Indications)

Implementation

- **PO:** Onset is rapid. Administer immediately before going to bed or after patient has gone to bed and has experienced difficulty falling asleep, only on nights when patient is able to get 8 or more hours of sleep before being active again.
- Swallow tablet whole; do not break, crush, or chew.
- Eszopiclone is more effective if not taken with or before a high-fat, heavy meal.

Patient/Family Teaching

- Instruct patient to take eszopiclone immediately before going to bed, as directed. Taking prior to going to bed may result in short-term memory impairment, hallucinations, impaired coordination, and dizziness. Do not increase dose or discontinue without notifying health care professional. Dose may need to be decreased gradually to minimize withdrawal symptoms. Rebound insomnia may occur upon discontinuation and usually resolves within 1–2 nights.
- May cause daytime drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional before taking any Rx, OTC, or herbal products with eszopiclone.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.

Copyright © 2008 by F.A. Davis

- Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decreased sleep latency and improved sleep maintenance.

etanercept (e-tan-er-sept)
Enbrel

Classification
Therapeutic: antirheumatics (DMARDs)
Pharmacologic: anti-TNF agents

Pregnancy Category B

Indications
To decrease progression, signs and symptoms of rheumatoid arthritis, juvenile arthritis, ankylosing spondylitis, psoriatic arthritis or plaque psoriasis when response has been inadequate to other disease-modifying agents. May be used with other agents.

Action
Binds to tumor necrosis factor (TNF), making it inactive. TNF is a mediator of inflammatory response. **Therapeutic Effects:** Decreased inflammation and slowed progression of arthritis, sponlylitis or psoriasis.

Pharmacokinetics
Absorption: 60% absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 115 hr (range 98–300 hr).

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
Subcut	2–4 wk	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Sepsis; OB: Lactation; Untreated infections; Wegener's granulomatosis (receiving immunosuppressive agents); Concurrent cyclophosphamide or anakinra.
Use Cautiously in: Pre-existing or recent demyelinating disorders (multiple sclerosis, myelitis, optic neuritis); History of tuberculosis (increased risk of reactivation); Underlying chronic diseases which may predispose to infections (advanced or poorly-controlled diabetes mellitus); Latex allergy (needle cover of diluent syringe contains latex); Geri: May have ↑ risk of infection; Pedi: Children with significant exposure to varicella virus (temporarily discontinue etanercept; consider varicella zoster immune globulin); OB: Pregnancy (use only if needed).

Adverse Reactions/Side Effects
CNS: headache, dizziness, weakness. **EENT:** rhinitis, pharyngitis, sinusitis. **Resp:** upper respiratory tract infection, cough, respiratory disorder. **GI:** abdominal pain, dyspepsia. **Derm:** rash. **Hemat:** pancytopenia. **Local:** injection site reactions. **Misc:** INFECTIONS, ↑ risk of malignancies.

Interactions
Drug-Drug: Concurrent use with **anakinra** ↑ risk of serious infections (not recommended). Concurrent use of **cyclophosphamide** may ↑ risk of malignancies. May decrease the antibody response to **live-virus vaccine** and increase the risk of adverse reactions (do not administer concurrently).

Route/Dosage
Subcut (Adults): *Adult rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis*—50 mg once weekly; *adult plaque psoriasis*—50 mg twice weekly for 3 mos, then 50 mg once weekly, may also be given as 25–50 mg once weekly as an initial dose.
Subcut (Children 4–17 yr): *>63 kg*—0.8 mg/kg/wk (up to 50 mg) as a single injection; *31–62 kg*—0.8 mg/kg/wk either as two injections on the same day or divided and given on two separate days 3–4 days apart; *<31 kg*—0.8 mg/kg/wk as a single injection.

Availability
Pre-filled syringes: 50 mg/ml. **Powder for injection:** 25 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess range of motion, degree of swelling, and pain in affected joints before and periodically during therapy.
- Assess patient for injection site reaction (erythema, pain, itching, swelling). Reactions are usually mild to moderate and last 3–5 days after injection.
- Monitor patients who develop a new infection while taking etanercept closely. Discontinue therapy in patients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

Implementation

- Needle cover of the pre-filled syringe contains latex and should not be handled by people with latex allergies.
- **Subcut:** Prepare injection with single dose pre-filled syringe or multi-dose vial for reconstitution.
- Solution in pre-filled syringe may be allowed to reach room temperature (15–30 min); do not remove needle cap during this time.
- For multi-dose vial, reconstitute with 1 ml of the bacteriostatic sterile water supplied by manufacturer for a concentration of 25 mg/mL. If the vial is used for multiple doses, use a 25-gauge needle for reconstituting and withdrawing solution and apply "Mixing Date" sticker with date of reconstitution entered. Inject diluent slowly into vial to avoid foaming. Some foaming will occur. Swirl gently for dissolution; do not shake or vigorously agitate to prevent excess foaming. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes <10 min. Withdraw solution into syringe. Some foam may remain in vial. Amount in syringe should approximate 1 ml. Do not filter reconstituted solution during preparation or administration. Attach a 27-gauge needle to inject. Administer as soon as possible after reconstitution; stable up to 6 hr if refrigerated. Solution and pre-filled syringes are stable if refrigerated and used within 14 days.
- May be injected into abdomen, thigh, or upper arm. Rotate sites. Do not administer within 1 inch of an old site or into area that is tender, red, hard, or bruised.
- **Syringe Incompatibility:** Do not mix with other solutions or dilute with other diluents.

Patient/Family Teaching

- Instruct patient on self-administration technique, storage, and disposal of equipment. First injection should be administered under the supervision of health care professional. Provide patient with a puncture-proof container for used equipment.
- Advise patient not to receive live vaccines during therapy. Parents should be advised that children should complete immunizations to date before initiation of etanercept. Patients with significant exposure to varicella virus (chickenpox) should temporarily discontinue therapy and varicella immune globulin should be considered.
- Advise patient that methotrexate, analgesics, NSAIDs, corticosteroids, and salicylates may be continued during therapy.
- Instruct patient to notify health care professional if upper respiratory or other infections occur. Therapy may need to be discontinued if serious infection occurs.

Evaluation/Desired Outcomes

- Reduction in symptoms of rheumatoid arthritis. Symptoms may return within 1 mo of discontinuation of therapy.

ethambutol

(e-**tham**-byoo-tole)
Etibi, Myambutol

Classification
Therapeutic: antituberculars

Pregnancy Category C

Indications

Active tuberculosis or other mycobacterial diseases (with at least one other drug).

Action

Inhibits the growth of mycobacteria. **Therapeutic Effects:** Tuberculostatic effect against susceptible organisms.

Pharmacokinetics

Absorption: Rapidly and well absorbed (80%) from the GI tract.
Distribution: Widely distributed; crosses blood-brain barrier in small amounts; crosses placenta and enters breast milk.
Metabolism and Excretion: 50% metabolized by the liver, 50% eliminated unchanged by the kidneys.
Half-life: 3.3 hr (increased in renal or hepatic impairment).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Optic neuritis.

Use Cautiously in: Renal and severe hepatic impairment (dosage reduction required); Children <13 yr (safety not established); Pregnancy (although safety not established, ethambutol has been used with isoniazid in pregnant women without adverse effects on the fetus); Lactation.

Adverse Reactions/Side Effects

CNS: confusion, dizziness, hallucinations, headache, malaise. **EENT:** optic neuritis. **GI:** HEPATITIS, abdominal pain, anorexia, nausea, vomiting. **Metab:** hyperuricemia. **MS:** joint pain. **Neuro:** peripheral neuritis. **Misc:** anaphylactoid reactions, fever.

Interactions

Drug-Drug: Neurotoxicity may be ↑ with other **neurotoxic agents**.

Route/Dosage

PO (Adults and Children >13 yr): 15–25 mg/kg/day (maximum 2.5 g/day) *or* 50 mg/kg (up to 2.5 g) twice weekly *or* 25–30 mg/kg (up to 2.5 g) 3 times weekly.

Availability (generic available)

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed before and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- Assessments of visual function should be made frequently during therapy. Advise patient to report blurring of vision, constriction of visual fields, or changes in color perception immediately. Visual impairment, if not identified early, may lead to permanent sight impairment.
- ***Lab Test Considerations:*** Monitor renal and hepatic functions, CBC, and uric acid levels routinely therapy. Frequently causes elevated uric acid concentrations, which may precipitate an attack of gout.

Potential Nursing Diagnoses

Risk for infection (Indications)
Disturbed sensory perception (Side Effects)

Implementation

- Ethambutol is given as a single daily dose and should be taken at the same time each day. Some regimens require dosing 2–3 times/week. Usually administered concurrently with other antitubercular medications to prevent development of bacterial resistance.
- **PO:** Administer with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. A full course of therapy may take months to years. Do not discontinue without consulting health care professional, even though symptoms may disappear.
- Advise patient to notify health care professional if pregnancy is suspected.
- Instruct patient to notify health care professional if no improvement is seen in 2–3 wk. Health care professional should also be notified if unexpected weight gain or decreased urine output occurs.
- Emphasize the importance of routine exams to evaluate progress and ophthalmic examinations if signs of optic neuritis occur.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of tuberculosis.
- Decrease in acid-fast bacteria in sputum samples.
- Improvement seen in chest x-rays. Therapy for tuberculosis is usually continued for at least 1–2 yr.

etidronate (eh-tih-**droe**-nate)
Didrocal, Didronel

Classification
Therapeutic: bone resorption inhibitors, hypocalcemics
Pharmacologic: biphosphonates

Pregnancy Category B (oral), C (intravenous)

Indications
Treatment of Paget's disease of bone. Treatment and prophylaxis of heterotopic calcification associated with total hip replacement or spinal cord injury. Used with other agents (saline diuresis) in the management of hypercalcemia associated with malignancies.

Action
Blocks the growth of calcium hydroxyapatite crystals by binding to calcium phosphate. **Therapeutic Effects:** Decreased bone resorption and turnover.

Pharmacokinetics
Absorption: Absorption is generally poor (1–6%) after oral administration.
Distribution: Half of the absorbed dose is bound to hydroxyapatite crystals in areas of increased osteogenesis.
Metabolism and Excretion: Unabsorbed drug is eliminated in the feces; 50% of the absorbed dose is excreted unchanged by the kidneys.
Half-life: 5–7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (Paget's disease)	1 mo†	unknown	1 yr
PO (heterotopic calcification)	unknown	unknown	several months
IV‡ (hypercalcemia)	24 hr	3 days	11 days

†As measured by decreased urinary hydroxyproline
‡As measured by decreased urinary calcium excretion

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe renal impairment (serum creatinine >5 mg/dl); Hypercalcemia due to hyperparathyroidism.
Use Cautiously in: Long bone fractures; CHF; Hypocalcemia; Hypovitaminosis D; Moderate renal impairment (dosage reduction recommended if serum creatinine 2.5–4.9 mg/dl); OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
GI: <u>diarrhea</u>, <u>nausea</u>; *IV*— loss of taste, metallic taste. **GU:** nephrotoxicity. **Derm:** rash. **MS:** <u>bone pain</u>, <u>bone tenderness</u>, microfractures.

Interactions
Drug-Drug: Antacids, **mineral supplements**, or **buffers** (as in **didanosine**) containing **calcium**, **aluminum**, **iron**, or **magnesium** may ↓ absorption of etidronate. Hypocalcemic effect may be additive with **calcitonin**.
Drug-Food: Foods containing large amounts of **calcium**, **aluminum**, **iron**, or **magnesium** may ↓ absorption of etidronate.

Route/Dosage

Paget's Disease
PO (Adults): 5–10 mg/kg/day single dose for up to 6 mo *or* 11–20 mg/kg/day for not more than 3 mo.

Copyright © 2008 by F.A. Davis

Heterotopic Ossification (Hip Replacement)

PO (Adults): 20 mg/kg/day for 1 mo before and 3 mo after surgery.

Heterotopic Ossification (Spinal Cord Injury)

PO (Adults): 20 mg/kg/day for 2 wk, then decreased to 10 mg/kg/day for 10 wk.

Hypercalcemia

PO (Adults): 20 mg/kg/day for 30–90 days.
IV (Adults): 7.5 mg/kg/day for 3 days; has also been given as a single dose of 25–30 mg/kg over 24 hr. May be followed by oral therapy.

Availability

Tablets: 200 mg, 400 mg. **Injection:** 50 mg/ml in 6-ml ampules.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone pain, weakness, or loss of function before and throughout therapy. Bone pain may persist or increase in patients with Paget's disease; it usually subsides days to months after therapy is discontinued. Confer with physician or other health care professional regarding analgesic to control pain.
- **Heterotopic Ossification:** Monitor for inflammation and pain at the site and loss of function if ossification occurs near a joint.
- **Hypercalcemia:** Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, and cardiac arrhythmias).
- Observe patient carefully for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, and Chvostek's or Trousseau's sign). Protect symptomatic patients by elevating and padding side rails; keep bed in low position. Risk of hypocalcemia is greatest after 3 days of continuous IV therapy.
- ***Lab Test Considerations:*** Etidronate interferes with bone uptake of technetium 99 in diagnostic scans.
- *Paget's disease:* Decreased urinary excretions of hydroxyproline and serum alkaline phosphatase are often the first clinical signs of effectiveness. These values are monitored every 3 mo. Treatment is restarted when levels return to 75% of pretreatment values. Serum phosphate levels are also monitored before and 4 wk after beginning therapy. Dosage may be reduced if serum phosphate is elevated without corresponding decrease in urinary excretion of hydroxyproline or serum alkaline phosphatase.
- *Hypercalcemia:* Monitor serum calcium and albumin levels to determine effectiveness of therapy.
- Monitor BUN and creatine before and periodically throughout course of therapy. Stable or reversible increases in BUN and creatinine may occur in patients with hypercalcemia.

Potential Nursing Diagnoses

Acute pain (Indications, Side Effects)
Risk for injury (Indications)

Implementation

- Do not confuse etidronate with etomidate.
- **Hypercalcemia:** Used as adjunctive treatment after IV hydration and loop diuretics have restored urine output.
- Oral doses may be started on the day after the last IV infusion.
- **PO:** Administer on empty stomach, because food decreases absorption.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in at least 250 mL of 0.9% NaCl or D5W. Solution is stable for 48 hr. Oral etidronate may be started on the day after last infusion. ***Rate:*** Infuse doses of 7.5 mg/kg over at least 2 hr.
- **Continuous Infusion:** ***Diluent:*** May also dilute 25–30 mg/kg single dose in 1000 mL of 0.9% NaCl. ***Rate:*** Administer over 24 hr.

Patient/Family Teaching

- Advise patient to take as directed. If dose is missed, take as soon as remembered unless almost time for next dose. Do not double up on doses. Dose should not be taken within 2 hr of eating (especially products high in calcium) or taking vitamins or antacids, because absorption will be impaired.
- Instruct patient to notify health care professional if diarrhea occurs. Health care professional may divide the dose throughout the day to control diarrhea.
- Encourage patients to comply with diet recommendations. Diet should contain adequate amounts of calcium and vitamin D (see Appendix L).
- Advise patient to notify health care professional if pain appears or worsens during therapy.

Copyright © 2008 by F.A. Davis

- Explain to patient receiving IV dose that metallic taste is not uncommon and usually disappears in a few hours.
- Advise patient to report signs of hypercalcemic relapse (bone pain, anorexia, nausea, vomiting, thirst, lethargy) to health care professional promptly.
- Emphasize need for keeping follow-up appointments to monitor progress, even after medication is discontinued, to detect relapse.

Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased bone pain and fractures in Paget's disease.
- Prevention or treatment of heterotopic ossification. Normal serum calcium levels are usually attained in 2–8 days in hypercalcemia associated with bony metastasis. Therapy may be repeated once after 1 wk.

etodolac (ee-**toe**-doe-lak)
Lodine, Lodine XL

Classification
Therapeutic: antirheumatics, nonopioid analgesics
Pharmacologic: pyranocarboxylic acid

Pregnancy Category C

Indications
Osteoarthritis. Rheumatoid arthritis. Mild to moderate pain (not XL tablets).

Action
Inhibits prostaglandin synthesis. Also has uricosuric action. **Therapeutic Effects:** Suppression of inflammation. Decreased severity of pain.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed,.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver; <1% excreted unchanged in urine.
Half-life: 6–7 hr (single dose); 7.3 hr (chronic dosing).

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	0.5 hr	1–2 hr	4–12 hr
PO (anti-inflammatory)	days–wks	unknown	6–12 hr†

†Up to 24 hr as XL (extended-release) tablet

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active GI bleeding or ulcer disease; Cross-sensitivity may exist with other NSAIDs, including aspirin.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use) Renal, or hepatic disease; Geri: Geriatric patients (increased risk of GI bleeding); History of ulcer disease; OB: Pregnancy (not recommended for use during second half of pregnancy); OB, Pedi: Lactation or children (safety not established).

Adverse Reactions/Side Effects
CNS: depression, dizziness, drowsiness, insomnia, malaise, nervousness, syncope, weakness. **EENT:** blurred vision, photophobia, tinnitus. **Resp:** asthma. **CV:** CHF, edema, hypertension, palpitations. **GI:** GI BLEEDING, dyspepsia, abdominal pain, constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastritis, nausea, stomatitis, thirst, vomiting. **GU:** dysuria, renal failure, urinary frequency. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, ecchymoses, flushing, hyperpigmentation, pruritus, rashes, sweating. **Hemat:** anemia, prolonged bleeding time, thrombocytopenia. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA, chills, fever.

Interactions
Drug-Drug: Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, **antiplatelet agents**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretic** or **antihypertensive** therapy. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytics**, **antiplatelet agents**, or **anticoagu-**

Copyright © 2008 by F.A. Davis

lants. Increased risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May increase the risk of nephrotoxicity from **cyclosporine**.
Drug-Natural Products: ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **fever few**, **garlic**, **ginkgo**, and **Panax ginseng**.

Route/Dosage

PO (Adults): *Analgesia*—200–400 mg q 6–8 hr (not to exceed 1200 mg/day). *Osteoarthritis/rheumatoid arthritis*—300 mg 2–3 times daily, 400 mg twice daily, or 500 mg twice daily; may also be given as 400–1200 mg once daily as XL tablets.

Availability (generic available)

Capsules: 200 mg, 300 mg. **Tablets:** 400 mg, 500 mg. **Extended-release tablets (XL):** 400 mg, 600 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- **Osteoarthritis/Rheumatoid Arthritis:** Assess pain and range of movement before and 1–2 hr after administration.
- **Pain:** Assess location, duration, and intensity of the pain before and 60 min after administration.
- ***Lab Test Considerations:*** May cause ↓ hemoglobin, hematocrit, leukocyte, and platelet counts.
- Monitor liver function tests within 8 wk of initiating etodolac therapy and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN, serum creatinine, and electrolytes periodically during therapy. May cause ↑ BUN, serum creatinine, and electrolyte concentrations and ↓ urine electrolyte concentrations.
- May cause ↓ serum and ↑ urine uric acid concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- Do not confuse Lodine (etodolac) with codeine or iodine.
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects.
- Use lowest effective dose for shortest period of time.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids containing aluminum or magnesium to decrease GI irritation.
- Do not crush, break, or chew extended-release tablets.

Patient/Family Teaching

- Advise patients to take etodolac with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as possible within 1–2 hr if taking twice/day, or unless almost time for next dose if taking more than twice/day. Do not double doses.
- Etodolac may occasionally cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, NSAIDs, or other OTC medications without consultation with health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Decreased severity of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum anti-inflammatory effects.

etonorgestrel, See CONTRACEPTIVES, HORMONAL.

HIGH ALERT

ETOPOSIDES (e-**toe**-poe-sides)

etoposide
VePesid, VP-16

Copyright © 2008 by F.A. Davis

etoposide phosphate
Etopophos

Classification
Therapeutic: antineoplastics
Pharmacologic: podophyllotoxin derivatives

Pregnancy Category D

Indications
Refractory testicular neoplasms (used in combination with other chemotherapeutic agents in patients who have already received chemotherapy, surgery, or radiation) (IV only). Small cell lung carcinoma (first-line therapy, used in combination with other chemotherapeutic agents) (oral and IV). **Unlabeled uses:** Lymphomas and some leukemias. Uterine cancer. Brain tumors.

Action
Damages DNA before mitosis (cycle-dependent and phase-specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: Variably absorbed after oral administration. After IV administration, etoposide phosphate is rapidly converted to etoposide.
Distribution: Rapidly distributed, poorly enters the CSF; probably crosses placenta; enters breast milk.
Protein Binding: 97%.
Metabolism and Excretion: Some metabolism by the liver with biliary excretion, 44% excreted in feces; 45% excreted unchanged by the kidneys.
Half-life: 4–11 hr.

TIME/ACTION PROFILE (noted as effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
Etoposide PO	unknown	7–14 days (granulocytes); 9–16 days (platelets)	20 days
Etoposide IV	7–14 days	7–14 days granulocytes; 9–16 days (platelets)	20 days
Etoposide phosphate IV	Unknown	12–19 days (granulocytes); 10–15 days (platelets)	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy and lactation; Known intolerance to benzyl alcohol, polysorbate 80, polyethylene glycol (IV etoposide only), or dextran (IV etoposide phosphate only).
Use Cautiously in: Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Hypoalbuminemia; Renal/hepatic impairment (dosage modification may be necessary); Other chronic debilitating illnesses; Geri: Elderly (may be at ↑ risk for adverse effects); Pedi: Children (safety and effectiveness not established).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, fatigue. **CV:** hypotension (IV). **GI:** anorexia, diarrhea, nausea, vomiting, abdominal pain, stomatitis, taste alteration. **Derm:** alopecia, pruritis, rashes, urticaria. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May alter immune response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage
Other regimens are used. Dosages below are expressed as the desired etoposide dosage.

Testicular Neoplasms
IV (Adults): Dosage ranges from 50–100 mg/m² daily for 5 days to 100 mg/m² on days 1, 3, and 5; repeat at 3–4 wk intervals.

Small-Cell Carcinoma of the Lung
PO (Adults): Dosage ranges from 70 mg/m² (rounded to the nearest 50 mg) daily for 4 days to 100 mg/m² (rounded to the nearest 50 mg) daily for 5 days; repeat at 3–4 wk intervals.
IV (Adults): Dosages range from 35 mg/m² daily for 4 days to 50 mg/m² daily for 5 days; repeat at 3–4 wk intervals.

Copyright © 2008 by F.A. Davis

Availability

Etoposide
Capsules: 50 mg. **Injection:** 20 mg/ml.

Etoposide Phosphate
Powder for injection: 100 mg/vial (with dextran).

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure before and every 15 min during infusion. If hypotension occurs, stop infusion and notify physician or other health care professional. After stabilizing blood pressure with IV fluids and supportive measures, infusion may be resumed at slower rate.
- Monitor for hypersensitivity reaction (fever, chills, dyspnea, pruritus, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, corticosteroids, volume expanders, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify physician if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- Monitor intake and output, appetite, and nutritional intake. Etoposide causes mild-to-moderate nausea and vomiting. Prophylactic antiemetics may ↓ frequency and duration of nausea and vomiting.
- Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- ***Lab Test Considerations:*** Monitor CBC and differential before and periodically during therapy. The nadir of leukopenia occurs in 7–14 days (etoposide) or 12–19 days (etoposide phosphate). Notify physician if leukocyte count is $<1000/mm^3$. The nadir of thrombocytopenia occurs in 9–16 days. Notify physician if the platelet count is $<75{,}000/mm^3$. Recovery of leukopenia and thrombocytopenia occurs in 20 days.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) before and periodically during therapy to detect hepatotoxicity and nephrotoxicity.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Do not confuse VePesid (etoposide) with Versed (midazolam). Do not confuse etoposide (VePesid) with etoposide phosphate (Etopophos).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- **PO:** Capsules should be refrigerated. Capsules are stable for 24 mo when refrigerated.

Etoposide (VePesid)

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute 5-ml vial with D5W or 0.9% NaCl. ***Concentration:*** 200–400 mcg/ml. The 200-mcg/ml solution is stable for 96 hr. The 400-mcg/ml solution is stable for 48 hr. Concentrations >400 mcg/ml are not recommended, because crystallization is likely. Discard solution if crystals are present. ***Rate:*** Infuse slowly over 30–60 min. Temporary hypotension may occur with infusion rates shorter than 30 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cladribine, doxorubicin liposome, fludarabine, gemcitabine, granisetron, melphalan, methotrexate, mitoxandrone, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinorelbine.
- **Y-Site Incompatibility:** cefepime, filgrastim, idarubicin.
- **Additive Compatibility:** carboplatin, cisplatin, cytarabine, floxuridine, fluorouracil, ifosfamide, mitoxantrone, ondansetron.

Copyright © 2008 by F.A. Davis

Etoposide phosphate (Etopophos)

IV Administration

- **Intermittent Infusion:** Reconstitute each vial with 5 or 10 ml of sterile water, D5W, or 0.9% NaCl for a concentration of 20 or 10 mg/ml, respectively. ***Diluent:*** May be administered undiluted or diluted with D5W or 0.9% NaCl. ***Concentration:*** Undiluted: 10–20 mg/ml; Diluted: as low as 0.1 mg/ml. Reconstituted solutions are stable for 24 hr at room temperature or if refrigerated. ***Rate:*** Administer over 5–210 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, ampcillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, oxaliplatin, paclitaxel, piperacillin, piperacillin/tazobactam, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, cefepime, chlorpromazine, imipenem/cilastatin, lansoprazole, methylprednisolone, mitomycin, prochlorperazine.

Patient/Family Teaching

- Instruct patient to take etoposide exactly as directed, even if nausea or vomiting occurs. If vomiting occurs shortly after dose is taken, consult physician. If a dose is missed, do not take at all.
- Advise patient to notify health care professional if fever; chills; sore throat or other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to notify health care professional if rapid heartbeat, difficulty breathing, abdominal pain, yellow skin, weakness, paresthesia, or gait disturbances occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Viscous lidocaine swishes may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient to use contraception.
- Instruct patient not to receive any vaccinations without advice of physician.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of testicular or small cell lung cancer.

exenatide (ex-**en**-a-tide)
Byetta

Classification
Therapeutic: antidiabetics
Pharmacologic: incretrin mimetic agents

Pregnancy Category C

Indications

Type 2 diabetes uncontrolled by metformin and/or a sulfonylurea.

Action

Mimics the action of incretin which promotes endogenous insulin secretion and promotes other mechanisms of glucose-lowering. **Therapeutic Effects:** Improved control of blood glucose.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration.
Distribution: Unknown.
Metabolism and Excretion: Excreted mostly by glomerular filtration followed by degradation.
Half-life: 2.4 hr.

TIME/ACTION PROFILE (effects on postprandial blood glucose)

ROUTE	ONSET	PEAK	DURATION
subcut	within 30 min	2.1 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Type 1 diabetes or diabetic ketoacidosis; End-stage renal disease (CCr <30 mL/min); Severe gastrointestinal disease; OB: Lactation.
Use Cautiously in: (dose adjustment may be necessary); OB: Use in pregnancy only if potential maternal benefit outweighs fetal risk); Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: dizziness, headache, jitteryness, weakness. **GI:** diarrhea, nausea, vomiting, dyspepsia, gastroinestinal reflux. **Derm:** hyperhydrosis. **Metab:** ↓ appetite, weight loss.

Interactions

Drug-Drug: Concurrent use with **sulfonlyureas** may ↑ risk of hypoglycemia (↓ dose of sulfonylurea if hypoglycemia occurs). Due to slowed gastric emptying, may decrease absorption of **orally administered medications**, especially those requiring rapid GI absorption or require a specific level for efficacy (**anti-infectives, oral contraceptives**).

Route/Dosage

Subcut (Adults): 5 mcg within 60 min before morning and evening meal; after one month, dose may be increased to 10 mcg depending on response.

Availability

Solution for subcutaneous injection: 250 mcg/ml in prefilled pen-injector that delivers either 5 mcg/dose (1.2-ml pen) or 10 mcg/dose (2.4-ml pen) for 60 doses (30 days of twice daily dosing). **Cost:** $200.98/1.2-ml pen, $225.99/2.4-ml pen.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, drowsiness, tremor, tachycardia, anxiety, confusion, irritability, jitteryness), especially when combined with oral sulfonylureas.
- ***Lab Test Considerations:*** Monitor serum glucose and glycolysated hemoglobin periodically during therapy to evaluate effectiveness of therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Some medications may need to be taken 1 hr before exenatide.
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Follow directions for *New Pen Setup* in *Information for Patient* prior to use of each new pen. Administer exenatide in thigh, abdomen, or upper arm at any time within the 60–min period **before** the morning and evening meals. Do not administer after a meal. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Refrigerate; discard pen 30 days after 1st use, even if some drug remains in pen. Do not freeze. Do not store pen with needle attached; medication may leak from pen or air bubbles may form in the cartridge.

Patient/Family Teaching

- Instruct patient to take exenatide as directed within 60 min before a meal. Do not take after a meal. If a dose is missed, skip the dose and take the next dose at the prescribed time. Do not take an extra dose or increase the amount of the next dose to make up for missed dose.
- Instruct patient in proper technique for administration, timing of dose and concurrent oral medications, storage of medication and disposal of used needles. Patients should read the "Information for Patient" insert prior to initiation of therapy and with each Rx refill. Advise patient that New Pen Setup should be done only with each new pen, not with each dose.
- Inform patient that pen needles are not included with pen and must be purchased separately. Advise patient which needle length and

Copyright © 2008 by F.A. Davis

gauge should be used. Caution patient not to share pen and needles.
- Explain to patient that exenatide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional. Risk of hypoglycemia is increased if sulfonureas are taken concurrently with exenatide.
- Inform patient that therapy may result in reduction of appetite, food intake, and/or body weight. Dose modification is not necessary. Nausea is more common at initiation of therapy and usually decreases over time.
- Advise patient to notify health care professional before taking any Rx, OTC, and herbal products. Exenatide delays stomach emptying. Some medications (such as anti-infectives and oral contraceptives) may need to be taken 1 hr before exenatide injection.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional if pregnancy is suspected or planned.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

ezetimibe (e-zet-i-mibe)

Ezetrol, Zetia

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: cholesterol absorption inhibitors

Pregnancy Category C

E

Indications

Alone or with other agents (HMG-CoA reductase inhibitors) in the management of dyslipidemias including primary hypercholesterolemia, homozygous familial hypercholesterolemia and homozygous sitosterolemia.

Action

Inhibits absorption of cholesterol in the small intestine. **Therapeutic Effects:** Lowering of cholesterol, a known risk factor for atherosclerosis.

Pharmacokinetics

Absorption: Following absorption, rapidly converted to ezetimibe-glucaronide, which is active. Bioavailability is variable.
Distribution: Unknown.
Metabolism and Excretion: Undergoes enterhepatic recycling, mostly eliminated in feces, minimal renal excretion.
Half-life: 22 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease or unexplained laboratory evidence of liver disease (when used with HMG-CoA reductase inhibitor); Moderate or severe hepatic insufficiency; Concurrent use of fibrates.
Use Cautiously in: OB: Lactation (use only if benefit to mother outweighs possible risks to infant); OB, Pedi: Pregnancy or children <10 yr (safety not established).

Adverse Reactions/Side Effects

GI: cholecystitis, cholelithiasis, ↑ hepatic transaminases (with HMG-CoA reductase inhibitors), nausea, pancreatitis. **Derm:** rash. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Effects may be ↓ by **cholestyramine** or other **bile acid sequestrants**. Con-

Copyright © 2008 by F.A. Davis

current use of **fibrates** may ↑ blood levels of ezetimibe and also ↑ the risk of cholelithiasis. **Cyclosporine** may ↑ ezetimibe levels. May ↑ risk of rhabdomyolysis when used with **HMG CoA-reductase inhibitors**.

Route/Dosage

PO (Adults): 10 mg once daily.

Availability

Tablets: 10 mg. **Cost:** $265.98/90. ***In combination with:*** simvastatin (Vytorin); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 2–4 wk of therapy, and periodically thereafter.
- May cause ↑ liver transaminases when administered with HMG-CoA reductase inhibitors. Monitor liver enzymes prior to initiation and during therapy according to recommendations of HMG-CoA reductase inhibitor. Elevations are usually asymptomatic and return to baseline with continued therapy.

Potential Nursing Diagnoses

Noncompliance, related to diet and medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer without regard to meals. May be taken at the same time as HMG-CoA reductase inhibitors.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Take missed doses as soon as remembered, but do not take more than 1 dose/day. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking. Ezetimibe does not assist with weight loss.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding. If regimen includes HMG-CoA reductase inhibitors, they are contraindicated in pregnancy.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occur. Risk may increase when used with HMG CoA reductase inhibitors.
- Advise patient to avoid taking OTC medications or natural/herbal products without consulting health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum LDL and total cholesterol levels.
- Increase in HDL cholesterol levels.

Copyright © 2008 by F.A. Davis

famciclovir

(fam-**sye**-kloe-veer)
Famvir

Classification
Therapeutic: antivirals

Pregnancy Category B

Indications

Acute herpes zoster infections (shingles). Treatment/suppression of recurrent herpes genitalis in immunocompetent patients. Treatment of recurrent mucocutaneous herpes simplex virus (HSV) infection in HIV-infected patients.

Action

Inhibits viral DNA synthesis in herpes-infected cells only. **Therapeutic Effects:** Decreased duration of herpes zoster infection with decreased duration of viral shedding. Decreased lesion formation and improved healing in recurrent HSV infection.

Pharmacokinetics

Absorption: Following absorption, famciclovir is rapidly converted in the intestinal wall to penciclovir, the active compound.
Distribution: Unknown.
Metabolism and Excretion: Penciclovir is mostly excreted by the kidneys.
Half-life: *Penciclovir*—2.1–3 hr (increased in renal impairment).

TIME/ACTION PROFILE (penciclovir blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.9 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Patients with impaired renal function (increased dosage interval/decreased dose recommended if CCr <40–60 ml/min); Geri: Geriatric patients (because of age-related decrease in renal function); OB, Pedi: Pregnancy, lactation, or children <18 yr (safety not established).

Adverse Reactions/Side Effects

CNS: headache, dizziness, fatigue. **GI:** diarrhea, nausea, vomiting.

Interactions

Drug-Drug: Probenecid increases plasma concentration of penciclovir.

Route/Dosage

Herpes Zoster

PO (Adults): 500 mg q 8 hr for 7 days.

Renal Impairment
PO (Adults): *CCr 40–59 ml/min*—500 mg q 12 hr; *CCr 20–39ml/min*—500 mg q 24 hr; *CCr <20 ml/min*—250 mg q 24 hr; *Hemodialysis*—250 mg after each dialysis.

Recurrent Genital Herpes Simplex Infections

PO (Adults): 1000 mg twice daily for one day.

Renal Impairment
PO (Adults): *CCr 40–59 mL/min*– 500 mg twice daily for one day; *CCr 20–39 mL/min*– 500 mg as a single dose; *CCr <20 ml/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Suppression of Recurrent Herpes Simplex Infections

PO (Adults): 250 mg q 12 hr for up to 1 yr.

Renal Impairment
PO (Adults): *CCr 20–39 ml/min*—125 mg q 12 hr for 5 days; *CCr <20 ml/min*—125 mg q 24 hr for 5 days; *Hemodialysis*—125 mg after each dialysis.

Recurrent Herpes Labialis Infections (cold sores)

PO (Adults): 1500 mg as a single dose.

Renal Impairment
PO (Adults): *CCr 40–59 mL/min*—750 mg as a single dose; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 ml/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Herpes Simplex in HIV-Infected Patients

PO (Adults): 500 mg q 12 hr for 7 days.

Renal Impairment
PO (Adults): *CCr 20–39 ml/min*—500 mg q 24 hr for 7 days; *CCr <20 ml/min*—250 mg q 24 hr for 7 days; *Hemodialysis*—250 mg after each dialysis.

Availability

Tablets: 125 mg, 250 mg, 500 mg.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess lesions prior to and daily during therapy.
- Assess patient for postherpetic neuralgia periodically during and following therapy.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)

Implementation

- Famciclovir therapy should be started as soon as herpes zoster is diagnosed, at least within 72 hr, preferably within 48 hr.
- **PO:** Famciclovir may be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take famciclovir as directed for the full course of therapy. If a dose is missed, take as soon as remembered if not just before next dose.
- Inform patient that famciclovir does not prevent the spread of infection to others. Until all lesions have crusted, precautions should be taken around others who have not had chickenpox or varicella vaccine or people who are immunosuppressed.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- Instruct women with genital herpes to have yearly Papanicolaou smears because these women may be more likely to develop cervical cancer.

Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and loss of crusts in patients with acute herpes zoster (shingles).
- Crusting over and healing of lesions in herpes labialis, genital herpes and in recurrent mucocutaneous HSV infection in HIV-infected patients.
- Prevention of recurrence of herpes genitalis.

famotidine, See HISTAMINE H_2 ANTAGONISTS.

felodipine (fe-**loe**-di-peen)

Plendil, Renedil

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications

Management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but extensively metabolized, resulting in decreased bioavailability.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized; minimal amounts excreted unchanged by kidneys.
Half-life: 11–16 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–4 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity may occur); Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Blood pressure <90 mm Hg.
Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Geri: Geriatric patients (dose reduction recommended; increased risk of hypotension); Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis,

Copyright © 2008 by F.A. Davis

tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** abnormal liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Ketoconazole**, **itraconazole**, **propranolol** and **erythromycin** ↓ metabolism, increase blood levels and the risk of toxicity (dose reduction may be necessary).

Drug-Food: Grapefruit and **grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 5 mg/day (2.5 mg/day in geriatric patients); may increase q 2 wk (range 5–10 mg/day; not to exceed 10 mg/day).

Availability (generic available)

Extended-release tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $89.96/90, 5 mg $85.97/90, 10 mg $139.97/90. ***In combination with:*** enalapril (Lexxel). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse before therapy, during dosage titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Hypertension:** Check frequency of refills to monitor adherence.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal upon discontinuation of therapy.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Acute pain (Indications)

Implementation

- Do not confuse Plendil (felodipine) with pindolol.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not crush, break, or chew sustained-release tablets. Empty tablets that appear in stool are not significant.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).

Copyright © 2008 by F.A. Davis

- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and to use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, occurs with diaphoresis or shortness of breath, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

fenofibrate (fen-o-**fi**-brate)
Antara, Lipofen, ✦Lipidil Micro, ✦Lipidil Supra, Lofibra, Tricor, Triglide

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Pregnancy Category C

Indications

With dietary therapy to decrease LDL cholesterol, total cholesterol, triglycerides, and apolipoprotein B in adult patients with hypercholesterolemia or mixed dyslipidemia. With dietary management in the treatment of hypertriglyceridemia (types IV and V hyperlipidemia) in patients who are at risk for pancreatitis and do not respond to nondrug therapy.

Action

Fenofibric acid primarily inhibits triglyceride synthesis. **Therapeutic Effects:** Lowering of cholesterol and triglycerides with subsequent decreased risk of pancreatitis.

Pharmacokinetics

Absorption: Well absorbed (60%) after oral administration; absorption is increased by food.
Distribution: Unknown.
Protein Binding: 99%.
Metabolism and Excretion: Rapidly converted to fenofibric acid, which is the active metabolite; fenofibric acid is metabolized by the liver. Fenofibric acid and its metabolites are primarily excreted in urine (60%).
Half-life: 20 hr.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment (including primary biliary cirrhosis); Pre-existing gallbladder disease; Severe renal impairment; Concurrent use of HMG-CoA reductase inhibitors; OB: Lactation.
Use Cautiously in: Concurrent warfarin therapy; OB, Pedi: Pregnancy or children (use in pregnancy only if benefits outweigh risks to the fetus; safety not established).

Adverse Reactions/Side Effects

CNS: fatigue/weakness, headache. **CV:** arrhythmias. **GI:** cholelithiasis, pancreatitis. **Derm:** rash, urticaria. **MS:** rhabdomyolysis. **Misc:** hypersensitivity reactions.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: ↑ anticoagulant effects of **warfarin**. Concurrent use with **HMG-CoA reductase inhibitors** ↑ risk of rhabdomyolysis (combined use should be avoided). Absorption is ↓ by **bile acid sequestrants** (fenofibrate should be given 1 hr before or 4–6 hr after). ↑ risk of nephrotoxicity with **cyclosporine**.

Route/Dosage

Primary Hypercholesterolemia/Mixed Dyslipidemia

PO (Adults): *Antara*—130 mg/day initially; *Lofibra*—200 mg/day initially; *Tricor*—145 mg/day initially; *Triglide*—160 mg/day initially; *Lipofen*—50 mg daily; *Lipidil Supra*—160 mg daily.

Hypertriglyceridemia

PO (Adults): *Antara*—43–130 mg/day; *Lofibra*—67–200 mg/day initially; *Tricor*—48–145 mg/day initially; *Triglide*—50–160 mg/day initially; *Lipofen*—50 mg daily; *Lipidil Supra*—160 mg daily.

Renal impairment/Geriatric patients

PO (Adults): *Antara*—43 mg/day; *Lofibra*—67 mg/day; *Tricor*—48 mg/day.

Availability

Tablets (Tricor): 48 mg, 145 mg. **Cost:** 48 mg $109.97/90, 145 mg $299.96/90. **Tablets (Triglide):** 50 mg, 160 mg. **Micronized tablets (Lofibra):** 54 mg, 160 mg. **Cost:** 160 mg $189.97/90. **Microcoated tablets (Lipidil Supra):** 100 mg, 160 mg. **Micronized capsules (Antara):** 43 mg, 130 mg. **Cost:** 43 mg $116.96/90, 130 mg $318.93/90. **Capsules (Lipofen):** 50 mg, 100 mg, 150 mg. **Micronized capsules (Lofibra):** 67 mg, 134 mg, 200 mg. **Cost:** *Generic*—67 mg $76.39/90, 134 mg $147.00/90, 200 mg $226.87/90. **Micronized capsules (Lipidil Micro):** 67 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption. Every attempt should be made to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibrate therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Therapy should be discontinued if gallstones are found.
- ***Lab Test Considerations:*** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST and ALT periodically during therapy. May cause ↑ levels. Therapy should be discontinued if levels rise >3 times the normal limit.
- If patient develops muscle tenderness during therapy, CPK levels should be monitored. If CPK levels are markedly ↑ or myopathy occurs, therapy should be discontinued.
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Patients taking anticoagulants concurrently should have prothrombin levels monitored frequently until levels stabilize.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Patients should be placed on a triglyceride-lowering diet before therapy and remain on this diet throughout therapy.
- Dose may be increased after repeated serum triglyceride levels every 4–8 wk.
- Brands are not interchangeable.
- **PO:** Administer *Antara, Lipofen, Lipidil Micro, Lipidil Supra, Lofibra,* and *Tricor* products with meals. *Triglide* formulation may be taken without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.

Copyright © 2008 by F.A. Davis

- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum triglycerides and cholesterol to normal levels. Therapy should be discontinued in patients who do not have an adequate response in 2 months of therapy.

fenoldopam

(fen-**ole**-doe-pam)
Corlopam

Classification
Therapeutic: antihypertensives
Pharmacologic: vasodilators

Pregnancy Category B

Indications

Short-term (<48 hr), in-hospital management of hypertensive emergencies, including malignant hypertension with end-organ deterioration.

Action

Acts as an agonist at dopamine d_1-like receptors. Also binds to alpha-adrenergic receptors. Acts as a vasodilator. **Therapeutic Effects:** Rapid lowering of blood pressure.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; 90% of metabolites are excreted in urine, 10% in feces.
Half-life: 5–10 min.

TIME/ACTION PROFILE (effect on blood pressure)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	15 min	1–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fenoldopam or sulfites; Concurrent beta blocker therapy (will prevent reflex tachycardia).

Use Cautiously in: Glaucoma or intraocular hypertension; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, nervousness/anxiety, dizziness. **CV:** hypotension, tachycardia, ECG changes, peripheral edema. **GI:** nausea, abdominal pain, constipation, diarrhea, vomiting. **Derm:** flushing, sweating. **F and E:** hypokalemia. **Local:** injection site reactions. **MS:** back pain.

Interactions

Drug-Drug: Concurrent use with **beta blockers** may result in excessive hypotension (concurrent use should be avoided).

Route/Dosage

IV (Adults): 0.01–1.6 mcg/kg/min.

Availability

Concentrate for injection: 10 mg/ml in 1- and 2-ml single-use ampules (with sodium meta-bisulfite).

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, heart rate, and ECG frequently throughout therapy; continuous monitoring is preferred. Consult physician for parameters.
- ***Lab Test Considerations:*** Monitor serum potassium concentrations every 6 hr during therapy. May cause hypokalemia. Treat with oral or IV potassium supplementation.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

IV Administration

- Administer via continuous infusion; do not use bolus doses. Avoid hypotension and rapid decreases in blood pressure. Initial dose titration should occur no more frequently than every 15 min and less frequently as desired blood pressure is reached. Increments of 0.05 to 0.1 mcg/kg/min are recommended for titration. Lower initial doses (0.03 to 0.1 mcg/kg/min) titrated slowly have been associated with less reflex tachycardia than higher initial doses
- Infusion can be abruptly discontinued or gradually tapered before discontinuation. Oral therapy with other antihypertensives can begin anytime after the blood pressure is sta-

Copyright © 2008 by F.A. Davis

ble. Do not administer beta blockers concurrently with fenoldopam.

- **Continuous Infusion:** ***Diluent:*** Dilute 4 ml (40 mg of drug) with 1000 ml, 2 ml (20 mg of drug) with 500 ml, or 1 ml (10 mg of drug) with 250 ml of 0.9% NaCl or D5W. Infusion is stable for 24 hrs at room temperature. ***Concentration:*** 40 mcg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired effect. Administer via infusion pump to ensure accurate dosage rate.
- **Y-Site Compatibility:** alfentanil, amikacin, aminocaproic acid, amiodarone, ampicillin/sulbactam, argatroban, atracurium, atropine, azithromycin, aztreonam, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, fluconazole, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sufentanil, tacrolimus, theophylline, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, amphotericin B, ampicillin, bumetanide, cefoxitin, dexamethasone sodium phosphate, diazepam, fosphenytoin, furosemide, ganciclovir, ketorolac, meropenem, methohexital, methylprednisolone sodium succinate, pantoprazole, pentobarbital, phenytoin, prochlorperazine, sodium bicarbonate, thiopental.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Advise patient to report headache or pain at the injection site.

Evaluation/Desired Outcomes

- Decrease in blood pressure without the appearance of side effects.

fentanyl buccal (fen-ta-nil)
Fentora

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Management of breakthrough pain in cancer patients already receiving and tolerant to opioid therapy for pain (60 mg/day of oral morphine or equivalent).

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of breakthrough pain.

Pharmacokinetics

Absorption: 65% absorbed from the buccal mucosa; 50% is absorbed transmucosally, remainder is swallowed and is absorbed slowly from the GI tract. Buccal absorption is enhanced by an effervescent reaction in the dose form. Bioavailability is greater than transmucosal fentanyl (Actiq).
Distribution: Readily crosses the placenta and enters breast milk.
Protein Binding: 80–85%.
Metabolism and Excretion: >90% metabolized by the liver and intestinal mucosa (CYP3A4 enzyme system; 7% excreted unchanged in urine.
Half-life: *100 mcg tablet*—2.6 hr; *200 mcg tablet*—4.4 hr; *100 mcg tablet*—2.6 hr; *400*

Copyright © 2008 by F.A. Davis

mcg tablet—11.0 hr; *800 mcg tablet*—11.7 hr.

TIME/ACTION PROFILE (decreased pain)

ROUTE	ONSET	PEAK	DURATION
Buccal	15 min	40–60 min	60 min

Contraindications/Precautions

Contraindicated in: Known intolerance or hypersensitivity; Acute/postoperative pain; Opioid non-tolerant patients; OB: Labor and delivery; OB: Lactation.

Use Cautiously in: Chronic obstructive pulmonary disease; History of substance abuse; Severe renal/hepatic impairment, CYP3A4 inhibitors (use lowest effective starting dose); Bradyarrhythmias; Geri: Patients >65 yr may be more sensitive to effects and may have an ↑ risk of adverse reactions; titrate dosage carefully; Pedi: Children <18 yr (safety not established).

Exercise Extreme Caution in: Head injuries/increased intracranial pressure.

Adverse Reactions/Side Effects

Opioid side effects increase with increased dosage.

CNS: dizziness, drowsiness, headache, confusion, depression, fatigue, insomnia, weakness. **Resp:** RESPIRATORY DEPRESSION, cough, dyspnea. **GI:** application site reactions, constipation, nausea, vomiting, abdominal pain, anorexia, diarrhea. **F and E:** dehydration, edema. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: CNS depressants, including other **opioids**, **sedative/hypnotics**, **general anesthetics**, **phenothiazines**, **skeletal muscle relaxants**, **sedating antihistamines**, and **alcohol** may ↑ CNS depression, hypoventilation and hypotension. Concurrent use of **agents that induce CYP3A4 enzyme activity** may ↓ analgesia. Concurrent use with **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **erythromycin**, **amprenavir**, **aprepitant**, **fluconazole**, **fosamprenavir**, and **verapamil** may significantly ↑ blood levels and ↑ risk of respiratory and CNS depression; careful monitoring and dose adjustment is recommended. Should not be used within 14 days of **MAO inhibitors** (may result in severe and unpredictable reactions).

Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Buccal (Adults): 100 mcg, then titrated to dose that provides adequate analgesia with tolerable side effects.

Availability

Buccal tablets: 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg.

NURSING IMPLICATIONS

Assessment

- Monitor type, location, and intensity of pain before and 15 min after administration of buccal fentanyl.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10 min, assess level of sedation. Physical stimulation may be sufficient to prevent hypoventilation. Subsequent doses may need to be decreased. Patients tolerant to opioid analgesics are usually tolerant to the respiratory depressant effects also.
- Monitor for application site reactions (paresthesia, ulceration, bleeding, pain, ulcer, irritation). Reactions are usually self-limited and rarely require discontinuation.
- ***Lab Test Considerations:*** May cause anemia, neutropenia, thrombocytopenia, and leukopenia.
- May cause hypokalemia, hypoalbuminemia, hypercalcemia, hypomagnesemia, and hyponatremia.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg every 2 min. Use extreme caution when titrating dose in patients physically dependent on opioid analgesics to avoid withdrawal, seizures, and severe pain. Duration of respiratory depression may be longer than duration of opioid antagonist, requiring repeated doses.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Adverse Reactions)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Patients considered opioid-tolerant are those who are taking ≥60 mg of oral morphine/day, at least 25 mcg transdermal fentanyl/hr, 30 mg of oxycodone/day, 8 mg of hydromorphone/day or an equianalgesic dose of another opioid for ≥1 wk.
- ***High Alert:*** Dose may be lethal to a child; keep out of reach of children.
- Do not substitute fentanyl buccal for fentanyl oral transmucosal; doses are not equivalent.
- **Buccal:** For patients not previously using transmucosal fentanyl, initial dose should be 100 mcg. Titrate to provide adequate relief while minimizing side effects. For patients switching from oral transmucosal fentanyl to fentanyl buccal, if transmucosal dose is 200–400 mcg, switch to 100 mcg buccal; if transmucosal dose is 600–800 mcg, switch to 200 mcg buccal; if transmucosal dose is 1200–1600 mcg, switch to 400 mcg buccal fentanyl.
- Dose may be repeated once during a single episode of breakthrough pain if not adequately relieved. Re-dose may occur 30 min after start of administration of fentanyl buccal and the same dose should be used.
- If more than one dose is required per breakthrough pain episode for several consecutive episodes, dose of maintenance opioid and fentanyl buccal should be adjusted. To increase dose, use multiples of 100 mcg tablet, use two 100 mcg tablets (one on each side of mouth in buccal cavity). If unsuccessful in controlling breakthrough pain episode, two 100 mcg tablets may be placed on each side of mouth in buccal cavity (four 100 mcg tablets). Titrate above 400 mcg by 200 mcg increments. To reduce risk of overdose, patients should have only one strength available at any one time.
- Once a successful dose has been established, if more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.

Patient/Family Teaching

- Instruct patient to take fentanyl buccal exactly as directed. Do not take more often than prescribed, keep out of reach of children, protect it from being stolen, and do not share with others, even if they have the same symptoms. Open blister pouch only when ready to administer. Do not attempt to push tablet through blister, may cause damage to tablet. Open by tearing along perforations to separate from blister card. Then bend blister unit on line where indicated. Blister backing should then be peeled to expose tablets. Use immediately; do not store, may damage integrity of tablet. Tablets are not to be sucked, chewed or swallowed whole; this will reduce medication effectiveness. Place between cheek and gum above a molar and allow medication to dissolve, usually 14–25 min. May cause bubbling sensation between teeth and gum while tablet dissolves. Do not attempt to split tablet. After 30 min, if remnants of tablet remain, swallow with glass of water. Advise patient to review *Medication Guide* each time fentanyl buccal is dispensed; new information may be available. Advise patient to notify health care professional if breakthrough pain is not alleviated or worsens.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants, such as sleep aids.
- Advise patient to notify health care professional if sores on gums or inside cheek become a problem.
- Instruct patient to notify health care professional before taking Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Inform patient if medication is no longer needed they should contact Cephalon at

Copyright © 2008 by F.A. Davis

1-800-896-5855 or remove from blister pack and flush any remaining product down toilet.

Evaluation/Desired Outcomes

- Decrease in severity of pain during episodes of breakthrough pain in patients receiving long-acting opioids.

HIGH ALERT

fentanyl (oral transmucosal) (fen-ta-nil)

Actiq

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Management of breakthrough cancer pain in patients with malignancies who are already receiving and are tolerant to opioid therapy for their underlying cancer pain.

Action

Binds to opiate receptors in the CNS, altering response to and perception of pain. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Initial rapid absorption (25%) from buccal mucosa is followed by more prolonged absorption (25%) from GI tract (combined bioavailability 50%).
Distribution: Highly lipid soluble; rapidly distributes to brain, heart, lungs, kidneys, and spleen, followed by slower distribution to muscle and fat.
Metabolism and Excretion: Mostly metabolized by liver and intestinal mucosa; <7% excreted unchanged in urine.
Half-life: 7 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
Oral/transmucosal	rapid	15–30 min	several hrs

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Management of acute or postoperative pain; Opioid-naive (nontolerant) patients; Lactation.

Use Cautiously in: Bradyarrhythmias; Concurrent use of CNS active drugs; Chronic pulmonary disease or predisposition to hypoventilation; Hepatic or renal impairment; Geri: Elderly patients may be more sensitive to effects; OB, Pedi: Pregnancy or children <16 yr (safety not established).
Exercise Extreme Caution in: Increased intracranial pressure or altered consciousness.

Adverse Reactions/Side Effects

Includes effects seen with concurrent use of longer-acting opioids.
CNS: dizziness, drowsiness, abnormal thinking, confusion, hallucinations, headache, insomnia, nervousness, weakness. **EENT:** abnormal vision. **Resp:** RESPIRATORY DEPRESSION, dyspnea. **CV:** hypotension. **GI:** nausea, constipation, dry mouth, vomiting. **Derm:** pruritus, rash, sweating. **Neuro:** abnormal gait.

Interactions

Drug-Drug: Should not be used within 14 days of **MAO inhibitors** because of possible severe and unpredictable reactions. Concurrent use of other **CNS depressants**, including **sedative/hypnotics**, **antidepressants**, other **opioid analgesics**, **skeletal muscle relaxants**, **sedating antihistamines**, or **alcohol** may produce ↑ sedation, hypoventilation, and hypotension. Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **apretitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Administration of **partial-antagonist opioid analgesics** or **opioid antagonists** will precipitate withdrawal in physically dependent patients. **Buprenorphine**, **nalbuphine**, or **pentazocine** may ↓ analgesia.
Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Transmucosal (Adults): *Dose titration*—One 200 mcg *Actiq* unit dissolved in mouth (see Implementation section) over 15 min; additional unit may be used 15 min after first unit is completed. If more than one unit is required per episode (as evaluated over several episodes), dose may be increased as required to control

Copyright © 2008 by F.A. Davis

pain. Optimal usage/titration should result in using no more than 4 units/day.

Availability

Lozenge on a stick (berry flavor-sugar free): 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg.

NURSING IMPLICATIONS

Assessment

- Monitor type, location, and intensity of pain before and 15 min after administration of transmucosal fentanyl.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10 min, assess level of sedation. Physical stimulation may be sufficient to prevent hypoventilation. Subsequent doses may need to be decreased by 25–50%. Patients tolerant to opioid analgesics are usually tolerant to the respiratory depressant effects also.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg every 2 min. Use extreme caution when titrating dose in patients physically dependent on opioid analgesics to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Adverse Reactions)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Patients considered opioid-tolerant are those who are taking ≥60 mg of oral morphine/day, 50 mcg transdermal fentanyl/hr, or an equianalgesic dose of another opioid for ≥1 wk.
- ***High Alert:*** Supplied in individually sealed child-resistant foil pouches. Dose may be lethal to a child; keep out of reach of children.
- **Transmucosal:** Open the foil package immediately before use. Instruct patient to place unit in the mouth between the cheek and lower gum, moving it from one side to the other using the handle. Patient should suck, not chew, the lozenge. If it is chewed and swallowed, lower peak concentrations and lower bioavailability may occur. Instruct patient to consume lozenge over 15-min period; longer or shorter periods may be less efficacious. If signs of excessive opioid effects occur, remove from patient's mouth immediately and decrease future doses.
- Initial dose for breakthrough pain should be 200 mcg. Six 200-mcg units should be prescribed and should be used before increasing to a higher dose. If one unit is ineffective, a second unit may be started 15 min after the completion of the first unit. Do not use more than 2 units during a single episode of breakthrough pain during titration phase. With each new dose during titration, 6 units should be prescribed, allowing treatment of several episodes of breakthrough pain. Adequate dose is determined based on effective analgesia with acceptable side effects. Side effects during titration period are usually greater than after effective dose is determined.
- Once an effective dose is determined, instruct patient to limit dose to 4 units/day. If >4 units/day are required, consider increasing the dose of the long-acting opioid.
- Discontinue with a gradual decrease in dose to prevent signs and symptoms of abrupt withdrawal.
- To dispose of remaining unit, remove drug matrix from handle by grasping with tissue paper and separating with a twisting motion. Flush remaining drug matrix down toilet. Drug remaining on handle may be removed by placing under running warm water until dissolved. Dispose of drug-free handle according to institutional protocol.
- ***High Alert:*** Partially consumed units are no longer protected by child-resistant pouch; dose may still be fatal. A temporary child-resistant storage bottle is provided for partially consumed units that cannot be disposed of properly.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient in proper use, storage, and disposal of unit. Review *Patient Leaflet* describing use of this medication with patient. Advise patient to notify health care professional if excessive opioid effects occur or if >4 units/day are required to control pain.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Inform patient that this drug may contain sugar and may cause dry mouth. Advise patient to maintain good oral hygiene and have regular dental exams.

Evaluation/Desired Outcomes

- Decrease in severity of pain during episodes of breakthrough pain in patients receiving long-acting opioids.

HIGH ALERT

fentanyl (parenteral)

(**fen**-ta-nil)
Sublimaze

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Analgesic supplement to general anesthesia; usually with other agents (ultra–short-acting barbiturates, neuromuscular blocking agents, and inhalation anesthetics) to produce balanced anesthesia. Induction/maintenance of anesthesia (with oxygen or oxygen/nitrous oxide and a neuromuscular blocking agents). Neuroleptanalgesia/neuroleptanesthesia (with or without nitrous oxide). Supplement to regional/local anesthesia. Preoperative and postoperative analgesia. **Unlabeled uses:** Continuous IV infusion as part of PCA.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. Produces CNS depression. **Therapeutic Effects:** Supplement in anesthesia. Decreased pain.

Pharmacokinetics

Absorption: Well absorbed after IM administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver, 10–25% excreted unchanged by the kidneys.
Half-life: Children: Bolus dose—2.4 hr, long-term continuous infusion—11–36 hr; Adults: 2–4 hr (increased after cardiopulmonary bypass and in geriatric patients).

TIME/ACTION PROFILE (analgesia*)

ROUTE	ONSET	PEAK	DURATION
IM	7–15 min	20–30 min	1–2 hr
IV	1–2 min	3–5 min	0.5–1 hr

*Respiratory depression may last longer than analgesia

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity among agents may occur; Known intolerance.
Use Cautiously in: Geriatric, debilitated, or critically ill patients; Diabetes; Severe renal, pulmonary or hepatic disease; CNS tumors; Increased intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (arrhythmias); Pregnancy and lactation.

Adverse Reactions/Side Effects

CNS: confusion, paradoxical excitation/delirium, postoperative depression, postoperative drowsiness. **EENT:** blurred/double vision. **Resp:** APNEA, LARYNGOSPASM, allergic bronchospasm, respiratory depression. **CV:** arrhythmias, bradycardia, circulatory depression, hypotension. **GI:** biliary spasm, nausea/vomiting. **Derm:** facial itching. **MS:** skeletal and thoracic muscle rigidity (with rapid IV infusion).

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depres-

Copyright © 2008 by F.A. Davis

sion. Additive CNS and respiratory depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, other **sedative/hypnotics**, and other **opioid analgesics**. ↑ risk of hypotension with **benzodiazepines**. **Nalbuphine**, **buprenorphine**, or **pentazocine** may ↓ analgesia.
Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Preoperative Use
IM, IV (Adults and Children >12 yr): 50–100 mcg 30–60 min before surgery.

Adjunct to General Anesthesia
IM, IV (Adults and Children >12 yr): *Low dose–minor surgery*—2 mcg/kg. *Moderate dose–major surgery*—2–20 mcg/kg. *High dose–major surgery*—20–50 mcg/kg.

Adjunct to Regional Anesthesia
IM, IV (Adults and Children >12 yr): 50–100 mcg.

Postoperative Use (Recovery Room)
IM, IV (Adults and Children >12 yr): 50–100 mcg; may repeat in 1–2 hr.

General Anesthesia
IV (Adults and Children >12 yr): 50–100 mcg/kg (up to 150 mcg/kg).
IV (Children 1–12 yr): 2–3 mcg/kg.

Sedation/Analgesia
IV (Adults and Children >12 yr): 0.5–1 mcg/kg/dose, may repeat after 30–60 min.
IV (Children 1–12 yr): *Bolus*—1–2 mcg/kg/dose, may repeat at 30–60 min intervals. *Continuous infusion*—1–5 mcg/kg/hr following bolus dose.
IV (Neonates): *Bolus*—0.5–3 mcg/kg/dose. *Continuous infusion*—0.5–2 mcg/kg/hr following bolus dose. *Continuous infusion during ECMO*—5–10 mcg/kg bolus followed by 1–5 mcg/kg/hr, may require up to 20 mcg/kg/hr after 5 days of therapy.

Availability (generic available)
Injection: 0.05 mg/ml. ***In combination with:*** droperidol (Innovar). See Appendix B.

NURSING IMPLICATIONS

Assessment
- Monitor respiratory rate and blood pressure frequently throughout therapy. Report significant changes immediately. The respiratory depressant effects of fentanyl may last longer than the analgesic effects. Initial doses of other opioids should be reduced by 25–33% of the usually recommended dose. Monitor closely.
- Geri: Opioids have been associated with increased risk of falls in geriatric patients. Assess risk and implement fall prevention strategies.
- **IV, IM:** Assess type, location, and intensity of pain before and 30 min after IM administration or 3–5 min after IV administration when fentanyl is used to treat pain.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** Symptoms of toxicity include respiratory depression, hypotension, arrhythmias, bradycardia, and asystole. Atropine may be used to treat bradycardia. If respiratory depression persists after surgery, prolonged mechanical ventilation may be required. If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. Pedi: For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Administration of naloxone in these circumstances, especially in cardiac patients, has resulted in hypertension and tachycardia, occasionally causing left ventricular failure and pulmonary edema.

Potential Nursing Diagnoses
Acute pain (Indications)
Ineffective breathing pattern (Adverse Reactions)
Risk for injury (Side Effects)

Implementation
- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders;

Copyright © 2008 by F.A. Davis

have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse fentanyl with alfentanil or sufentanil.

- Benzodiazepines may be administered before or after administration of fentanyl to reduce the induction dose requirements, decrease the time to loss of consciousness, and produce amnesia. This combination may also increase the risk of hypotension.
- ***High Alert:*** Opioid antagonists, oxygen, and resuscitative equipment should be readily available during the administration of fentanyl. Fentanyl derivatives should be administered IV only in monitored anesthesia care settings (operating room, emergency department, ICU) with immediate access to life-support equipment and should be administered only by personnel trained in resuscitation and emergency airway management.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 50 mcg/ml. ***Rate:*** Injections should be administered slowly over 1–3 min. Administer doses >5 mcg/kg over 5–10 min. Slow IV administration may reduce the incidence and severity of muscle rigidity, bradycardia, or hypotension. Neuromuscular blocking agents may be administered concurrently to decrease chest wall muscle rigidity.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in D5W or 0.9% NaCl. ***Concentration:*** Up to 50 mcg/ml. ***Rate:*** see Direct IV.
- **Syringe Compatibility:** atracurium, atropine, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, heparin, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, perphenazine, prochlorperazine edisylate, promethazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** pantoprazole, pentobarbital.
- **Y-Site Compatibility:** abciximab, amiodarone, amphotericin cholesteryl sulfate, argatroban, atracurium, atropine, bivalirudin, cisatracurium, dexamethasone sodium phosophate, diazepam, diltiazem, diphenhydramine, dobutamine, dopamine, doxapram, enalaprilat, epinephrine, esmolol, etomidate, fenoldopam, furosemide, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ketorolac, labetalol, lansoprazole, levofloxacin, linezolid, lorazepam, metoclopramide, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, oxaliplatin, pancuronium, phenobarbital, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, scopolamine, vecuronium, vitamin B complex with C.
- **Additive Compatibility:** bupivacaine, ropivacaine.
- **Additive Incompatibility:** methohexital, pentobarbital, thiopental.

Patient/Family Teaching

- Discuss the use of anesthetic agents and the sensations to expect with the patient before surgery.
- Explain pain assessment scale to patient.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geri: Geriatric patients may be a greater risk for orthostatic hypotension and, consequently, falls. Teach patient to take precautions until drug effects have completely resolved.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr after administration during outpatient surgery.
- Instruct patient to avoid alcohol or other CNS depressants for 24 hr after administration for outpatient surgery.

Evaluation/Desired Outcomes

- General quiescence.
- Reduced motor activity.
- Pronounced analgesia.

HIGH ALERT

fentanyl (transdermal)

(**fen**-ta-nil)
Duragesic

Classification
Therapeutic: opioid analgesics, anesthetic adjuncts
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Moderate to severe chronic pain requiring continuous opioid analgesic therapy for an exten-

Copyright © 2008 by F.A. Davis

ded time at a dosage of 25 mcg/hr or more of the transdermal system. Transdermal fentanyl is not recommended for the control of postoperative, mild, or intermittent pain, nor should it be used for short term-pain relief.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of chronic pain.

Pharmacokinetics

Absorption: Well absorbed (92% of dose) through skin surface under transdermal patch, creating a depot in the upper skin layers. Release from transdermal system into systemic circulation increases gradually to a constant rate, providing continuous delivery for 72 hr.
Distribution: Crosses the placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); 10–25% excreted unchanged by the kidneys.
Half-life: 17 hr after removal of a single application patch, increases to 21 hr after removal of multiple patches (because of continued release from deposition of drug in skin layers).

TIME/ACTION PROFILE (decreased pain)

ROUTE	ONSET	PEAK	DURATION
Transdermal	6 hr†	12–24 hr	72 hr‡

†Achievement of blood levels associated with analgesia. Maximal response and dose titration may take up to 6 days
‡While patch is worn

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fentanyl or adhesives; Known intolerance; Acute pain (onset not rapid enough); Alcohol intolerance (small amounts of alcohol released into skin); OB: Not recommeded during labor and delivery, avoid during lactation.
Use Cautiously in: Geri: Patients >60 yr, cachectic or debilitated patients (dose reduction suggested because of altered drug disposition); Diabetes; Patients with severe pulmonary or hepatic disease; CNS tumors; Increased intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (particularly bradyarrhythmias); Fever or situations that increase body temperature (increases release of fentanyl from delivery system); Titration period (additional analgesics may be required); Pedi: Children (safety not established for children <2 yr; pediatric patients initiating therapy at 25 mcg/hr should be opioid tolerant and receiving at least 60 mg oral morphine equivalents per day.

Adverse Reactions/Side Effects

CNS: confusion, sedation, weakness, dizziness, restlessness. **Resp:** APNEA, bronchoconstriction, laryngospasm, respiratory depression. **CV:** bradycardia. **GI:** anorexia, constipation, dry mouth, nausea, vomiting. **Derm:** sweating, erythema. **Local:** application site reactions. **MS:** skeletal and thoracic muscle rigidity. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme**. ↑ CNS and respiratory depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and other **opioids**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression.
Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Transdermal (Adults): 25 mcg/hr is the initial dose; patients who have not been receiving opioids should receive not more that 25 mcg/hr. To calculate the dosage of transdermal fentanyl required in patients who are already receiving opioid analgesics, assess the 24-hr requirement of currently used opioid. Using the equianalgesic table in Appendix J, convert this to

Copyright © 2008 by F.A. Davis

an equivalent amount of morphine/24 hr. Conversion to fentanyl transdermal may be accomplished by using the fentanyl conversion table (Appendix J). During dosage titration, additional short-acting opioids should be available for any breakthrough pain that may occur. Morphine 10 mg IM or 60 mg PO q 4 hr (60 mg/24 hr IM or 360 mg/24 hr PO) is considered to be approximately equivalent to transdermal fentanyl 100 mcg/hr. Transdermal patch lasts 72 hr in most patients. Some patients require a new patch every 48 hr.

Transdermal (Adults >60 yr, Debilitated, or Cachectic Patients): Initial dose should be 25 mcg/hr unless previous opioid use was >135 mg morphine PO/day (or other opioid equivalent).

Availability (generic available)

Transdermal systems: 12.5 mcg/hr, 25 mcg/hr, 50 mcg/hr, 75 mcg/hr, 100 mcg/hr.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 24 hr after application and periodically during therapy. Monitor pain frequently during initiation of therapy and dose changes to assess need for supplementary analgesics for breakthrough pain.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence.
- Progressively higher doses may be required to relieve pain with long-term therapy. It may take up to 6 days after increasing doses to reach equilibrium, so patients should wear higher dose through 2 applications before increasing dose again.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Monitor patient closely; dose may need to be repeated or may need to be administered as an infusion because of long duration of action despite removal of patch.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify ambiguous orders; have second practitioner independently check original order and dose calculations.
- Duragesic-12 delivers 12.5 mcg/hr of fentanyl. Use supplemental doses of short-acting opioid analgesics to manage pain until relief is obtained with the transdermal system. Patients may continue to require supplemental opioids for breakthrough pain. If >100 mcg/hr is required, use multiple transdermal systems.
- Dose is titrated based on the patient's report of pain until adequate analgesia (50% reduction in patient's pain rating on numerical or visual analogue scale or patient reports satisfactory relief) is attained. Dose is determined by calculating the previous 24-hr analgesic requirement and converting to the equianalgesic morphine dose using Appendix J. The conversion ratio from morphine to transdermal fentanyl is conservative; 50% of patients may require a dose increase after initial application. Increase after 3 days based on required daily doses of supplemental analgesics. Increases should be based on ratio of 45 mg/24 hr of oral morphine to 12.5 mcg/hr increase in transdermal fentanyl dose.

Copyright © 2008 by F.A. Davis

- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- To convert to another opioid analgesic, remove transdermal fentanyl system and begin treatment with half the equianalgesic dose of the new analgesic in 12–18 hr.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **Transdermal:** Apply system to flat, nonirritated, and nonirradiated site such as chest, back, flank, or upper arm. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. For continued use, remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal. Apply new system to a different site. Discard unused systems by removing from pouch and flushing down toilet.

Patient/Family Teaching

- Instruct patient in how and when to ask for pain medication.
- Instruct patient in correct method for application and disposal of transdermal system. Fatalities have occurred from children having access to improperly discarded patches. May be worn while bathing, showering, or swimming.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize dizziness.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase the release of fentanyl from the patch.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness, respiratory status, or blood pressure.

F

ferrous fumarate, See IRON SUPPLEMENTS.

ferrous gluconate, See IRON SUPPLEMENTS.

ferrous sulfate, See IRON SUPPLEMENTS.

fexofenadine

(fex-oh-**fen**-a-deen)
Allegra

Classification
Therapeutic: allergy, cold, and cough remedies, antihistamines

Pregnancy Category C

Indications

Relief of symptoms of seasonal allergic rhinitis. Management of chronic idiopathic urticaria.

Action

Antagonizes the effects of histamine at peripheral histamine–1 (H_1) receptors, including pruritus and urticaria. Also has a drying effect on the nasal mucosa. **Therapeutic Effects:** Decreased sneezing, rhinorrhea, itchy eyes, nose, and throat associated with seasonal allergies. Decreased urticaria.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: 80% excreted in urine, 11% excreted in feces.
Half-life: 14.4 hr (increased in renal impairment).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antihistaminic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	2–3 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Impaired renal function (increased dosing interval recommended); OB, Pedi: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue. **GI:** dyspepsia. **Endo:** dysmenorrhea.

Interactions

Drug-Drug: Magnesium- and **aluminum-containing antacids** ↓ absorption and may decrease effectiveness.
Drug-Food: Apple, **orange**, and **grapefruit juice** ↓ absorption and may decrease effectiveness.

Route/Dosage

PO (Adults and Children ≥12 yr): 60 mg twice daily, or 180 mg once daily.
PO (Children 2–11 yr): 30 mg twice daily.
PO (Children 6 months-2 yr): 15 mg twice daily.

Renal Impairment
PO (Adults): 60 mg once daily as a starting dose.
PO (Children 6–11 yr): 30 mg once daily as a starting dose.

Availability (generic available)

Tablets: 30 mg, 60 mg, 180 mg. **Cost:** *Generic*—30 mg $49.97/90, 60 mg $99.97/90, 180 mg $161.97/90. **Suspension (raspberry–cream):** 30 mg/5 mL in 30-ml and 300-ml bottles. **Cost:** $59.07/300 ml. ***In combination with:*** pseudoephedrine (Allegra-D). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** Will cause false-negative reactions on allergy skin tests; discontinue 3 days before testing.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation

- **PO:** Administer with food or milk to decrease GI irritation. Capsules and tablets should be taken with water or milk, not juice.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Inform patient that drug may cause drowsiness, although it is less likely to occur than with other antihistamines. Avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Decrease in urticaria.

filgrastim (fil-**gra**-stim)

Neupogen, G-CSF, granulocyte colony stimulating factor

Classification
Therapeutic: colony-stimulating factors

Pregnancy Category C

Indications

Prevention of febrile neutropenia and associated infection in patients who have received bone marrow–depressing antineoplastics for the treatment of nonmyeloid malignancies. Reduction of time for neutrophil recovery and duration of fever in patients undergoing induction and consolidation chemotherapy for acute myelogenous leukemia. Reduction of time to neutrophil recovery and sequelae of neutropenia in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation. Mobilization of hematopoietic progenitor cells into peripheral blood for collection by leukapheresis. Management of severe chronic neutropenia. **Unlabeled uses:** Neutropenia associated with HIV infection.

Copyright © 2008 by F.A. Davis

Action

A glycoprotein, filgrastim binds to and stimulates immature neutrophils to divide and differentiate. Also activates mature neutrophils.
Therapeutic Effects: Decreased incidence of infection in patients who are neutropenic from chemotherapy or other causes. Improved harvest of progenitor cells for bone marrow transplantation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 3.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV, subcut	unknown	unknown	4 days†

†Return of neutrophil count to baseline

Contraindications/Precautions

Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*–derived proteins.
Use Cautiously in: Malignancy with myeloid characteristics; Pre-existing cardiac disease; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

Hemat: excessive leukocytosis. **Local:** pain, redness at subcut site. **MS:** medullary bone pain.

Interactions

Drug-Drug: Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils—avoid use for 24 hr before and 24 hr after chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

After Myelosuppressive Chemotherapy

IV, Subcut (Adults): 5 mcg/kg/day as a single injection daily for up to 2 wk. Dosage may be increased by 5 mcg/kg during each cycle of chemotherapy, depending on blood counts.

After Bone Marrow Transplantation

IV, Subcut (Adults): 10 mcg/kg/day as a 4- or 24-hr IV infusion or as a continuous subcut infusion; initiate at least 24 hr after chemotherapy and at least 24 hr after bone marrow transplantation. Subsequent dosage is adjusted according to blood counts.

Peripheral Blood Progenitor Cell Collection and Therapy

Subcut (Adults): 10 mcg/kg/day as a bolus or continuous infusion for at least 4 days before first leukapheresis and continued until last leukapheresis; dosage modification suggested if WBC >100,000 cells/mm^3.

Severe Chronic Neutropenia

Subcut (Adults): *Congenital neutropenia*—6 mcg/kg twice daily. *Idiopathic/cyclical neutropenia*—5 mcg/kg daily (decrease if ANC remains >10,000/mm^3).

Availability

Injection: 300 mcg/ml in 1- and 1.6-ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate, blood pressure, and respiratory status before and periodically during therapy.
- Assess bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require treatment with opioid analgesics, especially in patients receiving high-dose IV therapy.
- ***Lab Test Considerations:*** *After chemotherapy,* obtain a CBC with differential, including examination for the presence of blast cells, and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC. A transient rise is seen 1–2 days after initiation of therapy, but therapy should not be discontinued until ANC >10,000/mm^3.
- *After bone marrow transplant,* the daily dose is titrated by the neutrophil response. When the ANC is >1000/mm^3 for 3 consecutive days, the dose should be reduced by 5 mcg/kg/day. If the ANC remains >1000/mm^3 for 3 or more consecutive days, filgrastim is discontinued. If the ANC decreases to <1000/mm^3, filgrastim should be resumed at 5 mcg/kg/day.
- *For chronic severe neutropenia,* monitor CBC with differential and platelet count twice weekly during initial 4 wk of therapy and during 2 wk after any dose adjustment.

Copyright © 2008 by F.A. Davis

- May cause ↓ platelet count and transient increases in uric acid, LDH, and alkaline phosphatase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)
Acute pain (Side Effects)

Implementation

- Administer no earlier than 24 hr after cytotoxic chemotherapy, at least 24 hr after bone marrow infusion, and not during the 24 hr before administration of chemotherapy.
- Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Discard if left at room temperature for >6 hr. Vial is for 1-time use only.
- **Subcut:** If dose requires >1 ml of solution, may be divided into 2 injection sites.
- May also be administered as a continuous subcut infusion over 24 hr after bone marrow transplantation.

IV Administration

- **Continuous Infusion:** ***Diluent:*** Dilute in D5W. Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Vial is for 1-time use only. ***Concentration:*** Dilute to a final concentration of at least 15 mcg/ml. If the final concentration is <15 mcg/ml, human albumin in a concentration of 2 mg/ml must be added to D5W before filgrastim to prevent adsorption of the components of the drug delivery system. ***Rate:*** *After chemotherapy* dose is administered via infusion over 15–60 min.
- *After chemotherapy* dose may also be administered as a continuous infusion.
- *After bone marrow transplant,* dose should be administered as an infusion over 4 or 24 hr.
- **Y-Site Compatibility:** acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, ceftazidime, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, cytarabine, dacarbazine, daunorubicin, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, ganciclovir, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, lorazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, cefepime, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin, mannitol, methylprednisolone sodium succinate, metronidazole, mitomycin, piperacillin, prochlorperazine, thiotepa.

Patient/Family Teaching

- **Home Care Issues:** Instruct patient on correct technique and proper disposal for home administration. Caution patient not to reuse needle, vial, or syringe. Provide patient with a puncture-proof container for needle and syringe disposal.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow–depressing antineoplastics.
- Reduction of duration and sequelae of neutropenia after bone marrow transplantation.
- Reduction of the incidence and duration of sequelae of neutropenia in patients with severe chronic neutropenia.
- Improved harvest of progenitor cells for bone marrow transplantation.

finasteride (fi-nas-teer-ide)
Propecia, Proscar

Classification
Therapeutic: hair regrowth stimulants
Pharmacologic: androgen inhibitors

Pregnancy Category X

Indications

Benign prostatic hyperplasia (BPH); can be used with doxazosin. Androgenetic alopecia (male pattern baldness) in men only.

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in prostate, liver, and skin; 5-alpha-dihydrotestosterone is partially responsible for prostatic

Copyright © 2008 by F.A. Davis

hyperplasia and hair loss. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms. Decreases hair loss; promotes hair regrowth.

Pharmacokinetics

Absorption: Well absorbed after oral administration (63%).
Distribution: Enters prostatic tissue and crosses the blood-brain barrier. Remainder of distribution not known.
Protein Binding: 90%.
Metabolism and Excretion: Mostly metabolized; 39% excreted in urine as metabolites; 57% excreted in feces.
Half-life: 6 hr (range 6–15 hr; slightly increased in patients >70 yr).

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	8 hr	2 wk

†Clinical effects as noted by urinary tract symptoms and hair regrowth may not be evident for several months and remain for 4 mo after discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Women.
Use Cautiously in: Patients with hepatic impairment or obstructive uropathy.

Adverse Reactions/Side Effects

GU: decreased libido, decreased volume of ejaculate, erectile dysfunction.

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults): *BPH*—5 mg once daily (Proscar); *androgenetic alopecia*—1 mg/day (Propecia).

Availability (generic available)

Tablets: 1 mg (Propecia), 5 mg (Proscar).
Cost: *Propecia*—1 mg $177.97/90; *Generic*—5 mg $199.98/90.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, may be evaluated before and periodically during therapy. Finasteride may cause a ↓ in serum PSA levels.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- **PO:** Administer once daily with or without meals.

Patient/Family Teaching

- Instruct patient to take finasteride as directed, even if symptoms improve or are unchanged. At least 6–12 mo of therapy may be necessary to determine whether or not an individual will respond to finasteride.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function. Sexual dysfunction side effects will diminish over time.
- Caution patient that finasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking finasteride and should not handle crushed finasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Hair regrowth in androgenetic alopecia. Evidence of hair growth usually requires 3 mo or longer. Continued use is recommended to sustain benefit. Withdrawal leads to reversal of effect within 12 mo.

Copyright © 2008 by F.A. Davis

flavocoxid (fla-vo-cox-id)
Limbrel

Classification
Therapeutic: nonopioid analgesics
Pharmacologic: flavanoids

Pregnancy Category UK

Indications
Dietary management of osteoarthritis; considered to be a medical food product.

Action
Anti-inflammatory and analgesic properties related to inhibition of prostaglandin synthesis by inhibiting cyclo-oxygenase (not COX-2 selective) and other mediators of inflammation.
Therapeutic Effects: Decreased pain/inflammation associated with osteoarthritis, with improved mobility.

Pharmacokinetics
Absorption: Some intestinal conversion prior to absorption, remainder unknown.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1–2 hr	unknown	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pregnancy, lactation or children <18 yr.
Use Cautiously in: History of GI bleeding.

Adverse Reactions/Side Effects
CV: ↑ blood pressure, ↑ in varicose veins.
GI: GI upset. **Derm:** psoriasis.

Interactions
Drug-Drug: None noted.

Route/Dosage
PO (Adults): 250 mg every 12 hr (up to 250 mg three times daily has been used).

Availability
Capsules: 250 mg.

NURSING IMPLICATIONS

Assessment
- Assess pain (note type, location, and intensity), range of motion, degree of swelling, and stiffness in affected joints before and periodically during therapy.

Potential Nursing Diagnoses
Chronic pain (Indications)

Implementation
- **PO:** Administer flavocoxid twice daily.

Patient/Family Teaching
- Instruct patient to take flavocoxid as directed. Do not increase does without consulting health care professional.

Evaluation/Desired Outcomes
- Decrease in pain and stiffness, and improved mobility in patients with osteoarthritis.

flecainide (flek-a-nide)
Tambocor

Classification
Therapeutic: antiarrhythmics (class IC)

Pregnancy Category C

Indications
Life-threatening ventricular arrhythmias, including ventricular tachycardia. Supraventricular tachyarrhythmias including: Paroxysmal supraventricular tachycardia (PSVT), Paroxysmal atrial fibrillation/flutter (PAF). **Unlabeled uses:** Single dose treatment of atrial fibrillation.

Action
Slows conduction in cardiac tissue by altering transport of ions across cell membranes. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics
Absorption: Well absorbed from the GI tract following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Mostly metabolized by liver; 30% excreted unchanged by kidneys.
Half-life: 11–14 hr.

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	days	days–weeks	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cardiogenic shock.
Use Cautiously in: CHF (dosage reduction may be required); Pre-existing sinus node dys-

Copyright © 2008 by F.A. Davis

function or 2nd- or 3rd-degree heart block (without a pacemaker); Renal impairment (dosage reduction required if CCr <35 ml/min); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, anxiety, fatigue, headache, mental depression. **EENT:** blurred vision, visual disturbances. **CV:** ARRHYTHMIAS, CHEST PAIN, CHF. **GI:** anorexia, constipation, drug-induced hepatitis, nausea, stomach pain, vomiting. **Derm:** rashes. **Neuro:** tremor.

Interactions

Drug-Drug: ↑ risk of arrhythmias with other **antiarrhythmics**, including **calcium channel blockers**. **Disopyramide**, **beta blockers**, or **verapamil** may have ↑ myocardial depressant effects; combination use should be undertaken cautiously. **Amiodarone** doubles serum flecainide levels (↓ flecainide dose by 50%). Increases serum **digoxin** levels by a small amount (15–25%). Concurrent **beta blocker** therapy may cause ↑ levels of beta blocker and flecainide. **Alkalinizing agents** promote reabsorption, ↑ blood levels, and may cause toxicity. **Acidifying agents** ↑ renal elimination and may ↓ effectiveness of flecainide (if urine pH <5).

Drug-Food: Foods that ↑ urine pH to >7 result in ↑ levels (strict **vegetarian diet**). **Foods or beverages that ↓ urine pH** to <5 ↑ renal elimination and may ↓ effectiveness of flecainide **(acidic juices)**.

Route/Dosage

Ventricular Tachycardia

PO (Adults): 100 mg q 12 hr initially, increased by 50 mg bid until response is obtained or maximum total daily dose of 400 mg is reached. Some patients may require q 8 hr dosing.

Renal Impairment

PO (Adults): *CCr <35 ml/min*—100 mg once a day or 50 mg q 12 hr initially; further dosing on the basis of frequent blood level monitoring.

PSVT/PAF

PO (Adults): 50 mg q 12 hr initially, increased by 50 mg bid until response is obtained or maximum total daily dose of 300 mg is reached. Some patients may require q 8 hr dosing.

Atrial Fibrillation (unlabeled)

PO (Adults): 200 mg or 300 mg single dose.

Availability (generic available)

Tablets: 50 mg, 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG or Holter monitor prior to and periodically during therapy. May cause QRS widening, PR prolongation, and QT prolongation.
- Monitor blood pressure and pulse periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess patient for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Evaluate renal, pulmonary, and hepatic functions and CBC periodically on patients receiving long-term therapy. Flecainide should be discontinued if bone marrow depression occurs.
- May cause ↑ in serum alkaline phosphatase during prolonged therapy.
- ***Toxicity and Overdose:*** Therapeutic blood levels range from 0.2 to 1.0 mcg/ml. Monitor plasma trough levels frequently during dose adjustment in patients with severe renal or hepatic disease or in patients with CHF and moderate renal impairment.

Potential Nursing Diagnoses

Decreased cardiac output (Adverse Reactions)

Implementation

- Previous antiarrhythmic therapy (except lidocaine) should be withdrawn 2–4 half-lives before starting flecainide.
- Therapy should be initiated in a hospital setting to monitor for increase in arrhythmias.
- Dose adjustments should be at least 4 days apart because of the long half-life of flecainide.
- **PO:** May be administered with meals if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take medication around the clock as directed at evenly spaced intervals, even if feeling better. Take missed doses as soon as remembered if within 6 hr; omit if remembered later. Gradual dosage reduction may be necessary.

Copyright © 2008 by F.A. Davis

- May cause dizziness or visual disturbances. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if chest pain, shortness of breath, or diaphoresis occurs.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in frequency of life-threatening ventricular arrhythmias.
- Decrease in supraventricular tachyarrhythmias.

fluconazole (floo-**kon**-a-zole)
Diflucan

Classification
Therapeutic: antifungals (systemic)

Pregnancy Category C

Indications

PO, IV: Fungal infections caused by susceptible organisms, including: Oropharyngeal or esophageal candidiasis, Serious systemic candidal infections, Urinary tract infections, Peritonitis, Cryptococcal meningitis. Prevention of candidiasis in patients who have undergone bone marrow transplantation. **PO:** Single-dose oral treatment of vaginal candidiasis. **Unlabeled uses:** Prevention of recurrent vaginal yeast infections.

Action

Inhibits synthesis of fungal sterols, a necessary component of the cell membrane. **Therapeutic Effects:** Fungistatic action against susceptible organisms. May be fungicidal in higher concentrations. **Spectrum:** *Cryptococcus neoformans*, *Candida,* spp.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed, good penetration into CSF, saliva, sputum, vaginal fluid, skin, eye, and peritoneum. Excreted in breast milk.
Metabolism and Excretion: >80% excreted unchanged by the kidneys; <10% metabolized by the liver.
Half-life: Premature neonates: 46–74 hr; Children: 19–25 hr (PO) and 15–17 hr (IV); Adults: 30 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fluconazole or other azole antifungals; Concurrent use with pimozide.
Use Cautiously in: Renal impairment (dose reduction required if CCr <50 ml/min); Geri: Increased risk of adverse reactions (rash, vomiting, diarrhea, seizures); consider age-related decrease in renal function in determining dose; Underlying liver disease; OB, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

Incidence of adverse reactions is increased in HIV patients.
CNS: headache, dizziness, seizures. **GI:** HEPATOTOXICITY, abdominal discomfort, diarrhea, nausea, vomiting. **Derm:** exfoliative skin disorders including STEVENS-JOHNSON SYNDROME. **Endo:** hypokalemia, hypertriglyceridemia. **Misc:** allergic reactions, including ANAPHYLAXIS.

Interactions

Drug-Drug: ↑ activity of **warfarin**. **Rifampin**, **rifabutin**, and **isoniazid** ↓ levels. Fluconazole at doses >200 mg/day may inhibit the CYP3A4 enzyme system and effect the activity of drugs metabolized by this system. ↑ hypoglycemic effects of **tolbutamide**, **glyburide**, or **glipizide**. ↑ levels and risk of toxicity from **cyclosporine**, **rifabutin**, **tacrolimus**, **theophylline**, **zidovudine**, **alfentanil**, and **phenytoin**. ↑ levels and effects of **benzodiazepines**, **zolpidem**, **bispirone**, **nisoldipine**, **tricyclic antidepressants**, and **losartan**. May ↑ risk of bleeding with **warfarin**. May antagonize effects of **amphotericin B**.

Route/Dosage

Oropharyngeal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg daily for at least 2 wk.

Copyright © 2008 by F.A. Davis

PO, IV (Children >14 days): 6 mg/kg initially, then 3 mg/kg/day for at least 2 wk.
PO, IV (Neonates <14 days, 30–36 weeks gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

Esophageal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg once daily for at least 3 wk (up to 400 mg/day).
PO, IV (Children >14 days): 6 mg/kg initially, then 3–12 mg/kg/day for at least 3 wk.
PO, IV (Neonates <14 days, 30–36 weeks gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

Vaginal Candidiasis

PO (Adults): 150-mg single dose; prevention of recurrence (unlabeled)—150 mg daily for 3 days then weekly for 6 mo.

Systemic Candidiasis

PO, IV (Adults): 400 mg/day initially, then 200–800 mg/day for 28 days.
PO, IV (Children >14 days): 6–12 mg/kg/day for 28 days.
PO, IV (Neonates <14 days, 30–36 weeks gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

Cryptococcal Meningitis

PO, IV (Adults): *Treatment*—400 mg once daily until favorable clinical response, then 200–800 mg once daily for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy*—200 mg once daily.
PO, IV (Children >14 days): 12 mg/kg/day initially, then 6–12 mg/kg/day for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy*—6 mg/kg/day.
PO, IV (Neonates <14 days, 30–36 weeks gestation): same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

Prevention of Candidiasis after Bone Marrow Transplant

PO, IV (Adults): 400 mg once daily; begin several days before procedure if severe neutropenia is expected, and continue for 7 days after ANC >1000/mm^3.
PO, IV (Children >14 days): 10–12 mg/kg/day, not to exceed 600 mg/day.

Renal Impairment

PO, IV (Adults): *CCr 11–50 ml/min*—50% of the usual dose.

Availability (generic available)

Tablets: 50 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic*—100 mg $109.99/30, 150 mg $167.19/12, 200 mg $247.57/30. **Oral suspension (orange flavor):** 10 mg/ml in 35-ml bottle, 40 mg/ml in 35-ml bottle. **Cost:** $25.99/35 ml. **Premixed infusion:** 2 mg/ml in 100- or 200-ml bottles/containers.

F

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor CSF cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor BUN and serum creatinine before and periodically during therapy; patients with renal dysfunction will require dose adjustment.
- Monitor liver function tests before and periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphate, and bilirubin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse Diflucan (fluconazole) with Diprivan (propofol).
- **PO:** Shake oral suspension well before administration.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Premixed infusions are pre-diluted and ready to use. Do not unwrap until ready to use. Do not administer solution that is cloudy or has a precipitate. Check for leaks by squeezing inner bag. If leaks are found, discard container as unsterile. ***Concentration:*** 2 mg/ml. ***Rate:*** Infuse over 1–2 hr. Do not exceed a rate of 200 mg/hr. Pedi: For children receiving doses >6 mg/kg/day, give over 2 hours.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ampicillin/sul-

bactam, atropine, aztreonam, benztropine, bivalirudin, bumetanide, calcium chloride, caspofungin, cefazolin, cefepime, cefoxitin, ceftizoxime, cimetidine, cisatracurium, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, drotrecogin, enalaprilat, epinephrine, ertapenem, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, foscarnet, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, insulin, isoproterenol, immune glogulin, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, melphanan, magnesium sulfate, meperidine, meropenem, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, paclitaxel, palonosetron, pancuronium, pemetrexed, penicillin G potassium, phenytoin, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinapristin-dalfopristin, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate, ampicillin, calcium gluconate, cefotaxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, diazepam, digoxin, furosemide, haloperidol, hydroxyzine, imipenem/cilastatin, pantoprazole, pentamidine, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses.
- Instruct patient to notify health care professional if skin rash, abdominal pain, fever, or diarrhea becomes pronounced, if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) occur, if unusual bruising or bleeding occur, or if no improvement is seen within a few days of therapy.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Full course of therapy may require weeks or months of treatment after resolution of symptoms.
- Prevention of candidiasis in patients who have undergone bone marrow transplantation.
- Decrease in skin irritation and vaginal discomfort in patients with vaginal candidiasis. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

fludrocortisone

(floo-droe-**kor**-ti-sone)
Florinef

Classification
Therapeutic: hormones
Pharmacologic: corticosteroids (mineralocorticoid)

Pregnancy Category C

Indications

Sodium loss and hypotension associated with adrenocortical insufficiency (given with hydrocortisone or cortisone). Management of sodium loss due to congenital adrenogenital syndrome (congenital adrenal hyperplasia). **Unlabeled uses:** Idiopathic orthostatic hypotension (with increased sodium intake). Type IV renal tubular acidosis.

Action

Causes sodium reabsorption, hydrogen and potassium excretion, and water retention by its effects on the distal renal tubule. **Therapeutic Effects:** Maintenance of sodium balance and blood pressure in patients with adrenocortical insufficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Widely distributed; probably enters breast milk.
Protein Binding: High.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 3.5 hr.

TIME/ACTION PROFILE (mineralocorticoid activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	1–2 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: CHF; Addison's disease (patients may have exaggerated response); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** CHF, arrhythmias, edema, hypertension. **GI:** anorexia, nausea. **Endo:** adrenal suppression, weight gain. **F and E:** hypokalemia, hypokalemic alkalosis. **MS:** arthralgia, muscular weakness, tendon contractures. **Neuro:** ascending paralysis. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Use with **thiazide** or **loop diuretics**, **piperacillin**, or **amphotericin B** may result in ↑ risk of hypokalemia. Hypokalemia may ↑ risk of **digoxin** toxicity. May produce prolonged neuromuscular blockade following the use of **nondepolarizing neuromuscular blocking agents**. **Phenobarbital** or **rifampin** may ↑ metabolism and ↓ effectiveness of fludrocortisone.
Drug-Food: Large amounts of **salt** or **sodium-containing foods** may cause excessive sodium retention and potassium loss.

Route/Dosage

PO (Adults): *Adrenocortical insufficiency*—100 mcg/day (range 100 mcg 3 times weekly—200 mcg daily). Doses as small as 50 mcg daily may be required by some patients. Use with 10–37.5 mg cortisone daily or 10–30 mg hydrocortisone daily. *Adrenogenital syndrome*—100–200 mcg/day. *Idiopathic hypotension*—50–200 mcg/day (unlabeled).
PO (Children): 50–100 mcg/day.

Availability (generic available)

Tablets: 100 mcg (0.1 mg).

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure periodically during therapy. Report significant changes. Hypotension may indicate insufficient dose.
- Monitor for fluid retention (weigh daily, assess for edema, and auscultate lungs for rales/crackles).
- Monitor patients with Addison's disease closely and stop treatment if a significant increase in weight or blood pressure, edema, or cardiac enlargement occurs. Patients with Addison's disease are more sensitive to the action of fludrocortisone and may have an exaggerated response.
- ***Lab Test Considerations:*** Monitor serum electrolytes periodically during therapy. Fludrocortisone causes ↓ serum potassium levels.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)
Excess fluid volume (Side Effects)

Implementation

- **PO:** Tablets are scored and may be broken if dose adjustment is necessary.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not just before next dose is due. Explain that lifelong therapy may be necessary and that abrupt discontinuation may lead to addisonian crisis. Patient should keep an adequate supply available at all times.
- Advise patient to follow dietary modification prescribed by health care professional. Instruct patient to follow a diet high in potassium (see Appendix L). Amount of sodium allowed in diet varies with pathophysiology.
- Instruct patient to inform health care professional if weight gain or edema, muscle weakness, cramps, nausea, anorexia, or dizziness occurs.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Normalization of fluid and electrolyte balance without the development of hypokalemia or hypertension.

flumazenil (flu-maz-e-nil)

Anexate, Romazicon

Classification

Therapeutic: antidotes
Pharmacologic: benzodiazepines

Pregnancy Category C

Indications

Complete/partial reversal of effects of benzodiazepines used as general anesthetics, or during diagnostic or therapeutic procedures. Management of intentional or accidental overdose of benzodiazepines.

Action

Flumazenil is a benzodiazepine derivative that antagonizes the CNS depressant effects of benzodiazepine compounds. It has no effect on CNS depression from other causes, including opioids, alcohol, barbiturates, or general anesthetics. **Therapeutic Effects:** Reversal of benzodiazepine effects.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 50% primarily to albumin.
Metabolism and Excretion: Metabolism of flumazenil occurs primarily in the liver.
Half-life: Children: 20–75 min; Adults: 41–79 min.

TIME/ACTION PROFILE (reversal of benzodiazepine effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	6–10 min	1–2 hr†

†Depends on dose/concentration of benzodiazepine and dose of flumazenil

Contraindications/Precautions

Contraindicated in: Hypersensitivity to flumazenil or benzodiazepines; Patients receiving benzodiazepines for life-threatening medical problems, including status epilepticus or increased intracranial pressure, should not be given flumazenil; Serious cyclic antidepressant overdosage.
Use Cautiously in: Mixed CNS depressant overdose (effects of other agents may emerge when benzodiazepine effect is removed); History of seizures (seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, who have recently received repeated doses of benzodiazepines, or who have a previous history of seizure activity); Head injury (may increase intracranial pressure and risk of seizures); Severe hepatic impairment; Pregnancy, lactation (safety not established); Pedi: children <2 yr (safety not established).

Adverse Reactions/Side Effects
