CNS: SEIZURES, dizziness, agitation, confusion, drowsiness, emotional lability, fatigue, headache, sleep disorders. **EENT:** abnormal hearing, abnormal vision, blurred vision. **CV:** arrhythmias, chest pain, hypertension. **GI:** nausea, vomiting, hiccups. **Derm:** flushing, sweating. **Local:** pain/injection-site reactions, phlebitis. **Neuro:** paresthesia. **Misc:** rigors, shivering.

Interactions

Drug-Drug: None significant.

Route/Dosage

Reversal of Conscious Sedation or General Anesthesia

IV (Adults): 0.2 mg. Additional doses may be given at 1-min intervals until desired results are obtained, up to a total dose of 1 mg. If resedation occurs, regimen may be repeated at 20-min intervals, not to exceed 3 mg/hr.
IV (Children): 0.01 mg/kg (up to 0.2 mg); if the desired level of consciousness is not obtained after waiting an additional 45 sec, further injections of 0.01 mg/kg (up to 0.2 mg) can be administered and repeated at 60-sec intervals when necessary (up to a maximum of 4 additional times) to a maximum total dose of 0.05 mg/kg or 1 mg, whichever is lower. The dose should be individualized based on the patient's response.

Suspected Benzodiazepine Overdose

IV (Adults): 0.2 mg. Additional 0.3 mg may be given 30 sec later. Further doses of 0.5 mg may be given at 1-min intervals, if necessary, to a total dose of 3 mg. Usual dose required is 1–3 mg. If resedation occurs, additional doses of 0.5 mg/min for 2 min may be given at 20-min intervals (given no more than 1 mg at a time, not to exceed 3 mg per hour).
IV (Children): *Unlabeled*—0.01 mg/kg (maximum dose 0.2 mg) with repeat doses every minute up to a cumulative dose of 1 mg. As an alternative to repeat doses, continuous infusions of 0.005–0.01 mg/kg/hr have been used.

Availability (generic available)

Injection: 0.1 mg/ml in 5- and 10-ml vials.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess level of consciousness and respiratory status before and during therapy. Observe patient for at least 2 hr after administration for the appearance of resedation. Hypoventilation may occur.
- **Overdose:** Attempt to determine time of ingestion and amount and type of benzodiazepine taken. Knowledge of agent ingested allows an estimate of duration of CNS depression.

Potential Nursing Diagnoses

Risk for injury (Indications)
Risk for poisoning (Indications)

Implementation

- Ensure that patient has a patent airway before administration of flumazenil.
- Observe IV site frequently for redness or irritation. Administer through a free-flowing IV infusion into a large vein to minimize pain at the injection site.
- Optimal emergence should be undertaken slowly to decrease undesirable effects including confusion, agitation, emotional lability, and perceptual distortion.
- Institute seizure precautions. Seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, patients who have recently received repeated doses of benzodiazepines, or those who have a previous history of seizure activity. Seizures may be treated with benzodiazepines, barbiturates, or phenytoin. Larger than normal doses of benzodiazepines may be required.
- **Suspected Benzodiazepine Overdose:** If no effects are seen after administration of flumazenil, consider other causes of decreased level of consciousness (alcohol, barbiturates, opioid analgesics).

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted or diluted in syringe with D5W, 0.9% NaCl, or LR. Diluted solution should be discarded after 24 hr. ***Concentration:*** Up to 0.1 mg/ml. ***Rate:*** Administer each dose over 15–30 sec into free-flowing IV in a large vein. Do not exceed 0.2 mg/min in children or 0.5 mg/min in adults.

Patient/Family Teaching

- Flumazenil does not consistently reverse the amnestic effects of benzodiazepines. Provide patient and family with written instructions for postprocedure care. Inform family that patient may appear alert at the time of discharge but the sedative effects of the benzodiazepine may recur. Instruct patient to avoid driving or other activities requiring alertness for at least 24 hr after discharge.
- Instruct patient not to take any alcohol or nonprescription drugs for at least 18–24 hr after discharge.
- Resumption of usual activities should occur only when no residual effects of the benzodiazepine remain.

Evaluation/Desired Outcomes

- Improved level of consciousness.
- Decrease in respiratory depression caused by benzodiazepines.

Classification
Therapeutic: anti-infectives
Pharmacologic: fluoroquinolones

Pregnancy Category C

†See Appendix C for ophthalmic use

Indications

PO, IV: Treatment of the following bacterial infections: Urinary tract infections including cystitis and prostatitis (ciprofloxacin, levofloxacin, norfloxacin, ofloxacin), Gonorrhea (may not be considered first-line agents due to increasing resistance), Gynecologic infections (ciprofloxacin, norfloxacin, ofloxacin), Respiratory tract infections including acute sinusitis, acute exacerbations of chronic bronchitis, and pneumonia (not norfloxacin), Skin and skin structure infections (levofloxacin, moxifloxacin, ciprofloxacin, ofloxacin), Bone and joint infections (ciprofloxacin), Infectious diarrhea (ciprofloxacin), Intra-abdominal infections (ciprofloxacin, moxifloxacin). Febrile neutropenia (ciprofloxacin). Post-exposure treatment of inhalational anthrax (ciprofloxacin, levofloxacin).

Action

Inhibit bacterial DNA synthesis by inhibiting DNA gyrase. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Broad activity includes many gram-positive pathogens: Staphylococci including methicillin-resistant *Staphylococcus aureus*, *Staphylococcus epidermidis*, *S. saprophyticus*, *Streptococcus pneumoniae*, *S. pyogenes*, and *Bacillus anthracis*. Gram-negative spectrum notable for activity against: *Escherichia coli*, *Klebsiella*, *Enterobacter*, *Salmonella*, *Shigella*, *Proteus*, *Providencia*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Serratia*, *Haemophilus*, *Acinetobacter*, *Neisseria gonorrhoeae*, *Moraxella catarrhalis*, *Campylobacter*. Additional spectrum includes: *Chlamydia pneumoniae*, *Legionella pneumoniae*, and *Mycoplasma pneumoniae*.

Pharmacokinetics

Absorption: Well absorbed after oral administration (*ciprofloxacin*—70%; *moxifloxacin*—90%; *gemifloxacin*—71%; *levofloxacin*—99%; *norfloxacin*—30–40%; *ofloxacin*—98%.
Distribution: Widely distributed. High tissue and urinary levels are achieved. All agents appear to cross the placenta. *Ciprofloxacin,* and *ofloxacin* enter breast milk.
Metabolism and Excretion: *Ciprofloxacin*—15% metabolized by the liver, 40–50% excreted unchanged by the kidneys; *gemifloxacin*—Minimal metabolism, 61% excreted unchanged in feces, 36% excreted unchanged in urine; *levofloxacin*—87% excreted unchanged in urine, small amounts metabolized; *moxifloxacin*—mostly metabolized by the liver, 20% excreted unchanged in urine, 25% excreted unchanged in feces; *norfloxacin*—10% metabolized by the liver, 30% excreted unchanged by the kidneys, 30% excreted unchanged in feces; *ofloxacin*—70–80% excreted unchanged by the kidneys.
Half-life: *Ciprofloxacin*—4 hr; *gemifloxacin*—7 hr; *levofloxacin*—8 hr; *moxifloxacin*—12 hr; *norfloxacin*—6.5 hr; *ofloxacin*—5–7 hr (all are increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Ciprofloxacin—PO	rapid	1–2 hr	12 hr
Ciprofloxacin—PO-ER	rapid	1–4 hr	24 hr
Ciprofloxacin—IV	rapid	end of infusion	12 hr
Gemifloxacin—PO	rapid	0.5—2 hr	24 hr
Levofloxacin—PO	rapid	1–2 hr	24 hr
Levofloxacin—IV	rapid	end of infusion	24 hr
Moxifloxacin—PO	within 1 hr	1–3 hr	24 hr
Moxifloxacin—IV	rapid	end of infusion	24 hr
Norfloxacin—PO	rapid	2–3 hr	12 hr
Ofloxacin—PO	rapid	1–2 hr	12 hr
Ofloxacin—IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity among agents within class may occur; **Gemifloxacin and moxifloxacin:** Concurrent use of amiodarone, disopyramide, erythromycin, pentamidine, phenothiazines, procainamide, quinidine, sotalol, or tricyclic antidepressants; Known QT prolongation or concurrent use of agents causing prolongation; OB: Pregnancy (do not use unless potential ben-

Copyright © 2008 by F.A. Davis

efit outweighs potential fetal risk); Pedi: Use only for treatment of anthrax and complicated UTIs in children 1–17 yrs due to possible arthropathy.

Use Cautiously in: Known or suspected CNS disorder; Renal impairment (dosage reduction if CCr ≤50 ml/min for ciprofloxacin, levofloxacin, ofloxacin; ≤30 ml/min for norfloxacin; <40 ml/min for gemifloxacin); Cirrhosis (levofloxacin or norfloxacin); Geri: Geriatric patients (↑ risk of adverse reactions); Lactation: safety not established except for treatment of anthrax.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, insomnia, acute psychoses, agitation, confusion, drowsiness. **CV:** *gemifloxacin, levofloxacin, moxifloxacin*— ARRHYTHMIAS, QT prolongation, vasodilation. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, abdominal pain, increased liver function tests (ciprofloxacin, moxifloxacin), vomiting. **GU:** vaginitis. **Derm:** photosensitivity, rash. **Endo:** hyperglycemia, hypoglycemia. **Local:** phlebitis at IV site. **MS:** tendinitis, tendon rupture. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: ↑ risk of QTc prolongation and life-threatening arrhythmias with concurrent use of gemifloxacin and moxifloxacin and **amiodarone**, **disopyramide**, **erythromycin**, **pentamidine**, **phenothiazines**, **procainamide**, **quinidine**, **sotalol**, and **tricyclic antidepressants** (concurrent use should be avoided). ↑ serum **theophylline** levels and may lead to toxicity. Administration with **magnesium and aluminum-containing antacids**, **iron salts**, **bismuth subsalicylate**, **sucralfate**, **didanosine**, and **zinc salts** ↓ absorption of fluoroquinolones. May ↑ ↓ the effects of **warfarin**. Ciprofloxacin may ↓ blood levels and effectiveness of **phenytoin**. Serum levels of fluoroquinolones may be ↓ by **antineoplastics**. **Cimetidine** may interfere with elimination of fluoroquinolones. Beneficial effects of ciprofloxacin may be antagonized by **nitrofurantoin**. **Probenecid** ↓ renal elimination of fluoroquinolones. May ↑ risk of nephrotoxicity from **cyclosporine**. Concurrent use of ciprofloxacin with **foscarnet** may ↑ risk of seizures. Concurrent therapy with **corticosteroids** may ↑ the risk of tendon rupture. May ↑ risk of hypoglycemia when used with **antidiabetic agents**.

Drug-Natural Products: Fennel ↓ the absorption of ciprofloxacin.

Drug-Food: Absorption is impaired by **concurrent tube feeding** (because of metal cations). Absorption is ↓ if taken with **dairy products** or **calcium-fortified juices.**

F

Route/Dosage

Ciprofloxacin

PO (Adults): *Most infections*—500–750 mg q 12 hr. *Complicated urinary tract infections*—500 mg q 12 hr for 7–14 days (immediate-release); *or* 1000 mg q 24 hr for 7–14 days (extended-release). *Uncomplicated urinary tract infections*—250 mg every 12 hr for 3 days (immediate-release) *or* 500 mg every 24 hr for 3 days (extended-release). *Gonorrhea*—250-mg single dose. *Inhalational anthrax (post exposure) or cutaneous anthrax*—500 mg every 12 hr for 60 days.

PO (Children 1–17 yr): *Complicated urinary tract infections*—10–15 mg/kg q 12 hr (not to exceed 750 mg/dose) for 10–21 days. *Inhalational anthrax (post-exposure) or cutaneous anthrax*—10–15 mg/kg q 12 hr (not to exceed 500 mg/dose) for 60 days.

IV (Adults): *Most infections*—400 mg q 12 hr. *Complicated urinary tract infections*—400 mg q 12 hr for 7–14 days. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 7–14 days. *Inhalational anthrax (post exposure)*—400 mg q 12 hr for 60 days.

IV (Children 1–17 yr): *Inhalational anthrax (post exposure)*—10 mg/kg q 12 hr (not to exceed 400 mg/dose) for 60 days; *Complicated urinary tract infections*—6–10 mg/kg q 8 hr (not to exceed 400 mg/dose) for 10–21 days.

Renal Impairment

PO (Adults): *CCr 30–50 ml/min*—250–500 mg q 12 hr; *CCr 5–29 ml/min*—250–500 mg q 18 hr (immediate-release) *or* 500 mg q 24 hr (extended-release).

IV (Adults): *CCr 5–29 ml/min*—200–400 mg q 18–24 hr.

Gemifloxacin

PO (Adults): *Acute bacterial exacerbation of chronic bronchitis*—320 mg once daily for 5 days; *Community-acquired-pneumonia (CAP) caused by Klebsiella pneumoniae, Mo-*

Copyright © 2008 by F.A. Davis

raxella catarrhalis, and multidrug resistant strains of S. pneumonia—320 mg once daily for 7 days. *Community-acquired-pneumonia (CAP) caused by S. pneumonia, Haemophilus influenzae, Mycoplasma pneumoniae, or Chlamydia pneumonia, and multidrug resistant strains of S. pneumonia*—320 mg once daily for 5 days.

Renal Impairment

PO (Adults): *CCr ≤40 ml/min* 160 mg once daily for 5 days.

Levofloxacin

PO, IV (Adults): *Most infections*—250–750 mg q 24 hr; *inhalational anthrax (post-exposure)*—500 mg once daily for 60 days.

Renal Impairment

PO, IV (Adults): *Normal renal function dosing of 750 mg/day:—CCr 20–49 ml/min*—750 mg q 48 hr; *CCr 10–19 ml/min*—750 mg initially, then 500 mg q 48 hr; *Normal renal function dosing of 500 mg/day:—CCr 20–49 ml/min*—500 mg initially then 250 mg q 24 hr; *CCr 10–19 ml/min*—500 mg initially then 250 mg q 48 hr. *Normal renal function dosing of 250 mg/day:—CCr 10–19 ml/min*—250 mg q 48 hr.

Moxifloxacin

PO, IV (Adults): *Bacterial sinusitis*—400 mg once daily for 10 days. *Community-acquired pneumonia*—400 mg once daily for 7–14 days. *Acute bacterial exacerbation of chronic bronchitis*—400 mg once daily for 5 days. *Complicated intraabdominal infection*—400 mg once daily for 5–14 days. *Urethritis/cervicitis*—300 mg q 12 hr for 7 days. *Skin/skin structure infections*—400 mg/day for 7–21 days.

Norfloxacin

PO (Adults): *Uncomplicated urinary tract infections*—400 mg q 12 hr for 3–14 days. *Complicated urinary tract infections*—400 mg q 12 hr for 10–21 days. *Gonorrhea*—800-mg single dose. *Prostatitis*—400 mg q 12 hr for 4–6 wk.

Renal Impairment

PO (Adults): *CCr ≤30 ml/min*—400 mg once daily.

Ofloxacin

PO (Adults): *Most infections*—400 mg q 12 hr. *Prostatitis*—300 mg q 12 hr for 6 wk. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 3–7 days. *Complicated urinary tract infections*—200 mg q 12 hr for 10 days. *Gonorrhea*—400-mg single dose.

Otic (Adults and Children ≥6 mo): *Otitis Externa 6 months to 13 yr*—5 drops instilled into affected ear once daily for 7 days; *Otitis Externa ≥13 yr*—10 drops instilled into affected ear once daily for 7 days. *Acute Otitis Media in pediatric patients 1–12 yr old with tympanostomy tubes*—5 drops instilled into the affected ear twice daily for 10 days. *Chronic Suppurative Otitis Media with perforated tympanic membranes in patients ≥12 yr*—10 drops instilled into the affected ear twice daily for 14 days.

Renal Impairment

PO, IV (Adults): *CCr 20–50 ml/min*—100% of the usual dose q 24 hr; *CCr <20 ml/min*—50% of the usual dose q 24 hr.

Availability

Ciprofloxacin

Tablets: 100 mg, 250 mg, 500 mg, 750 mg. **Extended-release tablets:** 500 mg, 1000 mg. **Oral suspension (strawberry flavor):** 250 mg/5 ml, 500 mg/5 ml. **Solution for injection:** 10 mg/ml. **Premixed infusion:** 200 mg/100 ml D5W, 400 mg/200 ml D5W. ***In combination with:*** hydrocortisone (Cipro HC) (see Appendix B).

Gemifloxacin

Tablets: 320 mg.

Levofloxacin

Tablets: 250 mg, 500 mg, 750 mg. **Cost:** 250 mg $199.98/20, 500 mg $231.98/20, 750 mg $429.99/20. **Oral solution:** 25 mg/ml. **Solution for injection:** 25 mg/ml. **Premixed infusion:** 250 mg/50 ml D5W, 500 mg/100 ml D5W, 750 mg/150 ml D5W.

Moxifloxacin

Tablets: 400 mg. **Cost:** $160.21/14. **Premixed infusion:** 400 mg/250 ml 0.8% NaCl.

Norfloxacin

Tablets: 400 mg.

Ofloxacin

Tablets: 200 mg, 300 mg, 400 mg. **Cost:** *Generic*—200 mg $77.13/20, 300 mg $91.42/20, 400 mg $83.33/20. **Otic solution:** 0.3% in 5- and 10-ml dropper bottles and 0.25 ml single-dispensing containers. **Cost:** *Generic*—$55.99/5 ml, $92.99/10 ml.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC; urinalysis; frequency and urgency of urination; cloudy or foul-smelling urine) prior to and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction. Patients taking *gemifloxacin* who are at greater risk for rash are those receiving gemifloxacin for >7 days, <40 yrs of age, females, and postmenopausal females receiving hormone replacement therapy.
- ***Lab Test Considerations:*** May cause ↑ serum AST, ALT, LDH, bilirubin, and alkaline phosphatase.
- May also cause ↑ or ↓ serum glucose.
- Moxifloxacin may cause hyperglycemia, hyperlipidemia, and altered prothrombin time. It may also cause ↑ WBC; ↑ serum calcium, chloride, albumin, and globulin; and ↓ glucose, hemoglobin, RBCs, neutrophils, eosinophils, and basophils.
- Monitor prothrombin time closely in patients receiving fluoroquinolones and warfarin; may enhance the anticoagulant effects of warfarin.

Potential Nursing Diagnoses

Risk for infection (Patient/Family Teaching)

Implementation

- Do confuse norfloxacin with Norflex (orphenadrine).
- **PO:** Administer *norfloxacin* and *ofloxacin* on an empty stomach 1 hr before or 2 hr after meals, with a full glass of water. *Moxifloxacin, levofloxacin,* and *gemifloxacin* may be administered without regard to meals. Should be taken at least 2 hr (3 hr for gemifloxacin, 4 hr for moxifloxacin) before or 2 hr (8 hr for moxifloxacin) after antacids or other products containing calcium, iron, zinc, magnesium, or aluminum.
- If gastric irritation occurs, ciprofloxacin may be administered with meals.
- Ciprofloxacin 5% and 10% oral suspension should not be administered through a feeding tube (may ↓ absorption). Shake solution for 15 seconds prior to administration. Do not chew microcapsules in solution.
- *Gemifloxacin* and *ciprofloxacin extended-release tablets* should be swallowed whole; do not crush, break, or chew.

F

Ciprofloxacin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. Stable for 14 days at refrigerated or room temperature. ***Concentration:*** 1–2 mg/ml. ***Rate:*** Administer over 60 min into a large vein to minimize venous irritation.
- **Y-Site Compatibility:** amifostine, amiodarone, anidulafungin, aztreonam, bivalirudin, calcium gluconate, ceftazidime, cisatracurium, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, etoposide, fenoldopam, gemcitabine, gentamicin, granisetron, lidocaine, linezolid, lorazepam, LR, metoclopramide, midazolam, midodrine, milrinone, piperacillin, potassium acetate, potassium chloride, promethazine, quinupristin-dalfopristin, ranitidine, remifentanil, 0.9% NaCL, tacrolimus, teniposide, thiotepa, tobramycin, verapamil.
- **Y-Site Incompatibility:** Manufacturer recommends temporarily discontinuing other solutions when administering ciprofloxacin, aminophylline, ampicillin/sulbactam, azithromycin, cefepime, dexamethasone, drotrecogin, furosemide, heparin, hydrocortisone, lansoprazole, methylprednisolone, pemetrexed, phenytoin, potassium phosphates, propofol, sodium phosphates, warfarin.

Levofloxacin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl, D5W, dextrose/saline combinations, 5% sodium bicarbonate, Plasmalyte 56, or sodium lactate. Also available in premixed bottles and flexible containers with D5W, which need no further dilution. Discard

Copyright © 2008 by F.A. Davis

unused solution. Diluted solution is stable for 72 hr at room temperature and 14 days if refrigerated. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer by infusion over at least 60 min for 250 mg or 500 mg doses and over 90 min for 750 mg dose. Avoid rapid bolus injection to prevent hypotension.

- **Y-Site Compatibility:** amikacin, aminophylline, ampicillin, bivalirudin, caffeine citrate, cefotaxime, cimetidine, clindamycin, dexamethasone, dexmedetomidine, dobutamine, dopamine, epinephrine, fenoldopam, fentanyl, gentamicin, isoproterenol, lidocaine, linezolid, lorazepam, metoclopramide, morphine, oxacillin, pancuronium, penicillin G, phenobarbital, phenylephrine, sodium bicarbonate, vancomycin.
- **Y-Site Incompatibility:** acyclovir, alprostadil, azithromycin, drotrecogin, furosemide, heparin, indomethacin, lansoprazole, nitroglycerin, nitroprusside, propofol.
- **Additive Compatibility:** linezolid.

Moxifloxacin

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Premixed bags are diluted in sodium chloride 0.8% and should not be further diluted. Use transfer set whose piercing pin does not require excessive force; insert with a gentle twisting motion until pin is firmly seated. ***Concentration:*** 1.6 mg/ml. ***Rate:*** Administer over 60 min. Avoid rapid or bolus infusion.
- **Solution Compatibility:** 0.9% NaCl, D5W, D10W, LR.
- **Y-Site Incompatibility:** Temporarily discontinue administration of other solutions during moxifloxacin.

Patient/Family Teaching

- Instruct patient to take medication as directed at evenly spaced times and to finish drug completely, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patients to notify health care professional immediately if they are taking theophylline.
- Encourage patient to maintain a fluid intake of at least 1500–2000 ml/day to prevent crystalluria.
- Advise patient that antacids or medications containing iron or zinc will decrease absorption. *Ciprofloxacin, levofloxacin, norfloxacin,* and *ofloxacin* should be taken at least 2 hr before (3 hr for *gemifloxacin*, 4 hr for *moxifloxacin*) or 2 hr after (8 hr for *moxifloxacin*) these products.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of any personal or family history of QTc prolongation or proarrhythmic conditions such as recent hypokalemia, significant bradycardia, or recent myocardial ischemia. Patients with this history should not receive fluoroquinolones.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions during and for 5 days after therapy. Notify health care professional if a sunburn-like reaction or skin eruption occurs.
- Instruct patients being treated for gonorrhea that partners also must be treated.
- Instruct patient to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional immediately if rash, jaundice, signs of hypersensitivity, or tendon (shoulder, hand, Achilles, and other) pain or inflammation occur. Increased risk in >65 yrs old, taking corticosteroids concurrently, and taking ciprofloxacin, ofloxacin, and levofloxacin. Therapy should be discontinued.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Time for complete resolution depends on organism and site of infection.
- Post exposure treatment of inhalational anthrax or cutaneous anthrax (ciprofloxacin and levofloxacin).

Copyright © 2008 by F.A. Davis

HIGH ALERT

fluorouracil

(flure-oh-**yoor**-a-sill)
Adrucil, Efudex, Fluoroplex, 5-FU

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Pregnancy Category D

Indications

IV: Used alone and in combination with other modalities (surgery, radiation therapy, other antineoplastics) in the treatment of: Colon cancer, Breast cancer, Rectal cancer, Gastric cancer, Pancreatic carcinoma. **Topical:** Management of multiple actinic (solar) keratoses and superficial basal cell carcinomas.

Action

Inhibits DNA and RNA synthesis by preventing thymidine production (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Minimal absorption (5–10%) after topical application.
Distribution: Widely distributed; concentrates and persists in tumors.
Metabolism and Excretion: Converted to an active metabolite; undergoes hepatic metabolism with small amounts excreted unchanged in urine.
Half-life: 20 hr.

TIME/ACTION PROFILE (IV = effects on blood counts, Top = dermatologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–9 days	9–21 days (nadir)	30 days
Top	2–3 days	2–6 wk	1–2 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: Infections; Depressed bone marrow reserve; Other chronic debilitating illnesses; Obese patients, patients with edema or ascites (dose should be based on ideal body weight).

Adverse Reactions/Side Effects

More likely to occur with systemic use than with topical use.
CNS: acute cerebellar dysfunction. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, maculopapular rash, local inflammatory reactions (topical only), melanosis of nails, nail loss, palmar-plantar erythrodysesthesia, phototoxicity. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** thrombophlebitis. **Misc:** fever.

Interactions

Drug-Drug: Combination chemotherapy with **irinotecan** may produce unacceptable toxicity (dehydration, neutropenia, sepsis). Additive bone marrow depression with other **bone marrow depressants**, including other **antineoplastics** and **radiation therapy**. May decrease antibody response to **live-virus vaccines** and increase risk of adverse reactions.

Route/Dosage

Doses may vary greatly, depending on tumor, patient condition, and protocol used.

Advanced Colorectal Cancer

IV (Adults): 370 mg/m² preceded by leucovorin *or* 425 mg/m² preceded by leucovorin daily for 5 days. May be repeated q 4–5 wk.

Other Tumors

IV (Adults): *Initial dose*—12 mg/kg/day for 4 days, then 1 day of rest, then 6 mg/kg every other day for 4–5 doses *or* 7–12 mg/kg/day for 4 days followed by 3-day rest, then 7–10 mg/kg q 3–4 days for 3 doses. *Maintenance*—7–12 mg/kg q 7–10 days *or* 300–500 mg/m²/day for 4–5 days, repeated monthly (no single daily dose should exceed 800 mg). **Poor-Risk Patients:** 3–6 mg/kg/day on days 1–3, 3 mg/kg/day on days 5, 7, 9 (not to exceed 400 mg/dose). Doses of 370–425 mg/m²/day for 5 days have been used in combination with leucovorin.

Actinic (Solar) Keratoses/Superficial Basal Cell Carcinomas

Topical (Adults): *Actinic/solar keratoses*—1% solution or cream 1–2 times daily to lesions on head, neck, or chest; 2–5% solution or cream may be needed for hands. *Superficial basal cell carcinomas*—5% solution or cream twice daily for 3–6 wk (up to 12 wk).

Copyright © 2008 by F.A. Davis

Availability

Injection: 50 mg/ml in 10-ml ampules or 10-, 20-, and 100-ml vials. **Cream:** 1%, 5%. **Solution:** 1%, 2%, 5%.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Notify physician if symptoms of toxicity (stomatitis or esophagopharyngitis, uncontrollable vomiting, diarrhea, GI bleeding, myocardial ischemia, leukocyte count $<3500/mm^3$, platelet count $<100,000/mm^3$, or hemorrhage from any site) occur; drug will need to be discontinued. May be reinitiated at a lower dose when side effects have subsided
- Assess IV site frequently for inflammation or infiltration. Patient should notify nurse if pain or irritation at injection site occurs. May cause thrombophlebitis. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Report immediately. Standard treatment includes application of ice compresses.
- Assess skin for palmar-plantar erythrodysesthesia (tingling of hands and feet followed by pain, erythema, and swelling) throughout therapy.
- Monitor intake and output, appetite, and nutritional intake. GI effects usually occur on 4th day of therapy. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status
- Monitor patient for cerebellar dysfunction (weakness, ataxia, dizziness). This may persist after discontinuation of therapy.
- **Topical:** Inspect involved skin before and throughout therapy.
- ***Lab Test Considerations:*** May cause ↓ in plasma albumin.
- Monitor hepatic (AST, ALT, LDH, and serum bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) functions before and periodically throughout therapy. Monitor CBC daily during IV therapy. Report WBC of $<3500/mm^3$ or platelets $<100,000/mm^3$ immediately; they are criteria for discontinuation. Nadir of leukopenia usually occurs in 9–14 days, with recovery by day 30. May also cause thrombocytopenia.
- May cause ↑ in urine excretion of 5-hydroxyindoleacetic acid (5-HIAA).

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. The number 5 in 5-fluorouracil is part of the drug name and does not refer to the dosage.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 50 mg/ml. ***Rate:*** Rapid IV push administration (over 1–2 min) is most effective, but there is a more rapid onset of toxicity.
- **Intermittent Infusion:** ***Diluent:*** May be diluted with D5W or 0.9% NaCl. Use plastic IV tubing and IV bags to maintain greater stability of medication. Solution is stable for 24 hr at room temperature; do not refrigerate. Solution is colorless to faint yellow. Discard highly discolored or cloudy solution. If crystals form, dissolve by warming solution to 140°F, shaking vigorously, and cooling to body temperature. ***Concentration:*** Up to 50 mg/ml. ***Rate:*** Onset of toxicity is greatly delayed by administering an infusion over 2–8 hr.
- **Syringe Compatibility:** bleomycin, cisplatin, cyclophosphamide, furosemide, heparin, leucovorin, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Syringe Incompatibility:** droperidol, epirubicin.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, bleomycin, cefepime, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, etoposide, fludarabine, furosemide, gemcitabine, granisetron, heparin, hydrocortisone, leucovorin, linezolid, mannitol, melphalan, methotrexate, metoclopramide, mitomycin, paclitaxel, pemetrexed, piperacillin/tazobactam, potassium chloride, propofol, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vitamin B complex with C.
- **Y-Site Incompatibility:** aldesleukin, amphotericin B cholesteryl sulfate complex, droperidol, filgrastim, lansoprazole, topotecan, vinorelbine.
- **Additive Compatibility:** bleomycin, cyclophosphamide, D5/LR, etoposide, floxuridine, ifosfamide, methotrexate, mitoxantrone, vincristine.
- **Additive Incompatibility:** carboplatin, cisplatin, cytarabine, diazepam, doxorubicin, epirubicin, fentanyl, leucovorin, metoclopramide, morphine.
- **Topical:** Consult health care professional before administering topical preparations to determine which skin preparation regimen should be followed. Tight occlusive dressings are not advised because of irritation to surrounding healthy tissue. A loose gauze dressing for cosmetic purposes is usually preferred. Wear gloves when applying medication. Do not use metallic applicator.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Review with patient the need for contraception during therapy.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.
- **Topical:** Instruct patient in correct application of solution or cream. Emphasize importance of avoiding the eyes; caution should also be used when applying medication near mouth and nose. If patient uses clean finger to self-administer, emphasize importance of washing hands thoroughly after application. Explain that erythema, scaling, and blistering with pruritus and burning sensation are expected. Therapy is discontinued when erosion, ulceration, and necrosis occur in 2–6 wk (10–12 wk for basal cell carcinomas). Skin heals 4–8 wk later.

Evaluation/Desired Outcomes

- Tumor regression.
- Removal of solar keratoses or superficial basal cell skin cancers.

fluoxetine (floo-**ox**-uh-teen)
Prozac, Prozac Weekly, Sarafem

Classification
Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category B

Indications

Various forms of depression. OCD. Bulimia nervosa. Panic disorder. **Sarafem:** Management of premenstrual dysphoric disorder (PMDD). **Unlabeled uses:** Anorexia nervosa: ADHD, Diabetic neuropathy, Fibromyalgia, Obesity, Raynaud's phenomenon, Social anxiety disorder (social phobia), Post-traumactic stress disorder (PTSD).

Copyright © 2008 by F.A. Davis

Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action. Decreased behaviors associated with: panic disorder, bulimia. Decreased mood alterations associated with PMDD.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Crosses the blood-brain barrier.
Protein Binding: 94.5%.
Metabolism and Excretion: Converted by the liver to norfluoxetine, another antidepressant compound; fluoxetine and norfluoxetine are mostly metabolized by the liver; 12% excreted by kidneys as unchanged fluoxetine, 7% as unchanged norfluoxetine.
Half-life: 1–3 days (norfluoxetine 5–7 days).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use or use within 14 days of discontinuing MAO inhibitors (fluoxetine should be discontinued 5 weeks before MAO therapy is initiated).
Use Cautiously in: Severe hepatic or renal impairment (lower/less frequent dose may be necessary); History of seizures; Debilitated patients (↑ risk of seizures); Diabetes mellitus; Patients with concurrent chronic illness, or multiple drug therapy (dose adjustments may be necessary); Patients with impaired hepatic function (lower doses/increased dosing interval may be necessary); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; OB: Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. May cause sedation in infant; Lactation: May cause sedation in infant; discontinue drug or bottle-feed; Pedi: Risk of suicide ideation or attempt may be greater in children or adolescents (safe use in children <8 yr not established); Geri: Appears on Beers list. Geriatric patients are at increased risk for excessive CNS stimulation, sleep disturbances, and agitation.

Adverse Reactions/Side Effects

CNS: SEIZURES, anxiety, drowsiness, headache, insomnia, nervousness, abnormal dreams, dizziness, fatigue, hypomania, mania, weakness. **EENT:** stuffy nose, visual disturbances. **Resp:** cough. **CV:** chest pain, palpitations. **GI:** diarrhea, abdominal pain, abnormal taste, anorexia, constipation, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** sexual dysfunction, urinary frequency. **Derm:** excessive sweating, pruritus, erythema nodusum, flushing, rashes. **Endo:** dysmenorrhea. **MS:** arthralgia, back pain, myalgia. **Neuro:** tremor. **Misc:** allergic reactions, fever, flu-like syndrome, hot flashes, sensitivity reaction.

Interactions

Drug-Drug: Discontinue use of **MAO inhibitors** for 14 days before fluoxetine therapy; combined therapy may result in confusion, agitation, seizures, hypertension, and hyperpyrexia (serotonin syndrome). Fluoxetine should be discontinued for at least 5 wk before MAO inhibitor therapy is initiated. Inhibits the activity of cytochrome P450 2D6 enzyme in the liver and ↑ effects of drugs metabolized by this enzyme system. **Medications that inhibit the P450 enzyme system** (including **ritonavir**, **saquinavir**, and **efavirenz**) may ↑ risk of developing the serotonin syndrome). For concurrent use with **ritonavir** ↓ fluoxetine dose by 70%; if initiating fluoxetine, start with 10 mg/day dose. ↓ metabolism and ↑ effects of **alprazolam** (decrease alprazolam dose by 50%). ↑ CNS depression with **alcohol**, **antihistamines**, other **antidepressants**, **opioid analgesics**, or **sedative/hypnotics**. ↑ risk of side effects and adverse reactions with other **antidepressants**, **tryptophan**, **risperidone**, or **phenothiazines**. May ↑ effectiveness/risk of toxicity from **carbamazepine**, **clozapine**, **digoxin**, **haloperidol**, **phenytoin**, **lithium**, or **warfarin**. May ↓ the effects of **buspirone**. **Cyproheptadine** may decrease or reverse effects of fluoxetine. May ↑ sensitivity to **adrenergics** and increase the risk of serotonin syndrome. May alter the activity of other **drugs that are highly bound to plasma proteins**.
Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe.**

Route/Dosage

PO (Adults): *Depression, OCD*—20 mg/day in the morning. After several weeks, may increase by 20 mg/day at weekly intervals. Doses greater than 20 mg/day should be given in 2 di-

Copyright © 2008 by F.A. Davis

vided doses, in the morning and at noon (not to exceed 80 mg/day). Patients who have been stabilized on the 20 mg/day dose may be switched over to delayed-release capsules (Prozac Weekly) at dose of 90 mg weekly, initiated 7 days after the last 20 mg dose. *Panic disorder*—10 mg/day initially, may increase after one week to 20 mg/day (usual dose is 20 mg, but may be increased as needed/tolerated up to 60 mg/day). *Bulimia nervosa*—60 mg/day (may need to titrate up to dosage over several days). *PMDD*—20 mg/day (not to exceed 80 mg/day) *or* 20 mg/day starting 14 days prior to expected onset on menses, continued through first full day of menstruation, repeated with each cycle.
PO (Geriatric Patients): *Depression*—10 mg/day in the morning initially, may be increased (not to exceed 60 mg/day).
PO (Children 7–17 yr): *adolescents and higher weight children*— 10 mg/day may be increased after 2 wk to 20 mg/day; additional increases may be made after several more weeks (range 20–60 mg/day); *lower-weight children*—10 mg/day initially, may be increased after several more weeks (range 20–30 mg/day).

Availability (generic available)

Tablets: 10 mg, 20 mg. **Cost:** *Generic*—10 mg $47.98/90, 20 mg $62.97/90. **Capsules:** 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg $48.97/90, 20 mg $26.99/90, 40 mg $119.97/90. **Delayed-release capsules (Prozac Weekly):** 90 mg. **Cost:** $110.99/4. **Oral solution (mint flavor):** 20 mg/5 ml. **Cost:** *Generic*—$72.98/120 ml. ***In combination with:*** olanzapine (Symbyax; see Appendix B).

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient
- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status
- Assess patient for sensitivity reaction (urticaria, fever, arthralgia, edema, carpal tunnel syndrome, rash, hives, lymphadenopathy, respiratory distress) and notify health care professional if present; symptoms usually resolve by stopping fluoxetine but may require administration of antihistamines or corticosteroids.
- Assess for sexual side effects (erectile dysfunction; decreased libido).
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Bulimia Nervosa:** Assess frequency of binge eating and vomiting during therapy.
- **PMDD:** Monitor patient's mood prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Notify physician or other health care professional if leukopenia, anemia, thrombocytopenia, or increased bleeding time occurs.
- Proteinuria and mild ↑ in AST may occur during sensitivity reactions.
- May cause ↑ in serum alkaline phosphatase, ALT, BUN, creatine phosphokinase; hypouricemia, hypocalcemia, hypoglycemia or hyperglycemia, and hyponatremia.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse Sarafem (fluoxetine) with Serophene (clomiphene).
- **PO:** Administer as a single dose in the morning. Some patients may require increased amounts, in divided doses, with a 2nd dose at noon.
- May be administered with food to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take fluoxetine as directed. If a dose is missed, omit and return to regular schedule. Do not double doses or discontinue without consulting health care professional; discontinuation may cause anxiety, insomnia, nervousness.
- May cause drowsiness, dizziness, impaired judgment, and blurred vision. Caution patient

Copyright © 2008 by F.A. Davis

to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to consult health care professional before taking other medications or natural/herbal products with fluoxetine.
- Caution patient to change positions slowly to minimize dizziness.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Inform patient that medication may cause decreased libido.
- Advise patient to notify health care professional if symptoms of sensitivity reaction occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.
- May be augmented with benzodiazepine to treat jitteriness or anxiety.
- Refer patient/family to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in binge eating and vomiting in patients with bulimia nervosa.
- Decreased incidence frequency of panic attacks.
- Decreased mood alterations associated with PMDD.

fluphenazine (floo-**fen**-a-zeen)

Apo-Fluphenazine, Modecate Concentrate, PMS-Fluphenazine, Prolixin, Prolixin Decanoate

Classification
Therapeutic: antipsychotics
Pharmacologic: phenothiazines

Pregnancy Category C

Indications

Acute and chronic psychoses.

Action

Alters the effects of dopamine in the CNS. Has anticholinergic and alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs and symptoms of psychoses.

Pharmacokinetics

Absorption: Well absorbed after PO/IM administration. Decanoate salt in sesame oil has delayed onset and prolonged action because of delayed release from oil vehicle and subsequent delayed release from fatty tissues.
Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Highly metabolized by the liver; undergo enterohepatic recirculation.
Half-life: *Fluphenazine hydrochloride*—33 hr; *fluphenazine decanoate*—6.8–9.6 days.

TIME/ACTION PROFILE (antipsychotic activity)

ROUTE	ONSET	PEAK	DURATION
PO hydrochloride	1 hr	unknown	6–8 hr
IM decanoate	24–72 hr	48–96 hr	≥4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other phenothiazines may exist; Subcortical brain damage; Severe CNS depression; Coma; Bone marrow depression; Liver disease; Hypersensitivity to sesame oil (decanoate salt); Some products contain alcohol or tartrazine and should be avoided in patients with known intolerance; Concurrent use of drugs that prolong the QT interval; Pedi: Safety not established in children <6 months.
Use Cautiously in: Cardiovascular disease; Parkinson's disease; Angle-closure glaucoma; Myasthenia gravis; Prostatic hypertrophy; Seizure disorders; OB, Lactation: Enters breast milk, not recommended; Geri: Initial dosage re-

Copyright © 2008 by F.A. Davis

duction may be necessary in geriatric or debilitated patients.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, extrapyramidal reactions, sedation, tardive dyskinesia. **EENT:** blurred vision, dry eyes. **CV:** hypertension, hypotension, tachycardia. **GI:** anorexia, constipation, drug-induced hepatitis, dry mouth, ileus, nausea, weight gain. **GU:** urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia, thrombocytopenia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Concurrent use with drugs that prolong the QT interval, including **antiarrhythmics**, **pimozide**, **erythromycin**, **clarithromycin**, **fluoroquinolones**, **methadone**, and **tricyclic antidepressants** may ↑ the risk for arrhythmias; concurrent use should be avoided. Additive hypotension with **antihypertensives**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioids**, **sedative/hypnotics**, or **general anesthetics**. **Phenobarbital** may increase metabolism and decrease effectiveness of fluphenazine. May ↑ the risk of **lithium** toxicity. **Aluminum-containing antacids** may decrease oral absorption of fluphenazine. May decrease anti-Parkinson activity of **levodopa** and **bromocriptine**. May decrease the vasopressor response to **epinephrine** and **norepinephrine**. **Beta-blockers**, **chlorpromazine**, **chloroquine**, **delavirdine**, **fluoxetine**, **paroxetine**, **quinidine**, **quinine**, **ritonavir**, and **ropinirole** may ↑ the effects of fluphenazine. Increased risk of anticholinergic effects with other **agents having anticholinergic properties**, including **antihistamines**, **tricyclic antidepressants**, **disopyramide**, or **quinidine**. **Metoclopramide** may ↑ the risk of extrapyramidal reactions.

Route/Dosage

Fluphenazine Decanoate

IM (Adults): 12.5–25 mg initially; may be repeated q 3 wk. Dosage may be slowly increased as needed (not to exceed 100 mg/dose).

Fluphenazine Hydrochloride

PO (Adults): 0.5–10 mg/day in divided doses q 6–8 hr (maximum dose = 40 mg/day).
PO (Geriatric Patients or Debilitated Patients): 1–2.5 mg/day initially; increase dose every 4–7 days by 1–2.5 mg/day as needed (max dose = 20 mg/day).
IM (Adults): 1.25–2.5 mg q 6–8 hr.

Availability (generic available)

Fluphenazine decanoate injection: 25 mg/ml, ✱100 mg/ml. **Fluphenazine hydrochloride tablets:** 1 mg, 2.5 mg, 5 mg^{Rx}, 10 mg. **Fluphenazine hydrochloride elixir (orange flavor):** 2.5 mg/5 ml. **Fluphenazine hydrochloride concentrate:** 5 mg/ml. **Fluphenazine hydrochloride injection:** 2.5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during the period of dose adjustment. May cause Q-wave and T-wave changes in ECG.
- Observe patient carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or

Copyright © 2008 by F.A. Davis

worm-like movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- ***Lab Test Considerations:*** Evaluate CBC, liver function tests, and ocular examinations periodically during therapy. May cause ↓ hematocrit, hemoglobin, leukocytes, granulocytes, and platelets. May cause ↑ bilirubin, AST, ALT, and alkaline phosphatase. Agranulocytosis may occur after 4–10 wk of therapy with recovery 1–2 wk after discontinuation. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Slight yellow to amber color does not alter potency.
- To prevent contact dermatitis, avoid getting liquid preparations on hands and wash hands thoroughly if spillage occurs.
- Injectable forms must be drawn up with a dry syringe and dry 21-gauge needle to prevent clouding of the solution.
- **PO:** Dilute concentrate just before administration in 120–240 ml of water, milk, carbonated beverage, soup, or tomato or fruit juice. Do not mix with beverages containing caffeine (cola, coffee), tannics (tea), or pectinates (apple juice).
- **Subcut:** Fluphenazine decanoate is dissolved in sesame oil for long duration of action. It may be administered subcut or IM. 12.5 mg of fluphenazine decanoate given every 3 wk is approximately equivalent to 10 mg/day orally of fluphenazine hydrochloride.
- **IM:** IM dose of fluphenazine hydrochloride is usually 30–50% of oral dose. Because fluphenazine hydrochloride has a shorter duration of action, it is used initially to determine the patient's response to the drug and to treat the acutely agitated patient.
- Administer deep IM, using a dry syringe and 21-gauge needle, into dorsal gluteal site. Instruct patient to remain recumbent for 30 min to prevent hypotension.
- **Syringe Compatibility:** Fluphenazine hydrocholride is compatible in syringe with benztropine, diphenhydramine, hydroxyzine.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to skip doses or double up on missed doses. If a dose is missed, take within 1 hr or skip dose and return to regular schedule if taking more than 1 dose/day; take as soon as possible unless almost time for next dose if taking 1 dose/day. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Exposed surfaces may develop a blue-gray pigmentation, which may fade after discontinuation of the medication. Extremes of temperature should also be avoided because this drug impairs body temperature regulation.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dry mouth. Health care professional should be notified if dry mouth persists beyond 2 wk.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams, including ocular exams, with long-term therapy and continued participation in psychotherapy.

Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.

Copyright © 2008 by F.A. Davis

flurandrenolide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

flurazepam (flur-**az**-e-pam)

Apo-Flurazepam, Dalmane, Novoflupam, Somnol

Classification

Therapeutic: sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category UK

Indications

Short-term management of insomnia (<4 wk).

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of insomnia.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed; crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation of drug occurs with chronic dosing.
Protein Binding: 97% (one of the active metabolites).
Metabolism and Excretion: Metabolized by the liver; some metabolites have hypnotic activity.
Half-life: 2.3 hr (half-life of active metabolite may be 30–200 hr).

TIME/ACTION PROFILE (hypnotic activity)

ROUTE	ONSET	PEAK	DURATION
PO	15–45 min	0.5–1 hr	7–8 hr

Contraindications/Precautions

Contraindicated in: Impaired repiratory function; Impaired repiratory function; Sleep apnea; Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; OB: Infants may experience withdrawal effects; Lactation: Enters breast milk; discontinue or bottle-feed.

Use Cautiously in: Hepatic dysfunction (dosage reduction may be necessary); History of suicide attempt or drug dependence; Geri: Appears on Beers list and is associated with increased falls risk in geriatric patients; Debilitated patients (initial dose reduction may be necessary); Pedi: Safety not established in children <15 yr.

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, confusion, daytime drowsiness, decreased concentration, dizziness, hallucinations, headache, lethargy, mental depression, paradoxical excitation, sleep—driving. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** rashes. **Neuro:** ataxia. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Concurrent use with **alcohol**, **antidepressants**, **antihistamines**, and **opioids** may result in additive CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ metabolism of flurazepam, enhancing its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and decrease ↓ effectiveness of flurazepam. Sedative effects may be ↓ by **theophylline**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): 15–30 mg at bedtime.
PO (Geriatric Patients or Debilitated Patients): 15 mg initially, may be increased.

Availability (generic available)

Capsules: 15 mg, 30 mg. **Tablets:** 15 mg, 30 mg.

NURSING IMPLICATIONS

Assessment

- Assess sleep patterns before and periodically throughout therapy.
- Assess mental status (orientation, mood, behavior) and potential for abuse prior to administering medication.
- Prolonged use may lead to psychological or physical dependence. Restrict amount of

Copyright © 2008 by F.A. Davis

drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- Geri: Assess fall risk and institute prevention strategies.

Potential Nursing Diagnoses
Insomnia (Indications)
Ineffective coping (Indications)
Sleep deprivation (Indications)
Risk for falls (Side Effects)
Acute confusion (Side Effects)
Risk for injury (Side Effects)

Implementation
- Do not confuse flurazepam with temazepam.
- Supervise ambulation and transfer of patients after administration. Remove cigarettes. Two side rails should be raised and call bell within reach at all times.
- When discontinuing, taper to decrease chance of withdrawal effects (may take months in some patients).
- **PO:** Capsules may be opened and mixed with food or fluids for patients having difficulty swallowing.

Patient/Family Teaching
- Advise patient to take medication exactly as directed.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nictotine and caffeine).
- Maximum hypnotic properties are apparent 2–3 nights after initiating therapy and may last 1–2 nights after therapy is discontinued.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Refer for psychotherapy if ineffective coping is basis for sleep pattern disturbance.
- OB: Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Geri: Caution patient or family to institute fall prevention strategies at home.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.

Evaluation/Desired Outcomes
- Improvement in sleep patterns (decreased number of night time awakenings, improved sleep onset, and increased total sleep time).

fluticasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), CORTICOSTEROIDS (TOPICAL/LOCAL).

fluvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

fluvoxamine
(floo-**voks**-a-meen)
Luvox

Classification
Therapeutic: antidepressants, antiobsessive agents
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category C

Indications
Obsessive-compulsive disorder (OCD). **Unlabeled uses:** Depression. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PSTD).

Action
Inhibits the reuptake of serotonin in the CNS.
Therapeutic Effects: Decrease in obsessive-compulsive behaviors.

Pharmacokinetics
Absorption: 53% absorbed after oral administration.
Distribution: Excreted in breast milk; enters the CNS. Remainder of distribution not known.
Metabolism and Excretion: Eliminated mostly by the kidneys.
Half-life: 13.6–15.6 hr.

TIME/ACTION PROFILE (improvement on obsessive-compulsive behaviors)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–3 wk	several mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to fluvoxamine or other SSRIs; Concurrent use or use within 14 days of discontinuing MAOI, alosetron, pimozide, thioridazine, or tizanidine.
Use Cautiously in: Impaired hepatic function; OB: Neonates exposed to SSRI in third trimester

Copyright © 2008 by F.A. Davis

may develop drug discontinuation syndrome including respiratory distress, feeding difficulty, and irritability; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established in children <8 yr; Geri: Geriatric patients may have increased sensitivity; recommend lower initial dose and slower dosage titration.

Adverse Reactions/Side Effects

CNS: sedation, dizziness, drowsiness, headache, insomnia, nervousness, weakness, agitation, anxiety, apathy, emotional lability, manic reactions, mental depression, psychotic reactions, syncope. **EENT:** sinusitis. **Resp:** cough, dyspnea. **CV:** edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, anorexia, dysphagia, elevated liver enzymes, flatulence, weight gain (unusual), vomiting. **GU:** decreased libido/sexual dysfunction. **Derm:** excessive sweating. **Metab:** weight gain, weight loss. **MS:** hypertonia, myoclonus/twitching. **Neuro:** hypokinesia/hyperkinesia, tremor. **Misc:** allergic reactions, chills, flu-like symptoms, tooth disorder/caries, yawning.

Interactions

Drug-Drug: Serious, potentially fatal reactions (serotonin syndrome) may occur with **MAO inhibitors**. **Smoking** may ↓ effectiveness of fluvoxamine. Concurrent use with **tricyclic antidepressants** may ↑ plasma levels of fluvoxamine. ↓ metabolism and may ↑ effects of some **beta blockers** (**propranolol**), **alosetron** (avoid concurrent use), some **benzodiazepines** (avoid concurrent **diazepam**), **carbamazepine**, **methadone**, **lithium**, **theophylline** (↓ dose to 33% of usual dose), **tolbutamide**, **warfarin**, and **L-tryptophan**. ↑ blood levels and risk of toxicity from **clozapine** (dosage adjustments may be necessary).

Route/Dosage

PO (Adults): *Initial dose*—50 mg daily at bedtime; increase by 50 mg q 4–7 days until desired effect is achieved. If daily dose >100 mg, give in two equally divided doses or give a larger dose at bedtime (not to exceed 300 mg/day). *Maintenance dose*—Make periodic adjustments to maintain lowest possible dose to control symptoms.

PO (Children 8–17 yr): 25 mg at bedtime, may increase by 25 mg/day q 4–7 days (not to exceed 200 mg/day; daily doses >50 mg should be given in divided doses with a larger dose at bedtime).

Hepatic Impairment

PO (Adults): 25 mg daily at bedtime initially, slower titration and longer dosing intervals should be used.

Availability

Tablets: 25 mg, 50 mg, 100 mg.

F

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor appetite and nutritional intake. Weigh weekly. Report significant changes in weight. Adjust diet as tolerated to support nutritional status.
- ***Toxicity and Overdose:*** Common symptoms of toxicity include drowsiness, vomiting, diarrhea, and dizziness. Coma, tachycardia, bradycardia, hypotension, ECG abnormalities, liver function abnormalities, and convulsions may also occur. Treatment is symptomatic and supportive.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Taper to avoid withdrawal effects. Reduce dose by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Initial therapy is administered as a single bedtime dose. May be increased every 4–7 days as tolerated.
- Fluvoxamine may be given without regard to meals.

Patient/Family Teaching

- Instruct patient to take fluvoxamine exactly as directed. Do not skip or double up on missed doses. Improvement in symptoms may be no-

Copyright © 2008 by F.A. Davis

ticed in 2–3 wk, but medication should be continued as directed.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol or other CNS depressants during therapy and to consult health care professional before taking other medications with fluvoxamine.
- Instruct female patients to notify health care professional if breastfeeding or if pregnancy is planned or suspected.
- Advise patient to notify health care professional if rash or hives occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Emphasize the importance of follow-up exams to monitor progress.
- Advise patient to avoid use of caffeine (chocolate, tea, cola).
- Refer patient to psychotherapy to improve coping skills and/or to an OCD support group.

Evaluation/Desired Outcomes
- Decrease in symptoms of obsessive-compulsive disorder.

folic acid (foe-lik a-sid)
Apo-Folic, folate, Folvite, Novofolacid, vitamin B

Classification
Therapeutic: antianemics, vitamins
Pharmacologic: water soluble vitamins

Pregnancy Category A

Indications
Prevention and treatment of megaloblastic and macrocytic anemias. Given during pregnancy to promote normal fetal development.

Action
Required for protein synthesis and red blood cell function. Stimulates the production of red blood cells, white blood cells, and platelets. Necessary for normal fetal development. **Therapeutic Effects:** Restoration and maintenance of normal hematopoiesis.

Pharmacokinetics
Absorption: Well absorbed from the GI tract and IM and subcut sites.
Distribution: Half of all stores are in the liver. Enters breast milk. Crosses the placenta.
Protein Binding: Extensive.
Metabolism and Excretion: Converted by the liver to its active metabolite, dihydrofolate reductase. Excess amounts are excreted unchanged by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (increase in reticulocyte count)

ROUTE	ONSET	PEAK	DURATION
PO, IM, subcut, IV	30–60 min	1 hr	unknown

Contraindications/Precautions
Contraindicated in: Uncorrected pernicious, aplastic, or normocytic anemias (neurologic damage will progress despite correction of hematologic abnormalities); Preparations containing benzyl alcohol should not be used in newborns.
Use Cautiously in: Undiagnosed anemias.

Adverse Reactions/Side Effects
Derm: rashes.
CNS: irritability, difficulty sleeping, malaise, confusion. **Misc:** fever.

Interactions
Drug-Drug: Pyrimethamine, **methotrexate**, **trimethoprim**, and **triamterene** prevent the activation of folic acid (leucovorin should be used instead to treat overdoses of these drugs). Absorption of folic acid is ↓ by **sulfonamides** (including **sulfasalazine**), **anatacids**, and **cholestyramine**. Folic acid requirements are ↑ by **estrogens**, **phenytoin**, **phenobarbital**, **primidone**, **carbamazepine**, or **corticosteroids**. May ↓ **phenytoin** serum concentration.

Route/Dosage

Therapeutic Dose (Folic acid deficiency)
PO, IM, IV, Subcut (Adults and Children >11 yr): 1 mg/day initial dosage then 0.5 mg/day maintenance dose.
PO, IM, IV, Subcut (Children >1 yr): 1 mg/day initial dosage then 0.1–0.4 mg/day maintenance dose.
PO, IM, IV, Subcut (Infants): 15 mcg/kg/dose daily or 50 mcg/day.

Recommended Daily Allowance
PO (Adults and Children >15 yr): 0.2 mg/day.

Copyright © 2008 by F.A. Davis

PO (Adults, Pregnant or Lactating): 0.4 mg/day.
PO (Children 11–14 yr): 0.15 mg/day.
PO (Children 7–10 yr): 0.1 mg/day.
PO (Children 4–6 yr): 0.075 mg/day.
PO (Infants 6 months–3 yr): 0.05 mg/day.

Availability (generic available)

Tablets: 0.4 mg, 0.8 mg, 1 mg, ✱5 mg. **Injection:** 5 mg/ml. ***In combination with:*** other vitamins and minerals as multiple vitamins Rx, OTC.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of megaloblastic anemia (fatigue, weakness, dyspnea) before and periodically throughout therapy.
- ***Lab Test Considerations:*** Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count before and periodically during therapy.
- May cause ↓ serum concentrations of other B complex vitamins when given in high continuous doses.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Activity intolerance (Indications)

Implementation

- Do not confuse folic acid with folinic acid (leucovorin calcium).
- Because of infrequency of solitary vitamin deficiencies, combinations are commonly administered (see Appendix B).
- May be given subcut, deep IM, or IV when PO route is not feasible.
- **PO:** Antacids should be given at least 2 hr after folic acid; folic acid should be given 2 hr before or 4–6 hr after cholestyramine. A 50-mcg/ml oral solution may be extemporaneously prepared by pharmacy for use in neonates and infants.
- **IV:** Solution ranges from yellow to orange-yellow in color.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute with dextrose or 0.9%NaCl. ***Concentration:*** 0.1 mg/ml. ***Rate:*** 5 mg/min.
- **Continuous Infusion:** May be added to hyperalimentation solution.
- **Y-Site Compatibility:** famotidine.
- **Additive Compatibility:** D20W.
- **Additive Incompatibility:** D50W, calcium gluconate.

Patient/Family Teaching

- Encourage patient to comply with diet recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups. A diet low in vitamin B and folate will be used to diagnose folic acid deficiency without concealing pernicious anemia.
- Foods high in folic acid include vegetables, fruits, and organ meats; heat destroys folic acid in foods.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproven and may cause side effects.
- Explain that folic acid may make urine more intensely yellow.
- Instruct patient to notify health care professional if rash occurs, which may indicate hypersensitivity.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Reticulocytosis 2–5 days after beginning therapy.
- Resolution of symptoms of megaloblastic anemia.

HIGH ALERT

fondaparinux

(fon-da-**par**-i-nux)
Arixtra

Classification
Therapeutic: anticoagulants
Pharmacologic: active factor X inhibitors

Pregnancy Category B

Indications

Prevention and treatment of deep vein thrombosis and pulmonary embolism. **Unlabeled uses:** Systemic anticoagulation for other diagnoses.

Action

Binds selectively to antithrombin III (AT III). This binding potentiates the neutralization (in-

Copyright © 2008 by F.A. Davis

activation) of active factor X (Xa). **Therapeutic Effects:** Interruption of the coagulation cascade resulting in inhibition of thrombus formation. Prevention of thrombus formation decreases the risk of pulmonary emboli.

Pharmacokinetics

Absorption: 100% absorbed following subcutaneous administration.
Distribution: Distributes mainly throughout the intravascular space.
Metabolism and Excretion: Eliminated mainly unchanged in urine.
Half-life: 17–21 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (CCr <30 ml/min; increased risk of bleeding); Body weight <50 kg in patients undergoing hip replacement (markedly increased risk of bleeding); Active major bleeding; Bacterial endocarditis; Thrombocytopenia due to fonaparinux antibodies.
Use Cautiously in: Mild-to-moderate renal impairment; Retinopathy (hypertensive or diabetic); Untreated hypertension; Recent history of ulcer disease; History of congenital or acquired bleeding disorder; Geri: Patients >65 yr (increased risk of bleeding); Malignancy; History of heparin-induced thrombocytopenia; OB, Pedi: Pregnancy, lactation, or children (safety not established; use during pregnancy only if clearly needed)
Exercise Extreme Caution in: Severe uncontrolled hypertension; Bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; Spinal/epidural anesthesia or spinal puncture (increased risk of spinal/epidural hematoma that may lead to long-term or permanent paralysis).

Adverse Reactions/Side Effects

CNS: confusion, dizziness, headache, insomnia. **CV:** edema, hypotension. **GI:** constipation, diarrhea, dyspepsia, increased serum aminotransferases, nausea, vomiting. **GU:** urinary retention. **Derm:** bullous eruption, hematoma, purpura, rash. **Hemat:** bleeding, thrombocytopenia. **F and E:** hypokalemia. **Misc:** fever, increased wound drainage.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **warfarin** or **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **dipyridamole**, some **cephalosporins**, **valproates**, **clopidogrel**, **ticlopidine**, **abciximab**, **eftifibatide**, **tirofiban**, and **dextran**.
Drug-Natural Products: ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

Route/Dosage

Treatment of DVT/PE

Subcut (Adults): *<50 kg* 5—mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); warfarin may be started within 72 hr of fondaparinux (has been used for up to 26 days). *50–100 kg*—7.5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days). *>100 kg*—10 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for for two consecutive days); warfarin may be started within 72 hr of fondaparinux.

Prevention of DVT/PE

Subcut (Adults): 2.5 mg once daily, starting 6–8 hr after surgery, continuing for 5–9 days (up to 11 days) following abdominal surgery or knee/hip replacement or continuing for 24 days following hip fracture surgery (up to 32 days).

Availability

Solution for subcut injection: 2.5 mg/0.5 ml in prefilled syringes, 5 mg/0.4 ml in prefilled syringes, 7.5 mg/0.6 ml in prefilled syringes, 10 mg/0.8 ml in prefilled syringes.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit; sudden drop in blood pressure; guaiac positive stools); bleeding from surgical site. Notify physician if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status fre-

Copyright © 2008 by F.A. Davis

quently for signs of impairment. May require urgent treatment.

- ***Lab Test Considerations:*** Monitor platelet count closely; may cause thrombocytopenia. If platelet count is <100,000/mm^3, discontinue fondaparinux.
- Fondaparinux is not accurately measured by prothrombin time (PT), activated thromboplastin time (aPTT), or international standards of heparin or low-molecular-weight heparins. If unexpected changes in coagulation parameters or major bleeding occurs, discontinue fondaparinux.
- Monitor CBC, serum creatinine levels, and stool occult blood tests routinely during therapy.
- May cause asymptomatic ↑ in AST and ALT. Elevations are fully reversible and not associated with ↑ in bilirubin.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

Implementation

- Fondaparinux cannot be used interchangeably with heparin, low-molecular-weight heparins, or heparinoids as they differ in manufacturing process, anti-Xa and anti-IIa activity, units, and dosage. Each of these medications has its own instructions for use.
- Initial dose should be administered 6-8 hr after surgery. Administration before 6 hr after surgery has been associated with risk of major bleeding.
- **Subcut:** Administer subcut only into fatty tissue, alternating sites between right and left anterolateral or posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter. Do not mix with other injections.
- Fondaparinux is provided in a single-dose prefilled syringe with an automatic needle protection system. Do not expel air bubble from prefilled syringe before injection to prevent loss of drug.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional during therapy.

Evaluation/Desired Outcomes

- Prevention and treatment of deep vein thrombosis and pulmonary embolism.

formoterol (for-**mo**-te-role)
Foradil, Perforomist

Classification
Therapeutic: bronchodilators
Pharmacologic: adrenergics

Pregnancy Category C

Indications

Long-term maintenance treatment of asthma. Prevention of bronchospasm in reversible obstructive airways disease, including. Long-term management of bronchoconstriction associated with COPD including chronic bronchitis and emphysema. Acute prevention of exercise-induced bronchospasm, when used on an occasional, as needed, basis. Maintenance treatment of emphysema and chronic bronchitis.

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors, resulting in relaxation of airway smooth muscle. Relatively specific for beta$_2$ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Following inhalation, majority of inhaled drug is swallowed and absorbed.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; 10–18% excreted unchanged in urine.
Half-life: 10 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
inhalation	15 min	1–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attack of asthma (onset of action is delayed).
Use Cautiously in: Cardiovascular disease (including angina and hypertension); Diabetes; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); OB, Pedi: Pregnancy, lactation, or children <5 yr (may inhibit contractions during labor; use only if potential benefits outweigh risks).

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, insomnia, malaise, nervousness. **Resp:** PARADOXICAL BRONCHOSPASM. **CV:** angina, arrhythmias, hypertension, hypotension, palpitations, tachycardia. **GI:** dry mouth, nausea. **F and E:** hypokalemia. **Metab:** hyperglycemia, metabolic acidosis. **MS:** muscle cramps. **Neuro:** tremor. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors, tricyclic antidepressants** or other **agents that may prolong the QTc interval** may result in serious arrhythmias and should be undertaken with extreme caution. ↑ risk of hypokalemia with **theophylline**, **corticosteroids**, **potassium-losing diuretics**. **Beta blockers** may ↓ therapeutic effects of formoterol. ↑ adrenergic effects may occur with concurrent use of **adrenergics**.

Route/Dosage

Maintenance Treatment of Asthma

Inhaln (Adults and Children ≥5 yr): 1 capsule (12 mcg) every 12 hr using the Aerolizer Inhaler.

Prevention of Exercise-Induced Bronchospasm

Inhaln (Adults and Children ≥12 yr): 1 capsule (12 mcg) at least 15 min before exercise on an occasional as-needed basis.

Maintenance Treatment of Emphysema and Chronic Bronchitis

Inhaln (Adults): 20 mcg/2 mL-unit-dose vial twice daily via jet nebulizer.

Availability

Capsule for Aerolizer use: 12 mcg. **Vials for nebulization:** 20 mcg/2 mL. ***In combination with:*** budesonide (Symbicort; see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating and periodically therapy to determine effectiveness of medication.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify physician or other health care provider immediately.
- Monitor ECG periodically during therapy. May cause prolonged QTc interval.
- Monitor patient for signs of anaphylaxis (dyspnea, rash, laryngeal edema) throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and decreased serum potassium.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **Inhaln:** *For use with inhaler:* Place capsule in the well of the Aerolizer Inhaler with dry hands; do not expose to moisture. The capsule is pierced by pressing and releasing the buttons on the side of the device. Medication is dispersed into the air stream when patient inhales rapidly and deeply through mouthpiece. Capsules are only to be used with Aerolizer Inhaler and should not be taken orally. Store capsules in the blister and only remove immediately before use. Store inhaler in a level, horizontal position. Aerolizer Inhaler should never be washed and should be kept dry.
- Do not use a spacer with fomoterol.
- To use, pull off the Aerolizer cover. Hold the base of the inhaler firmly, and twist mouthpiece in the direction of the arrow to open. Push the buttons in to make sure four pins are visible in the capsule well on each side. Remove capsule from blister pack immediately before use. Separate one blistered cap-

Copyright © 2008 by F.A. Davis

sule by tearing at perforations. With foil-side up, fold back along perforation and flatten. Starting at slit, tear off corner; separate and peel foil from paper backing and remove capsule. Place capsule in the capsule chamber in the base of the Aerolizer Inhaler. Never place a capsule directly into the mouthpiece. Twist the mouthpiece back to the closed position. With the mouthpiece upright, simultaneously press both buttons only once. A click should be heard as the capsule is being pierced. Release buttons; if buttons stick in depressed position grasp wings on buttons and retract before inhalation. With patient sitting or standing in a comfortable upright position, exhale fully. Do not exhale into the device. Tilt head back slightly and breathe in rapidly but steadily. A sweet taste will be experienced and a whirring noise heard. If no whirring is heard, the capsule may be stuck. Open inhaler and loosen capsule allowing it to spin freely. Do not repeatedly press buttons to loosen capsule. Hold breath for as long as comfortably possible after removing inhaler from mouth. Open inhaler to see if any powder is still in capsule. If powder is found, repeat inhalation steps. After use, open, remove and discard empty capsule.

- **Inhaln:** *For use with nebulizer:* Administer via standard jet nebulizer via mouthpiece or face mask. Remove vial from foil immediately prior to use and discard via after use. May be stored in refrigerator for up to 3 months.

Patient/Family Teaching

- Instruct patient to take fomoterol as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If on a scheduled dosing regimen, take a missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 2 times a day or less than 12 hr apart; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication Instruct patient to review medication guide with each Rx refill.
- Advise patient to have a rapid-acting bronchodilator available for use at all times for symptomatic relief of acute asthma attacks.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, or sleeplessness occur.
- Instruct patient to notify health care professional if there is no response to the usual dose of fomoterol. Asthma and treatment regimen should be re-evaluated and corticosteroids should be considered. Need for increased use to treat symptoms indicates decrease in asthma control and need to re-evaluate therapy.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if nursing.
- **Inhaler:** Instruct patient on correct technique for use of Aerolizer Inhaler. Advise patient always to use new Aerolizer Inhaler that comes with each refill. Take sticker with "use by" date written by pharmacist from the outside of the box and place it on the Aerolizer Inhaler cover. If the date is blank, count 4 months from the date of purchase and write date on sticker. Use new inhaler and blister pack following the "use by" date.
- Inform patient that in rare cases capsule might break into small pieces. These pieces should be retained by the screen in the inhaler, however in rare instances tiny pieces may reach mouth or throat after inhalation. Shattering of capsule is less likely to happen if storage conditions are strictly followed, capsules removed from blister immediately before use, and capsules are only pierced once.

Evaluation/Desired Outcomes

- Prevention of bronchospasm.

Copyright © 2008 by F.A. Davis

fosamprenavir calcium

(fos-am-**pren**-a-veer)
Lexiva

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Pregnancy Category C

Indications

With other antiretrovirals in the management of HIV infection.

Action

Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV and its sequelae.

Pharmacokinetics

Absorption: Fosamprenavir is a prodrug. Following oral administration, it is rapidly converted to amprenavir by the gut lining during absorption.
Distribution: Penetration into RBCs is concentration dependent.
Metabolism and Excretion: Mostly metabolized the liver (CYP3A4 enzyme system). Minimal renal excretion.
Half-life: 7.7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.5–4 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity, sulfonamide/sulfa hypersensitivity; Severe hepatic impairment; Concurrent use of flecainide, propafenone, rifampin, ergot derivatives, St. John's wort, lovastatin, simvastatin, pimozide, delavirdine, midazolam or triazolam.
Use Cautiously in: Geri: Geriatric patients (consider age-related decrease in body mass, cardiac/hepatic/renal impairment, concurrent illness and medications); Mild to moderate hepatic impairment; Concurrent use of medications handled by or affecting the CYP3A4 enzyme system (may require serum level monitoring, dose or dosing interval alterations); OB, Pedi: Pregnancy, lactation, children (safety not established; breast feeding not recommended in HIV-infected patients).

Adverse Reactions/Side Effects

Reflects use with other antiretrovirals.
CNS: headache, fatigue, mood disorders. **GI:** diarrhea, nausea, vomiting, abdominal pain, ↑ liver enzymes. **Derm:** rash. **Endo:** glucose intolerance. **Hemat:** neutropenia. **Metab:** fat redistribution, ↑ triglycerides. **Misc:** allergic reactions including STEVENS-JOHNSON SYNDROME, inflammatory response to opportunistic infection.

Interactions

Drug-Drug: Amprenavir, the active moiety of fosamprenavir is metabolized by CYP3A4; it also inhibits and induces this enzyme system. The action of any other medication that is also handled by or affects this system may be altered by concurrent use. Concurrent use of **flecainide**, **propafenone**, **rifampin**, **ergot derivatives** (**dihydroergotamine**, **ergotamine**, **ergonovine**, **methylergonovine**), **fluticasone lovastatin**, **simvastatin**, **pimozide**, **delavirdine**, **midazolam** or **triazolam** may result in serious, potentially life-threatening adverse reactions including arrhythmias, excessive sedation, myopathy or loss of virologic response and is contraindicated. Blood levels are ↓ by **efavirenz** (additional ritonavir may be required when used together), **nevirapine**, **lopinavir/ritonavir**, **saquinavir**, **carbamazepine**, **phenobarbital**, **phenytoin**, **dexamethasone**, **histamine H_2-receptor antagonists**, and **proton-pump inhibitors**; monitor for ↓ antiretroviral activity. Levels are ↑ by **indinavir** and **nelfinavir**. May ↓ **methadone** and **paroxetine** levels. ↑ levels and risk of toxicity from **amiodarone**, **lidocaine**, **quinidine** (monitor blood levels), **ketoconazole**, and **itraconazole** (dose of itraconazole or ketoconazole should not exceed 200 mg/day when fosamprenavir is used with ritonavir or 400 mg/day when used without), **rifabutin** (monitor for neutropenia, ↓ rifabutin dose by 50% when used with fosamprenavir or by 75% when used with fosamprenavir with ritonavir), **atorvastatin** and **rosuvastatin** (dose not to exceed 20 mg/day or consider other HMG-CoA reductase inhibitors), **cyclosporine** or **tacrolimus** (monitor blood levels of immunosuppressants), **calcium channel blockers** (clinical monitoring recommended), some **benzodiazepines** (**alprazolam**, **clorazepate**, **diazepam**, **flurazepam** (dose reduction of benzodiazepine may be needed), **sildenafil**, **tadalafil**, and **vardenafil** (use

Copyright © 2008 by F.A. Davis

cautiously; ↓ dose of sildenafil to 25 mg every 48 hr, for tadalafil single dose should not exceed 10 mg in any 72 hr period, dose of vardenafil should not exceed 2.5 mg every 24 hr if used without ritonavir or 2.5 mg every 72 hr with ritonavir with monitoring for toxicity) and **tricyclic antidepressants** (blood level monitoring recommended). May alter the effects of **warfarin** (monitor INR) or **hormonal contraceptives** (use alternative method of contraception).

Drug-Natural Products: Concurrent use of **St. John's wort** is contraindicated; ↓ blood levels and may lead to ↓ virologic response.

Route/Dosage

PO (Adults): *Treatment-naive patients without ritonavir*—1400 mg twice daily; *treatment-naive patients with ritonavir*—1400 mg once daily with ritonavir 100 or 200 mg once daily, or 700 mg twice daily with ritonavir 100 mg twice daily. *Protease inhibitor–experienced patients*—700 mg twice daily with ritonavir 100 mg twice daily. If efavirenz is added to a once daily regimen using both fosamprenavir and ritonavir, an additional 100 mg of ritonavir (total of 300 mg) should be given.

Hepatic Impairment

PO (Adults mild-moderate hepatic impairment): 700 mg twice daily without ritonavir.

Availability

Tablets: 700 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess patient for allergy to sulfonamides. May exhibit cross-sensitivity.
- Assess patient for skin reactions throughout therapy. Reactions may be severe and life threatening. Discontinue therapy if severe reactions or moderate rashes with systemic symptoms occur.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum glucose, and triglyceride levels.
- May cause ↑ AST and ALT levels.
- May cause neutropenia.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with or without food.

Patient/Family Teaching

- Emphasize the importance of taking fosamprenavir exactly as directed. Advise patient to read the Patient Information that comes with the prescription prior to initiation of therapy and with each prescription refill. Fosamprenavir must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular schedule. If a dose is skipped, do not double the next doses.
- Instruct patient that fosamprenavir should not be shared with others.
- Inform patient that fosamprenavir does not cure AIDS or prevent associated or opportunistic infections. Fosamprenavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of fosamprenavir are unknown at this time.
- Emphasize the importance of providing health care professional with accurate current drug history and notifying health care professional before taking any prescription or OTC medications or herbal products because of potentially serious drug interactions.
- May decrease effectiveness of hormonal contraceptives; advise patient to use a nonhormonal form of contraception during therapy.
- Instruct patient to notify health care professional if nausea, vomiting, diarrhea, or rash occurs.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.

Copyright © 2008 by F.A. Davis

- Decrease in viral load and increase in CD4 cell counts.

foscarnet (foss-**kar**-net)
Foscavir

Classification
Therapeutic: antivirals

Pregnancy Category C

Indications
Treatment of cytomegalovirus (CMV) retinitis in HIV-infected patients (alone or with ganciclovir). Treatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised patients.

Action
Prevents viral replication by inhibiting viral DNA-polymerase and reverse transcriptase.
Therapeutic Effects: Virustatic action against susceptible viruses including CMV.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Variable penetration into CSF. May concentrate in and be slowly released from bone.
Metabolism and Excretion: 80–90% excreted unchanged in urine.
Half-life: 3 hr (in patients with normal renal function); longer half-life of 90 hr may reflect release of drug from bone.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8–24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal impairment (dose reduction required if CCr ≤1.4–1.6 ml/min/kg; see product information); History of seizures; OB, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: SEIZURES, headache, anxiety, confusion, dizziness, fatigue, malaise, mental depression, weakness. **EENT:** conjunctivitis, eye pain, vision abnormalities. **Resp:** coughing, dyspnea. **CV:** chest pain, ECG abnormalities, edema, palpitations. **GI:** diarrhea, nausea, vomiting, abdominal pain, abnormal taste sensation, anorexia, constipation, dyspepsia. **GU:** renal failure, albuminuria, dysuria, nocturia, polyuria, urinary retention. **Derm:** increased sweating, pruritus, rash, skin ulceration. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyperphosphatemia, hypophosphatemia. **Hemat:** anemia, granulocytopenia, leukopenia. **Local:** pain/inflammation at injection site. **MS:** arthralgia, myalgia, back pain, involuntary muscle contraction. **Neuro:** ataxia, hypoesthesia, neuropathy, paresthesia, tremor. **Misc:** fever, chills, flu-like syndrome, lymphoma, sarcoma.

Interactions
Drug-Drug: Concurrent use with parenteral **pentamidine** may result in severe, life-threatening hypocalcemia. Risk of nephrotoxicity may be ↑ by concurrent use of other **nephrotoxic agents** (**amphotericin B**, **aminoglycosides**).

Route/Dosage
IV (Adults): *CMV retinitis*—60 mg/kg q 8 hr or 90 mg/kg q 12 hr for 2–3 wk, then 90–120 mg/kg/day as a single dose. Dosage reduction required for any degree of renal impairment; *HSV*—40 mg/kg q 8–12 hr for 2–3 wk or until healing occurs.

Availability (generic available)
Injection: 6000 mg/250 ml, 12,000 mg/500 ml.

NURSING IMPLICATIONS

Assessment
- **CMV Retinitis:** Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with foscarnet. Ophthalmologic examinations should also be performed at the conclusion of induction and every 4 wk during maintenance therapy.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis.
- **HSV Infections:** Assess lesions before and daily during therapy.
- ***Lab Test Considerations:*** Monitor serum creatinine before and 2–3 times weekly during induction therapy and at least once every 1–2 wk during maintenance therapy. Monitor 24-hr CCr before and periodically throughout therapy. If CCr drops below 0.4 ml/min/kg, foscarnet should be discontinued.

Copyright © 2008 by F.A. Davis

- Monitor serum calcium, magnesium, potassium, and phosphorus before and 2–3 times weekly during induction therapy and at least weekly during maintenance therapy. May cause concentrations.
- May cause anemia, granulocytopenia, leukopenia, and thrombocytopenia. May cause ↑ AST and ALT levels and abnormal A-G ratios.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Patient should be adequately hydrated with 750–1000 ml of 0.9% NaCl or D5W before first infusion to establish diuresis, then 750–1000 ml with 120 mg/kg of foscarnet or 500 ml with 40–60 mg/kg of foscarnet should be administered with each dose to prevent renal toxicity.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** May be administered via central line undiluted. If administered via peripheral line, *must* be diluted with D5W or 0.9% NaCl to prevent vein irritation. Do not administer solution that is discolored or contains particulate matter. Use diluted solution within 24 hr. ***Concentration:*** Undiluted: 24 mg/ml; Diluted: 12 mg/ml.
- Dose is based on patient weight; excess solution may be discarded from bottle before administration to prevent overdosage.
- Patients who experience progression of CMV retinitis during maintenance therapy may be re-treated with induction therapy followed by maintenance therapy. ***Rate:*** Administer at a rate not to exceed 1 mg/kg/min.
- Infuse solution via infusion pump to ensure accurate infusion rate.
- **Y-Site Compatibility:** aldesleukin, amikacin, aminophylline, ampicillin, aztreonam, cefazolin, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, dexamethasone sodium phosphate, dopamine, erythromycin lactobionate, fluconazole, flucytosine, furosemide, gentamicin, heparin, hydrocortisone, hydromorphone, imipenen-cilastatin, metoclopramide, metronidazole, morphine, nafcillin, oxacillin, penicillin G potassium, phenytoin, piperacillin, ranitidine, ticarcillin/clavulanate, tobramycin.
- **Y-Site Incompatibility:** Manufacturer recommends that foscarnet not be administered concurrently with other drugs or solutions in the same IV catheter except D5W or 0.9% NaCl, acyclovir, amphotericin B, diazepam, digoxin, diphenhydramine, dobutamine, droperidol, ganciclovir, haloperidol, leucovorin, midazolam, pentamidine, prochlorperazine, promethazine, trimetrexate.

Patient/Family Teaching

- Inform patient that foscarnet is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmologic exams.
- Advise patient to notify health care professional immediately if perioral tingling or numbness in the extremities or paresthesia occurs during or after infusion. If these signs of electrolyte imbalance occur during administration, infusion should be stopped and lab samples for serum electrolyte concentrations obtained immediately.
- Emphasize the importance of frequent follow-up exams to monitor renal function and electrolytes.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Crusting over and healing of skin lesions in HSV infections.

fosinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

fosphenytoin (foss-**fen**-i-toyn)
Cerebyx

Classification
Therapeutic: anticonvulsants

Pregnancy Category D

Indications

Short-term (<5 day) parenteral management of generalized, convulsive status epilepticus when use of phenytoin is not feasible. Treatment and prevention of seizures during neurosurgery when use of phenytoin is not feasible.

Copyright © 2008 by F.A. Davis

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Fosphenytoin is rapidly converted to phenytoin, which is responsible for its pharmacologic effects. **Therapeutic Effects:** Diminished seizure activity.

Pharmacokinetics

Absorption: Rapidly converted to phenytoin after IV administration and completely absorbed after IM administration.
Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.
Protein Binding: *Fosphenytoin*—95–99%; *phenytoin*—90–95%.
Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted in the urine.
Half-life: *Fosphenytoin*—15 min; *phenytoin*—22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	30 min	up to 24 hr
IV	15–45 min	15–60 min	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree AV heart block or Adams-Stokes syndrome.
Use Cautiously in: Hepatic or renal disease (increased risk of adverse reactions; dose reduction recommended for hepatic impairment); OB: Safety not established; may result in fetal hydantoin syndrome if used chronically or hemorrhage in the newborn if used at term; Lactation: Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, nystagmus, agitation, brain edema, headache, stupor, vertigo. **EENT:** amblyopia, deafness, diplopia, tinnitus. **CV:** hypotension (with rapid IV administration), tachycardia. **GI:** dry mouth, nausea, taste perversion, tongue disorder, vomiting. **Derm:** pruritus, rash, STEVENS-JOHNSON SYNDROME. **MS:** back pain. **Neuro:** ataxia, dysarthria, extrapyramidal syndrome, hypesthesia, incoordination, paresthesia, tremor. **Misc:** pelvic pain.

Interactions

Drug-Drug: Disulfiram, acute ingestion of **alcohol**, **amiodarone**, **ethosuximide**, **isoniazid**, **chloramphenicol**, **sulfonamides**, **fluoxetine**, **gabapentin**, **H2 antagonists**, **benzodiazepines**, **omeprazole**, **ketoconazole**, **fluconazole**, **estrogens**, **succinamides**, **halothane**, **methylphenidate**, **phenothiazines**, **salicylates**, **ticlopidine**, **tolbutamide**, **topiramate**, **trazodone**, **felbamate**, and **cimetidine** may ↑ phenytoin blood levels . **Barbiturates**, **carbamazepine**, **reserpine**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may decrease the effects of **amiodarone**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **corticosteroids**, **disopyramide**, **warfarin**, **felbamate**, **doxycycline**, **lamotrigine**, **oral contraceptives**, **paroxetine**, **propafenone**, **rifampin**, **ritonavir**, **quinidine**, **tacrolimus**, **theophylline**, **topiramate**, **tricyclic antidepressants**, **zonisamide**, **methadone**, **cyclosporine**, and **estrogens**. IV phenytoin and **dopamine** may cause additive hypotension. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Antacids** may ↓ absorption of orally administered phenytoin. ↑ systemic clearance of antileukemic drugs **teniposide** and **methotrexate** which has been associated with a worse event free survival. **Phenytoin** use is not recommended in children undergoing chemotherapy for acute lymphocytic leukemia. **Calcium** and **sucralfate** ↓ phenytoin absorption.

Route/Dosage

Note: Doses of fosphenytoin are expressed as phenytoin sodium equivalents [PE].

Status Epilepticus

IV (Adults): 15–20 mg PE/kg.

Nonemergent and Maintenance Dosing

IV, IM (Adults and Children >16 yr): *Loading dose*—10–20 mg PE/kg. *Maintenance dose*—4–6 mg PE/kg/day.
IV, IM (Children 10–16 yr): 6–7 mg PE/kg/day.
IV, IM (Children 7–9 yr): 7–8 mg PE/kg/day.
IV, IM (Children 4–6 yr): 7.5–9 mg PE/kg/day.
IV, IM (Children 0.5–3 yr): 8–10 mg PE kg/day.
IV, IM (Infants): 5 mg PE kg/day.
IV, IM (Neonates): 5–8 mg PE/kg/day.

Availability

Injection: 50 mgPE/ml.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically during therapy.
- Monitor blood pressure, ECG, and respiratory function continuously during administration of fosphenytoin and during period when peak serum phenytoin levels occur (15–30 min after administration).
- Observe patient for development of rash. Discontinue fosphenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis preclude further use of phenytoin or fosphenytoin. If less serious skin eruptions (measles-like or scarlatiniform) occur, fosphenytoin may be resumed after complete clearing of the rash. If rash reappears, further use of fosphenytoin or phenytoin should be avoided.
- ***Lab Test Considerations:*** Fosphenytoin contains 0.0037 mmol phosphate per mg PE. Monitor serum phosphate concentrations in patients with renal insufficiency; may cause ↑ phosphate concentrations.
- May cause ↑ serum alkaline phosphatase, GTT, and glucose levels.
- Fosphenytoin therapy may be monitored using phenytoin levels. Optimal total plasma phenytoin concentrations are typically 10–20 mcg/ml (unbound plasma phenytoin concentrations of 1–2 mcg/ml).
- ***Toxicity and Overdose:*** Serum phenytoin levels should not be monitored until complete conversion from fosphenytoin to phenytoin has occurred (2 hr after IV or 4 hr after IM administration): Initial signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

Potential Nursing Diagnoses

Risk for injury (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse fosphenytoin (Cerebyx) with celocoxib (Celebrex) or citalopram (Celexa).
- Implement seizure precautions.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- The anticonvulsant effect of fosphenytoin is not immediate. Additional measures (including parenteral benzodiazepines) are usually required in the immediate management of status epilepticus. Loading dosage of *fosphenytoin* should be followed with the institution of maintenance anticonvulsant therapy.

IV Administration

- **Direct IV:** *Diluent:* DSW or 0.9% NaCl. *Concentration:* 1.5–25 mg PE/ml. May be refrigerated for up to 48 hr. ***Rate:*** Administer at a rate of <150 mg PE/min in adults and <3 mg/kg/min in children to minimize risk of hypotension.
- **Y-Site Compatibility:** lorazepam, phenobarbital.
- **Y-Site Incompatibility:** fenoldopam, midazolam.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

Patient/Family Teaching

- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional if skin rash, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, bleeding or tender gums, yellow skin or eyes, joint pain, fever, sore throat, unusual bleeding or bruising, or persistent headache occurs.
- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine exams to monitor progress. Patient should have rou-

Copyright © 2008 by F.A. Davis

tine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

frovatriptan (froe-va-trip-tan)

Frova

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT_1 agonists

Pregnancy Category C

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-HT receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics

Absorption: 20–30% following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver (P450 1A2 enzyme system); some metabolites eliminated in urine, <10% excreted unchanged.

Half-life: 26 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History, symptoms or findings consistent with;: ischemic heart disease, coronary artery vasospasm, other significant underlying cardiovascular disease Cerebrovascular syndromes including;: strokes of any type, transient ischemic attacks Uncontrolled hypertension; Hemiplegic or basilar migraine; Peripheral vascular disease, including ischemic bowel disease; Should not be used within 24 hr of any other 5-HT agonist or ergot-type compounds (dihydroergotamine); Children <18 yr.

Use Cautiously in: Elderly patients (may be more susceptible to adverse cardiovascular effects); Pregnancy or lactation (safety not established).

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, chest pain, myocardial ischemia. **GI:** dry mouth, dyspepsia, nausea. **Derm:** flushing. **MS:** skeletal pain. **Neuro:** paresthesia. **Misc:** pain.

Interactions

Drug-Drug: Blood levels may be increased by **hormonal contraceptives** or **propranolol**. Blood levels may be decreased by **ergotamine**. Increased risk of serious vasospastic reactions with **dihydroergotamine** (concurrent use contraindicated).

Route/Dosage

PO (Adults): 2.5 mg; if there has been initial relief, a second tablet may be taken after at least 2 hr (daily dose should not exceed 3 tablets and should not be used to treat more than 4 attacks/30-day period).

Availability

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets may be administered at any time after the headache starts.

Patient/Family Teaching

- Inform patient that frovatriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack

Copyright © 2008 by F.A. Davis

but not to prevent or reduce the number of attacks.
- Instruct patient to administer frovatriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 3 tablets in any 24-hr period.
- If dose does not relieve headache, additional frovatriptan doses are not likely to be effective; notify health care professional.
- Advise patient that lying down in a darkened room following frovatriptan administration may further help relieve headache.
- Caution patient not to use frovatriptan if she is pregnant, suspects she is pregnant, plans to become pregnant, or is breastfeeding. Adequate contraception should be used during therapy.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional prior to next dose of frovatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more frovatriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during frovatriptan use.

Evaluation/Desired Outcomes
- Relief of migraine attack.

furosemide (fur-**oh**-se-mide)
Apo-Furosemide, Lasix, Lasix Special, Novosemide, Nu-Furosemide, PMS-Furosemide

Classification
Therapeutic: diuretics
Pharmacologic: loop diuretics

Pregnancy Category C

F

Indications
Edema due to heart failure, hepatic impairment or renal disease. Hypertension.

Action
Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased blood pressure.

Pharmacokinetics
Absorption: 60–67% absorbed after oral administration (↓ in acute CHF and in renal failure); also absorbed from IM sites.
Distribution: Crosses placenta, enters breast milk.
Protein Binding: 91–99%.
Metabolism and Excretion: Minimally metabolized by liver, some nonhepatic metabolism, some renal excretion as unchanged drug.
Half-life: 30–60 min (↑ in renal impairment).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	6–8 hr
IM	10–30 min	unknown	4–8 hr
IV	5 min	30 min	2 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria; Some liquid products may contain alcohol, avoid in patients with alcohol intolerance.
Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Geri: Geriatric patients may have increased risk of side effects, especially hypotension and electrolyte imbalance, at usual doses; Diabetes mellitus; Increasing azo-

Copyright © 2008 by F.A. Davis

temia; Pregnancy and lactation; Pedi: Increased risk of renal calculi and patent ductus arteriosis in premature neonates.

Adverse Reactions/Side Effects

CNS: blurred vision, dizziness, headache, vertigo. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, pancreatitis, vomiting. **GU:** excessive urination. **Derm:** photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **Hemat:** APLASTIC ANEMIA, AGRANULOCYTOSIS, hemolytic anemia, leukopenia, thrombocytopenia. **MS:** muscle cramps. **Neuro:** paresthesia. **Misc:** fever, increased BUN, nephrocalcinosis.

Interactions

Drug-Drug: ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDS** ↓ effects of furosemide. ↓ effects of furosemide when given at same time as **sucralfate**, **cholestyramine**, or **colestipol**. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy).

Route/Dosage

Edema

PO (Adults): 20–80 mg/day as a single dose initially, may repeat in 6–8 hr; may increase dose by 20–40 mg q 6–8 hr until desired response. Maintenance doses may be given once or twice daily (doses up to 2.5 g/day have been used in patients with congestive heart failure or renal disease). *Hypertension*—40 twice daily initially (when added to regimen, decrease dose of other antihypertensives by 50%); adjust further dosing based on response; *Hypercalcemia*—120 mg/day in 1–3 doses.

PO (Children >1 month): 2 mg/kg as a single dose; may be increased by 1–2 mg/kg q 6–8 hr (maximum dose = 6 mg/kg).

PO (Neonates): 1–4 mg/kg/dose 1–2 times/day.

IM, IV (Adults): 20–40 mg, may repeat in 1–2 hr and increase by 20 mg every 1–2 hr until response is obtained, maintenance dose may be given q 6–12 hr; *Continuous infusion*—Bolus 0.1 mg/kg followed by 0.1 mg/kg/hr, double q 2 hr to a maximum of 0.4 mg/kg/hr.

IM, IV (Children): 1–2 mg/kg/dose q 6–12 hr *Continuous infusion*—0.05 mg/kg/hr, titrate to clinical effect.

IM, IV (Neonates): 1–2 mg/kg/dose q 12–24 hr.

Hypertension

PO (Adults): 40 twice daily initially (when added to regimen, decrease dose of other antihypertensives by 50%); adjust further dosing based on response.

Availability (generic available)

Tablets: 20 mg, 40 mg, 80 mg, 500 mg. **Cost:** *Generic*—20 mg $10.99/100, 40 mg $8.99/100, 80 mg $16.99/100. **Oral solution (10 mg/ml-orange flavor, 8 mg/ml-pineapple-peach flavor):** 8 mg/ml, 10 mg/ml. **Cost:** *Generic*—10 mg/ml $13.99/60 ml. **Solution for injection:** 10 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess fluid status. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify physician or other health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity because of the potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with

Copyright © 2008 by F.A. Davis

decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically throughout therapy. Commonly ↓ serum potassium. May cause ↓ serum sodium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Deficient fluid volume (Side Effects)

Implementation

- Do not confuse furosemide with torsemide.
- If administering twice daily, give last dose no later than 5pm to minimize disruption of sleep cycle.
- IV route is preferred over IM route for parenteral administration.
- **PO:** May be taken with food or milk to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing.
- Do not administer discolored solution or tablets.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted (larger doses may be diluted and administered as intermittent infusion [see below]). ***Concentration:*** 10 mg/ml. ***Rate:*** Administer at a rate of 20 mg/min. Pedi: Administer at a maximum rate of 0.5 mg/kg/min (for doses <120 mg) or 4 mg/min (for doses >120 mg).
- **Intermittent Infusion:** ***Diluent:*** Dilute larger doses in 50 ml of D5W or 0.9% NaCl. Infusion stable for 24 hr at room temperature. Do not refrigerate. Protect from light. ***Concentration:*** Final concentration should not exceed 10 mg/ml. ***Rate:*** Administer at a rate not to exceed 4 mg/min (for doses >120 mg) in adults to prevent ototoxicity. Use an infusion pump to ensure accurate dosage.
- **Continuous Infusion:** ***Diluent:*** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. ***Concentration:*** Final concentration should not exceed 10 mg/ml. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amphotericin B cholesteryl sulfate, anidulafungin, argatroban, atropine, aztreonam, bivalirudin, calcium chloride, calcium gluconate, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyclosporine, daptomycin, dexamethasone, digoxin, enalaprilat, epinephrine, ertapenem, fentanyl, ganciclovir, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem, insulin, ketorolac, lidocaine, linezolid, lorazepam, meropenem, methylprednisolone, metoprolol, metronidazole, micafungin, nafcillin, nitroglycerin, nitroprusside, palonosetron, pantoprazole, penicillin G potassium, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, sodium bicarbonate, tacrolimus, thiopental, ticarcillin/clavulanate, tirofiban, tobramycin, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** azithromycin, caspofungin, cimetidine, ciprofloxacin, diazepam, diltiazem, diphenhydramine, doxycycline, droperidol, eptifibatide, erythromycin, esmolol, fenoldopam, filgrastim, hydroxyzine, labetalol, lansoprazole, levofloxacin, midazolam, milrinone, nesiritide, nicardipine, ondansetron, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sulfamethoxazole/trimethoprim, vecuronium, vinblastine, vincristine, vinorelbine.

Patient/Family Teaching

- Instruct patient to take furosemide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix L).
- Advise patient to notify health care professional of weight gain more than 3 lbs in one day.

Copyright © 2008 by F.A. Davis

- Advise patient to consult health care professional before taking OTC medication or herbal products concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise diabetic patients to monitor blood glucose closely; may cause increased blood glucose levels.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Furosemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in blood pressure.

Copyright © 2008 by F.A. Davis

gabapentin (ga-ba-**pen**-tin)
Neurontin

Classification
Therapeutic: analgesic adjuncts, anticonvulsants, mood stabilizers

Pregnancy Category C

Indications
Partial seizures (adjunct treatment). Post-herpetic neuralgia. **Unlabeled uses:** Chronic pain. Prevention of migraine headache. Bipolar disorder. Anxiety.

Action
Mechanism of action is not known. May affect transport of amino acids across and stabilize neuronal membranes. **Therapeutic Effects:** Decreased incidence of seizures. Decreased post-herpetic pain.

Pharmacokinetics
Absorption: Well absorbed after oral administration by active transport. At larger doses, transport becomes saturated and absorption decreases (bioavailability ranges from 60% for a 300-mg dose to 35% for a 1600-mg dose).
Distribution: Crosses blood-brain barrier; enters breast milk.
Metabolism and Excretion: Eliminated mostly by renal excretion of unchanged drug.
Half-life: 5–7 hr (normal renal function); up to 132 hr in anuria.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal insufficiency (↓ dose and/or ↑ dosing interval if CCr ≤60 ml/min); Geri: Geriatric patients (because of age-related ↓ in renal function); OB, Pedi: Safety not established for children <3 yr and pregnant women; Lactation: Discontinue drug or bottle-feed.

Adverse Reactions/Side Effects
CNS: confusion,, depression, drowsiness, sedation, anxiety, concentration difficulties (children), dizziness, emotional lability (children), hostility, hyperkinesia (children), malaise, vertigo, weakness. **EENT:** abnormal vision, nystagmus. **CV:** hypertension. **GI:** weight gain, anorexia, flatulence, gingivitis. **MS:** arthralgia. **Neuro:** ataxia, altered reflexes, hyperkinesia, paresthesia. **Misc:** facial edema.

Interactions
Drug-Drug: Antacids may ↓ absorption of gabapentin. ↑ risk of CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. **Morphine** ↑ gabapentin levels and may ↑ risk of toxicity, dosage adjustments may be required.
Drug-Natural Products: Kava kava, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage
Epilepsy
PO (Adults and Children >12 yr): 300 mg 3 times daily initially. Titration may be continued until desired (range is 900–1800 mg/day in 3 divided doses; doses should not be more than 12 hr apart). Doses up to 2400–3600 mg/day have been well tolerated.
PO (Children ≥5–12 yr): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 25–35 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).
PO (Children 3–4 yrs): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 40 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).

Renal Impairment
PO (Adults and Children >12 yr): *CCr 30–60 ml/min*—300 mg twice daily; *CCr 15–30 ml/min*—300 mg once daily; *CCr <15 ml/min*—300 mg once every other day; further adjustments are based on clinical response.

Post-Herpetic Neuralgia
PO (Adults): 300 mg once daily on first day, 300 mg twice daily on second day, then 300 mg three times/day on day 3, may then be titrated upward as needed up to 600 mg three times/day.

Availability (generic available)
Capsules: 100 mg, 300 mg, 400 mg. **Cost:** *Generic*—100 mg $64.96/270, 300 mg $169.97/270, 400 mg $209.98/270. **Tablets:** 100 mg, 300 mg, 400 mg, 600 mg, 800 mg.

Copyright © 2008 by F.A. Davis

Cost: *Generic*—600 mg $229.96/270, 800 mg $199.96/270. **Oral solution (cool strawberry anise flavor):** 250 mg/5 ml. **Cost:** $130.10/470 ml.

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Postherpetic Neuralgia & Chronic Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Migraine Prophylaxis:** Monitor frequecy and intensity of pain on pain scale.
- ***Lab Test Considerations:*** May cause false-positive readings when testing for urinary protein with *Ames N-Multistix SG* dipstick test; use sulfosalicylic acid precipitation procedure.
- May cause leukopenia.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Chronic pain (Indications)
Risk for aspiration (Adverse Reactions)
Ineffective coping (Indications)

Implementation

- **PO:** May be administered without regard to meals.
- 600 mg and 800 mg tablets are scored and can be broken to administer a half-tablet. If half-tablet is used, administer other half at the next dose. Discard half-tablets not used within several days.
- Gabapentin should be discontinued gradually over at least 1 wk. Abrupt discontinuation may cause increase in seizure frequency.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Patients on tid dosing should not exceed 12 hr between doses. Take missed doses as soon as possible; if less than 2 hr until next dose, take dose immediately and take next dose 1–2 hr later, then resume regular dosing schedule. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures.
- Advise patient not to take gabapentin within 2 hr of an antacid.
- Gabapentin may cause dizziness and drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Seizure patients should not resume driving until physician gives clearance based on control of seizure disorder.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she intends to breastfeed or is breastfeeding an infant.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Refer patients with bipolar disorder to Manic-Depressive and Depressive Association for support.

Evaluation/Desired Outcomes

- Decreased frequency of or cessation of seizures.
- Decreased post-herpetic neuralgia pain.
- Decreased intensity of chronic pain.
- Decreased frequency of migraine headaches.
- Increased mood stability.

galantamine (ga-**lant**-a-meen)
Razadyne, Razadyne ER

Classification
Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Pregnancy Category B

Indications

Mild to moderate dementia of the Alzheimer's type.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. **Therapeutic Effects:** Decreased dementia (temporary) associated with Alzheimer's disease. Cognitive enhancer.

Pharmacokinetics

Absorption: Well absorbed (90%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; 20% excreted unchanged in urine.
Half-life: 7 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (antihcholinesterase activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	12 hr
PO-ER	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment; Children or lactation.

Use Cautiously in: Patients with supraventricular cardiac conduction defects or concurrent use of drugs that may slow heart rate (increased risk of bradycardia); History of ulcer disease/GI bleeding/concurrent NSAID use; Severe asthma or obstructive pulmonary disease; Mild to moderate renal impairment (avoid use if CCr <9 ml/min); Mild to moderate hepatic impairment (cautious dose titration recommended); May increase risk of cardiovascular mortality; OB: Use only if potential benefit outweighs potential risk to fetus.

Adverse Reactions/Side Effects

CNS: fatigue, dizziness, headache, syncope. **CV:** bradycardia, chest pain. **GI:** anorexia, diarrhea, dyspepsia, flatulence, nausea, vomiting. **GU:** bladder outflow obstruction, incontinence. **Neuro:** tremor. **Misc:** weight loss.

Interactions

Drug-Drug: Will ↑ neuromuscular blockade from **succinylcholine-type neuromuscular blocking agents**. May ↑ effects of other **cholinesterase inhibitors** or other **cholinergic agonists**, including **bethanechol**. May ↓ effectiveness of **anticholinergic medications**. Blood levels and effects may be ↑ by **ketoconazole**, **paroxetine**, **amitriptyline**, **fluvoxamine**, or **quinidine**.

Route/Dosage

PO (Adults): *Immediate-release tablets*—4 mg twice daily initially, dose increments of 4 mg should be made at 4 wk intervals, up to 12 mg twice daily. Doses up to 16 mg twice daily have been used (range 16–32 mg/day; *Extended-release capsules*—8mg/day as a single dose in the morning, may be increased to 16 mg/day after 4 wk, then up to 24 mg/day after 4 wk, increments based on benefit/tolerability.

Renal Impairment

PO (Adults): *Moderate renal impairment*—Daily dose should not exceed 16 mg.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Daily dose should not exceed 16 mg.

Availability

Immediate-release tablets: 4 mg, 8 mg, 12 mg. **Extended-release capsules:** 8 mg, 16 mg, 24 mg. **Oral solution:** 4 mg/ml in 100 ml bottles.

G

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Risk for injury (Indications)
Impaired environmental interpretation syndrome (Indications)

Implementation

- Patient should be maintained on a stable dose for a minimum of 4 weeks prior to increasing dose.
- If dose has been interrupted for several days or longer, restart at the lowest dose and escalate to the current dose.
- **PO:** Administer twice daily, preferably with morning and evening meal. Administration with food, the use of antiemetic medications, and ensuring adequate fluid intake may decrease nausea and vomiting.
- Administer extended-release capsules in the morning, preferably with food. *Razadyne XR* can be opened and sprinkled on applesauce or yogurt; should be consumed within 10 min.
- Use pipette provided with oral solution to administer accurate amount.

Patient/Family Teaching

- Emphasize the importance of taking galantamine daily, as directed. Instruct patient and/or caregiver in correct use of pipette if using oral solution. Skip missed doses and return to regular schedule the following day; do not double doses. Do not discontinue abruptly;

Copyright © 2008 by F.A. Davis

although no increase in frequency of adverse events may occur, beneficial affects of galantamine are lost when the drug is discontinued.
- Caution patient and caregiver that galantamine may cause dizziness.
- Advise patient and caregiver to notify health care professional if nausea or vomiting persists beyond 7 days or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress.
- Teach patient and caregivers that improvements in cognitive functioning may take weeks to months to stabilize.
- Caution that disease is not cured and degenerative process is not reversed.

Evaluation/Desired Outcomes
- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

ganciclovir (gan-**sye**-kloe-vir)
Cytovene, Vitrasert

Classification
Therapeutic: antivirals

Pregnancy Category C

Indications
IV: Treatment of cytomegalovirus (CMV) retinitis in immunocompromised patients, including HIV-infected patients (may be used with foscarnet). Prevention of CMV infection in transplant patients at risk. **PO:** Maintenance treatment of stable CMV retinitis in immunocompromised patients after initial IV treatment and prevention of CMV retinitis in patients with advanced HIV infection.

Action
CMV converts ganciclovir to its active form (ganciclovir phosphate) inside the host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

Pharmacokinetics
Absorption: 5–9% absorbed after oral administration. IV administration results in complete bioavailability. Action of intravitreal implant is local.
Distribution: Widely distributed; enters CSF.
Metabolism and Excretion: 90% excreted unchanged by the kidneys.
Half-life: 2.9 hr (increased in renal impairment).

TIME/ACTION PROFILE (antiviral levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.8–3 hr	3–8 hr
IV	rapid	end of infusion	12–24 hr
Intravitreal	rapid	unknown	5–8 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity to ganciclovir or acyclovir.
Use Cautiously in: Renal impairment (dose reduction required if CCr <80 ml/min); Geriatric patients (dose reduction recommended); Bone marrow depression or immunosuppression; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: SEIZURES, abnormal dreams, coma, confusion, dizziness, drowsiness, headache, malaise, nervousness. **EENT:** retinal detachment; *intravitreal only*—decreased visual acuity, vitreous hemorrhage, hyphema, intraocular pressure spikes, lens opacities, macular abnormalities, optic nerve changes, uveitis. **Resp:** dyspnea. **CV:** arrhythmias, edema, hypertension, hypotension. **GI:** GI BLEEDING, abdominal pain, increased liver enzymes, nausea, vomiting. **GU:** gonadal suppression, hematuria, renal toxicity. **Derm:** alopecia, photosensitivity, pruritus, rash, urticaria. **Endo:** hypoglycemia. **Hemat:** neutropenia, thrombocytopenia, anemia, eosinophilia. **Local:** pain/phlebitis at IV site. **Neuro:** ataxia, tremor. **Misc:** fever.

Interactions
Drug-Drug: ↑ risk of bone marrow depression with **antineoplastics**, **radiation therapy**, or **zidovudine**. Toxicity may be ↑ by **probenecid**. ↑ risk of seizures with **imipenem/cilastatin**. Concurrent use of other **nephrotoxic drugs**, **cyclosporine**, or **amphotericin B** ↑ risk of nephrotoxicity.

Route/Dosage
IV (Adults): *Induction*—5 mg/kg q 12 hr for 14–21 days. *Maintenance regimen*—5 mg/kg/day or 6 mg/kg for 5 days of each week. If progression occurs, increase to q 12 hr regimen.

Copyright © 2008 by F.A. Davis

Prevention—5 mg/kg q 12 hr for 7–14 days, then 5 mg/kg/day or 6 mg/kg for 5 days of each week.
PO (Adults): *Maintenance regimen*—1000 mg 3 times daily (with food) or 500 mg 6 times daily; *Prevention of CMV retinitis in advanced HIV infection*—1000 mg 3 times daily.
Intravitreal (Adults): 4.5 mg implant.

Availability (generic available)

Capsules: 250 mg, 500 mg. **Powder for injection:** 500 mg/vial. **Intravitreal insert:** 4.5 mg.

NURSING IMPLICATIONS

Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with ganciclovir.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several weeks, resistance to ganciclovir may have occurred. Ophthalmologic exams should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or after ganciclovir treatment.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify physician or other health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- ***Lab Test Considerations:*** Monitor neutrophil and platelet count at least every 2 days during bid therapy and weekly thereafter. Granulocytopenia usually occurs during the first 2 wk of treatment but may occur anytime during therapy. Do not administer if neutrophil count <500/mm^3 or platelet count <25,000/mm^3. Recovery begins within 3–7 days of discontinuation of therapy.
- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy.
- Monitor liver function tests (AST, ALT, serum bilirubin, alkaline phosphatase) periodically during therapy. May cause ↑ levels.
- May cause ↓ blood glucose.

Potential Nursing Diagnoses

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- Do not confuse Cytovene (ganciclovir) with Cytosar (cytarabine).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Do not administer subcut or IM; severe tissue irritation may result.
- **PO:** Administer capsules with food.
- **IV:** Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Maintain adequate hydration throughout therapy.

IV Administration

- **Intermittent Infusion:** Reconstitute 500 mg with 10 ml of sterile water for injection for a concentration of 50 mg/ml. Do not reconstitute with bacteriostatic water with parabens; precipitation will occur. Shake well to dissolve completely. Discard vial if particulate matter or discoloration occurs. Reconstituted solution is stable for 12 hr at room temperature; do not refrigerate.
- ***Diluent:*** Dilute in 100 ml of D5W, 0.9% NaCl, Ringer's or LR. Once diluted for infusion, solution should be used within 24 hr. Refrigerate but do not freeze. ***Concentration:*** 10 mg/ml. ***Rate:*** Administer slowly, via infusion pump, over 1 hr using an in-line filter. Rapid administration may increase toxicity.
- **Y-Site Compatibility:** allopurinol, amphotericin B cholesteryl sulfate, cisplatin, cyclophosphamide, docetaxel, doxorubicin liposome, enalaprilat, etoposide phosphate, filgrastim, fluconazole, granisetron, lansoprazole, linezolid, melphalan, methotrexate, paclitaxel, pemetrexed, propofol, remifentanil, teniposide, thiotepa.
- **Y-Site Incompatibility:** aldesleukin, amifostine, amsacrine, aztreonam, cefepime, cytarabine, doxorubicin, fludarabine, foscarnet, gemcitabine, ondansetron, piperacillin/

Copyright © 2008 by F.A. Davis

tazobactam, sargramostim, tacrolimus, vinorelbine.

Patient/Family Teaching

- Instruct patient to take ganciclovir with food, exactly as directed.
- Inform patient that ganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmic exams at least every 6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient that ganciclovir may have teratogenic effects. A nonhormonal method of contraception should be used during and for at least 90 days after therapy.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in immunocompromised patients.
- Prevention of CMV retinitis in transplant patients at risk.

gefitinib (je-fit-in-ib)

Iressa

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Pregnancy Category D

Indications

Patients who are currently benefiting from or have benefited from gefitinib in the past for treatment of non-small cell lung cancer.

Action

Inhibits activation of kinases found in transmembrane cell surface receptors, including epidermal growth factor receptor (EGFR-TK). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: 60% absorbed following oral administration.
Distribution: Extensively distributed.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); excreted in feces, <4% excreted in urine.
Half-life: 48 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy, lactation, children.
Use Cautiously in: Idiopathic pulmonary fibrosis (↑ risk of pulmonary toxicity); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (may increase risk of toxicity).

Adverse Reactions/Side Effects

CNS: weakness. **EENT:** aberrant eyelash, conjunctivitis, corneal erosion/ulcer, eye pain, ↓ vision. **CV:** peripheral edema. **Resp:** PULMONARY TOXICITY, dyspnea. **GI:** diarrhea, nausea, vomiting, anorexia, hepatotoxicity, mouth ulceration. **Derm:** acne, dry skin, rash, pruritus. **Metab:** weight loss. **Misc:** allergic reactions including ANGIOEDEMA.

Interactions

Drug-Drug: Strong inducers of the CYP3A4 enzyme system, including **rifampin** and **phenytoin** ↓ blood levels and effects (consider ↑ dose of gefitinib to 500 mg/day). Strong inhibitors of the CYP3A4 enzyme system, including **ketoconazole** and **itraconazole** ↑ blood levels and effects (use with caution). Absorption and efficacy may be ↓ by **drugs that** ↑ **gastric pH** including **cimetidine** and **ranitidine**. May ↑ the risk of bleeding with **warfarin**. Concurrent use with **vinorelbine** may ↑ risk/severity of neutropenia.

Route/Dosage

PO (Adults): 250 mg once daily.

Availability

Tablets: 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of pulmonary toxicity (dyspnea, cough, fever). If interstitial lung disease

Copyright © 2008 by F.A. Davis

is confirmed, discontinue gefitinib and treat appropriately.

- Assess patient for eye symptoms such as pain during therapy. May require interruption of therapy and removal of aberrant eyelash. After symptoms and eye changes have resolved, may reinstate therapy.
- ***Lab Test Considerations:*** Monitor liver function tests periodically. May cause ↑ transaminases, bilirubin, and alkaline phosphatase. Discontinue gefitinib if elevations are severe.
- Monitor for changes in prothrombin time and INR in patients taking warfarin. May cause ↑ levels.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)
Impaired skin integrity (Side Effects)
Ineffective breathing pattern (Adverse Reactions)

Implementation

- **PO:** Administer one tablet daily without regard to food.
- May interrupt therapy briefly (14 days) for patients with poorly tolerated diarrhea with dehydration or skin adverse reactions. Follow by restarting 250 mg dose.

Patient/Family Teaching

- Instruct patient to take gefitinib as directed.
- Advise patient to notify health care professional promptly if severe persistent diarrhea, nausea, vomiting, or anorexia occur; if shortness of breath or cough occur or worsen; or if eye irritation or other new symptoms develop.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Decrease in size and spread of tumors in non-small cell lung cancer.

HIGH ALERT

gemcitabine (jem-site-a-been)
Gemzar

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites, nucleoside analogues

Pregnancy Category D

Indications

Pancreatic cancer (locally advanced or metastatic). Inoperable locally advanced/metastatic non-small cell lung cancer (with cisplatin). Metastatic breast cancer (with paclitaxel). Advanced ovarian cancer that has relapsed 6 months after completion of platinum-based therapy (with carboplatin).

Action

Interferes with DNA synthesis (cell-cycle phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Converted in cells to active diphosphate and triphosphate metabolites; these are excreted primarily by the kidneys.
Half-life: 32–94 min.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation.
Use Cautiously in: History of cardiovascular disease; Impaired hepatic or renal function (increased risk of toxicity); OB: Patients with childbearing potential; Other chronic debilitating illness.

Adverse Reactions/Side Effects

Resp: PULMONARY TOXICITY, dyspnea, bronchospasm. **CV:** ARRHYTHMIAS, CEREBROVASCULAR ACCIDENT, MI, edema, hypertension. **GI:** HEPATOTOXICITY, diarrhea, nausea, stomatitis, transient elevation of hepatic transaminases, vomiting. **GU:** HEMOLYTIC UREMIC SYNDROME, hematuria, proteinuria. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reac-

Copyright © 2008 by F.A. Davis

tions. **Neuro:** paresthesias. **Misc:** flu-like symptoms, fever, anaphylactoid reactions.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.

Pancreatic Cancer

IV (Adults): 1000 mg/m² once weekly for 7 wk, followed by a week of rest. May be followed by cycles of once-weekly administration for 3 wk followed by a week of rest.

Non-Small Cell Lung Cancer (with Cisplatin)

IV (Adults): 1000 mg/m² on days 1, 8, and 15 of each 28-day cycle (cisplatin is also given on day 1) *or* 1250 mg/m² on days 1 and 8 of each 21-day cycle (cisplatin is also given on day 1).

Breast Cancer

IV (Adults): 1250 mg/m² on days 1 and 8 of each 21-day cycle (paclitaxel is also given on day 1).

Ovarian Cancer

IV (Adults): 1000 mg/m² on days 1 and 8 of each 21–day cycle.

Availability

Powder for injection: 200 mg in 10-ml vial, 1 g in 50-ml vial. **Cost:** 200 mg $117.95/10-ml vial, 1 g $589.90/50-ml vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess injection site during administration. Although gemcitabine is not considered a vesicant, local reactions may occur.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Mild to moderate nausea and vomiting occur frequently. Antiemetics may be used prophylactically.
- ***Lab Test Considerations:*** Monitor CBC, including differential and platelet count, before each dose. Dose guidelines are based on the CBC. *For single-agent use:* If the absolute granulocyte count is >1000 and platelet count is >100,000, the full dose may be administered. If the absolute granulocyte count is 500–999 or platelet count is 50,000–99,000, 75% of the dose may be given. If the absolute granulocyte count is <500 or the platelet count is <50,000, withhold further doses. *For gemcitabine with paclitaxel (breast cancer):* If the absolute granulocyte count is >1200 and platelet count is >75,000, the full dose may be administered. If the absolute granulocyte count is 1000–1199 or platelet count is 50,000–75,000, 75% of the dose may be given. If the absolute granulocyte count is 700–999 or platelet count is ≥50,000, 50% of the dose may be given. If the absolute granulocyte count is <700 or the platelet count is <50,000, withhold further doses.
- Monitor serum creatinine, potassium, calcium, and magnesium in patients taking cisplatin with gemcitabine. *For gemcitabine with carboplatin (ovarian cancer):* If the absolute granulocyte count is >1500 and platelet count is >100,000, the full dose may be administered. If the absolute granulocyte count is 1000–1499 or platelet count is 75,000–99,000, 75% of the dose may be given. If the absolute granulocyte count is <1000 or the platelet count is <75,000, withhold further doses.
- Monitor hepatic and renal function before and periodically during therapy. May cause transient ↑ in serum AST, ALT, alkaline phosphatase, and bilirubin concentrations.
- May also cause ↑ BUN and serum creatinine concentrations, proteinuria, and hematuria.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings.

Copyright © 2008 by F.A. Davis

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** To reconstitute, add 5 ml of 0.9% NaCl without preservatives to 200-mg vial or 25 ml of 0.9% NaCl to the 1-g vial of gemcitabine for a concentration of 40 mg/ml. Incomplete dissolution may result in concentrations greater than 40 mg/ml. ***Diluent:*** May be further diluted with 0.9% NaCl. Solution is colorless to light straw color. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature. Discard unused portions. Do not refrigerate; crystallization may occur. ***Concentration:*** 0.1–38 mg/ml. ***Rate:*** Administer dose over 30 min. Infusions longer than 60 min have a greater incidence of toxicity.
- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromizine, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin, dexrazoxane, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucoverin, linezolid, lorazepam, mannitol, meperidine, mesna, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, oxaliplatin, paclitaxel, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amphotericin B, cefotaxime, furosemide, ganciclovir, imipenem-cilastatin, irinotecan, lansoprazole, methotrexate, methoprednisolone, mitomycin, pemetrexed, piperacillin, piperacillin/tazobactam, prochlorperazine.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics.
- Instruct patient to notify health care professional if flu-like symptoms (fever, anorexia, headache, cough, chills, myalgia), swelling of the feet or legs, or shortness of breath occurs.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Palliative, symptomatic improvement in patients with pancreatic cancer.
- Decrease in size and spread of malignancy in lung, ovarian, and breast cancer.

gemfibrozil (gem-**fye**-broe-zil)
Lopid

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Pregnancy Category C

Indications

Management of type II-b hyperlipidemia (decreased HDLs, increased LDLs, increased tri-

Copyright © 2008 by F.A. Davis

glycerides) in patients who do not yet have clinical coronary artery disease and have failed therapy with diet, exercise, weight loss, or other agents (niacin, bile acid sequestrants).

Action

Inhibits peripheral lipolysis. Decreases triglyceride production by the liver. Decreases production of the triglyceride carrier protein. Increases HDL. **Therapeutic Effects:** Decreased plasma triglycerides and increased HDL.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism by the liver, 70% excreted by the kidneys (mostly unchanged), 6% excreted in feces.
Half-life: 1.3–1.5 hr.

TIME/ACTION PROFILE (triglyceride-VLDL–lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–5 days	4 wk	several mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Primary biliary cirrhosis; Concurrent use of HMG-CoA reductase inhibitors.
Use Cautiously in: Gallbladder disease; Liver disease; Severe renal impairment; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** blurred vision. **GI:** abdominal pain, diarrhea, epigastric pain, flatulence, gallstones, heartburn, nausea, vomiting. **Derm:** alopecia, rashes, urticaria. **Hemat:** anemia, leukopenia. **MS:** myositis.

Interactions

Drug-Drug: May ↑ the effects of **warfarin** or **sulfonylurea oral hypoglycemic agents**. Concurrent use with **HMG-CoA reductase inhibitors** may ↑ the risk of rhabdomyolysis (avoid concurrent use). May ↓ the effect of **cyclosporine**.

Route/Dosage

PO (Adults): 600 mg twice daily 30 min before breakfast and dinner.

Availability (generic available)

Tablets: 600 mg. **Cost:** *Generic*—$45.97/180. **Capsules:** 300 mg.

NURSING IMPLICATIONS

Assessment

- Obtain patient's diet history, especially regarding fat and alcohol consumption.
- ***Lab Test Considerations:*** Serum triglyceride and cholesterol levels should be monitored before and periodically throughout therapy. LDL and VLDL levels should be assessed before and periodically throughout therapy. Medication should be discontinued if paradoxical increase in lipid levels occurs.
- Liver function tests should be assessed before and periodically throughout therapy. May cause an increase in serum bilirubin, alkaline phosphatase, CK, LDH, AST, and ALT. If hepatic function tests rise significantly, therapy should be discontinued and not resumed.
- CBC and electrolytes should be evaluated every 3–6 mo and then yearly throughout course of therapy. May cause mild decrease in hemoglobin, hematocrit, and leukocyte counts. May cause a decrease in serum potassium concentrations.
- May cause slight increase in serum glucose.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Lopid (gemfibrozil) with Levbid (hyoscyamine).
- **PO:** Administer 30 min before breakfast or dinner.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, not to skip doses or double up on missed doses. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional promptly if any of the following symptoms occur: severe stomach pains with nausea and vomiting, fever, chills, sore throat, rash, diarrhea, muscle cramping, general abdominal discomfort, or persistent flatulence.

Evaluation/Desired Outcomes

- Decrease in serum triglyceride and cholesterol levels and improved HDL to total cholester-

Copyright © 2008 by F.A. Davis

ol ratios. If response is not seen within 3 mo, medication is usually discontinued.

gemifloxacin, See FLUOROQUINOLONES.

gentamicin, See AMINOGLYCOSIDES.

glimepiride, See HYPOGLYCEMIC AGENTS, ORAL.

glipiZIDE, See HYPOGLYCEMIC AGENTS, ORAL.

glucagon (gloo-ka-gon)
GlucaGen

Classification
Therapeutic: hormones
Pharmacologic: pancreatics

Pregnancy Category B

Indications
Acute management of severe hypoglycemia when administration of glucose is not feasible. Facilitation of radiographic examination of the GI tract. **Unlabeled uses:** Antidote to: Beta blockers, Calcium channel blockers.

Action
Stimulates hepatic production of glucose from glycogen stores (glycogenolysis). Relaxes the musculature of the GI tract (stomach, duodenum, small bowel, and colon), temporarily inhibiting movement. Has positive inotropic and chronotropic effects. **Therapeutic Effects:** Increase in blood glucose. Relaxation of GI musculature, facilitating radiographic examination.

Pharmacokinetics
Absorption: Well absorbed following IM and subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver, plasma, and kidneys.
Half-life: 8–18 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM (hyperglycemic action)	within 10 min	30 min	12–27 min
IV (hyperglycemic action)	1 min	5 min	9–17 min
Subcut (hyperglycemic action)	within 10 min	30–45 min	60–90 min
IV (effect on GI musculature)	45 sec (for 0.25–2-mg dose)	unknown	9–17 min (0.25–0.5-mg dose); 22–25 min (2-mg dose)
IM (effect on GI musculature)	8–10 min (1-mg dose); 4–7 min (2-mg dose)	unknown	9–27 min (1-mg dose); 21–32 min (2-mg dose)

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pheochromocytoma; Some products contain glycerin and phenol—avoid use in patients with hypersensitivities to these ingredients.
Use Cautiously in: History suggestive of insulinoma or pheochromocytoma; Prolonged fasting, starvation, adrenal insufficiency or chronic hypoglycemia (low levels of releasable glucose); When used to inhibit GI motility, use cautiously in geriatric patient with cardiac disease or diabetics; OB: Should be used during pregnancy only if clearly needed; Lactation: Safety not established.

Adverse Reactions/Side Effects
CV: hypotension. **GI:** nausea, vomiting. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

Interactions
Drug-Drug: Large doses may enhance the effect of **warfarin**. Negates the response to **insulin** or **oral hypoglycemic agents**. **Phenytoin** inhibits the stimulant effect of glucagon on insulin release. Hyperglycemic effect is intensified and prolonged by **epinephrine**. Patients on concurrent **beta blocker** therapy may have a greater increase in heart rate and blood pressure.

Route/Dosage
Hypoglycemia
IV, IM, Subcut (Adults and Children ≥20 kg): 1 mg; may be repeated in 15 min if necessary.

Copyright © 2008 by F.A. Davis

IV, IM, Subcut (Children <20 kg): 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.

Radiographic Examination of the GI Tract

IM, IV (Adults): 0.25–2 mg; depending on location and duration of examination (0.5 mg IV or 2 mg IM for relaxation of stomach, for examination of the colon 2 mg IM 10 min before procedure).

Antidote (unlabeled)

IV (Adults): *To beta blockers*—50–150 mcg (0.05–0.15 mg)/kg, followed by 1–5 mg/hr infusion. *To calcium channel blockers*—2 mg; additional doses determined by response.

Availability

Powder for injection: 1-mg (equivalent to 1 unit) vials as an emergency kit for low blood glucose and a diagnostic kit.

NURSING IMPLICATIONS

Assessment

- Assess for signs of hypoglycemia (sweating, hunger, weakness, headache, dizziness, tremor, irritability, tachycardia, anxiety) prior to and periodically during therapy.
- Assess neurologic status throughout therapy. Institute safety precautions to protect patient from injury caused by seizures, falling, or aspiration. For insulin shock therapy, 0.5–1 mg is administered after 1 hr of coma; patient usually awakens in 10–25 min. If no response occurs, repeat the dose. Feed patient supplemental carbohydrates orally to replenish liver glycogen and prevent secondary hypoglycemia as soon as possible after awakening, especially pediatric patients.
- Assess nutritional status. Patients who lack liver glycogen stores (starvation, chronic hypoglycemia, adrenal insufficiency) will require glucose instead of glucagon.
- Assess for nausea and vomiting after administration of dose. Protect patients with depressed level of consciousness from aspiration by positioning on side; ensure that a suction unit is available. Notify health care professional if vomiting occurs; patient will require parenteral glucose to prevent recurrent hypoglycemia.
- ***Lab Test Considerations:*** Monitor serum glucose levels throughout episode, during treatment, and for 3–4 hr after patient regains consciousness. Use of bedside finger-stick blood glucose determination methods is recommended for rapid results. Follow-up lab results may be ordered to validate finger-stick values, but do not delay treatment while awaiting lab results, as this could result in neurologic injury or death.
- Large doses of glucagon may cause a ↓ in serum potassium concentrations.

Potential Nursing Diagnoses

Risk for injury (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- May be given subcut, IM, or IV. Reconstitute with diluent supplied in kit by manufacturer. Inspect solution prior to use; use only clear, water-like solution. Solution is stable for 48 hr if refrigerated, 24 hr at room temperature. Unmixed medication should be stored at room temperature.
- Administer supplemental carbohydrates IV or orally to facilitate increase of serum glucose levels.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each vial with 1 ml of an appropriate diluent. For doses ≤2 mg, use diluent provided by manufacturer. For doses >2 mg, use sterile water for injection instead of diluent supplied by manufacturer to minimize risk of thrombophlebitis, CNS toxicity, and myocardial depression from phenol preservative in diluent supplied by manufacturer. Reconstituted vials should be used immediately. ***Concentration:*** Not exceed 1 mg/ml. ***Rate:*** Administer at a rate not exceeding 1 mg/min. May be administered through IV line containing D5W.
- **Continuous Infusion:** ***Diluent:*** Reconstitute vials as per directions above (use sterile water for injection). Further dilute 10 mg of glucagon in 100 ml of D5W. ***Concentration:*** 0.1 mg/ml. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** No information available.

Patient/Family Teaching

- Teach patient and family signs and symptoms of hypoglycemia. Instruct patient to take oral glucose as soon as symptoms of hypoglycemia occur—glucagon is reserved for episodes when patient is unable to swallow because of decreased level of consciousness.
- **Home Care Issues:** Instruct family on correct technique to prepare, draw up, and

Copyright © 2008 by F.A. Davis

administer injection. Health care professional must be contacted immediately after each dose for orders regarding further therapy or adjustment of insulin dose or diet.
- Advise family that patient should receive oral glucose when alertness returns.
- Instruct family to position patient on side until fully alert. Explain that glucagon may cause nausea and vomiting. Aspiration may occur if patient vomits while lying on back.
- Instruct patient to check expiration date monthly and to replace outdated medication immediately.
- Review hypoglycemic medication regimen, diet, and exercise programs.
- Patients with diabetes mellitus should carry a source of sugar (such as a packet of sugar or candy) and identification describing disease process and treatment regimen at all times.

Evaluation/Desired Outcomes
- Increase of serum glucose to normal levels with improved level of consciousness.
- Smooth muscle relaxation of the stomach, duodenum, and small and large intestine in patients undergoing radiologic examination of the GI tract.

glyBURIDE, See HYPOGLYCEMIC AGENTS, ORAL.

glycopyrrolate
(glye-koe-**pye**-roe-late)
Robinul, Robinul-Forte

Classification
Therapeutic: antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category B

Indications
Inhibits salivation and excessive respiratory secretions when given preoperatively. Reverses some of the secretory and vagal actions of cholinesterase inhibitors used to treat nondepolarizing neuromuscular blockade (cholinergic adjunct). Adjunctive management of peptic ulcer disease.

Action
Inhibits the action of acetylcholine at postganglionic sites located in smooth muscle, secretory glands, and the CNS (antimuscarinic activity). Low doses decrease sweating, salivation, and respiratory secretions. Intermediate doses result in increased heart rate. Larger doses decrease GI and GU tract motility. **Therapeutic Effects:** Decreased GI and respiratory secretions.

Pharmacokinetics
Absorption: Incompletely absorbed (10%) after oral administration. Well absorbed after IM administration.
Distribution: Distribution not fully known. Does not significantly cross the blood-brain barrier or eye. Crosses the placenta.
Metabolism and Excretion: Eliminated primarily unchanged in the feces, via biliary excretion.
Half-life: 1.7 hr (0.6–4.6 hr).

TIME/ACTION PROFILE (anticholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–12 hr
IM	15–30 min	30–45 min	2–7 hr*
IV	1–10 min	unknown	2–7 hr*

*Antisecretory effect lasts up to 7 hr; vagal blockade lasts 2–3 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Pedi: Injection contains benzyl alcohol and should not be given to neonates; Myasthenia gravis; Obstructive uropathy; Paralytic ileus.
Use Cautiously in: Geri: Geriatric have increased sensitivity to anticholinergic drugs and are more susceptible to adverse reactions. Pedi: Young children and infants have increased sensitivity to anticholinergic drugs and are more susceptible to adverse reactions; Patients who may have intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; Down syndrome and children with spastic paralysis or brain damage (may be hypersensitive to antimuscarinic effects); Pregnancy and lactation (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: confusion, drowsiness. **EENT:** blurred vision, cycloplegia, dry eyes, mydriasis. **CV:** tachycardia, orthostatic hypotension, palpitations. **GI:** dry mouth, constipation. **GU:** urinary hesitancy, retention.

Interactions

Drug-Drug: Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **phenothiazines, meperidine, amantadine, tricyclic antidepressants**, **quinidine**, and **disopyramide**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. **Antacids** or **adsorbent antidiarrheal agents** ↓ absorption of anticholinergics. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. ↑ risk of adverse cardiovascular reactions with **cyclopropane** anesthesia. Concurrent use may ↓ absorption of **ketoconazole** (administer 2 hr after ketoconazole).

Route/Dosage

Control of Secretions during Surgery

IM (Adults): 4.4 mcg/kg 30–60 min preop (not to exceed 0.1 mg).
IM (Children >2 yr): 4.4 mcg/kg 30–60 min preop.
IM (Children <2 yr): 4.4–8.8 mcg/kg 30–60 min preop.

Control of Secretions (chronic)

IM, IV (Children): 4–10 mcg/kg/dose q 3–4 hr.
PO (Children): 40–100 mcg/kg/dose 3–4 times/day.

Cholinergic Adjunct

IV (Adults and Children): 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine given at the same time.

Antiarrhythmic

IV (Adults): 100 mcg, may be repeated q 2–3 min.
IV (Children): 4.4 mcg/kg (up to 100 mcg); may be repeated q 2–3 min.

Peptic Ulcer

PO (Adults): 1–2 mg 2–3 times daily. An additional 2 mg may be given at bedtime; may be decreased to 1 mg twice daily (not to exceed 8 mg/day).
IM, IV (Adults): 100–200 mcg q 4 hr up to 4 times daily.

Availability (generic available)

Tablets: 1 mg, 2 mg. **Injection:** 200 mcg (0.2 mg)/ml.

NURSING IMPLICATIONS

Assessment

- Assess heart rate, blood pressure, and respiratory rate before and periodically during parenteral therapy.
- Pedi: Assess for hyperexcitability, a paradoxical response that may occur in children.
- Monitor intake and output ratios in geriatric or surgical patients; glycopyrrolate may cause urinary retention. Instruct patient to void before parenteral administration.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Periodic intraocular pressure determinations should be made for patients receiving long-term therapy.
- ***Lab Test Considerations:*** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.
- May cause ↓ uric acid levels in patients with gout or hyperuricemia.
- ***Toxicity and Overdose:*** If overdosage occurs, neostigmine is the antidote.

Potential Nursing Diagnoses

Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

Implementation

- Do not administer cloudy or discolored solution.
- **PO:** Administer 30–60 min before meals to maximize absorption.
- Do not administer within 1 hr of antacids or antidiarrheal medications.
- Oral dose is 10 times the parenteral dose.
- **IM:** May be administered undiluted (200 mcg/ml).

IV Administration

- **Direct IV:** ***Diluent:*** May be given undiluted through Y-site. ***Concentration:*** 200 mcg/ml. ***Rate:*** Administer at a maximum rate of 20 mcg over 1 min.
- **Syringe Compatibility:** chlorpromazine, cimetidine, codeine, diphenhydramine, droperidol, hydromorphone, hydroxyzine, levorphanol, lidocaine, meperidine, midazolam,

Copyright © 2008 by F.A. Davis

morphine, nalbuphine, neostigmine, ondansetron, oxymorphone, prochlorperazine, promethazine, pyridostigmine, ranitidine, trifluprom azine.

- **Syringe Incompatibility:** chloramphenicol, dexamethasone, diazepam, dimenhydrinate, methohexital, pentazocine, pentobarbital, secobarbital, sodium bicarbonate, thiopental.
- **Y-Site Compatibility:** propofol.
- **Solution Compatibility:** D5/0.45% NaCl, D5W, 0.9% NaCl, Ringer's solution. Administer immediately after admixing.
- **Additive Incompatibility:** methylprednisolone sodium succinate.

Patient/Family Teaching

- Instruct patient to take glycopyrrolate exactly as directed and not to take more than the prescribed amount. Take missed doses as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient to change positions slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- Geri: Advise geriatric patients about increased susceptibility to side effects and to call health care professional immediately if they occur.

Evaluation/Desired Outcomes

- Mouth dryness preoperatively.
- Reversal of cholinergic medications.
- Decrease in GI motility and pain in patients with peptic ulcer disease.

granisetron (gra-**nees**-e-tron)
Kytril

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Pregnancy Category B

G

Indications
Prevention of nausea and vomiting due to: emetogenic chemotherapy, radiation therapy. Prevention and treatment of postoperative nausea and vomiting.

Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy, radiation therapy or surgery.

Pharmacokinetics
Absorption: 50% absorbed following oral administration.
Distribution: Distributes into erythrocytes; remainder of distribution is unknown.
Metabolism and Excretion: Mostly metabolized by the liver; 12% excreted unchanged in urine.
Half-life: *Patients with cancer*—8–9 hr (range 0.9–31.1 hr); *healthy volunteers*—4.9 hr (range 0.9–15.2 hr); *geriatric patients*—7.7 hr (range 2.6–17.7 hr).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	24 hr
IV	rapid	30 min	up to 24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain benzyl alcohol; avoid use in neonates.
Use Cautiously in: OB: Pregnancy or lactation (safety not established); Pedi: Children <2 yr (safe use of IV route not established); Pedi: Chil-

Copyright © 2008 by F.A. Davis

dren <18 yr (safe use of PO route not established).

Adverse Reactions/Side Effects

CNS: headache, agitation, anxiety, CNS stimulation, drowsiness, weakness. **CV:** hypertension. **GI:** constipation, diarrhea, elevated liver enzymes, taste disorder. **Misc:** anaphylactoid reactions, fever.

Interactions

Drug-Drug: ↑ risk of extrapyramidal reactions with other **agents causing extrapyramidal reactions**.

Route/Dosage

Prevention of Nausea and Vomiting Due to Emetogenic Chemotherapy

PO (Adults): 1 mg twice daily; 1st dose given at least 60 min prior to chemotherapy and 2nd dose 12 hr later only on days when chemotherapy is administered; may also be given as 2 mg once daily at least 60 min prior to chemotherapy.
IV (Adults and Children 2–16 yr): 10 mcg/kg within 30 min prior to chemotherapy.

Prevention of Nausea and Vomiting Associated with Radiation Therapy

PO (Adults): 2 mg taken once daily within 1 h of radiation therapy.

Prevention and Treatment of Postoperative Nausea and Vomiting

IV (Adults): *Prevention*—1 mg prior to induction or anesthesia or just prior to reversal of anesthesia; *Treatment*—1 mg.

Availability

Tablets: 1 mg. **Cost:** $131.99/2. **Oral solution (orange flavor):** 2 mg/10 ml in 30 ml bottles. **Solution for injection:** 1 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess for extrapyramidal symptoms (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) during therapy. This occurs rarely and is usually associated with concurrent use of other drugs known to cause this effect.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- For chemotherapy or radiation, granisetron is administered only on the day(s) chemotherapy or radiation is given. Continued treatment when not on chemotherapy or radiation therapy has not been found to be useful.
- **PO:** Administer 1st dose up to 1 hr before chemotherapy or radiation therapy and 2nd dose 12 hr after the first.
- 2 tsp oral solution are equal to 2 mg granisetron.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted or diluted in 20–50 ml of 0.9% NaCl or D5W. Solution should be prepared at time of administration but is stable for 24 hr at room temperature. ***Concentration:*** Up to 1 mg/ml. ***Rate:*** Administer undiluted granisetron over 30 sec or as a diluted solution over 30 min–1 hr.
- **Syringe Compatibility:** dexamethasone, methylprednisolone.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, ampicillin-sulbactam, amsacrine, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, dexmedetomidine, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin, linezolid, lorazepam, magnesium sulfate, mechlorethamine, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone, morphine, nalbuphine, ofloxacin, oxaliplatin, paclitaxel, pemetrexed, piperacil-

Copyright © 2008 by F.A. Davis

lin, piperacillin-tazobactam, potassium chloride, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, lansoprazole.
- **Additive Incompatibility:** Granisetron should not be admixed with other medications.

Patient/Family Teaching

- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy or radiation therapy.
- Prevention and treatment of postoperative nausea and vomiting.

GROWTH HORMONES

somatropin (recombinant)
(soe-ma-**troe**-pin)
Genotropin, Humatrope, Norditropin, Nutropin, Nutropin AQ, Saizen, Serostim, Serostim LQ, Tev-Tropin, Zorbtive

Classification
Therapeutic: hormones
Pharmacologic: growth hormones

Pregnancy Category B (Serostim and Zorbtive), C (all others)

Indications

Growth failure in children due to chronic renal insufficiency. Growth failure in children due to deficiency of growth hormone. Short stature associated with Turner's syndrome. Short stature associated with or Noonan's syndrome (Norditropin only). Growth hormone deficiency in adults (Humatrope, Nutropin, Norditropin). Short stature (Humatrope). AIDS wasting or cachexia (Serostim only). Increases spinal bone density in childhood–onset growth hormone–deficient patients (somatropin). As part of a comprehensive treatment program for Short Bowel Syndrome (Zorbtive).

Action

Produce growth (skeletal and cellular). Metabolic actions include: Increased protein synthesis, Increased carbohydrate metabolism, Lipid mobilization, Retention of sodium, phosphorus, and potassium. Somatropin has the same amino acid sequence as naturally occurring growth hormone; somatrem has 1 additional amino acid. Both are produced by recombinant DNA techniques. Growth hormone enhances GI tract mucosal transport of water, electrolytes and nutrients. **Therapeutic Effects:** Increased skeletal growth in children with growth hormone deficiency. Replacement of somatropin in deficient adults. Decreased wasting in patients with AIDS. Increased bone density in adult growth hormone–deficient patients. Enhanced GI absorption of water, electrolytes and nutrients in short bowel syndrome.

Pharmacokinetics

Absorption: Well absorbed.
Distribution: Localize to highly perfused organs (liver, kidneys).
Metabolism and Excretion: Broken down in renal cells to amino acids that are recirculated; some liver metabolism.
Half-life: *Subcut*—3.8 hr; *IM*—4.9 hr.

TIME/ACTION PROFILE (growth)

ROUTE	ONSET	PEAK	DURATION
IM, subcut	within 3 mo	unknown	12–48 hr

Contraindications/Precautions

Contraindicated in: Closure of epiphyses; Active neoplasia; Hypersensitivity to growth hormone, *m* -cresol or glycerin (somatropin) or benzyl alcohol (Zorbtive); Acute critical illness (therapy should not be initiated) or respiratory failure; Diabetic retinopathy; Prader-Willi syndrome with obesity and respiratory impairment (risk of fatal complications; can be used only if growth hormone deficiency is documented); OB: Use only if clearly needed.
Use Cautiously in: Growth hormone deficiency due to intracranial lesion; Coexisting adrenocorticotropic hormone (ACTH) deficiency; Diabetes (may cause insulin resistance); Thyroid dysfunction; Lactation: Safety not established;

Copyright © 2008 by F.A. Davis

Geri: ↑ sensitivity, ↑ risk of adverse reactions; use lower starting dose and smaller dose increments.

Adverse Reactions/Side Effects

CV: edema of the hands and feet. **Endo:** hyperglycemia, hypothyroidism, insulin resistance. **Local:** pain at injection site. **MS:** arthralgia; *Serostim only*—carpal tunnel syndrome, musculoskeletal pain.

Interactions

Drug-Drug: Excessive **corticosteroid** use (equivalent to 10–15 mg/m^2/day) may ↓ response to somatropin.

Route/Dosage

Somatrem (Protropin)

IM, Subcut (Children): up to 0.3 mg (0.9 unit)/kg weekly; subcut route is preferred.

Somatropin (Genotropin)

Subcut (Children): 0.16–0.24 mg/kg/wk divided in 6–7 daily doses.
Subcut (Adults): 0.04–0.8 mg/kg/wk divided in 6–7 daily doses.

Somatropin (Humatrope)

Subcut (Adults): 0.018 unit/kg/day (up to 0.0375 unit/kg/day).
IM, Subcut (Children): 0.18 mg/kg (0.54 unit/kg)/wk given in divided doses on 3 alternating days or 6 times weekly (up to 0.3 mg/kg or 0.9 unit/kg/wk).

Somatropin (Nutropin/Nutropin AQ)

Subcut (Children): *Growth hormone inadequacy*—0.3 mg/kg. *Chronic renal insufficiency*—0.35 mg/kg (1.05 units/kg)/wk given as daily injections. *Turner's syndrome*—≤0.375 mg/kg (1.125 units/kg)/wk in 3–7 divided doses.
Subcut (Adults): <0.006 mg/kg daily; may be increased to 0.025 mg/kg/day in patients <35 yrs or 0.0125 mg/kg in patients >35 yrs.

Somatropin (Norditropin)

Subcut (Adults): 0.005 mg/kg/day, may be increased to 0.01 mg/kg/day after 4 wk.
Subcut (Children): 0.024–0.034 mg/kg 6–7 times weekly (up to 0.066 mg/kg/day in Noonan's syndrome).

Somatropin (Saizen)

Subcut, IM (Children): 0.06 mg (0.18 unit/kg) 3 times weekly.

Somatropin (Serostim)

Subcut (Adults): *>55 kg*—6 mg once daily; *45–55 kg*—5 mg once daily; *35–45 kg*—4 mg once daily; *<35 kg*—0.1 mg/kg once daily.

Somatropin (Tev-Tropin)

Subcut (Children): up to 0.1 mg/kg three times weekly.

Somatropin (Zorbtive)

Subcut (Adults): 0.1 mg/kg/day for 4 wk (not to exceed 8 mg/dose), dose may be stopped for 5 days and resumed at half dose for fluid retention or arthalgias.

Availability

Somatropin/Genotropin

Powder for injection: 1.5-mg intra-mix cartridge (delivers 1.3 mg), 5.8-mg intra-mix cartridge (delivers 5 mg), 5.8-mg intra-mix cartridge (delivers 5 mg) as Pen 5 system, 13.8-mg intra-mix cartridge (delivers 12 mg), 13.8-mg intra-mix cartridge (delivers 12 mg) as Pen 12 system, MiniQuick system 0.2 mg, MiniQuick system 0.4 mg, MiniQuick system 0.6 mg, MiniQuick system 0.8 mg, MiniQuick system 1 mg, MiniQuick system 1.4 mg, MiniQuick system 1.6 mg, MiniQuick system 1.8 mg, MiniQuick system 2 mg.

Humatrope

Powder for injection: 5 mg/vial.

Norditropin

Powder for injection: 4 mg (12 units)/vial, 5 mg (13 units)/vial, 8 mg (24 units)/vial, 10 mg (26 units)/vial. **Cartridges for injection (using Nordipen):** 5 mg/1.5 ml, 10 mg/1.5 ml, 15 mg/1.5 ml.

Nutropin

Powder for injection: 5 mg (13 units)/vial, 10 mg (26 units)/vial.

Nutropin AQ

Solution for injection (AQ): 5 mg (15 units)/ml in 2-ml vial.

Saizen

Powder for injection: 5 mg (15 units)/vial, 6 mg (18 units)/vial.

Serostim

Powder for injection: 6 mg (15 units)/vial.
Liquid for injection: 6 mg/0.5 mL cartridge.

Tev-Tropin

Powder for injection: 5 mg (15 units)/vial.

Zorbtive

Powder for injection: 4-, 5- or 6-mg vials, 8.8 mg multidose vials.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- **Growth Failure:** Monitor bone age annually and growth rate determinations, height, and weight every 3–6 mo during therapy.
- **AIDS Wasting/Cachexia:** Re-evaluate treatment in patients who continue to lose weight in first 2 wk of treatment.
- ***Lab Test Considerations:*** Monitor thyroid function prior to and during therapy. May decrease T^4, radioactive iodine uptake, and thyroxine-binding capacity. Hypothyroidism necessitates concurrent thyroid replacement for growth hormone to be effective. Serum inorganic phosphorus, alkaline phosphatase, and parathyroid hormone may ↑ with somatropin therapy.
- Monitor blood glucose periodically during therapy. Diabetic patients may require ↑ insulin dose.
- Monitor for development of neutralizing antibodies if growth rate does not exceed 2.5 cm/6 mo.
- Monitor alkaline phosphatase closely in patients with adult growth hormone deficiency.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Implementation

- Rotate injection sites with each injection.
- **Somatropin:** Reconstitute 5-mg vial with 1.5–5 ml of sterile water for injection provided by manufacturer (contains preservative *m*-cresol), aiming the liquid against glass vial wall. Do not shake; swirl gently to dissolve. Solution is clear; do not use solutions that are cloudy or contain a precipitate. Stable for 14 days when refrigerated; do not freeze.
- **Genotropin intra-mix:** Dissolve powder with solution provided with 2-chamber cartridge as directed. Gently tip cartridge upside down a few times until contents are completely dissolved. The 1.5-mg cartridge is stable following dilution for 24 hr if refrigerated. The 5.8-mg and 13.8-mg cartridges contain preservatives and are stable for 14 days if refrigerated.
- **Genotropin Pen:** Prepare and administer as directed in patient instruction insert. Store in the refrigerator.
- **Genotropin MiniQuick:** For single use only. Inject immediately after reconstitution; may be refrigerated for 24 hr after reconstitution. Follow directions on patient package insert for reconstitution and administration.
- **Humatrope:** Reconstitute each 5-mg vial with 1.5–5 ml of diluent provided. Stable for 14 days if refrigerated.
- **Norditropin:** Reconstitute each 4-mg or 8-mg vial with 2 ml of diluent. Use reconstituted vials within 14 days. If using cartridges for the Nordipen, each cartridge has a corresponding color-coded pen which is graduated to deliver the appropriate dose based on the concentration of norditropin in the cartridge. Color coding of cartridge and pen must match.
- **Nutropin/Nutropin AQ:** Reconstitute 5-mg vial with 1–5 ml and 10-mg vial with 1–10 ml of bacteriostatic water for injection. Reconstituted vials are stable for 14 days (Nutropin) or 28 days (Nutropin AQ) if refrigerated.
- **Saizen:** Reconstitute each 5-mg vial with 1–3 ml of bacteriostatic water for injection. Reconstituted vials are stable for 14 days if refrigerated. To use cool.click needle-free injector, wind the device to energize the spring, and draw medication into the Crystal Check nozzle. Using firm pressure at the injection site, hold the injector at a 90° angle and press the blue actuator button.
- **Serostim:** Reconstitute each vial with 1 ml of sterile water for injection. Use within 24 hr of reconstitution.
- **Tev-tropin:** Reconstitute with 1–5 mL or 0.9% NaCl. May be cloudy if refrigerated. Allow to warm to room temperature. If remains solution cloudy or contains particulate matter, do not use.
- **Zorbtive:** Reconstitute each 4-, 5-, or 6-mg vial with 0.5–1 mL of sterile water for injection and each 8.8 mg vial with 1 or 2 mL bacteriostatic water for injection. Solution should be clear upon reconstitution. Do not administer if cloudy upon reconstitution (4-, 5-, or 6-mg vials) or after refrigeration (8.8-mg vial). After refrigeration may contain small particles which should disappear when allowed to warm to room temperature. Solution reconstituted with bacteriostatic water is stable for 14 days if refrigerated.
- **Subcut:** Injection volume for *somatropin* should not exceed 1 ml.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient and parents on correct procedure for reconstituting medication, site selection, technique for IM or subcut injection, and disposal of needles and syringes. Review dosage schedule. Parents should report persistent pain or edema at injection site.
- Explain rationale for prohibition of use for increasing athletic performance. Administration to persons without growth hormone deficiency or after epiphyseal closure may result in acromegaly (coarsening of facial features; enlarged hands, feet, and internal organs; increased blood glucose; hypertension).
- Emphasize need for regular follow-up with endocrinologist to ensure appropriate growth rate, to evaluate lab work, and to determine bone age by x-ray exam.
- Assure parents and child that these dose forms are synthetic and therefore not capable of transmitting Creutzfeldt-Jakob disease, as was the original somatropin, which was extracted from human cadavers.

Evaluation/Desired Outcomes

- Child's attainment of adult height in growth failure secondary to pituitary growth hormone deficiency. Therapy is limited to period before closure of epiphyseal plates (approximately up to 14–15 yr in girls, 15–16 yr in boys).
- Replacement of somatropin in deficient adults.
- Decreased wasting in patients with AIDS.
- Enhanced GI absorption of water, electrolytes and nutrients in short bowel syndrome.

guaifenesin (gwye-**fen**-e-sin)

Alfen Jr, Altarussin, Benylin-E, Breonesin, Calmylin Expectorant, Diabetic Tussin, Ganidin NR, Guiatuss, Hytuss, Hytuss-2X, Mucinex, Naldecon Senior EX, Organidin NR, Resyl, Robitussin, Scottussin Expectorant, Siltussin SA, Siltussin DAS

Classification

Therapeutic: allergy, cold, and cough remedies, expectorants

Pregnancy Category C

Indications

Coughs associated with viral upper respiratory tract infections.

Action

Reduces viscosity of tenacious secretions by increasing respiratory tract fluid. **Therapeutic Effects:** Mobilization and subsequent expectoration of mucus.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Renally excreted as metabolites.
Half-life: Unknown.

TIME/ACTION PROFILE (expectorant action)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	4–6 hr
PO-ER	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol and should be avoided in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.
Use Cautiously in: Cough lasting >1 wk or accompanied by fever, rash, or headache; Pregnancy (although safety has not been established, guaifenesin has been used without adverse effects); Patients receiving disulfiram (liquid products may contain alcohol); Diabetic patients (some products may contain sugar); Children (check age limitations on specific dose forms).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** nausea, diarrhea, stomach pain, vomiting. **Derm:** rashes, urticaria.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 200–400 mg q 4 hr or 600–1200 mg q 12 hr as extended-release product (not to exceed 2400 mg/day).
PO (Children 6–12 yr): 100–200 mg q 4 hr or 600 mg q 12 hr as extended-release product (not to exceed 1200 mg/day).
PO (Children 2–6 yr): 50–100 mg q 4 hr (not to exceed 600 mg/day).

Availability (generic available)

Syrup: 100 mg/5 ml[OTC]. **Oral solution:** 100 mg/5 ml[Rx, OTC], 200 mg/5 ml[OTC]. **Capsules:** 200 mg[OTC]. **Tablets:** 100 mg[OTC], 200 mg[Rx, OTC], 1200 mg. **Extended-release tablets (Mucinex):**

Copyright © 2008 by F.A. Davis

600 mg, 1200 mg. ***In combination with:*** analgesics/antipyretics, antihistamines, decongestants, and cough suppressants[Rx, OTC].

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, frequency and type of cough, and character of bronchial secretions periodically during therapy. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **PO:** Administer each dose of guaifenesin followed by a full glass of water to decrease viscosity of secretions.
- Extended-release tablets should be swallowed whole; do not open, crush, break, or chew.

Patient/Family Teaching

- Instruct patient to cough effectively. Patient should sit upright and take several deep breaths before attempting to cough.
- Inform patient that drug may occasionally cause dizziness. Avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to limit talking, stop smoking, maintain moisture in environmental air, and take some sugarless gum or hard candy to help alleviate the discomfort caused by a chronic nonproductive cough.
- Instruct patient to contact health care professional if cough persists longer than 1 wk or is accompanied by fever, rash, or persistent headache or sore throat.

Evaluation/Desired Outcomes

- Easier mobilization and expectoration of mucus from cough associated with upper respiratory infection.

halcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

halobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

haloperidol (ha-loe-**per**-i-dole)

Apo-Haloperidol, Haldol, Haldol Decanoate, Haldol LA, Novo-Peridol, Peridol, PMS Haloperidol

Classification

Therapeutic: antipsychotics
Pharmacologic: butyrophenones

Pregnancy Category C

Indications

Acute and chronic psychotic disorders including: schizophrenia, manic states, drug-induced psychoses. Schizophrenic patients who require long-term parenteral (IM) antipsychotic therapy. Also useful in managing aggressive or agitated patients. Tourette's syndrome. Severe behavioral problems in children which may be accompanied by: unprovoked, combative, explosive hyperexcitability, hyperactivity accompanied by conduct disorders (short-term use when other modalities have failed). Considered second-line treatment after failure with atypical antipsychotic. **Unlabeled uses:** Nausea and vomiting from surgery or chemotherapy.

Action

Alters the effects of dopamine in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs and symptoms of psychoses. Improved behavior in children with Tourette's syndrome or other behavioral problems.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration. Decanoate salt is slowly absorbed and has a long duration of action.
Distribution: Concentrates in liver. Crosses placenta; enters breast milk.
Protein Binding: 90%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 21–24 hr.

TIME/ACTION PROFILE (antipsychotic activity)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–6 hr	8–12 hr
IM	20–30 min	30–45 min	4–8 hr†
IM (decanoate)	3–9 days	unknown	1 mo

†Effect may persist for several days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Bone marrow depression; CNS depression; Severe liver or cardiovascular disease (Q-T interval prolonging conditions); Some products contain tartrazine, sesame oil, or benzyl alcohol and should be avoided in patients with known intolerance or hypersensitivity.
Use Cautiously in: Debilitated patients (dose reduction required); Cardiac disease; Diabetes; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures; OB: Safety not established; Lactation: Discontinue drug or bottle-feed; Geri: Dosage reduction required due to increased sensitivity.

Adverse Reactions/Side Effects

CNS: SEIZURES, extrapyramidal reactions, confusion, drowsiness, restlessness, tardive dyskinesia. **EENT:** blurred vision, dry eyes. **Resp:** respiratory depression. **CV:** hypotension, tachycardia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus, weight gain. **GU:** urinary retention. **Derm:** diaphoresis, photosensitivity, rashes. **Endo:** galactorrhea, amenorrhea. **Hemat:** anemia, leukopenia. **Metab:** hyperpyrexia. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, hypersensitivity reactions.

Interactions

Drug-Drug: ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ anticholinergic effects with **drugs having anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **phenothiazines**, **quinidine**, and **disopyramide**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/**

H

Copyright © 2008 by F.A. Davis

hypnotics. Concurrent use with **epinephrine** may result in severe hypotension and tachycardia. May ↓ therapeutic effects of **levodopa**. Acute encephalopathic syndrome may occur when used with **lithium**. Dementia may occur with **methyldopa**.
Drug-Natural Products: Kava kava, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Haloperidol

PO (Adults): 0.5–5 mg 2–3 times daily. Patients with severe symptoms may require up to 100 mg/day.
PO (Geriatric Patients or Debilitated Patients): 0.5–2 mg twice daily initially; may be gradually increased as needed.
PO (Children 3–12 yr or 15–40 kg): 50 mcg/kg/day in 2–3 divided doses; may increase by 500 mcg (0.5 mg)/day q 5–7 days as needed (up to 75 mcg/kg/day for nonpsychotic disorders or Tourette's syndrome or 150 mcg/kg/day for psychoses).
IM (Adults): 2–5 mg q 1–8 hr (not to exceed 100 mg/day).
IV (Adults): 0.5–5 mg, may be repeated q 30 min (unlabeled).

Haloperidol Decanoate

IM (Adults): 10–15 times the previous daily PO dose but not to exceed 100 mg initially, given monthly (not to exceed 300 mg/mo).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg. **Oral concentrate:** 2 mg/ml. **Haloperidol injection:** 5 mg/ml. **Haloperidol decanoate injection:** 50 mg/ml, 100 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess positive (hallucination, delusions) and negative (social isolation) symptoms of schizophrenia.
- Monitor blood pressure (sitting, standing, lying) and pulse prior to and frequently during the period of dose adjustment. May cause QT interval changes on ECG.
- Observe patient carefully when administering medication, to ensure that medication is actually taken and not hoarded.
- Monitor intake and output ratios and daily weight. Assess patient for signs and symptoms of dehydration (decreased thirst, lethargy, hemoconcentration), especially in geriatric patients.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipating effects.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving), which may appear within 6 hr of 1st dose and may be difficult to distinguish from psychotic agitation. Benztropine may be used to differentiate agitation from akathisia. Observe closely for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs). Trihexyphenidyl or benztropine may be used to control these symptoms. Benzodiazepines may alleviate akathisia.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately. May also cause leukocytosis, elevated liver function tests, elevated CPK.
- ***Lab Test Considerations:*** Monitor CBC with differential and liver function tests periodically during therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Disturbed sensory perception (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

Implementation

- Avoid skin contact with oral solution; may cause contact dermatitis.
- **PO:** Administer with food or full glass of water or milk to minimize GI irritation.
- Use calibrated measuring device for accurate dosage. Do not dilute concentrate with coffee

Copyright © 2008 by F.A. Davis

or tea; may cause precipitation. Should be given undiluted, but if necessary may dilute in at least 60 ml of liquid.

- **IM:** Inject slowly, using 2-in., 21-gauge needle into well-developed muscle via Z-track technique. Do not exceed 3 ml per injection site. Slight yellow color does not indicate altered potency. Keep patient recumbent for at least 30 min following injection to minimize hypotensive effects.

IV Administration

- **IV:** Haloperidol decanoate should not be administered IV.
- **Direct IV:** ***Diluent:*** May be administered undiluted for rapid control of acute psychosis or delirium. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer at a rate of 5 mg/min.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 30–50 ml of D5W. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** amifostine, amphotericin B liposome, amsacrine, aztreonam, bivalirudin, caspofungin, cimetidine, cisatracurium, cladribine, daptomycin, dexmedetomidine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin liposome, ertapenem, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, gemcitabine, granisetron, hydromorphone, lidocaine, levofloxacin, linezolid, lorazepam, melphalan, methadone, midazolam, morphine, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, paclitaxel, palonosetron, pemetrexed, phenylephrine, propofol, quinupristin/dalfopristin, remifentanil, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tigecycline, tirofiban, voriconazole, vinorelbine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, bumetanide, calcium chloride, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dexamethasone sodium phosphate, diazepam, fluconazole, foscarnet, furosemide, ganciclovir, heparin, hydralazine, imipenem/cilastatin, ketorolac, lansoprazole, magnesium sulfate, methylprednisolone sodium succinate, metronidazole, nafcillin, pantoprazole, penicillin G potassium, phenytoin, piperacillin/tazobactam, potassium chloride, sargramostim, sodium bicarbonate, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout the day. May require several weeks to obtain desired effects. Do not increase dose or discontinue medication without consulting health care professional. Abrupt withdrawal may cause dizziness; nausea; vomiting; GI upset; trembling; or uncontrolled movements of mouth, tongue, or jaw.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report symptoms immediately.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if weakness, tremors, visual disturbances, dark-colored urine or clay-colored stools, sore throat, or fever is noted.
- Encourage continued participation in psychotherapy.
- Provide positive reinforcement for medication compliance.
- Refer to local support group.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in hallucinations, insomnia, agitation, hostility, and delusions.
- Decreased tics and vocalization in Tourette's syndrome.
- Improved behavior in children with severe behavioral problems. If no therapeutic effects are seen in 2–4 wk, dosage may be increased.

HIGH ALERT

heparin (hep-a-rin)

Calcilean, Calciparine, Hepalean, Heparin Leo, Hep-Lock, Hep-Lock U/P

Classification

Therapeutic: anticoagulants
Pharmacologic: antithrombotics

Pregnancy Category C

Indications

Prophylaxis and treatment of various thromboembolic disorders including: Venous thromboembolism, Pulmonary emboli, Atrial fibrillation with embolization, Acute and chronic consumptive coagulopathies, Peripheral arterial thromboembolism. Used in very low doses (10–100 units) to maintain patency of IV catheters (heparin flush).

Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. In low doses, prevents the conversion of prothrombin to thrombin by its effects on factor Xa. Higher doses neutralize thrombin, preventing the conversion of fibrinogen to fibrin. **Therapeutic Effects:** Prevention of thrombus formation. Prevention of extension of existing thrombi (full dose).

Pharmacokinetics

Absorption: Erratically absorbed following subcut or IM administration.
Distribution: Does not cross the placenta or enter breast milk.
Protein Binding: Very high (to low-density lipoproteins, globulins, and fibrinogen).
Metabolism and Excretion: Probably removed by the reticuloendothelial system (lymph nodes, spleen).
Half-life: 1–2 hr (increases with increasing dose); affected by obesity, renal and hepatic function, malignancy, presence of of pulmonary embolism, and infections.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Heparin subcut	20–60 min	2 hr	8–12 hr
Heparin IV	immediate	5–10 min	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled bleeding; Severe thrombocytopenia; Open wounds (full dose); Products containing benzyl alcohol should not be used in premature infants.
Use Cautiously in: Severe liver or kidney disease; Retinopathy (hypertensive or diabetic); Untreated hypertension; Ulcer disease; Spinal cord or brain injury; History of congenital or acquired bleeding disorder; Malignancy; OB: May be used during pregnancy, but use with caution during the last trimester and in the immediate postpartum period; Geri: Women >60 yr have increased risk of bleeding.
Exercise Extreme Caution in: Severe uncontrolled hypertension; Bleeding disorders; GI bleeding/ulceration etc; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; History of thrombocytopenia related to heparin.

Adverse Reactions/Side Effects

GI: drug-induced hepatitis. **Derm:** alopecia (long-term use), rashes, urticaria. **Hemat:** BLEEDING, anemia, thrombocytopenia (can occur up to several weeks after discontinuation of therapy). **Local:** pain at injection site. **MS:** osteoporosis (long-term use). **Misc:** fever, hypersensitivity.

Interactions

Heparin is frequently used concurrently or sequentially with other agents affecting coagulation. The risk of potentially serious interactions is greatest with full anticoagulation.
Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **clopi-**

Copyright © 2008 by F.A. Davis

dogrel, **dipyridamole**, some **penicillins**, **ticlopidine**, **abciximab**, **eptifibitide**, **tirofiban**, and **dextran**. Risk of bleeding may be ↑ by concurrent use of **drugs that cause hypoprothrombinemia**, including **quinidine**, **cefoperazone**, **cefotetan**, and **valproic acid**. Concurrent use of **thrombolytics** ↑ risk of bleeding. Heparins affect the prothrombin time used in assessing the response to **warfarin**. **Digoxin**, **tetracyclines**, **nicotine**, and **antihistamines** may ↓ anticoagulant effect of heparin. **Streptokinase** may be followed by relative resistance to heparin.

Drug-Natural Products: ↑ risk of bleeding with **arnica, anise, chamomile, clove, dong quai, fever few, garlic, ginger,** and **Panax ginseng.**

Route/Dosage

Therapeutic Anticoagulation

IV (Adults): *Intermittent bolus*—10,000 units, followed by 5000–10,000 units q 4–6 hr. *Continuous infusion*—5000 units (35–70 units/kg), followed by 20,000–40,000 units infused over 24 hr (approx. 1000 units/hr or 15–18 units/kg/hr).

IV (Children >1 yr): *Intermittent bolus*—50–100 units/kg, followed by 50–100 units/kg q 4 hr. *Continuous infusion*—Loading dose 75 units/kg, followed by 20 units/kg/hr, adjust to maintain aPTT of 60–85 seconds.

IV (Neonates and Infants <1yr): *Continuous infusion*—Loading dose 75 units/kg, followed by 28 units/kg/hr, adjust to maintain aPTT of 60–85 seconds.

Subcut (Adults): 5000 units IV, followed by initial subcut dose of 10,000–20,000 units, then 8000–10,000 units q 8 hr or 15,000–20,000 units q 12 hr.

Prophylaxis of Thromboembolism

Subcut (Adults): 5000 units q 8–12 hr (may be started 2 hr prior to surgery).

Cardiovascular Surgery

IV (Adults): At least 150 units/kg (300 units/kg if procedure <60 min; 400 units/kg if >60 min).

IA (Neonates, Infants and Children): 100–150 units/kg via an artery prior to cardiac catheterization.

Line Flushing

IV (Adults and Children): 10–100 units/ml (10 units/ml for infants <10 kg, 100 units/ml for all others) solution to fill heparin lock set to needle hub; replace after each use.

Total Parenteral Nutrition

IV (Adults and Children): 05–1 units/ml (final solution concentration) to maintain line patency.

Arterial Line Patency

IA (Neonates): 0.5–2 units/ml.

Availability (generic available)

Heparin Sodium

Solution for injection: 10 units/ml, 100 units/ml, 1000 units/ml, 5000 units/ml, 7500 units/ml, 10,000 units/ml, 20,000 units/ml, 40,000 units/ml. **Premixed solution:** 1000 units/500 ml, 2000 units/1000 ml, 12,500 units/250 ml, 25,000 units in 250 and 500 ml.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools). Notify physician if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria). Report signs to physician.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor activated partial thromboplastin time (aPTT) and hematocrit prior to and periodically throughout therapy. When *intermittent IV* therapy is used, draw aPTT levels 30 min before each dose during initial therapy and then periodically. During *continuous* administration, monitor aPTT levels every 4 hr during early therapy. For *Subcut* therapy, draw blood 4–6 hr after injection.
- Monitor platelet count every 2–3 days throughout therapy. May cause mild thrombocytopenia, which appears on 4th day and resolves despite continued heparin therapy. Heparin-induced thrombocytopenia (HIT), a

Copyright © 2008 by F.A. Davis

more severe form which necessitates discontinuing medication, may develop on 8th day of therapy; may reduce platelet count to as low as 5000/mm^3 and lead to increased resistance to heparin therapy. HIT may progress to development of venous and arterial thrombosis (HITT) and may occur up to several wks after discontinuation. Patients who have received a previous course of heparin may be at higher risk for severe thrombocytopenia for several months after the initial course.

- May cause prolonged prothrompintine (PT) levels, ↑ serum thyroxine, T_3 resin and false-negative ^{125}I fibrinogen uptake tests.
- May cause ↓ serum triglyceride and cholesterol levels and ↑ plasma free fatty acid concentrations.
- May also cause hyperkalemia and ↑ AST and ALT levels.
- ***Toxicity and Overdose:*** Protamine sulfate is the antidote. Due to short half-life, overdose can often be treated by withdrawing the drug.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Unintended concomitant use of two heparin products (unfractionated heparin and LMW heparins) has resulted in serious harm or death. Review patients' recent (emergency department, operating room) and current medication administration records before administering any heparin or LMW heparin product. Dose calculation and infusion pump programming errors have also occurred. Have second practitioner independently check original order, dose calculation and infusion pump settings. Do not confuse heparin with Hespan (hetastarch in sodium chloride). Do not confuse vials of heparin with vials of insulin.
- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. IM injections of other medications should be avoided, because hematomas may develop.
- In patients requiring long-term anticoagulation, oral anticoagulant therapy should be instituted 4–5 days prior to discontinuing heparin therapy.
- Solution is colorless to slightly yellow.

IV Administration

- **Subcut:** Administer deep into subcut tissue. Alternate injection sites between the left and right abdominal wall above the iliac crest. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter
- **Direct IV:** ***Diluent:*** Loading dose administered undiluted. ***Concentration:*** Varies depending upon vial used. ***Rate:*** Administer over at least 1 min. Loading dose given before continuous infusion.
- **Continuous Infusion:** ***Diluent:*** Heparin vials must be diluted. Dilute 25,000 units of heparin in 250–500 ml of 0.9% NaCl or D5W. Premixed infusions are already diluted and ready to use. Admixed solutions stable for 24 hr at room temperature or if refrigerated. Premixed infusion stable for 30 days once overwrap removed. ***Concentration:*** 50–100 units/ml. ***Rate:*** See Route/Dosage section. Adjust to maintain therapeutic aPTT. Use an infusion pump to ensure accuracy. Flush to prevent clot formation in intermittent infusion (heparin lock) sets, inject dilute heparin solution of 10–100 units/0.5–1 ml after each medication injection or every 8–12 hr. To prevent incompatibility of heparin with medication, flush lock set with sterile water or 0.9% NaCl for injection before and after medication is administered.
- **Y-Site Compatibility:** acyclovir, aminophylline, amphotericin B liposome, anidulafungin, atropine, aztreonam, betamethasone, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlordiazepoxide, cimetidine, clindamycin, conjugated estrogens, cyclosporine, daptomycin, dexamethasone, digoxin, dopamine, enalaprilat, epinephrine, eptifibatide, ertapenem, ethacrynate, famotidine, fenoldopam, fentanyl, fluconazole, flumazenil, furosemide, ganciclovir, gemcitabine, granisetron, hydralazine, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, lansoprazole, linezolid, lorazepam, magnesium sulfate, meropenem, metoclopramide,

Copyright © 2008 by F.A. Davis

metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, scopolamine, sodium bicarbonate, sulfamethoxazole/trimethoprim, tacrolimus, ticarcillin/clavulanate, tigecycline, tirofiban, vasopressin, vecuronium, verapamil, voriconazole, warfarin.

- **Y-Site Incompatibility:** alteplase, amikacin, amiodarone, amphotericin B cholesteryl sulfate, caspofungin, ciprofloxacin, diazepam, doxycycline, filgrastim, gentamicin, haloperidol, hydroxyzine, levofloxacin, nesiritidne, phenytoin, quinupristin/dalfopristin, reteplase, tobramycin, vancomycin.
- **Additive Compatibility:** It is recommended that heparin not be mixed in solution with other medications when given for anticoagulation, even those that are compatible, because changes in rate of heparin infusion may be required that would also affect admixtures. If heparin is added to an admixture, the following drugs are compatible:, aminophylline, amphotericin, calcium gluconate, cefepime, chloramphenicol, clindamycin, colistimethate, dopamine, enalaprilat, esmolol, fluconazole, flumazenil, furosemide, lidocaine, magnesium sulfate, meropenem, methyldopate, methylprednisolone, nafcillin, octreotide, potassium chloride, ranitidine, sodium bicarbonate, verapamil, vitamin B complex, vitamin B complex with C. Also compatible with TPN solutions or fat emulsion.
- **Additive Incompatibility:** alteplase, amikacin, ciprofloxacin, cytarabine, daunorubicin, erythromycin lactobionate, gentamicin, hyaluronidase, kanamycin, meperidine, morphine, streptomycin.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take medications containing aspirin or NSAIDs while on heparin therapy.
- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during heparin therapy.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Patients on anticoagulant therapy should carry an identification card with this information at all times.

Evaluation/Desired Outcomes

- Prolonged partial thromboplastin time (PTT) of 1.5–2.5 times the control, without signs of hemorrhage.
- Prevention of deep vein thrombosis and pulmonary emboli.
- Patency of IV catheters.

H

HIGH ALERT

HEPARINS (LOW MOLECULAR WEIGHT)

dalteparin (dal-**te**-pa-rin)
Fragmin

enoxaparin (e-nox-a-**pa**-rin)
Lovenox

tinzaparin (tin-za-**pa**-rin)
Innohep

Classification
Therapeutic: anticoagulants
Pharmacologic: antithrombotics

Pregnancy Category B

Indications

Enoxaparin and dalteparin: Prevention of venous thromboembolism (VTE) (deep vein thrombosis (DVT) and/or pulmonary embolism (PE)) in surgical or medical patients. **Dalteparin only:** Extended treatment of symptomatic DVT and/or PE in patients with cancer. **Enoxaparin and tinzaparin:** Treatment of DVT with or without PE (with warfarin). **Enoxaparin and dalteparin only:** Prevention of ischemic complications (with aspirin) from unstable angina and non-ST-segment-elevation MI. **Enoxaparin only:** Treatment of acute ST-segment-elevation MI (with thrombolytics or percutaneous coronary intervention).

Copyright © 2008 by F.A. Davis

Action

Potentiate the inhibitory effect of antithrombin on factor Xa and thrombin. **Therapeutic Effects:** Prevention of thrombus formation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration (87% for dalteparin and tinzaparin, 92% for enoxaparin).
Distribution: Unknown.
Metabolism and Excretion: *Dalteparin*—unknown; *enoxaparin*—primarily eliminated renally; *tinzaparin*—partially metabolized, elimination is primarily renal.
Half-life: *Dalteparin*—2.1–2.3 hr; *enoxaparin*—3–6 hr; *tinzaparin*—3.9 hr (all are ↑ in renal insufficiency).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Dalteparin subcut	rapid	4 hr	up to 24 hr
Enoxaparin subcut	unknown	3–5 hr	12 hr
Tinzaparin subcut	rapid	4–6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to specific agents or pork products; cross-sensitivity may occur; Some products contain sulfites or benzyl alcohol and should be avoided in patients with known hypersensitivity or intolerance; Active major bleeding; History of heparin-induced thrombocytopenia; *Dalteparin*—regional anesthesia during treatment for unstable angina/non–Q-wave MI.
Use Cautiously in: Severe liver or kidney disease (adjust dose of enoxaparin if CCr <30 ml/min); Women <45 kg or men <57 kg; Retinopathy (hypertensive or diabetic); Untreated hypertension; Geri: Geriatric patients (may have ↑ risk of bleeding due to age-related decrease in renal function); Recent history of ulcer disease; History of congenital or acquired bleeding disorder; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established; should not be used in pregnant patients with prosthetic heart valves without careful monitoring).
Exercise Extreme Caution in: Spinal/epidural anesthesia (increased risk of spinal/epidural hematomas, especially with concurrent NSAIDs, repeated or traumatic epidural puncture, or indwelling epidural catheter); Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia. **CV:** edema. **GI:** constipation, nausea, reversible increase in liver enzymes, vomiting. **GU:** urinary retention. **Derm:** ecchymoses, pruritus, rash, urticaria. **Hemat:** BLEEDING, anemia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **Misc:** fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function and coagulation**, including **warfarin**, **aspirin**, **NSAIDs**, **dipyridamole**, some **penicillins**, **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, **tirofiban**, **thrombolytics** and **dextran**.
Drug-Natural Products: ↑ bleeding risk with, **arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng,** and **others.**

Route/Dosage

Dalteparin

Subcut (Adults): *Prophylaxis of DVT following abdominal surgery*—2500 IU 1–2 hr before surgery, then once daily for 5–10 days; *Prophylaxis of VTE in high-risk patients undergoing abdominal surgery*—5000 IU evening before surgery, then once daily for 5–10 days *or* in patients with malignancy, 2500 IU 1–2 hr before surgery, another 2500 IU 12 hr later, then 5000 IU once daily for 5–10 days; *Prophylaxis of VTE in patients undergoing hip replacement surgery*—2500 IU within 2 hr before surgery, then 2500 IU 4–8 hr after surgery, then 5000 IU once daily (start at least 6 hr after postsurgical dose) for 5–10 days *or* 5000 IU evening before surgery (10–14 hr before surgery), then 5000 IU 4–8 hr after surgery, then 5000 IU once daily for 5–10 days *or* 2500 IU 4–8 hr after surgery, then 5000 IU once daily (start at least 6 hr after postsurgical dose); *Prophylaxis of VTE in medical patients with severely restricted mobility during acute illness*—5000 IU once daily for 12 to 14 days. *Unstable angina/non–ST—segment—elevation MI*—120 IU/kg (not to exceed 10,000 IU) q 12 hr for 5–8 days with concurrent aspirin; *Extended treatment of symptomatic VTE in cancer patients*—200 IU/kg (not to exceed 18,000 IU) once daily for first 30 days, followed

Copyright © 2008 by F.A. Davis

by 150 IU/kg (not to exceed 18,000 IU) once daily through 6th month.

Renal Impairment

Subcut (Adults): *Cancer patients receiving extended treatment of symptomatic VTE with CCr ≤30 ml/min* - Monitor anti-Xa levels (target 0.5–1.5 IU/ml).

Enoxaparin

Subcut (Adults): *VTE prophylaxis in patients undergoing knee replacement surgery*—30 mg q 12 hr starting 12–24 hr postop for 7–10 days; *VTE prophylaxis in patients undergoing hip replacement surgery*—30 mg q 12 hr starting 12–24 hr postop *or* 40 mg once daily starting 12 hr before surgery (either dose may be continued for 7–14 days; continued prophylaxis with 40 mg once daily may be continued for up to 3 wk); *VTE prophylaxis following abdominal surgery*—40 mg once daily starting 2 hr before surgery and then continued for 7–12 days or until ambulatory (up to 14 days); *VTE prophylaxis in medical patients with acute illness*—40 mg once daily for 6–14 days; *Treatment of DVT/PE (outpatient)*—1 mg/kg q 12 hr. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); *Treatment of DVT/PE (inpatient)*—1 mg/kg q 12 hr *or* 1.5 mg/kg once daily. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); *Unstable angina/non—ST—segment—elevation MI* –1 mg/kg q 12 hr for 2–8 days (with aspirin).

IV, Subcut (Adults <75 yr): *Acute ST—segment—elevation MI*—Administer single IV bolus of 30 mg plus 1 mg/kg subcut dose (maximum of 100 mg for first 2 doses only), followed by 1 mg/kg subcut q 12 hrs. The usual duration of treatment is 2–8 days. In patients undergoing percutaneous coronary intervention, if last subcut dose was <8 hr before balloon inflation, no additional dosing needed; if last subcut dose was ≥8 hr before balloon inflation, administer single IV bolus of 0.3 mg/kg.

Subcut (Adults ≥75 yr): *Acute ST—segment—elevation MI*—0.75 mg/kg every 12 hrs (no IV bolus needed) (maximum of 75 mg for first 2 doses only; no initial bolus). The usual duration of treatment is 2–8 days.

Renal Impairment

Subcut (Adults CCr <30 ml/min): *VTE prophylaxis for abdominal or knee/hip replacement surgery*—30 mg once daily. *Treatment of DVT/PE*—1 mg/kg once daily. *Unstable angina/non-ST-segment-elevation MI*—1 mg/kg once daily. *Acute ST-segment-elevation MI (patients <75 yr)*—Single IV bolus of 30 mg plus 1 mg/kg subcut dose, followed by 1 mg/kg subcut once daily. *Acute ST-segment-elevation MI (patients ≥75 yr)*—1 mg/kg once daily (no initial bolus).

Tinzaparin

Subcut (Adults): *Treatment of deep vein thrombosis*—175 anti-Xa IU/kg once daily for at least 6 days and until adequate anticoagulation is achieved with warfarin (INR >2 for two consecutive days).

Availability

Dalteparin

Solution for injection (prefilled syringes): 2500 IU/0.2 ml, 5000 IU/0.2 ml, 7500 IU/0.3 ml, 10,000 IU/0.4 ml, 10,000 IU/1 ml, 12,500 IU/0.5 ml, 15,000 IU/0.6 ml, 18,000 IU/0.72 ml. **Solution for injection (multidose vials):** 10,000 IU/ml in 9.5-ml vials, 25,000 IU/ml in 3.8-ml vials.

Enoxaparin

Solution for injection (prefilled syringes): 30 mg/0.3 ml, 40 mg/0.4 ml, 60 mg/0.6 ml, 80 mg/0.8 ml, 100 mg/1 ml, 120 mg/0.8 ml, 150 mg/ml. **Solution for injection (multidose vials):** 300 mg/3 ml.

Tinzaparin

Solution for injection: 20,000 anti-Xa units/ml in 2-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools); bleeding from surgical site. Notify physician or other health care professional if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of in-

Copyright © 2008 by F.A. Davis

volvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor for hypersensitivity reactions (chills, fever, urticaria). Report signs to physician or other health care professional.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor CBC, platelet count, and stools for occult blood periodically during therapy. If thrombocytopenia occurs (platelet count <100,000/mm^3), discontinue therapy. If hematocrit ↓ unexpectedly, assess patient for potential bleeding sites. For *dalteparin* use for extended treatment of symptomatic VTE in cancer patients, if platelets ↓ to 50,000–100,000/mm^3, reduce dose to 2500 IU once daily until recovery to ≥100,000/mm^3; if platelets <50,000/mm^3, discontinue until count returns to ≥50,000/mm^3.
- Special monitoring of aPTT is not necessary. Monitoring of anti-Xa levels may be considered in patients who are obese or have renal dysfunction (for *enoxaparin*, obtain 4 hr after injection).
- May cause ↑ in AST and ALT levels.
- ***Toxicity and Overdose:*** For *enoxaparin* overdose, protamine sulfate 1 mg for each mg of *enoxaparin* should be administered by slow IV injection. For *dalteparin* overdose, protamine sulfate 1 mg for each 100 anti-factor Xa IU of *dalteparin* should be administered by slow IV injection. If the aPTT measured 2–4 hr after protamine administration remains prolonged, a 2nd infusion of protamine 0.5 mg/100 anti-factor Xa IU of *dalteparin* may be administered.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Unintended concomitant use of two heparin products (unfractionated heparin and LMW heparins) has resulted in serious harm and death. Review patients' recent and current medication administration records before administering any heparin or low-molecular-weight heparin product.
- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall, the upper thigh, or buttocks. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.
- **Enoxaparin:** To avoid the loss of drug, do not expel the air bubble from the syringe before the injection.
- **Subcut:** Per manufacturer's recommendations, to enhance absorption, inject enoxaparin into left or right anterolateral or posterolateral abdominal wall only.
- To minimize risk of bleeding after vascular instrumentation for unstable angina, recommended intervals between doses should be followed closely. Leave vascular access sheath in place for 6–8 hr after enoxaparin dose. Give next enoxaparin dose ≥6–8 hr after sheath removal. Observe site for bleeding or hematoma formation.
- **Direct IV:** Use multidose vial for bolus injections. Administer through a pre-exsting IV line. Flush line with 0.9% NaCl or D5W before and after administration.
- **Tinzaparin:** Tinzaparin should be administered daily for at least 6 days and until patient is adequately anticoagulated with warfarin (INR at least 2.0 for 2 consecutive days). Warfarin therapy should be started within 1–3 days of tinzaparin initiation.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional while on therapy.

Evaluation/Desired Outcomes

- Prevention of DVT and pulmonary emboli (enoxaparin and dalteparin only).

Copyright © 2008 by F.A. Davis

- Resolution of DVT and pulmonary embolism (enoxaparin and tinzaparin only).
- Prevention of ischemic complications (with aspirin) in patients with unstable angina or non–ST—segment—elevation MI (enoxaparin and dalteparin only).
- Prevention of recurrent MI or death in patients with acute ST-segment-elevation MI (enoxaparin only).

HISTAMINE H_2 ANTAGONISTS

cimetidine (sye-**me**-ti-deen)
Apo-Cimetidine, Dom-Cimetidine, Gen-Cimetidine, Novo-Cimetine, Nu-Cimet, PMS-Cimetidine, Tagamet, Tagamet HB

Classification
Therapeutic: antiulcer agents
Pharmacologic: histamine H2 antagonists

Pregnancy Category B

Indications

Short-term treatment of active duodenal ulcers and benign gastric ulcers. Maintenance therapy for duodenal and gastric ulcers after healing of active ulcers. Management of GERD. Treatment of heartburn, acid indigestion, and sour stomach (OTC use). **Cimetidine, famotidine, ranitidine:** Management of gastric hypersecretory states (Zollinger-Ellison syndrome). **Cimetidine, famotidine, ranitidine IV:** Prevention and treatment of stress-induced upper GI bleeding in critically ill patients. **Ranitidine:** Treatment of and maintenance therapy for erosive esophagitis. **Unlabeled uses:** Management of GI symptoms associated with the use of NSAIDs. Prevention of acid inactivation of supplemental pancreatic enzymes in patients with pancreatic insufficiency. Management of urticaria.

H

Action

Inhibits the action of histamine at the H_2-receptor site located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. **Therapeutic Effects:** Healing and prevention of ulcers. Decreased symptoms of gastroesophageal reflux. Decreased secretion of gastric acid.

Pharmacokinetics

Absorption: *Cimetidine*—well absorbed after oral and IM administration. *Famotidine*—40–45% absorbed after oral administration. *Nizatidine*—70–95% absorbed after oral administration. *Ranitidine*—50% absorbed after PO and IM administration.
Distribution: All agents enter breast milk and cerebrospinal fluid.
Metabolism and Excretion: *Cimetidine*—30% metabolized by the liver; remainder is eliminated unchanged by the kidneys. *Famotidine*—up to 70% excreted unchanged by the kidneys, 30–35% metabolized by the liver. *Nizatidine*—60% excreted unchanged by the kidneys; some hepatic metabolism; at least 1 metabolite has histamine-blocking activity. *Ranitidine*—metabolized by the liver, mostly on first pass; 30% excreted unchanged by the kidneys after PO administration, 70% after parenteral administration.
Half-life: *Cimetidine*—2 hr; *famotidine*—2.5–3.5 hr; *nizatidine*—1.6 hr; *ranitidine*—2–2.5 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cimetidine PO	30 min	45–90 min	4–5 hr
Cimetidine IM, IV	10 min	30 min	4–5 hr

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Famotidine PO	within 60 min	1–4 hr	6–12 hr
Famotidine IV	within 60 min	0.5–3 hr	8–15 hr
Nizatidine PO	unknown	unknown	8–12 hr
Ranitidine PO	unknown	1–3 hr	8–12 hr
Ranitidine IM	unknown	15 min	8–12 hr
Ranitidine IV	unknown	15 min	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol and should be avoided in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.

Use Cautiously in: Renal impairment (more susceptible to adverse CNS reactions; increased dosage interval recommended for *cimetidine* and *nizatidine* if CCr ≤50 ml/min, and for *famotidine* and *ranitidine* if CCr <50 ml/min; Hepatic impairment (for *ranitidine*); Acute porphyria (for *ranitidine*); Geri: Geriatric patients (more susceptible to adverse CNS reactions; dosage reduction recommended); OB, Lactation: Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: confusion, dizziness, drowsiness, hallucinations, headache. **CV:** ARRHYTHMIAS. **GI:** constipation, diarrhea, drug-induced hepatitis (nizatidine, cimetidine), nausea. **GU:** decreased sperm count, erectile dysfunction (cimetidine). **Endo:** gynecomastia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site. **Misc:** hypersensivity reactions, vasculitis.

Interactions

Drug-Drug: Cimetidine is a moderate inhibitor of the CYP1A2, CYP2C9, CYP2D6, and CYP3A4 isoenzymes in the liver; may lead to ↑ levels and toxicity with **benzodiazepines** (especially **chlordiazepoxide**, **diazepam**, and **midazolam**), some **beta blockers** (**labetalol**, **metoprolol**, **propranolol**), **caffeine**, **calcium channel blockers**, **carbamazepine**, **cyclosporine**, **dofetilide**, **lidocaine**, **metronidazole**, **mexiletine**, **nefazodone**, **pentoxifylline**, **phenytoin**, **procainamide**, **propafenone**, **quinidine**, **metformin**, **risperidone**, **ritonavir**, **ropinirole**, **selective serotonin reuptake inhibitors**, **sildenafil**, **sulfonylureas**, **tacrolimus**, **theophylline**, **tricyclic antidepressants**, **venlafaxine** and **warfarin**. Famotidine, nizatidine, and ranitidine have a much smaller and less significant effect on the metabolism of other drugs. Cimetidine may ↑ myelosuppressive effects of **carmustine** (avoid concurrent use). All agents ↓ absorption of **atazanavir**, **delavirdine**, **ketoconazole**, and **itraconazole**.

Route/Dosage

Cimetidine

PO (Adults): *Short-term treatment of active ulcers*—300 mg 4 times daily *or* 800 mg at bedtime *or* 400–600 mg twice daily (not to exceed 2.4 g/day) for up to 8 wk. *Duodenal ulcer prophylaxis*—300 mg twice daily *or* 400 mg at bedtime. *GERD*—400 mg q 6 hr *or* 800 mg twice daily for 12 wk. *Gastric hypersecretory conditions*—300–600 mg q 6 hr (up to 2400 mg/day). *OTC use*—up to 200 mg may be taken twice daily (for not more than 2 wk).

PO (Children): *Short-term treatment of active ulcers*—5–10 mg/kg q 6 hr.

IM, IV (Adults): *Short-term treatment of active ulcers*—300 mg q 6 hr (not to exceed 2.4 g/day). *Continuous IV infusion*—900 mg infused over 24 hr (37.5 mg/hr); may be preceded by a 150-mg bolus dose. *Gastric hypersecretory conditions*—300–600 mg q 6 hr (not to exceed 2.4 g/day). *Prevention of upper GI bleeding in critically ill patients*—50 mg/hr.

IM, IV (Children): *Short-term treatment of active ulcers*—5–10 mg/kg q 6 hr.

Renal Impairment

IV, PO (Adults): *CCr 10–50 ml/min*—Administer 50% of normal dose; *CCr <10 ml/min*—Administer 25% of normal dose; *prevention of upper GI bleeding in critically ill patients if CCr <30 ml/min*—25 mg/hr.

Renal Impairment

PO (Children): 10–15 mg/kg/day.

Famotidine

PO (Adults): *Short-term treatment of active duodenal ulcers*—40 mg/day at bedtime or 20 mg twice daily for up to 8 wk. *Treatment of benign gastric ulcers*—40 mg/day at bedtime. *Maintenance treatment of duodenal ulcers*—20 mg once daily at bedtime. *GERD*—20 mg twice daily for up to 6 wk; up to 40 mg twice daily for up to 12 wk for esophagitis with erosions, ulcerations, and continuing symptoms. *Gastric hypersecretory conditions*—20 mg q 6 hr initially, up to 160 mg q 6 hr. *OTC use*—10 mg for relief of symptoms; for prevention—10 mg 60 min before eating or take 10 mg as chewable tablet 15 minutes before heartburn-inducing

Copyright © 2008 by F.A. Davis

foods or beverages (not to exceed 20 mg/24 hr for up to 2 wk).
PO, IV (Children 1–16 yr): *Peptic ulcer*—0.5 mg/kg/day as a single bedtime dose or in 2 divided doses (up to 40 mg daily); *GERD*—1 mg/kg/day in 2 divided doses (up to 80 mg twice daily).
PO (Infants >3 mo—1 yr): *GERD*—0.5 mg/kg/dose twice daily.
PO (Infants and neonates <3 mo): *GERD*—0.5 mg/kg/dose once daily.
IV (Adults): 20 mg q 12 hr.

Renal Impairment
PO (Adults): *CCr <50 ml/min*—administer normal dose q 36–48 hr *or* 50% of normal dose at normal dosing interval. *CCr <10 ml/min*—dosing interval may need to be ↑ to q 36–48 hr.

Nizatidine

PO (Adults): *Short-term treatment of active duodenal or benign gastric ulcers*—300 mg once daily at bedtime. *Maintenance treatment of duodenal ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *OTC use*—75 mg twice daily given 30–60 min before foods or beverages expected to cause symptoms.

Renal Impairment
PO (Adults): *Short-term treatment of active ulcers—CCr 20–50 ml/min*—150 mg once daily; *CCr <20 ml/min*—150 mg every other day. *Maintenance treatment of duodenal ulcers—CCr 20–50 ml/min*—150 mg every other day; *CCr <20 ml/min*—150 mg every 3 days.

Ranitidine

PO (Adults): *Short-term treatment of active duodenal of benign gastric ulcers*—150 mg twice daily *or* 300 mg once daily at bedtime. *Maintenance treatment of duodenal or gastric ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *Erosive esophagitis*—150 mg 4 times daily initially, then 150 mg twice daily as maintenance. *Gastric hypersecretory conditions*—150 mg twice daily initially; up to 6 g/day have been used. *OTC use*—75 mg 30–60 min before foods or beverages expected to cause symptoms (up to twice daily) (not to be used for more than 2 wk).
PO (Children 1 mo-16 yr): *Treatment of gastric/duodenal ulcers* 2–4 mg/kg/day in 2 divided doses (up to 300 mg/day) *Maintenance treatment of ulcers*—2–4 mg/kg once daily (up to 150 mg/day); *GERD/erosive esophagitis*—5–10 mg/kg/day in 2 divided doses (up to 300 mg/day for GERD or 600 mg/day for erosive esophagitis).
PO (Neonates): 2 mg/kg/day in 2 divided doses.
IV, IM (Adults): 50 mg q 6–8 hr. *Continuous IV infusion*—6.25 mg/hr. *Gastric hypersecretory conditions*—1 mg/kg/hr; may be ↑ by 0.5 mg/kg/hr (not to exceed 2.5 mg/kg/hr).
IV, IM (Children 1 mo-16 yr): *Treatment of gastric/duodenal ulcers*—2–4 mg/kg/day divided q 6–8 hr (up to 200 mg/day). *Continuous infusion*—1 mg/kg/dose followed by 0.08–0.17 mg/kg/hr.
IV (Neonates): 1.5 mg/kg/dose load, then in 12 hr start maintenance of 1.5–2 mg/kg/day divided q 12 hr. *Continuous IV infusion*—1.5 mg/kg/dose load followed by 0.04–0.08 mg/kg/hr infusion.

Renal Impairment
PO (Adults): *CCr<50 ml/min*—150 mg q 24 hr.

Renal Impairment
IV (Adults): *CCr<50 ml/min*—50 mg q 24 hr.

Availability

Cimetidine

Tablets: 200 mg[Rx, OTC], 300 mg, 400 mg, ✱600 mg, 800 mg. **Oral liquid (mint-peach flavor):** 200 mg/5 ml[OTC], 300 mg/5 ml. **Premixed infusion:** 300 mg/50 ml 0.9% NaCl. **Solution for injection:** 150 mg/ml.

Famotidine

Tablets: 10 mg[OTC], 20 mg[Rx, OTC], 40 mg. **Gelcaps:** 10 mg[OTC]. **Oral suspension (cherry-banana-mint flavor):** 40 mg/5 ml. **Premixed infusion:** 20 mg/50 ml 0.9% NaCl. **Solution for injection:** 10 mg/ml. ***In combination with:*** calcium carbonate and magnesium hydroxide[OTC] (Pepcid Complete, see Appendix B).

Nizatidine

Tablets: 75 mg[OTC]. **Capsules:** 150 mg, 300 mg. **Oral solution (bubble gum flavor):** 15 mg/mL.

Ranitidine

Tablets: 75 mg[OTC], 150 mg, 300 mg. **Cost:** *Generic*—150 mg $23.99/180, 300 mg $24.84/90. **Capsules:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg $89.95/180, 300 mg $79.99/90. **Effer-**

Copyright © 2008 by F.A. Davis

vescent tablets (EFFERdose): 25 mg. **Syrup (peppermint flavor):** 15 mg/ml. **Cost:** $330.01/473 ml. **Premixed infusion:** 50 mg/50 ml 0.45% NaCl. **Solution for injection:** 25 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Geri: Assess geriatric and debilitated patients routinely for confusion. Report promptly.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- Antagonize effects of pentagastrin and histamine during gastric acid secretion testing. Avoid administration for 24 hr before the test.
- May cause false-negative results in skin tests using allergenic extracts. Histamine H_2 antagonists should be discontinued 24 hr before the test.
- May cause ↑ in serum transaminases and serum creatinine.
- Serum prolactin concentration may be ↑ after IV bolus of *cimetidine*. May also cause ↓ parathyroid concentrations.
- *Nizatidine* may cause ↑ alkaline phosphatase concentrations.
- *Ranitidine* and *famotidine* may cause false-positive results for urine protein; test with sulfosalicylic acid.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Administer with meals or immediately afterward and at bedtime to prolong effect.
- If antacids or sucralfate are used concurrently for relief of pain, avoid administration of antacids within 30 min-1 hr of the H_2 antagonist and take sucralfate 2 hr after H_2 antagonist; may ↓ absorption of H_2 antagonist.
- Doses administered once daily should be administered at bedtime to prolong effect.
- Shake oral suspension before administration. Discard unused suspension after 30 days.
- Remove foil from *ranitidine effervescent tablets* and dissolve in 6–8 oz water before drinking.

Cimetidine

IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl, D5W, D10W, D5/LR, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.25% NaCl, Ringer's or LR, or sodium bicarbonate. ***Concentration:*** 15 mg/ml. ***Rate:*** Administer over at least 5 min (minimum 5 min). Rapid administration may cause hypotension and arrhythmias.
- **Intermittent Infusion:** ***Diluent:*** See Direct IV. Diluted solution is stable for 48 hr at room temperature. Refrigeration may cause cloudiness but will not affect potency. Do not use solution that is discolored or contains precipitate. ***Concentration:*** 6 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** Dilute cimetidine 900 mg in 100–1000 ml of compatible solution (see Direct IV). ***Rate:*** Usually infused at a rate of 37.5 mg/hr or greater but should be individualized.
- **Continuous Infusion:** ***Diluent:*** Dilute 4 ml (40 mg of drug) with 1000 ml, 2 ml (20 mg of drug) with 500 ml, or 1 ml (10 mg of drug) with 250 ml of 0.9% NaCl or D5W. Infusion is stable for 24 hrs at room temperature. ***Concentration:*** 40 mcg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired effect. Administer via infusion pump to ensure accurate dosage rate.
- **Syringe Compatibility:** atropine, butorphanol, diazepam, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, lorazepam, meperidine, midazolam, morphine, nafcillin, nalbuphine, penicillin G sodium, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, sodium acetate, sodium chloride, sodium lactate, sterile water.
- **Y-Site Compatibility:** alfentanil, amikacin, aminocaproic acid, amiodarone, ampicillin/sulbactam, argatroban, atracurium, atropine, azithromycin, aztreonam, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, fluconazole, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone,

insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sufentanil, tacrolimus, theophylline, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.

- **Y-Site Incompatibility:** acyclovir, aminophylline, amphotericin B, ampicillin, bumetanide, cefoxitin, dexamethasone sodium phosphate, diazepam, fosphenytoin, furosemide, ganciclovir, ketorolac, meropenem, methohexital, methylprednisolone sodium succinate, pantoprazole, pentobarbital, phenytoin, prochlorperazine, sodium bicarbonate, thiopental, promazine.
- **Syringe Incompatibility:** chlorpromazine, pentobarbital, secobarbital.
- **Y-Site Compatibility:** acyclovir, amifostine, aminophylline, atracurium, anakinra, anidulafungin, aztreonam, bivalirudin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, diltiazem, docetaxel, doxorubicin, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fenoldopam, filgrastim, fluconazole, fludarabine, foscarnet, gemcitabine, granisetron, haloperidol, heparin, idarubicin, inamrinone, labetalol, levofloxacin, linezolid, melphalan, meropenem, methotrexate, midazolam, milrinone, nicardipine, ondansetron, oxaliplatin, paclitaxel, pancuronium, pemetrexed, piperacillin/tazobactam, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, topotecan, vecuronium, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, amsacrine, cefepime, indomethacin, lansoprazole, warfarin.

Famotidine

IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl, D5W, D10W, or LR. ***Concentration:*** 4 mg/ml. ***Rate:*** Administer at a rate of 10 mg/min. Rapid administration may cause hypotension.
- **Intermittent Infusion:** ***Diluent:*** Dilute each 20 mg in 100 ml of 0.9% NaCl, D5W, D10W, or LR. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or contains a precipitate. ***Concentration:*** 0.2 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, amsacrine, anakinra, atropine, aztreonam, bivalirudin, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexamethasone, dexmedetomidine, dextran 40, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, erythromycin lactobionate, esmolol, etoposide phosphate, fenoldopam, filgrastim, fluconazole, fludarabine, folic acid, gatifloxin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, insulin, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meperidine, methotrexate, methylprednisolone, metoclopramide, midazolam, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, oxacillin, paclitaxel, pemetrexed, perphenazine, phenylephrine, phenytoin, phytonadione, potassium chloride, potassium phosphate, procainamide, propofol, remifentanil, sargramostim, sodium bicarbonate, teniposide, theophylline, thiamine, thiotepa, ticarcillin, ticarcillin/clavulanate, tirofiban, verapamil, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, azithromycin, cefepime, lansoprazole, piperacillin/tazobactam.

H

Ranitidine

IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl or D5W for injection. ***Concentration:*** 2.5 mg/ml. ***Rate:*** Administer over at least 5 min not to exceed 10 mg/min. Rapid administration may cause hypotension and arrhythmias.
- **Intermittent Infusion:** ***Diluent:*** See Direct IV. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or that contains precipitate. ***Concentration:*** 0.5 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** Add ranitidine to D5W for a concentration of 150 mg/250 ml (no greater than 2.5 mg/ml for Zollinger-Ellison patients). ***Rate:*** Administer at a rate of 6.25 mg/hr. In patients with Zollinger-Ellison syndrome, start infusion at 1 mg/kg/hr. If gastric acid output is >10 mEq/hr or patient becomes symptomatic after 4 hr, adjust dose by 0.5 mg/kg/hr increments and remeasure gastric output.
- **Syringe Compatibility:** atropine, cyclizine, dexamethasone, dimenhydrinate, diphenhydramine, fentanyl, glycopyrrolate, heparin, hydromorphone, meperidine, metoclopramide, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, thiethylperazine.
- **Syringe Incompatibility:** hydroxyzine, midazolam, pantoprazole, pentobarbital, phenobarbital.
- **Y-Site Compatibility:** acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amsacrine, atracurium, aztreonam, bivalirudin, cefazolin, cefepime, cefoxitin, ceftazidime, ceftizoxime, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, enalaprilat, epinephrine, esmolol, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gemcitabine, granisetron, heparin, hydromorphone, idarubicin, labetalol, linezolid, lorazepam, melphalan, meperidine, methotrexate, midazolam, milrinone, morphine, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, paclitaxel, pancuronium, pemetrexed, piperacillin/tazobactam, procainamide, propofol, remifentanil, sargramostim, tacrolimus, teniposide, theophylline, thiopental, thiotepa, vecuronium, vinorelbine, warfarin, zidovudine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, insulin, lansoprazole.
- **Additive Compatibility:** amikacin, aminophylline, chloramphenicol, ciprofloxacin, dexamethasone, dobutamine, dopamine, doxycycline, furosemide, gentamicin, heparin, insulin, regular, lidocaine, methylprednisolone, penicillin G potassium, penicillin G sodium, potassium chloride, tobramycin, vancomycin.
- **Additive Incompatibility:** amphotericin B, phytonadione.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patients taking OTC preparations not to take the maximum dose continuously for more than 2 wk without consulting health care professional. Notify health care professional if difficulty swallowing occurs or abdominal pain persists.
- Inform patient that smoking interferes with the action of histamine antagonists. Encourage patient to quit smoking or at least not to smoke after last dose of the day.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Inform patient that increased fluid and fiber intake and exercise may minimize constipation.
- Advise patient to report onset of black, tarry stools; fever; sore throat; diarrhea; dizziness; rash; confusion; or hallucinations to health care professional promptly.

Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Treatment and prevention of gastric or duodenal irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy is continued for at least 6 wk in treatment of ulcers but not usually longer than 8 wk.
- Decreased symptoms of esophageal reflux.

Copyright © 2008 by F.A. Davis

- Treatment of heartburn, acid indigestion, and sour stomach (OTC use).

HMG-CoA REDUCTASE INHIBITORS (statins)

atorvastatin (a-**tore**-va-stat-in)
Lipitor

fluvastatin (**floo**-va-sta-tin)
Lescol, Lescol XL

lovastatin (**loe**-va-sta-tin)
Altoprev, Mevacor

pravastatin (**pra**-va-sta-tin)
Pravachol

rosuvastatin (roe-**soo**-va-sta-tin)
Crestor

simvastatin (**sim**-va-sta-tin)
Zocor

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: HMG-CoA reductase inhibitors

Pregnancy Category X

Indications

Adjunctive management of primary hypercholesterolemia and mixed dyslipidemias. **Atorvastatin:** Primary prevention of cardiovascular disease (↓ risk of MI or stroke) in patients with multiple risk factors for coronary heart disease CHD or type 2 diabetes mellitus (also ↓ risk of angina or revascularization procedures in patients with multiple risk factors for CHD). **Atorvastatin and Pravastatin:** Secondary prevention of cardiovascular disease (↓ risk of MI, stroke, revascularization procedures, angina, and hospitalizations for CHF) in patients with clinically evident CHD. **Fluvastatin:** Secondary prevention of coronary revascularizations procedures in patients with clinically evident CHD. **Fluvastatin, lovastatin, and rosuvastatin:** Slow progression of coronary atherosclerosis in patients with CHD. **Lovastatin:** Primary prevention of CHD (↓ risk of MI, unstable angina, and coronary revascularization) in patients without symptomatic cardiovascular disease with ↑ total and low-density lipoprotein (LDL) cholesterol and ↓ high-density lipoprotein (HDL) cholesterol. **Pravastatin:** Primary prevention of CHD (↓ risk of MI, coronary revascularization, and cardiovascular mortality) in patients without clinically evident CHD. **Simvastatin:** Secondary prevention of cardiovascular events (↓ risk of MI, coronary revascularization, stroke, and cardiovascular mortality) in patients with clinically evident CHD or those at high-risk for CHD (history of diabetes, peripheral arterial disease, or stroke).

Action

Inhibit an enzyme, 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, which is responsible for catalyzing an early step in the synthesis of cholesterol. **Therapeutic Effects:** Lowers total and LDL cholesterol and triglycerides. Slightly increase HDL. Slows of the progression of coronary atherosclerosis with resultant decrease in CHD-related events (all agents except rosuvastatin have indication for ↓ events).

Pharmacokinetics

Absorption: *Atorvastatin*—rapidly absorbed but undergoes extensive GI and hepatic metabolism, resulting in 14% bioavailability; *fluvastatin*—98% absorbed after oral administration, but undergoes extensive first-pass metabolism resulting in 24% bioavailability; *lovastatin, pravastatin*—poorly and variably absorbed after oral administration; *rosuvastatin*—20% absorbed following oral administration; *simvastatin*—85% absorbed but rapidly metabolized.
Distribution: *Atorvastatin*—probably enters breast milk. *Fluvastatin*—enters breast milk. *Lovastatin*—crosses the blood-brain barrier and placenta. *Pravastatin*—small amounts enter breast milk. *Rosuvastatin and simvastatin*—unknown.
Protein Binding: *Atorvastatin, fluvastatin, and simvastatin*—>98%.
Metabolism and Excretion: All agents are extensively metabolized by the liver *atorvastatin*—<2%, *lovastatin*—10%, *fluvastatin*—5%, *pravastatin*—20% and *simvastatin*—13%.
Half-life: *Atorvastatin*—14 hr; *fluvastatin*—1.2 hr; *lovastatin*—3 hr; *pravastatin*—1.3–2.7 hr; *rosuvastatin*—19 hr; *simvastatin*—unknown.

Simvastatin	several days	2–4 wk	unknown

*After discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active liver disease or unexplained persistent ↑ in AST or ALT; OB, Lactation: Pregnancy or lactation (potential for fetal anomalies); Concurrent use of gemfibrozil or azole antifungals; Concurrent use of nelfinavir or ritonavir (with lovastatin or simvastatin).

Use Cautiously in: History of liver disease; Alcoholism; *Rosuvastatin only*—patients with Asian ancestry (may have ↑ blood levels and ↑ risk of rhabdomyolysis); *Atorvastatin, lovastatin, rosuvastatin, and simvastatin only*—concurrent use of gemfibrozil, azole antifungals, macrolides, protease inhibitors, niacin, cyclosporine, amiodarone or verapamil (↑ risk of myopathy/rhabdomyolysis); Renal impairment; OB: Women of childbearing age; Pedi: Children <8 yr (safety not established; some products approved for use in older children only).

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia, weakness. **CV:** chest pain, peripheral edema. **EENT:** rhinitis; *lovastatin*— blurred vision. **Resp:** bronchitis. **GI:** abdominal cramps, constipation, diarrhea, flatus, heartburn, altered taste, drug-induced hepatitis, dyspepsia, elevated liver enzymes, nausea, pancreatitis. **GU:** erectile dysfunction. **Derm:** rashes, pruritus. **MS:** RHABDOMYOLYSIS, arthralgia, arthritis, myalgia, myositis. **Misc:** hypersensitivity reactions.

Interactions

Atorvastatin, lovastatin, simvastatin, and rosuvastatin are metabolized by the CYP3A4 metabolic pathway. Fluvastatin is metabolized by CYP2C9. Pravastatin is not metabolized by the CYPP450 system.

Drug-Drug: Atorvastatin, lovastatin and simvastatin may interact with **CYP3A4 inhibitors**. Bioavailability and effectiveness may be ↓ by **cholestyramine** and **colestipol**. Risk of myopathy with atorvastatin, lovastatin, and simvastatin is ↑ with **amiodarone**, **cyclosporine**, **gemfibrozil**, **clofibrate**, **diltiazem**, **verapamil**, **erythromycin**, **clarithromycin**, **telithromycin**, **nefazodone**, large doses of **niacin**, **azole antifungals**, **nelfinavir**, **saquinavir**, and **ritonavir**. Atorvastatin, fluvastatin, and simvastatin may slightly ↑ serum **digoxin** levels. Atorvastatin and rosuvastatin may ↑ levels of **hormonal contraceptives**. Atorvastatin, fluvastatin, lovastatin, rosuvastatin, and simvastatin may ↑ risk of bleeding with **warfarin**. **Isradipine** may ↓ the effectiveness of lovastatin. **Alcohol**, **cimetidine**, **ranitidine**, and **omeprazole** may ↑ fluvastatin levels. **Rifampin** may ↓ fluvastatin levels. **Antacids** ↓ absorption of rosuvastatin (administer 2 hr after rosuvastatin. **Lopinavir/ritonavir** may ↑ rosuvastatin levels. **Cyclosporine** ↑ levels and risk of toxicity of rosuvastatin (dosage adjustment required). Fluvastatin ↑ levels of **glyburide**; **glyburide** ↑ fluvastatin levels (monitoring of both agents recommended). Fluvastatin ↑ levels of **phenytoin**; **phenytoin** ↑ fluvastatin levels (monitoring of both agents recommended).

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness (lovastatin and simvastatin).

Drug-Food: Large quantities of **grapefruit juice** ↑ blood levels and ↑ risk of rhabdomyolysis. **Food** enhances blood levels of lovastatin.

Route/Dosage

Atorvastatin

PO (Adults): 10—20 mg once daily initially (may start with 40 mg/day if LDL should be lowered by >45%); may be increased q 2–4 wk up to 80 mg/day.

PO (Children 10–17 yr): 10 mg/day initially, may be ↑ q 4 wk up to 20 mg/day.

Fluvastatin

PO (Adults): 20 mg (capsule) once daily at bedtime (may start with 40 mg once daily at bedtime if LDL needs to be lowered by ≥25%). May be ↑ to 80 mg once daily (as extended-release tablet) or 40 mg twice daily (capsule).

Lovastatin

PO (Adults): 20 mg once daily with evening meal. May be ↑ at 4-wk intervals to a maximum of 80 mg/day (immediate-release) or 60 mg/day (extended-release); initiate at 10 mg/day in patients receiving cyclosporine or other immunosuppressants and do not exceed 20 mg/day;

Copyright © 2008 by F.A. Davis

should not exceed 40 mg/day (immediate-release) or 20 mg/day (extended-release) if receiving verapamil or amiodarone; should not exceed 20 mg/day if receiving danazol or niacin (>1 g/day).

Renal Impairment

PO (Adults): *CCr <30 ml/min*—dosage should not exceed 20 mg/day unless carefully titrated.

PO (Children/Adolescents 10-17 yr): *Familial heterozygous hypercholesterolemia*—10-40 mg/day adjusted at 4 wk intervals.

Pravastatin

PO (Adults): 40 mg once daily at bedtime; may be ↑ at 4–wk intervals up to maximum of 80 mg/day. *Concurrent cyclosporine therapy*——initial dose is 10 mg/day and should not exceed 20 mg/day.

PO (Children 14-18 yrs): 40 mg once daily.

PO (Children 8-13 yrs): 20 mg once daily.

Hepatic/Renal Impairment

PO (Adults): 10–20 mg once daily at bedtime; ↑ at 4–wk intervals as needed (usual range = 10–20 mg/day).

Rosuvastatin

PO (Adults): 10 mg once daily initially (range 5–20 mg initially); dose may be adjusted at 2–4 wk intervals, some patients may require up to 40 mg/day (associated with ↑ risk of rhabdomyolysis); *Patients with Asian ancestry*—initial dose should not exceed 5 mg/day *Concurrent cyclosporine therapy*—dose should not exceed 5 mg/day; *Concurrent gemfibrozil or lopinavir/ritonavir therapy*—dose should not exceed 10 mg/day (avoid if possible)

Renal Impairment

PO (Adults): *CCr <30 ml/min*—5 mg once daily intially; dose may be ↑ but should not exceed 10 mg/day.

Simvastatin

PO (Adults): 5–80 mg once daily in the evening. *Concurrent cyclosporine or danazol therapy*—Initiate at 5 mg once daily; dose should not exceed 10 mg/day. *Concurrent fibrate or niacin therapy* -Dose should not exceed 10 mg/day. *Concurrent amiodarone or verapamil therapy* -Dose should not exceed 20 mg/day.

PO (Children and adolescents 10–17 yr): 10 mg once daily initially, may be ↑ at 4–wk intervals up to 40 mg/day (not to exceed 10 mg/day in patients receiving cyclosporine, danazol, fibrates, or niacin or 20 mg/day in patients receiving amiodarone or verapamil)

Renal Impairment

PO (Adults): *CCr <10 ml/min* –5 mg/day initially, titrate carefully.

Availability

Atorvastatin

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** 10 mg $237.99/90, 20 mg $321.97/90, 40 mg $325.97/90, 80 mg $329.97/90. ***In combination with:*** amlodipine (Caduet); see Appendix B.

Fluvastatin

Capsules: 20 mg, 40 mg. **Cost:** 20 mg $205.97/90, 40 mg $205.97/90. **Extended-release tablets:** 80 mg. **Cost:** 80 mg $265.99/90.

Lovastatin

Immediate-release tablets: 10 mg, 20 mg, 40 mg. **Cost:** 10 mg $89.70/60, 20 mg $158.19/60, 40 mg $284.76/60. **Extended-release tablets:** 10 mg, 20 mg, 40 mg, 60 mg. ***In combination with:*** Niacin (Advicor). See Appendix B.

Pravastatin

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** 10 mg $169.97/90, 20 mg $44.67/90, 40 mg $49.97/90, 80 mg $379.72/90.

Rosuvastatin

Tablets: 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** 5 mg $275.96/90, 10 mg $275.96/90, 20 mg $275.96/90, 40 mg $278.96/90.

Simvastatin

Tablets: 5 mg, 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—5 mg $45.97/90, 10 mg $49.97/90, 20 mg $73.97/90, 40 mg $75.97/90, 80 mg $89.97/90. ***In combination with:*** Ezetimibe (Vytorin). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Obtain a dietary history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 4–6 wk of therapy, and periodically thereafter.

H

Copyright © 2008 by F.A. Davis

- Monitor liver function tests, including AST, before, at 12 wk after initiation of therapy or after dose elevation, and then q 6 mo. If AST levels ↑ to 3 times normal, HMG-CoA reductase inhibitor therapy should be reduced or discontinued. May also cause ↑ alkaline phosphatase and bilirubin levels.
- If patient develops muscle tenderness during therapy, monitor CK levels. If CK levels are >10 times the upper limit of normal or myopathy occurs, therapy should be discontinued.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Pravachol (pravastatin) with Prevacid (lansoprazole).
- **PO:** Administer *lovastatin* with food. Administration on an empty stomach decreases absorption by approximately 30%. Initial once-daily dose is administered with the evening meal.
- Administer extended-release tablets at bedtime. Extended-release tablets should be swallowed whole, do not crush, break, or chew.
- Administer *fluvastatin, pravastatin,* and *simvastatin* once daily in the evening. *Atorvastatin* and *rosuvastatin* can be taken any time of day. May be administered without regard to food.
- Avoid large amounts of grapefruit juice during therapy; may ↑ risk of toxicity.
- If *fluvastatin* or *pravastatin* is administered in conjunction with bile acid sequestrants (cholestyramine, colestipol), administer at least 4 hr after bile acid sequestrant.
- If *rosuvastatin* is administered in conjunction with magnesium or aluminum-containing antacids, administer antacid at least 2 hr after *rosuvastatin*.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to skip doses or double up on missed doses. Advise patient to avoid drinking more that 200 mL/day of grapefruit juice during therapy. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Advise patient to avoid taking Rx, OTC, or herbal products without consulting with a health care professional.
- OB: Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in sLDL and total cholesterol levels.
- Increase in HDL cholesterol levels.
- Decrease in triglyceride levels.
- Slowing of the progression of coronary artery disease.

human papillomavirus quadravalent (types 6, 11, 16, 18) recombinant vaccine

(**hyoo**-man pa-pil-**lo**-ma)
Gardasil

Classification
Therapeutic: vaccines/immunizing agents

Indications

Prevention of squamous cell cervical cancer, other cervical and vaginal neoplasias and genital warts.

Action

Vaccination results in antibodies to HPV viruses that are causative agents for squamous cell cervical cancer and genital warts. **Therapeutic Effects:** Prevention of squamous cell cervical cancer and genital warts.

Pharmacokinetics

Absorption: Well absorbed following IM administration.
Distribution: Unk.
Metabolism and Excretion: Unk.
Half-life: Unk.

TIME/ACTION PROFILE (antibody response)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	1 mo*	unknown

*After third vaccination

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Thrombocytopenia/bleeding disorder; OB: Pregnancy. **Use Cautiously in:** Current/recent febrile illness; Immunosuppression may ↓ antibody response; OB: Use cautiously during lactation; Pedi: Safety in children <9 yr not established.

Adverse Reactions/Side Effects

Local: injection site reactions. **Misc:** ANAPHYLAXIS (RARE).

Interactions

Drug-Drug: Immunosuppressants or **antineoplastics** may ↓ antibody response.

Route/Dosage

IM (Adults and Children—females 9–26 yr): Three 0.5 ml doses at 0, 2 and 6 months.

Availability

Sterile preparation for intramuscular administration: 20 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 40 mcg of HPV 16 L1 protein, and 20 mcg of HPV 18 L1 protein/0.5-mL dose.

NURSING IMPLICATIONS

Assessment

- Assess vital signs prior to administration. Do not administer to patient with a current or recent febrile illness; low grade fever (<100°F) and mild upper respiratory infection and usually not contraindicated.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **General:** Vaccine is not intended for treatment of active genital warts or cervical cancer and will not protect from diseases not caused by HPV.
- **IM:** Prefilled syringe is for single use; do not use for more than one person. Administer as supplied; do not dilute; administer full dose. Shake well prior to administration to maintain suspension of vaccine. Solution is cloudy and white; do not administer solution that is discolored or contains particulate matter. If using single-dose vial, withdraw 0.5 mL dose and administer entire contents of syringe. Administer intramuscularly in the deltoid or in the high anterolateral area of the thigh.

Patient/Family Teaching

- Provide information about vaccine and the importance of completing immunization series unless contraindicated to patient and guardian.
- Inform patient that vaccine does not replace routine cervical cancer screening or prevent other sexually transmitted diseases; such screening should be continued as usual.
- Advise patient to consult health care professional prior to taking Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected. Women exposed to vaccine during pregnancy are encouraged to call manufacturer pregnancy registry at 800-986-8999.
- Instruct patient to report any adverse reactions to health care professional.

Evaluation/Desired Outcomes

- Prevention of cervical cancer, genital warts, cervical adenocarcinoma in situ, cervical, vulvar, and vaginal intraepithelial neoplasia caused by HPV.

hydrALAZINE

(hye-**dral**-a-zeen)
Apresoline, ✱Novo-Hylazin

Classification
Therapeutic: antihypertensives
Pharmacologic: vasodilators

Pregnancy Category C

Indications

Moderate to severe hypertension (with a diuretic). **Unlabeled uses:** CHF unresponsive to conventional therapy with digoxin and diuretics.

Action

Direct-acting peripheral arteriolar vasodilator. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients and decreased afterload in patients with CHF.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration; well absorbed from IM sites. **Distribution:** Widely distributed. Crosses the placenta; enters breast milk in minimal concentrations.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Mostly metabolized by the GI mucosa and liver.
Half-life: 2–8 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	45 min	2 hr	2–4 hr
IM	10–30 min	1 hr	3–8 hr
IV	5–20 min	15–30 min	2–6hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance.
Use Cautiously in: Cardiovascular or cerebrovascular disease; Severe renal and hepatic disease (dose modification may be necessary); Pregnancy and lactation (has been used safely during pregnancy).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rashes. **F and E:** sodium retention. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuropathy. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. **MAO inhibitors** may exaggerate hypotension. May ↓ pressor response to **epinephrine**. **NSAIDs** may ↓ antihypertensive response. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** ↑ hydralazine levels. ↑ blood levels of **metoprolol** and **propranolol**.

Route/Dosage

PO (Adults): *Hypertension*—10 mg 4 times daily initially. After 2–4 days may increase to 25 mg 4 times daily for the rest of the 1st week; may then increase to 50 mg 4 times daily (up to 300 mg/day). Once maintenance dose is established, twice-daily dosing may be used. *CHF*—25–37.5 mg 4 times daily; may be increased up to 300 mg/day in 3–4 divided doses.
PO (Children >1 month): Initial—0.75–1 mg/kg/day in 2–4 divided doses, not to exceed 25 mg/dose; may increase gradually to 5 mg/kg/day in infants and 7.5 mg/kg/day in children (not to exceed 200 mg/day) in 2–4 divided doses.
IM, IV (Adults): *Hypertension*—5–40 mg repeated as needed. *Eclampsia*—5 mg q 15–20 min; if no response after a total of 20 mg, consider an alternative agent.
IM, IV (Children >1 month): Initial—0.1–0.2 mg/kg/dose (not to exceed 20 mg) q 4–6 hr as needed, up 1.7–3.5 mg/kg/day in 4–6 divided doses.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—10 mg $23.30/100, 25 mg $22.90/100, 50 mg $23.30/100, 100 mg $66.65/100.
Injection: 20 mg/ml. ***In combination with:*** isosorbide dinitrate (BiDil). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** Monitor CBC, electrolytes, LE cell prep, and ANA titer prior to and periodically during prolonged therapy.
- May cause a positive direct Coombs' test result.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse hydralazine with hydroxyzine.
- IM or IV route should be used only when drug cannot be given orally.
- May be administered concurrently with diuretics or beta blockers to permit lower doses and minimize side effects.
- **PO:** Administer with meals consistently to enhance absorption.
- Pharmacist may prepare oral solution from hydralazine injection for patients with difficulty swallowing.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. Use solution as quickly as possible after drawing through needle into syringe. ***Concentration:*** 20 mg/ml. ***Rate:*** Administer over at least 1 min. Pedi: Administer at a rate of 0.2 mg/kg/min in children. Monitor blood

Copyright © 2008 by F.A. Davis

pressure and pulse in all patients frequently after injection.

- **Y-Site Compatibility:** daptomycin, diltiazem, fenoldopam, granisetron, heparin, hydrocortisone, hydromorphone, linezolid, palonosetron, potassium chloride, tacrolimus, tirofiban, verapamil, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, ampicillin, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, diazepam, ertapenem, furosemide, ganciclovir, haloperidol, lorazepam, methylprednisolone sodium succinate, nafcillin, nesiritide, nitroprusside, pantoprazole, phenytoin, procainamide, trimethoprim/sulfamethoxazole.
- **Solution Compatibility:** 0.45% NaCl, 0.9% NaCl, LR.
- **Solution Incompatibility:** D5W.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered; do not double doses. If more than 2 doses in a row are missed, consult health care professional. Must be discontinued gradually to avoid sudden increase in blood pressure. Hydralazine controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol intake, regular exercise, and stress management). Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- Patients should weigh themselves twice weekly and assess feet and ankles for fluid retention.
- May occasionally cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to minimize orthostatic hypotension.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication prior to treatment or surgery.
- Advise patient to notify health care professional immediately if general tiredness; fever; muscle or joint aching; chest pain; skin rash; sore throat; or numbness, tingling, pain, or weakness of hands and feet occurs. Vitamin B_6 (pyridoxine) may be used to treat peripheral neuritis.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.
- Decreased afterload in patients with CHF.

hydralazine/isosorbide dinitrate

(hye-**dral**-a-zeen eye-so-**sor**-bide di-**ni**-trate)
BiDil

Classification
Therapeutic: vasodilators
Pharmacologic: vasodilators, nitrates

Pregnancy Category C

Indications

Management of heart failure in black patients.

Action

BiDil is a fixed-dose combination of **isosorbide dinitrate**, a vasodilator with effects on both arteries and veins, and **hydralazine**, a predominantly arterial vasodilator. **Therapeutic Effects:** Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

Pharmacokinetics

See pharmacokinetic sections in hydralazine and isosorbide dinitrate monographs of Davis's Drug Guide for Nurses for more information.
Absorption: *Hydralazine*—10–26% absorbed in CHF patients, absorption can be saturated leading to large increases in absorption with higher doses; *isosorbide dinitrate*—vari-

Copyright © 2008 by F.A. Davis

able absorbed (10–90%) reflecting first-pass hepatic metabolism.
Distribution: *Hydralazine*—widely distributed, crosses the placenta, minimal amounts in breast milk; *isosorbide dinitrate*—accumulates in muscle and venous wall.
Metabolism and Excretion: *Hydralazine*—mostly metabolized by GI mucosa and liver; *isosorbide dinitrate*—undergoes extensive first-pass metabolism in the liver mostly metabolized by the liver, some metabolites are vasodilators.
Half-life: *Hydralazine*—4 hr; *isosorbide dinitrate*—2 hr.

TIME/ACTION PROFILE (effect on blood pressure)

ROUTE	ONSET	PEAK	DURATION
hydralazine	45 min	2 hr	2–4 hr
isosorbide	15–40 min	unknown	4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to either component.
Use Cautiously in: Pedi: Children <18 yr or lactation (safety not established); Hydralazine-Cardiovascular or cerebrovascular disease; Severe renal/hepatic disease (dose modification may be necessary); Pregnancy and lactation (has been used safely during pregnancy); isosorbide dinitrate. Head trauma or cerebral hemorrhage; Geriatric patients (start with lower doses); OB: Pregnancy (may compromise maternal/fetal circulation) or lactation (safety not established).

Adverse Reactions/Side Effects
Hydralazine **CNS:** dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rashes. **F and E:** sodium retention. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuropathy. **Misc:** drug-induced lupus syndrome.
isosorbide dinitrate **CNS:** dizziness, headache, apprehension, weakness. **CV:** hypotension, tachycardia, paradoxic bradycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Misc:** cross-tolerance, flushing, tolerance.

Interactions
Drug-Drug: ↑ risk of hypotension with **phosphodiesterase inhibitors** (**sildenafil**, **vardenafil**, or **tadalafil**) other **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**. **MAO inhibitors** may exaggerate hypotension. May reduce the pressor response to **epinephrine**. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** increase hydralazine levels. Hydralazine ↑ blood levels of **metoprolol** and **propranolol**.

Route/Dosage
PO (Adults): 1 tablet three times daily, may be increased to 2 tablets three times daily.

Availability
Tablets: hydralazine 37.5 mg/isosorbide dinitrate 20 mg.

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure and pulse routinely during period of dosage adjustment. Symptomatic hypotension may occur even with small doses. Use caution with patients who are volume depleted or hypotensive.
- ***Lab Test Considerations:*** If symptoms of systemic lupus erythematosus (SLE) occur obtain a CBC and ANA titer. If positive for SLE, carefully weigh risks/benefits of continued therapy.

Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)
Activity intolerance (Indications)

Implementation
- Dose may be titrated rapidly over 3–5 days, but may need to decrease if side effects occur. May decrease to one-half tablet three time daily if intolerable side effects occur. Titrate up as soon as side effects subside.

Patient/Family Teaching
- Instruct patient to take medication as directed on a regular schedule.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or medications for erectile dysfunction with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking this medication.
- Caution patient that inadequate fluid intake or excessive fluid loss from perspiration, diarrhea or vomiting may lead to a fall in blood

Copyright © 2008 by F.A. Davis

pressure, dizziness or syncope. If syncope occurs, discontinue medication and notify health care professional promptly.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if symptoms of systemic lupus erythematosus occur (arthralgia, fever, chest pain, prolonged malaise or other unexplained symptoms).

Evaluation/Desired Outcomes
- Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

HIGH ALERT

hydrocodone
(hye-droe-**koe**-done)
Hycodan, Tussigon (U.S. antitussive formulations contain homatropine)
hydrocodone/acetaminophen
Anexsia, Co-Gesic, Lorcet-HD, Lortab, Norco, Vicodin, Zydone
hydrocodone/aspirin
Azdone
hydrocodone/ibuprofen
Vicoprofen

Classification
Therapeutic: allergy, cold, and cough remedies (antitussive), opioid analgesics
Pharmacologic: opioid agonists/nonopioid analgesic combinations

Schedule III (in combination)

Pregnancy Category C (with acetaminophen, or ibuprofen), D (with aspirin)

For information on the acetaminophen, aspirin, and ibuprofen components of these formulations, see the acetaminophen, aspirin, and ibuprofen monographs

Indications
Used mainly in combination with nonopioid analgesics (acetaminophen/aspirin/ibuprofen) in the management of moderate to severe pain. Antitussive (usually in combination products with decongestants).

Action
Bind to opiate receptors in the CNS. Alter the perception of and response to painful stimuli while producing generalized CNS depression: Suppress the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in severity of moderate pain. Suppression of the cough reflex.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; eliminated in the urine (50–60% as metabolites, 15% as unchanged drug).
Half-life: 2.2 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	10–30 min	30–60 min	4–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to hydrocodone (cross-sensitivity may exist to other opioids); Hypersensitivity to acetaminophen/aspirin/ibuprofen (for combination products); Aspirin- and ibuprofen-containing products should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen should be avoided in patients with severe hepatic or renal disease; Ibuprofen-containing products should be avoided in patients undergoing coronary artery bypass graft surgery; OB, Lactation: Pregnancy or lactation (avoid chronic use); Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Cardiovascular disease (ibuprofen-containing products only); History of peptic ulcer disease (ibuprofen-containing products only); Alcoholism; Geriatric or debilitated patients (initial dosage reduction required; more prone to CNS depression, constipation); Patients with undiagnosed abdominal

Copyright © 2008 by F.A. Davis

pain; Prostatic hyperplasia; Pedi: Children (safety not established).

Adverse Reactions/Side Effects

Noted for hydrocodone only; see acetaminophen/aspirin/ibuprofen monographs for specific information on individual components. **CNS:** confusion, dizziness, sedation, euphoria, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, dyspepsia, nausea, vomiting. **GU:** urinary retention. **Derm:** sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may produce severe, unpredictable reactions—do not use within 14 days of each other). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of partial antagonist opioids (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may ↓ analgesia or precipitate opioid withdrawal in physically dependent patients.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

Route/Dosage

PO (Adults): *Analgesic*—2.5–10 mg q 3–6 hr as needed; if using combination products, acetaminophen or aspirin dosage should not exceed 4 g/day and should not exceed 5 tablets/day of ibuprofen-containing products; *Antitussive*—5 mg q 4–6 hr as needed.
PO (Children): *Analgesic (2–13 yr)*—0.14 mg/kg q 4–6 hr. *Antitussive (6–12 yr)*—2.5 mg q 4–6 hr.

Availability

Hydrocodone

Hydrocodone tablets: 5 mg (Hycodan).
Hydrocodone syrup: 5 mg/ml (Hycodan, Robidone).

Hydrocodone/Acetaminophen

Tablets: 2.5 mg hydrocodone/500 mg acetaminophen, 5 mg hydrocodone/400 mg acetaminophen (Zydone), 5 mg hydrocodone/325 mg acetaminophen (Anexsia 5/325, Norco), 5 mg hydrocodone/500 mg acetaminophen (Anexsia 5/500, Co-Gesic, Lorcet, Lortab 5/500, Vicodin), 7.5 mg hydrocodone/325 mg acetaminophen (Anexsia 7.5/325, Norco), 7.5 mg hydrocodone/400 mg acetaminophen (Zydone), 7.5 mg hydrocodone/500 mg acetaminophen, 7.5 mg hydrocodone/650 mg acetaminophen (Anexsia 7.5/650), 7.5 mg hydrocodone/750 mg acetaminophen (Vicodin ES), 10 mg hydrocodone/325 mg acetaminophen (Norco), 10 mg hydrocodone/400 mg acetaminophen (Zydone), 10 mg hydrocodone/500 mg acetaminophen (Lortab 10/500), 10 mg hydrocodone/650 mg acetaminophen, 10 mg hydrocodone/660 mg acetaminophen (Vicodin HP), 10 mg hydrocodone/750 mg acetaminophen (Anexsia 10/750). **Capsules:** 5 mg hydrocodone/500 mg acetaminophen (Lorcet-HD). **Elixir/oral solution:** 2.5 mg hydrocodone plus 167 mg acetaminophen/5 ml.

Hydrocodone/Aspirin

Tablets: 5 mg hydrocodone/500 mg aspirin (Azdone).

Hydrocodone/Ibuprofen

Tablets: 7.5 mg hydrocodone/200 mg ibuprofen.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another

Copyright © 2008 by F.A. Davis

- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioids for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations. Do not confuse hydrocodone with hydrocortisone.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Combination with nonopioid analgesics may have additive analgesic effects and permit lower doses. Maximum doses of nonopioid agents limit the titration of hydrocodone doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.

Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to take more than the recommended amount. Severe and permanent liver damage may result from prolonged use or high doses of acetaminophen. Renal damage may occur with prolonged use of acetaminophen, aspirin, or ibuprofen. Doses of nonopioid agents should not exceed the maximum recommended daily dose.
- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of nonproductive cough.

hydrochlorothiazide, See DIURETICS (THIAZIDE).

hydrocortisone, See CORTICOSTEROIDS (SYSTEMIC), CORTICOSTEROIDS (TOPICAL/LOCAL).

HIGH ALERT

hydromorphone

(hye-droe-**mor**-fone)
Dilaudid, Dilaudid-HP, Hydrostat IR, PMS Hydromorphone

Classification
Therapeutic: allergy, cold, and cough remedies (antitussives), opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications
Moderate to severe pain (alone and in combination with nonopioid analgesics); extended release product for opioid-tolerant patients requiring around-the-clock management of persistent pain. Antitussive (lower doses).

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Suppresses the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in moderate to severe pain. Suppression of cough.

Pharmacokinetics
Absorption: Well absorbed following oral, rectal, subcut, and IM administration. Extended-release product results in an initial release of drug, followed by a second sustained phase of absorption.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: *Oral, immediate release, or injection*—2–4 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	30–90 min	4–5 hr
Subcut	15 min	30–90 min	4–5 hr
IM	15 min	30–60 min	4–5 hr
IV	10–15 min	15–30 min	2–3 hr
Rect	15–30 min	30–90 min	4–5 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known hypersensitivity; OB, Lactation: Avoid chronic use during pregnancy or lactation.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Geriatric or debilitated patients (dose reduction recommended); Undiagnosed abdominal pain; Prostatic hypertrophy.

Adverse Reactions/Side Effects
CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Exercise extreme caution with **MAO inhibitors** (may produce severe, unpredictable reactions—reduce initial dose of hydromorphone to 25% of usual dose, discontinue MAO inhibitors 2 wk prior to hydromorphone). ↑ risk of CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics** including **benzodazepines** and **phenothiazines**. Administration of partial antagonists (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia.
Drug-Natural Products: Concomitant use of **kava kava, valerian, chamomile,** or **hops** can ↑ CNS depression.

Route/Dosage
Doses depend on level of pain and tolerance.

Analgesic
PO (Adults ≥50 kg): 4–8 mg q 3–4 hr initially (some patients may respond to doses as small as 2 mg initially).
PO (Adults and Children <50 kg): 0.06 mg/kg q 3–4 hr initially, younger children may require smaller initial doses of 0.03 mg/kg. Maximum dose 5 mg.
IV, IM, Subcut (Adults ≥50 kg): 1.5 mg q 3–4 hr as needed initially; may be increased.
IV, IM, Subcut (Adults and Children <50 kg): 0.015 mg/kg mg q 3–4 hr as needed initially; may be increased.

Copyright © 2008 by F.A. Davis

IV (Adults): *Continuous infusion (unlabeled)*—0.2–30 mg/hr depending on previous opioid use. An initial bolus of twice the hourly rate in mg may be given with subsequent breakthrough boluses of 50–100% of the hourly rate in mg.
Rect (Adults): 3 mg q 6–8 hr initially as needed.

Antitussive

PO (Adults and Children >12 yr): 1 mg q 3–4 hr.
PO (Children 6–12 yr): 0.5 mg q 3–4 hr.

Availability (generic available)

Tablets: 2 mg, 3 mg, 4 mg, 8 mg. **Oral solution:** 5 mg/5 ml. **Injection:** 1 mg/ml, 2 mg/ml, 4 mg/ml, 10 mg/ml. **Suppositories:** 3 mg. ***In combination with:*** guaifenesin and alcohol (Dilaudid Cough Syrup). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Geri, Pedi: Assess geriatric and pediatric patients frequently; more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr following IM and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting hydromorphone, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive hydromorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse with meperidine or morphine; fatalities have occurred. Do not confuse high-potency (HP) dose forms with regular dose forms. Pedi: Medication errors with opioid analgesics are common in pediatric patients; do not misinterpret or miscalculate doses. Use appropriate measuring devices.

Copyright © 2008 by F.A. Davis

- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute with at least 5 ml of sterile water or 0.9% NaCl for injection. Inspect solution for particulate matter. Slight yellow color does not alter potency. Store at room temperature. ***Rate:*** Administer slowly, at a rate not to exceed 2 mg over 3–5 min.
- ***High Alert:*** Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Syringe Compatibility:** atropine, bupivacaine, ceftazidime, chlorpromazine, cimetidine, diphenhydramine, fentanyl, glycopyrrolate, hydroxyzine, lorazepam, metoclopramide, midazolam, pentobarbital, potassium chloride, prochlorperazine, promethazine, ranitidine, scopolamine, thiethylperazine.
- **Syringe Incompatibility:** ampicillin, diazepam, heparin, hyaluronidase, pantoprazole, phenobarbital, phenytoin.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, amsacrine, atropine, aztreonam, bivalirudin, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dexamethasone, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, epinephrine, erythromycin lactobionate, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, foscarnet, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, kanamycin, ketorolac, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, methotrexate, methotrimeprizine, metoclopramide, metronidazole, midazolam, milrinone, morphine, nafcillin, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, paclitaxel, pemetrexed, penicillin G potassium, piperacillin/tazobactam, propofol, ranitidine, remifentanil, scopolamine, tacrolimus, teniposide, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole, phenytoin, sargramostim, thiopental.
- **Additive Compatibility:** bupivicaine, clonidine, heparin, midazolam, ondansetron, potassium chloride.
- **Additive Incompatibility:** sodium bicarbonate, thiopental.
- **Solution Compatibility:** D5W, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, D5/Ringer's solution, 0.45% NaCl, 0.9% NaCl, Ringer's and LR.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- **Home Care Issues:** Explain to patient and family how and when to administer hydromorphone and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- Emphasize the importance of aggressive prevention of constipation with the use of hydromorphone.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.

hydroxychloroquine

(hye-drox-ee-**klor**-oh-kwin)

Plaquenil

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antimalarials, antirheumatics (DMARDs)

Pregnancy Category C

Indications
Suppression/chemoprophylaxis of malaria. Treatment of severe rheumatoid arthritis/systemic lupus erythematosus.

Action
Inhibits protein synthesis in susceptible organisms by inhibiting DNA and RNA polymerase.
Therapeutic Effects: Death of plasmodia responsible for causing malaria. Also has anti-inflammatory properties.

Pharmacokinetics
Absorption: Highly variable (31–100%) following oral administation.
Distribution: Widely distributed; high concentrations in RBCs; crosses the placenta; excreted into breast milk.
Metabolism and Excretion: Partially metabolized by the liver to active metabolites; partially excreted unchanged by the kidneys.
Half-life: 72–120 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid†	1–2 hr	days–weeks

†Onset of antirheumatic action may take 6 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity to hydroxychloroquine or chloroquine; Previous visual damage from hydroxychloroquine or chloroquine.
Use Cautiously in: Concurrent use of hepatotoxic drugs; History of liver disease or alcoholism or renal impairment; Severe neurological disorders; Severe blood disorders; Retinal or visual field changes; G6PD deficiency; Psoriasis; Bone marrow depression; Obesity (determine dose by ideal body weight); Pregnancy or lactation (avoid use unless treating/preventing malaria or treating amebic abscess); Children (long-term use increased sensitivity to effects).

Adverse Reactions/Side Effects
CNS: SEIZURES, aggressiveness, anxiety, apathy, confusion, fatigue, headache, irritability, personality changes, psychoses. **EENT:** keratopathy, ototoxicity, retinopathy, tinnitus, visual disturbances. **CV:** ECG changes, hypotension. **GI:** abdominal cramps, anorexia, diarrhea, epigastric discomfort, nausea, vomiting, hepatic failure. **Derm:** bleaching of hair, alopecia, hyperpigmentation, photosensitivity, Stevens-Johnson syndrome. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Neuro:** neuromyopathy, peripheral neuritis.

Interactions
Drug-Drug: May ↑ the risk of hepatotoxicity when administered with **hepatotoxic drugs**. May ↑ the risk of hematologic toxicity when administered with **penicillamine**. May ↑ risk of dermatitis when administered with other **agents having dermatologic toxicity**. May ↓ serum titers of rabies antibody when given concurrently with **human diploid cell rabies vaccine**. **Urinary acidifiers** may ↑ renal excretion. May ↑ serum levels of **digoxin**.

Route/Dosage
Antimalarial doses expressed as mg of base; antirheumatic and lupus doses expressed as mg of hydroxychloroquine sulfate (200 mg hydroxychloroquine sulfate = 155 mg of hydroxychloroquine base).

Malaria
PO (Adults): *Suppression or chemoprophylaxis*—310 mg once weekly; start 1–2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—620 mg, then 310 mg at 6 hr, 24 hr, and 48 hr after initial dose.
PO (Children): *Suppression or chemoprophylaxis*—5 mg/kg once weekly; start 1–2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—10 mg/kg initially, then 5 mg/kg at 6–8 hr, 24 hr, and 48 hr after initial dose.

Rheumatoid Arthritis
PO (Adults): 400–600 mg once daily initially, maintenance 200–400 mg/day divided 1–2 times/day.
PO (Children): 3–5 mg/kg/day divided 1–2 times/day to a maximum of 400 mg/day; not to exceed 7 mg/kg/day.

Systemic Lupus Erythematosus
PO (Adults): 400 mg once or twice daily, maintenance 200–400 mg/day.

Copyright © 2008 by F.A. Davis

PO (Children): 3–5 mg/kg/day divided 1–2 times/day to a maximum of 400 mg/day; not to exceed 7 mg/kg/day.

Availability

Tablets: 200 mg (155-mg base).

NURSING IMPLICATIONS

Assessment

- Assess deep tendon reflexes periodically to determine muscle weakness. Therapy may be discontinued should this occur.
- Patients on prolonged high-dose therapy should have eye exams prior to and every 3–6 mo during therapy to detect retinal damage.
- **Malaria or Lupus Erythematosus:** Assess patient for improvement in signs and symptoms of condition daily throughout course of therapy.
- **Rheumatoid Arthritis:** Assess patient monthly for pain, swelling, and range of motion.
- ***Lab Test Considerations:*** Monitor CBC and platelet count periodically throughout therapy. May cause decreased RBC, WBC, and platelet counts. If severe decreases occur that are not related to the disease process, hydroxychloroquine should be discontinued.

Potential Nursing Diagnoses

Risk for infection (Indications)
Chronic pain (Indications)

Implementation

- **PO:** Administer with milk or meals to minimize GI distress.
- Tablets may be crushed and placed inside empty capsules for patients with difficulty swallowing. Contents of capsules may also be mixed with a teaspoonful of jam, jelly, or Jell-O prior to administration.
- **Malaria Prophylaxis:** Hydroxychloroquine therapy should be started 2 wk prior to potential exposure and continued for 4–6 wk after leaving the malarious area.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and continue full course of therapy even if feeling better. Missed doses should be taken as soon as remembered unless it is almost time for next dose. Do not double doses.
- Advise patients to avoid use of alcohol while taking hydroxychloroquine.
- Caution patient to keep hydroxychloroquine out of reach of children; fatalities have occurred with ingestion of 3 or 4 tablets.
- Explain need for periodic ophthalmic exams for patients on prolonged high-dose therapy. Advise patient that the risk of ocular damage may be decreased by the use of dark glasses in bright light. Protective clothing and sunscreen should also be used to reduce risk of dermatoses.
- Advise patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, blurred vision, visual changes, ringing in the ears, difficulty hearing, or muscle weakness occurs.
- **Malaria Prophylaxis:** Review methods of minimizing exposure to mosquitoes with patients receiving hydroxychloroquine prophylactically (use repellent, wear long-sleeved shirt and long trousers, use screen or netting).
- Advise patient to notify health care professional if fever develops while traveling or within 2 mo of leaving an endemic area.
- **Rheumatoid Arthritis:** Instruct patient to contact health care professional if no improvement is noticed within a few days. Treatment for rheumatoid arthritis may require up to 6 mo for full benefit.

Evaluation/Desired Outcomes

- Prevention or resolution of malaria.
- Improvement in signs and symptoms of rheumatoid arthritis.
- Improvement in symptoms of lupus erythematosus.

hydrOXYzine (hye-drox-i-zeen)

Apo-Hydroxyzine, Atarax, Hyzine-50, Multipax, Novohydroxyzin, Vistaril

Classification

Therapeutic: antianxiety agents, antihistamines, sedative/hypnotics

Pregnancy Category C

Indications

Treatment of anxiety. Preoperative sedation. Antiemetic. Antipruritic. May be combined with opioid analgesics.

Action

Acts as a CNS depressant at the subcortical level of the CNS. Has anticholinergic, antihistaminic,

Copyright © 2008 by F.A. Davis

and antiemetic properties. Blocks histamine 1 receptors. **Therapeutic Effects:** Sedation. Relief of anxiety. Decreased nausea and vomiting. Decreased allergic symptoms associated with release of histamine, including pruritus.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration.
Distribution: Unknown.
Metabolism and Excretion: Completely metabolized by the liver; eliminated in the feces via biliary excretion.
Half-life: 3 hr.

TIME/ACTION PROFILE (sedative, antiemetic, antipruritic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	2–4 hr	4–6 hr
IM	15–30 min	2–4 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Potential for congenital defects (oral clefts and hypoplasia of cerebral hemisphere; Lactation: Safety not established.
Use Cautiously in: Severe hepatic dysfunction; OB: Has been used safely during labor; Pedi: Injection contains benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates; Geri: Appears on *Beers list*. Geriatric patients are more susceptible to adverse reactions due to anticholinergic effects; dosage reduction recommended.

Adverse Reactions/Side Effects

CNS: drowsiness, agitation, ataxia, dizziness, headache, weakness. **Resp:** wheezing. **GI:** dry mouth, bitter taste, constipation, nausea. **GU:** urinary retention. **Derm:** flushing. **Local:** pain at IM site, abscesses at IM sites. **Misc:** chest tightness.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. Can antagonize the vasopressor effects of **epinephrine**.

Drug-Natural Products: Concomitant use of **kava kava, valerian,** or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **angel's trumpet, jimson weed,** and **scopolia.**

Route/Dosage

PO (Adults): *Antianxiety*—25–100 mg 4 times/day, not to exceed 600 mg/day. *Preoperative sedation*—50–100 mg single dose. *Antipruritic*—25 mg 3–4 times daily.
PO (Children):—2 mg/kg/day divided q 6–8 hr.
IM (Adults): *Preoperative sedation*—25–100 mg single dose. *Antiemetic, adjunct to opioid analgesics*—25–100 mg q 4–6 hr as needed.
IM (Children): 0.5–1 mg/kg q 4–6 hr as needed.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 100 mg. **Capsules:** 🍁10 mg, 25 mg, 50 mg, 100 mg. **Syrup:** 10 mg/5 ml. **Oral suspension:** 25 mg/5 ml. **Injection:** 25 mg/ml, 50 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for profound sedation and provide safety precautions as indicated (side rails up, bed in low position, call bell within reach, supervision of ambulation and transfer). Geri: Older adults are more sensitive to CNS and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia). Monitor for drowsiness, agitation, over sedation, and other systemic side effects. Assess falls risk and implement prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, and behavior).
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis.
- **Pruritus:** Assess degree of itching and character of involved skin.
- ***Lab Test Considerations:*** May cause false-negative skin test results using allergen extracts. Discontinue hydroxyzine at least 72 hr before test.

Potential Nursing Diagnoses

Anxiety (Indications)

Copyright © 2008 by F.A. Davis

Impaired skin integrity (Indications)
Risk for injury (Side Effects)
Ineffective coping (Side Effects)

Implementation

- Do not confuse hydroxyzine with hydralazine or Atarax (hydroxyzine) with Ativan (lorazepam).
- **PO:** Tablets may be crushed and capsules opened and administered with food or fluids for patients having difficulty swallowing.
- Shake suspension well before administration.
- **IM:** Administer *only* IM deep into well-developed muscle, preferably with Z-track technique. Injection is extremely painful. Do not use deltoid site. If must be administered to children, midlateral muscles of the thigh are preferred. Significant tissue damage, necrosis, and sloughing may result from subcut or intra-arterial injections. Hemolysis may result from IV injections. Rotate injection sites frequently.
- **Syringe Compatibility:** atropine, butorphanol, chlorpromazine, cimetidine, codeine, diphenhydramine, doxapram, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, lidocaine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, oxymorphone, pentazocine, perphenazine, procaine, prochlorperazine, promethazine, scopolamine, sufentanil.
- **Syringe Incompatibility:** dimenhydrinate, haloperidol, heparin, ketorolac, pentobarbital, ranitidine.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as remembered unless it is almost time for next dose; do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Geri: Warn patients or caregivers that older adults are at increased risk for CNS effects and falls.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help decrease dry mouth. If dry mouth persists for more than 2 wk, consult dentist about saliva substitute.
- If used for anxiety, advise patient that psychotherapy is beneficial in addressing sources of anxiety and improving coping skills.
- Teach other methods to decrease anxiety, such as increased exercise, support groups, and relaxation techniques.

Evaluation/Desired Outcomes

- Decrease in anxiety.
- Relief of nausea and vomiting.
- Relief of pruritus.
- Sedation when used as a sedative/hypnotic.

hyoscyamine

(hi-oh-**si**-a-meen)
Anaspaz, A-Spas S/L, Cystospaz, Cystospaz-M, Donnamar, ED-SPAZ, Gastrosed, Levsinex, Levsin, Levbid, L-hyoscyamine, NuLev

Classification
Therapeutic: antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Control of gastric secretion, visceral spasm, hypermotility in spastic colitis, spastic bladder, pylorospasm, and related abdominal cramps. Decreases symptoms of various functional intestinal disorders including mild dysenteries, diverticulitis, infant colic, biliary and renal colic. Adjunctive therapy in peptic ulcer disease, irritable bowel syndrome, neurogenic bowel disturbances. Decreases pain and hypersecretion associated with pancreatitis. Relief of symptoms of acute rhinitis. Decreases rigidity and tremors associated with parkinsonism and controls related sialorrhea and hyperhidrosis. May also be used to manage anticholinesterase poisoning. Management of cystitis or renal colic. Management of some forms of heart block due to vagal activity. **IM, IV, Subcut** Facilitation of diagnostic hypotonic duodenography; may also increase radiologic visibility of the kidneys. Preoperative administration decreases secretions and blocks bradycardia associated with some forms of anesthesia and related surgical agents.

Action

Inhibits the muscarinic effect of acetylcholine in smooth muscle, secretory glands and the CNS. Small doses decrease salivary and bronchial

Copyright © 2008 by F.A. Davis

secretions and decrease sweating; intermediate doses dilate the pupil, inhibit accommodation, increase heart rate (vagolytic action); large doses decrease GI and GU motility, further increase in dose decreases gastric acid secretion. **Therapeutic Effects:** Decreased secretions with decreased GI and GU symptomatology. Increased heart rate.

Pharmacokinetics

Absorption: Well absorbed; food does not affect absorption.
Distribution: Crosses the placenta and blood-brain barrier; enters breast milk.
Metabolism and Excretion: Excreted mostly unchanged by the kidneys.
Half-life: 3.5 hr.

TIME/ACTION PROFILE (GI effects)

ROUTE	ONSET	PEAK	DURATION
PO	20–30 min	unknown	4–6 hr
IM, IV, subcut	2–3 min	unknown	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; synechiae; Tachycardia or unstable cardiovascular status; GI obstructive disease, paralytic ileus, intestinal atony, severe ulcerative colitis; Obstructive uropathy; Myasthenia gravis; Lactation; Products containing benzyl alcohol should not be used in newborn or immature infants; Some products contain alcohol, sulfites, or tartrazine and should be avoided in patients with known intolerance/hypersensitivity; Phenylketonuria (NuLev contains aspartame).
Use Cautiously in: History of cardiovascular disease including CHF, arrhythmias, hypertension, tachycardia, or coronary artery disease; Renal disease or prostatic hyperplasia; Hepatic disease, early ileus, or reflux esophagitis; Autonomic neuropathy; Hyperthyroidism; Geri: Appears on Beers list. Geriatric patients have increased sensitivity to anticholinergics.; Infants, small children, blondes, Down's syndrome, brain damage, or spastic paralysis (increased sensitivity); Pregnancy (may cause fetal tachycardia; safety not established).

Adverse Reactions/Side Effects

CNS: confusion/excitement (especially in geriatric patients), dizziness, flushing, headache, insomnia, lightheadedness (IM, IV, subcut), nervousness. **EENT:** blurred vision, cycloplegia, increased intraocular pressure, mydriasis, photophobia. **CV:** palpitations, tachycardia. **GI:** dry mouth, altered taste perception, bloated feeling, constipation, nausea, paralytic ileus, vomiting. **GU:** erectile dysfunction, urinary hesitancy/retention. **Derm:** decreased sweating, urticaria. **Local:** local irritation (IM, IV, subcut). **Misc:** allergic reactions including ANAPHYLAXIS, fever (especially in children), suppression of lactation.

Interactions

Drug-Drug: Concurrent administration with **amantadine** ↑ anticholinergic side effects (may require dose reduction). ↑ effects of **atenolol**. Concurrent use with **phenothiazines** may result in ↓ effect of phenothiazine and ↑ anticholinergic side effects (dose reduction may be necessary). ↑ anticholinergic side effects with **tricyclic antidepressants**.

Route/Dosage

PO, SL (Adults): 0.125–0.25 mg 3–4 times daily or 0.375–0.75 mg as sustained release form every 12 hr.
PO (Children 2–<12 yr): *orally disintegrating tablets (NuLev)*—0.0625–0.125 mg (1/2–1 tablet) every 4 hr, up to 6 times/day.
PO (Children 34–36 kg): 125–187 mcg every 4 hr as needed.
PO (Children 22.7–33 kg): 94–125 mcg every 4 hr as needed.
PO (Children 13.6–22.6 kg): 63 mcg every 4 hr as needed.
PO (Children 9.1–13.5 kg): 31.3 mcg every 4 hr as needed.
PO (Children 6.8–9 kg): 25 mcg every 4 hr as needed.
PO (Children 4.5–6.7 kg): 18.8 mcg every 4 hr as needed.
PO (Children 3.4–4.4 kg): 15.6 mcg every 4 hr as needed.
PO (Children 2.3–3.3 kg): 12.5 mcg every 4 hr as needed.
IM, IV, Subcut (Adults): *Gastrointestinal anticholinergic*—0.25–0.5 mg 3–4 times daily as needed; *preoperative prophylaxis of secretions*—0.5 mg or 0.005 mg/kg 30–60 min before anesthesia; *antiarrhythmic*—0.125 mg IV repeated as needed; *cholinergic adjunct (cu-*

Copyright © 2008 by F.A. Davis

rariform block)—0.2 mg for each 1 mg of neostigmine.
IM, IV, Subcut (Children ≥2 yr): *preoperative prophylaxis of secretions*—0.005 mg/kg 30–60 min before anesthesia.

Availability (generic available)

Tablets: 0.125 mg, 0.15 mg. **Sublingual tablets:** 0.125 mg, 0.375 mg. **Orally-disintegrating tablets (contains aspartame) (mint):** 0.125 mg. **Extended-release tablets:** 0.375 mg. **Timed-release capsules:** 0.375 mg. **Solution (drops) (orange):** 0.125 mg/ml. **Elixir (orange):** 0.125 mg/5 ml. **Injection:** 0.5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure, or increased ventricular ectopy or angina to physician promptly.
- Monitor intake and output ratios in elderly or surgical patients because hyoscyamine may cause urinary retention
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- ***Toxicity and Overdose:*** If overdose occurs, physostigmine is the antidote.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

Implementation

- Do not confuse Levbid (hyoscyamine) with Lithobid (lithium) Lopid (gemfibrozil) or Lorabid (loracarbef).
- **PO:** Oral doses are usually given 30 min before meals.

IV Administration

- **Direct IV:** ***Diluent:*** May give IV undiluted or dilute in 10 mL of sterile water. ***Rate:*** No rate information available, give slowly.

Patient/Family Teaching

- Instruct patient to take exactly as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that hyoscyamine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products concurrently with hyoscyamine.
- Inform male patients with benign prostatic hyperplasia that hyoscyamine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

Evaluation/Desired Outcomes

- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

HIGH ALERT

HYPOGLYCEMIC AGENTS, ORAL

glimepiride (glye-**me**-pye-ride)
Amaryl, Apo-Glimepiride, Co-Glimepiride

glipiZIDE (**glip**-i-zide)
Glucotrol, Glucotrol XL

glyBURIDE (**glye**-byoo-ride)
Apo-Glyburide, DiaBeta, Dom-Glyburide, Euglucon, Gen-Glybe, Glynase PresTab, Micronase

Classification
Therapeutic: antidiabetics
Pharmacologic: sulfonylureas

Pregnancy Category B (glyburide [Micronase, Glynase PresTab]), C (glimepiride, glipizide, and glyburide [Diabeta])

Indications

Control of blood glucose in type 2 diabetes mellitus when diet therapy fails. Require some pancreatic function.

Action

Lower blood glucose by stimulating the release of insulin from the pancreas and increasing the

Copyright © 2008 by F.A. Davis

sensitivity to insulin at receptor sites. May also decrease hepatic glucose production. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients.

Pharmacokinetics

Absorption: All agents are well absorbed after oral administration.
Distribution: *Glyburide*—reaches high concentrations in bile and crosses the placenta.
Protein Binding: *Glimepiride* –99.5%, *glipizide* 99%, *glyburide* 99%,.
Metabolism and Excretion: All agents are mostly metabolized by the liver. *Glimepiride*—converted to a metabolite with some hypoglycemic activity.
Half-life: *Glimepiride*—5–9.2; *glipizide*—2.1–2.6 hr; *glyburide*—10 hr.

TIME/ACTION PROFILE (hypoglycemic activity)

ROUTE	ONSET	PEAK	DURATION
Glimepiride	unknown	2–3 hr	24 hr
Glipizide	15–30 min	1–2 hr	up to 24 hr
Glyburide	45–60 min	1.5–3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity with sulfonamides (cross-sensitivity may occur); Type 1 diabetes; Diabetic coma or ketoacidosis.
Use Cautiously in: Geri: Elderly (↑ sensitivity; dosage reduction may be required); Renal or hepatic dysfunction (↑ risk of hypoglycemia); Infection, trauma, or surgery (may alter requirements for control of blood glucose); Impaired pituitary, or adrenal function; Prolonged nausea or vomiting; Debilitated or malnourished patients (↑ risk of hypoglycemia); OB, Lactation: Pregnancy or lactation (safety not established; insulin recommended during pregnancy); Pedi: Children (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache, weakness. **GI:** constipation, cramps, diarrhea, drug-induced hepatitis, heartburn, increased appetite, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hypoglycemia. **F and E:** hyponatremia. **Hemat:** APLASTIC ANEMIA, agranulocytosis, leukopenia, pancytopenia, thrombocytopenia.

Interactions

Drug-Drug: Effectiveness may be ↓ by concurrent use of **diuretics**, **corticosteroids**, **phenothiazines**, **oral contraceptives**, **estrogens**, **thyroid preparations**, **phenytoin**, **niacin**, **sympathomimetics**, and **isoniazid**. **Alcohol**, **androgens (testosterone)**, **chloramphenicol**, **MAO inhibitors**, **NSAIDs**, **salicylates**, **sulfonamides**, and **warfarin** may ↑ risk of hypoglycemia. **Fluoroquinolones** may ↑ effects of glyburide. Concurrent use with **warfarin** may alter the response to both agents (↑ effects of both initially, then ↓ activity); close monitoring recommended during any changes in dosage. **Beta blockers** may mask the signs and symptoms of hypoglycemia.

Route/Dosage

Glimepiride

PO (Adults): 1–2 mg once daily initially; may ↑ q 1–2 wk up to 8 mg/day (usual range 1–4 mg/day).
PO (Geriatric Patients): 1 mg/day initially.

Glipizide

PO (Adults): 5 mg/day initially, may be ↑ by 2.5–5 mg/day at weekly intervals as needed; maximum dose = 40 mg/day (immediate-release), 20 mg/day (XL); XL dosage form is given once daily. Doses >15 mg/day should be given as 2 divided doses of immediate-release tablets (not XL).
PO (Geriatric Patients): 2.5 mg/day initially.

Glyburide

The nonmicronized formulation (Diabeta or Micronase) cannot be used interchangeably with the micronized formulation (Glynase PresTab)

PO (Adults): *DiaBeta/Micronase (nonmicronized)*—2.5–5 mg once daily initially; may be ↑ by 2.5–5 mg/day at weekly intervals (range 1.25–20 mg/day). *Glynase PresTab (micronized)*—1.5–3 mg/day initially; may be ↑ by 1.5 mg/day at weekly intervals (range 0.75–12 mg/day; doses >6 mg/day should be given as divided doses).
PO (Geriatric Patients): *DiaBeta/Micronase (nonmicronized)*—1.25 mg/day initially; may be ↑ by 2.5 mg/day at weekly intervals. *Glynase PresTab (micronized)*—0.75 mg/day; may be ↑ by 1.5 mg/day at weekly intervals.

H

Copyright © 2008 by F.A. Davis

Availability

Glimepiride

Tablets: 1 mg, 2 mg, 4 mg. ***In combination with:*** pioglitazone (Duetact); rosiglitazone (Avandaryl) See Appendix B.

Glipizide

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg $16.65/100, 10 mg $12.22/100. **Extended-release tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $32.97/90, 5 mg $32.97/90, 10 mg $59.97/90. ***In combination with:*** metformin (Metaglip); see Appendix B.

Glyburide

Tablets: 1.25 mg, 2.5 mg, 5 mg. **Micronized tablets:** 1.5 mg, 3 mg, 6 mg. ***In combination with:*** metformin (Glucovance). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess patient for allergy to sulfonamides.
- Patients on concurrent beta-blocker therapy may have very subtle signs of hypoglycemia.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of treatment.
- Monitor CBC periodically during therapy. Report ↓ in blood counts promptly.
- May cause an ↑ in AST, LDH, BUN, and serum creatinine.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Severe hypoglycemia should be treated with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dl.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** Accidental administration of oral hypoglycemic agents to non-diabetic adults and children has resulted in serious harm or death. Before administering, confirm that patient has type 2 diabetes.
- ***High Alert:*** Several oral hypoglycemic agents are subject to sound-alike or look-alike confusion: Do not confuse glipizide with glyburide. Do not confuse Glucotrol with Glucotrol XL. Do not confuse micronase (glyburide) with Micro-K (potassium).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- To convert from other oral hypoglycemic agents, gradual conversion is not required. For insulin dosage of less than 20 units/day, change to oral hypoglycemic agents can be made without gradual dose adjustment. Patients taking 20 or more units/day should convert gradually by receiving oral agent and a 25–30% reduction in insulin dose every day or every 2nd day with gradual insulin dose reduction as tolerated. Monitor serum or urine glucose and ketones at least 3 times/day during conversion.
- **PO:** May be administered once in the morning with breakfast or divided into 2 doses.
- Administer *glipizide* 30 min before a meal.
- Do not administer *nonmicronized glyburide* with a meal high in fat. *Micronized glyburide* cannot be substituted for *nonmicronized glyburide*. These preparations are not equivalent.

Patient/Family Teaching

- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not take if unable to eat.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.

Copyright © 2008 by F.A. Davis

- May occasionally cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid other medications, especially alcohol, while on this therapy without consulting health care professional.
- Concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headaches, and hypoglycemia).
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional promptly if unusual weight gain, swelling of ankles, drowsiness, shortness of breath, muscle cramps, weakness, sore throat, rash, or unusual bleeding or bruising occurs.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

ibandronate (i-ban-dro-nate)
Boniva

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Pregnancy Category C

Indications
Treatment/prevention of postmenopausal osteoporosis.

Action
Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal/prevention of progression of osteoporosis with decreased fractures.

Pharmacokinetics
Absorption: 0.6% absorbed following oral administration (significantly decreased by food).
Distribution: Rapidly binds to bone.
Protein Binding: 90.9–99.5%.
Metabolism and Excretion: 50–60% excreted in urine; unabsorbed drug is eliminated in feces.
Half-life: *PO*—10–60 hr; *IV*—4.6–25.5 hrs.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–2 hr	up to 1 mo
IV	unknown	3 hr	up to 3 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Uncorrected hypocalcemia; Inability to stand/sit upright for at least 60 min; CCr <30 ml/min.
Use Cautiously in: Geri: Consider age-related decreases in body mass, renal and hepatic function, concurrent disease states and drug therapy; Concurrent use of NSAIDs or aspirin; OB: Pregnancy (use only if potential benefit outweighs risks to mother and fetus); OB: Lactation; Pedi: Children <18 yr (safety not established).

Adverse Reactions/Side Effects
GI: diarrhea, dyspepsia, esophagitis, esophageal/gastric ulcer. **MS:** injection site reactions, pain in arms/legs.

Interactions
Drug-Drug: Calcium, aluminum, magnesium, and **iron**-containing products, including **antacids** ↓ absorption (ibandronate should be taken 60 min before). Concurrent use of **NSAIDs** including **aspirin**, may ↑ risk of gastric irritation.
Drug-Food: Milk and other foods ↓ absorption.

Route/Dosage
PO (Adults): 2.5 mg once daily or 150 mg once monthly.
IV (Adults): 3 mg every 3 months.

Availability
Tablets: 2.5 mg, 150 mg. **Cost:** 150 mg $254.00/3. **Injection:** 3 mg/3 mL in prefilled single-use syringe.

NURSING IMPLICATIONS

Assessment
- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- ***Lab Test Considerations:*** Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating ibandronate therapy.
- May cause ↓ total alkaline phosphatase levels.
- May cause hypercholesterolemia.

Potential Nursing Diagnoses
Risk for injury (Indications)

Implementation
- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food.
- *Once-monthly tablet* should be administered on the same date each month.

IV Administration
- **IV:** Administer using prefilled syringe. Do not administer solution that is discolored or contain particulate matter. Administer IV only; other routes may cause tissue damage. ***Rate:*** Administer as a 15–30 second bolus.
- **Y-Site Incompatibility:** Do not administer with calcium-containing solutions or other IV drugs.

Patient/Family Teaching
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D. Wait at least 60 min after administration before taking supplemental calcium and vitamin D.

Copyright © 2008 by F.A. Davis

- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she is breastfeeding.
- **PO:** Instruct patient on the importance of taking as directed, first thing in the morning, 60 min before other medications, beverages, or food. Ibandronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). Do not chew or suck on tablet. If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a once-monthly dose is missed and the next scheduled dose is >7 days away, take in the morning following the date it is remembered. Resume original schedule the following month. If the next dose is <7 days away, omit dose and take next scheduled dose. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 60 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation.
- **IV:** Advice patient that IV doses should not be administered sooner that every 3 months. If a dose is missed, have health care professional administer as soon as possible; next injection should be scheduled 3 months from last injection.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women.

ibuprofen, oral

(eye-byoo-**proe**-fen)

Actiprofen, Advil, Advil Migraine Liqui-Gels, Apo-Ibuprofen, Children's Advil, Children's Motrin, Excedrin IB, Genpril, Haltran, Junior Strength Advil, Menadol, Medipren, Midol Maximum Strength Cramp Formula, Motrin, Motrin Drops, Motrin IB, Motrin Junior Strength, Motrin Migraine Pain, Novo-Profen, Nu-Ibuprofen, Nuprin, PediaCare Children's Fever

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents

Pharmacologic: nonopioid analgesics

Pregnancy Category B (first trimester)

Indications

Mild to moderate pain or dysmenorrhea. Inflammatory disorders including: Rheumatoid arthritis (including juvenile), Osteoarthritis. Lowering of fever. **Unlabeled uses:** Slows progression of lung disease in cystic fibrosis patients >5 yrs of age (high doses).

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain and inflammation. Reduction of fever.

Pharmacokinetics

Absorption: Well absorbed (80%) from the GI tract.
Distribution: Does not enter breast milk in significant amounts.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver; small amounts (1%) excreted unchanged by the kidneys.
Half-life: Children: 1–2 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (antipyretic)	0.5–2.5 hr	2–4 hr	6–8 hr
PO (analgesic)	30 min	1–2 hr	4–6 hr
PO (anti-inflammatory)	7 days	1–2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; Chewable tablets contain aspartame and should not be used in patients with phenylketonuria; Peri-operative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Cardiovascular disease (may ↑ risk of cardiovascular events); Renal or hepatic disease, dehydration, or patients on nephrotoxic drugs (may ↑ risk of renal toxicity); Aspirin triad patients (asthma, nasal polyps, and aspirin intolerance); can cause fatal anaphylactoid reactions; Geri: Increased risk of adverse reactions secondary to age-related de-

Copyright © 2008 by F.A. Davis

crease in renal and hepatic function, concurrent illnesses, and medications; Chronic alcohol use/abuse; History of ulcer disease (may ↑ risk of GI bleeding); OB: Not recommended for pregnant patients; has been associated with persistent pulmonary hypertension in infants; Lactation: Has been used safely; Pedi: Safety not established for infants <6 mo.

Adverse Reactions/Side Effects

CNS: headache, dizziness, drowsiness, psychic disturbances. **EENT:** amblyopia, blurred vision, tinnitus. **CV:** arrhythmias, edema. **GI:** GI BLEEDING, HEPATITIS, constipation, dyspepsia, nausea, vomiting, abdominal discomfort. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rashes. **Hemat:** blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: May limit the cardioprotective effects of low-dose **aspirin**. Concurrent use with **aspirin** may ↓ effectiveness of ibuprofen. Additive adverse GI side effects with **aspirin**, **oral potassium** and other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemic effects of **insulin** or **oral hypoglycemic agents**. May slightly ↑ serum **digoxin** levels. May ↑ serum **lithium** levels and risk of toxicity. ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from ibuprofen. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytics**, **warfarin**, and **drugs affecting platelet function** including **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**.

Drug-Natural Products: ↑ bleeding risk with, **arnica**, **chamomile**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

Analgesia

PO (Adults): *Anti-inflammatory*—400–800 mg 3–4 times daily (not to exceed 3600 mg/day). *Analgesic/antidysmenorrheal/antipyretic*—200–400 mg q 4–6 hr (not to exceed 1200 mg/day).

PO (Children 6 mo–12 yr): *Anti-inflammatory*—30–50 mg/kg/day in 3–4 divided doses (maximum dose: 2.4 g/day). *Antipyretic*—5 mg/kg for temperature <102.5°F (39.17°C) or 10 mg/kg for higher temperatures (not to exceed 40 mg/kg/day); may be repeated q 4–6 hr. *Cystic fibrosis (unlabeled)*—20–30 mg/kg/day divided twice daily.

PO (Infants and Children): *Analgesic*—4–10 mg/kg/dose q 6–8 hr.

Pediatric OTC Dosing

PO (Children 11 yr—72–95 lb): 300 mg q 6–8 hr.

PO (Children 9–10 yr—60–71 lb): 250 mg q 6–8 hr.

PO (Children 6–8 yr—48–59 lb): 200 mg q 6–8 hr.

PO (Children 4–5 yr—36–47 lb): 150 mg q 6–8 hr.

PO (Children 2–3 yr—24–35 lb): 100 mg q 6–8 hr.

PO (Children 12–23 mo—-18–23 lb): 75 mg q 6–8 hr.

PO (Infants 6–11 mo—12–17 lb): 50 mg q 6–8 hr.

Availability (generic available)

Tablets: 100 mg[OTC], 200 mg[OTC], 300 mg, 400 mg, 600 mg, 800 mg. **Capsules (liqui-gels):** 200 mg[OTC]. **Chewable tablets (fruit, grape, orange, and citrus flavor):** 50 mg[OTC], 100 mg[OTC]. **Liquid (berry flavor):** 100 mg/5 ml[OTC]. **Oral suspension (fruit, berry, grape flavor):** 100 mg/5 ml[OTC], 100 mg/2.5 ml[OTC]. **Pediatric drops (berry flavor):** 50 mg/1.25 ml[OTC]. ***In combination with:*** decongestants, [OTC], hydrocodone (Vicoprofen), oxycodone (Combunox). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Geri: Higher risk for poor outcomes or death from GI bleeding. Age-related renal impairment increases risk of hepatic and renal toxicity. Assess for signs and symptoms of GI bleeding (tarry stools, lightheadedness, hy-

Copyright © 2008 by F.A. Davis

potension), renal dysfunction (elevated BUN and creatinine levels, decreased urine output), and hepatic impairment (elevated liver enzymes, jaundice).
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** BUN, serum creatinine, CBC, and liver function tests should be evaluated periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May cause prolonged bleeding time; may persist for <1 day following discontinuation.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- Administration of higher than recommended doses does not provide increased pain relief but may increase incidence of side effects.
- Geri: Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Tablets may be crushed and mixed with fluids or food; 800-mg tablet can be dissolved in water.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

Patient/Family Teaching

- Advise patients to take ibuprofen with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. Pedi: Teach parents or caregivers to calculate and measure doses accurately and to use measuring device supplied with product.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC or herbal products without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patients not to take OTC ibuprofen preparations for more than 10 days for pain or more than 3 days for fever, and to consult health care professional if symptoms persist or worsen. Many OTC products contain ibuprofen; avoid duplication.
- Pedi: Teach parents or caregivers to check labels of all OTC products to prevent administration of more than one ibuprofen product.
- Caution patient that use of ibuprofen with 3 or more glasses of alcohol per day may increase the risk of GI bleeding.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Pedi: Advise parents or caregivers not to administer ibuprofen to children who may be dehydrated (can occur with vomiting, diarrhea, or poor fluid intake); dehydration increases risk of renal dysfuntion.

Evaluation/Desired Outcomes

- Decrease in severity of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 7 days, but maximum effectiveness may require 1–2 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction in fever.

Copyright © 2008 by F.A. Davis

ibutilide (eye-**byoo**-ti-lide)
Corvert

Classification
Therapeutic: antiarrhythmics (class III)

Pregnancy Category C

Indications
Rapid conversion of recent-onset atrial flutter or fibrillation to normal sinus rhythm, including management of atrial flutter or fibrillation occurring within 1 wk of coronary artery bypass or cardiac valve surgery.

Action
Activates slow inward current of sodium in cardiac tissue, resulting in delayed repolarization, prolonged action potential duration, and increased refractoriness. Mildly slows sinus rate and AV conduction. **Therapeutic Effects:** Conversion to normal sinus rhythm.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Highly metabolized by the liver, 1 metabolite is active; metabolites excreted by kidneys.
Half-life: 6 hr (2–12 hr).

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	within 30–90 min	unknown	up to 24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: CHF or left ventricular dysfunction (↑ risk of more serious arrhythmias during infusion); Pregnancy, lactation, or children <18 yr (safety not established).

Adverse Reactions/Side Effects
CNS: headache. **CV:** arrhythmias. **GI:** nausea.

Interactions
Drug-Drug: Amiodarone, **disopyramide**, **procainamide**, **quinidine**, and **sotalol** should not be given concurrently or within 4 hr because of additive effects on refractoriness. Proarrhythmic effects may be ↑ by **phenothiazines**, **tricyclic** and **tetracyclic antidepressants**, some **antihistamines**, and **histamine H_2-receptor blocking agents**; concurrent use should be avoided.

Route/Dosage
Atrial Fibrillation/Flutter
IV (Adults ≥60 kg): 1 mg infusion; may be repeated 10 min after end of first infusion.
IV (Adults <60 kg): 0.01 mg/kg infusion; may be repeated 10 min after end of first infusion.

Atrial Fibrillation/Flutter After Cardiac Surgery
IV (Adults ≥60 kg): 0.5 mg infusion, may be repeated once.
IV (Adults <60 kg): 0.005 mg/kg infusion, may be repeated once.

Availability
Solution for injection: 0.1 mg/ml in 10-ml vial.

NURSING IMPLICATIONS

Assessment
- Monitor ECG continuously throughout and for 4 hr after infusion or until QT interval normalizes. Discontinue if arrhythmia terminates or if sustained ventricular tachycardia, prolonged QT, or QT develops. Ibutilide may have proarrhythmic effects. These arrhythmias may be serious and potentially life threatening. Clinicians trained to treat ventricular arrhythmias, medications, and equipment (defibrillator/cardioverter) should be available during therapy and monitoring of patient.

Potential Nursing Diagnoses
Decreased cardiac output (Indications)

Implementation
- Oral antiarrhythmic therapy may be instituted 4 hr after ibutilide infusion.

IV Administration
- **Intermittent Infusion:** ***Diluent:*** May be administered undiluted or diluted in 50 ml of 0.9% NaCl or D5W. Diluted solution is stable for 24 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** Undiluted: 0.1 mg/ml; Diluted: 0.017 mg/ml. ***Rate:*** Administer over 10 min.
- **Additive Incompatibility:** Information unavailable; do not admix with other solutions or medications.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Inform patient of the purpose of ibutilide.

Evaluation/Desired Outcomes

- Conversion of recent-onset atrial flutter or fibrillation to normal sinus rhythm.

idarubicin (eye-da-roo-bi-sin)
Idamycin

Classification
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Pregnancy Category D

Indications

Acute myelogenous leukemia in adults (with other agents).

Action

Inhibits nucleic acid synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly distributed with extensive tissue binding. High degree of cellular uptake.
Metabolism and Excretion: Extensive hepatic and extrahepatic metabolism. One metabolite is active (idarubicinol). Primarily eliminated via biliary excretion.
Half-life: 22 hr (range 4–46 hr).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	Unknown	10–14 days	21 days

Contraindications/Precautions

Contraindicated in: Pregnancy or lactation.
Use Cautiously in: Children (safety not established); Patients with childbearing potential; Active infection; Decreased bone marrow reserve; Geriatric patients; Other chronic debilitating illnesses; Hepatic impairment (dose reduction may be required; avoid if bilirubin ≥5 mg/dl); Renal impairment; Pre-existing cardiac disease; Previous daunorubicin or doxorubicin therapy.

Adverse Reactions/Side Effects

CNS: headache, mental status changes. **Resp:** pulmonary toxicity, pulmonary allergic reactions. **CV:** ARRHYTHMIAS, CARDIOTOXICITY, CHF. **GI:** abdominal cramps, diarrhea, mucositis, nausea, vomiting. **Derm:** alopecia, photosensitivity, rashes. **Endo:** gonadal suppression. **Hemat:** BLEEDING, anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** fever.

Interactions

Drug-Drug: ↑ myelosuppression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage

IV (Adults): 12 mg/m² daily for 3 days in combination with cytarabine.

Availability (generic available)

Powder for injection: 5-mg vials, 10-mg vials.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios. Report significant discrepancies. Encourage fluid intake of 2000–3000 ml/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Parenteral antiemetics should be administered 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis; report emesis exceeding guidelines to prevent dehydration.
- Monitor for development of signs of myocardial toxicity manifested by life-threatening arrhythmias, cardiomyopathy, and CHF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x-ray, ECG, echocardiography, and radionuclide angiography determinations of ejection fraction should be mon-

Copyright © 2008 by F.A. Davis

itored prior to and periodically during therapy.
- Assess injection site frequently for redness, irritation, or inflammation. May infiltrate painlessly. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Treatment of extravasation includes rest and elevation of the extremity and application of intermittent ice packs (apply for 30 min immediately and 30 min qid for 3 days). If pain, erythema, or vesication persists longer than 48 hr, immediate plastic surgery may be warranted.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count prior to and frequently during therapy. Nadirs of leukopenia and thrombocytopenia are 10–14 days, with recovery occurring 21 days after a dose.
- Monitor renal and hepatic function prior to and periodically during therapy. Idarubicin may cause hyperuricemia. May also cause transient ↑ in AST, ALT, LDH, serum alkaline phosphatase, and bilirubin.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- Do not confuse Adriamycin (doxorubicin hydrochloride) with Idamycin (idarubicin).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- See cytarabine monograph for specific information on administration of cytarabine with idarubicin.
- Do not administer subcut or IM and avoid extravasation; may cause severe tissue necrosis.

IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl (nonbacteriostatic) for injection. Reconstitute 5-mg and 10-mg vials with 5 ml and 10 ml, respectively. ***Concentration:*** 1 mg/ml. Vial contents are under pressure; use care when inserting needle
- Reconstituted medication is stable for 72 hr at room temperature and 7 days if refrigerated. ***Rate:*** Administer each dose slowly over 10–30 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Tubing may be attached to a butterfly needle and injected into a large vein.
- **Y-Site Compatibility:** amifostine, amikacin, aztreonam, cimetidine, cladribine, cyclophosphamide, cytarabine, diphenhydramine, droperidol, erythromycin lactobionate, etoposide phosphate, filgrastim, gemcitabine, granisetron, imipenem/cilastatin, magnesium sulfate, mannitol, melphalan, metoclopramide, potassium chloride, ranitidine, sargramostim, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, ampicillin/sulbactam, cefazolin, cefepime, ceftazidime, clindamycin, dexamethasone, etoposide, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, lorazepam, meperidine, methotrexate, piperacillin/tazobactam, sodium bicarbonate, teniposide, vancomycin, vincristine.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, as these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Further courses of idarubicin should be withheld until recovery from mucositis, and subsequent doses should be decreased by 25%. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient that this medication may have teratogenic effects. Contraception should be practiced during and for at least 4 mo after therapy is concluded.
- Instruct patient to notify health care professional immediately if irregular heartbeat,

Copyright © 2008 by F.A. Davis

shortness of breath, or swelling of lower extremities occurs.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that urine may turn a reddish color.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Improvement of hematologic status in leukemias.

ifosfamide (**eye**-foss-fam-ide)
Ifex

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications
Germ cell testicular carcinoma (with other agents). Used with mesna, which prevents ifosfamide-induced hemorrhagic cystitis.

Action
Following conversion to active compounds, interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific).
Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: Administered IV only; inactive prior to conversion to metabolites.
Distribution: Excreted in breast milk.
Metabolism and Excretion: Metabolized by the liver to active antineoplastic compounds.
Half-life: 15 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	7–14 days	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pregnancy or lactation.

Use Cautiously in: Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Geriatric patients; Other chronic debilitating illness; Impaired renal function; Children.

Adverse Reactions/Side Effects
CNS: CNS toxicity (somnolence, confusion, hallucinations, coma), cranial nerve dysfunction, disorientation, dizziness. **CV:** cardiotoxicity. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, hepatotoxicity. **GU:** hemorrhagic cystitis, dysuria, sterility, renal toxicity. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis. **Misc:** allergic reactions.

Interactions
Drug-Drug: ↑ myelosuppression with other **antineoplastics** or **radiation therapy**. Toxicity may be ↑ by **allopurinol** or **phenobarbital**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage
Other Regimens are Used
IV (Adults): 1.2 g/m²/day for 5 days; coadminister with mesna. May repeat cycle q 3 wk.

Availability
Injection: 1- and 3-g vials. ***In combination with:*** mesna (in a kit).

NURSING IMPLICATIONS

Assessment
- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. Notify physician if hematuria occurs. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 ml/day for adults and 1000–2000 ml/day for children. Mesna is given concurrently to prevent hemorrhagic cystitis.
- Monitor neurologic status. Ifosfamide should be discontinued if severe CNS symptoms (agitation, confusion, hallucinations, unusual tiredness) occur. Symptoms usually abate within 3 days of discontinuation of ifosfamide but may persist for longer; fatalities have been reported.
- Assess nausea, vomiting, and appetite. Weigh weekly. Premedication with an antiemetic may be used to minimize GI effects. Adjust diet as tolerated.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petec-

Copyright © 2008 by F.A. Davis

hiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count prior to and periodically during therapy. Withhold dose and notify physician if WBC $<2000/mm^3$ or platelet count is $<50,000/mm^3$. Nadir of leukopenia and thrombocytopenia occurs within 7–14 days and usually recovers within 21 days of therapy.
- Urinalysis should be evaluated before each dose. Withhold dose and notify physician if urinalysis shows >10 RBCs per high-power field.
- May cause ↑ in liver enzymes and serum bilirubin.
- Monitor AST, ALT, serum alkaline phosphatase, bilirubin, and LDH prior to and periodically during therapy. Ifosfamide may cause ↑ in liver enzymes and serum bilirubin.
- Monitor BUN, serum creatinine, phosphate, and potassium periodically during therapy.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **IV:** ***Diluent:*** Sterile water or bacteriostatic water for injection containing parabens. Prepare solution by diluting each 1-g vial with 20 ml of diluent. Use solution prepared without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 1 wk at 30°C or 6 wk at 5°C
- **Intermittent Infusion:** ***Concentration:*** May be further diluted to a concentration of 0.6 to 20 mg/ml (maximum 40 mg/ml) in D5W, 0.9% NaCl, LR, or sterile water for injection. ***Rate:*** Administer over at least 30 min.
- **Continuous Infusion:** Has also been administered as a continuous infusion over 72 hr.
- **Syringe Compatibility:** epirubicin, mesna.
- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate, aztreonam, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, lansoprazole, linezolid, melphalan, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, propofol, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinorelbine.
- **Y-Site Incompatibility:** cefepime, methotrexate.
- **Additive Compatibility:** carboplatin, cisplatin, epirubicin, etoposide, fluorouracil, mesna.

Patient/Family Teaching

- Emphasize need for adequate fluid intake throughout therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Notify health care professional immediately if hematuria is noted.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or confusion occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs, as these may precipitate GI hemorrhage.
- Review with patient the need for contraception during therapy.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional; ifosfamide may decrease antibody response to and increase risk of adverse reactions from live-virus vaccines.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant germ cell testicular carcinoma.

Copyright © 2008 by F.A. Davis

HIGH ALERT

imatinib (i-mat-i-nib)
Gleevec

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Pregnancy Category D

Indications
Newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML). CML in blast crisis, accelerated phase, or in chronic phase after failure of interferon-alpha treatment. Kit (CD117) positive. Metastatic/unresectable malignant gastrointestinal stomal tumors (GIST). Pediatric patients with Ph+ CML after failure of bone marrow transplant or resistance to interferon-alpha. Adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL). Myelodysplastic/myelyproliferative disease (MDS/MPD). Aggressive systemic mastocytosis (ASM). Hypereosinophilic syndrome and/or chronic eosinophilic leukemia (HES/CEL). Unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP).

Action
Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cell lines with decreased proliferation of leukemic cells in CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

Pharmacokinetics
Absorption: Well absorbed (98%) following oral administration.
Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 enzyme system to N-demethyl imatinib, which is as active as imatinib. Excreted mostly in feces as metabolites. 5% excreted unchanged in urine.
Half-life: *Imatinib*—18 hr; *N-desmethyl imatinib*—40 hr.

TIME/ACTION PROFILE (blood levels of imatinib)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Potential for fetal harm; Lactation: Potential for serious adverse reactions in nursing infants; breast-feeding should be avoided.
Use Cautiously in: Hepatic impairment (dose reduction recommended if bilirubin >3 times normal or liver transaminases >5 times normal); Cardiac disease (severe congestive heart failure and left ventricular dysfunction may occur); Pedi: Safety not established for children <3 yr; Geri: Increased risk of edema.

Adverse Reactions/Side Effects
CNS: fatigue, headache, weakness. **Resp:** cough, dyspnea, epistaxis, nasopharyngitis, pneumonia. **GI:** HEPATOTOXICITY, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting. **Derm:** petechiae, pruritus, skin rash. **F and E:** edema (including pleural effusion, pericardial infusion, anasarca, superficial edema and fluid retention), hypokalemia. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** weight gain. **MS:** arthralgia, muscle cramps, musculoskeletal pain, myalgia. **Misc:** fever, night sweats.

Interactions
Drug-Drug: Blood levels and effects are ↑ by concurrent **ketoconazole**. Blood levels and effects may be ↓ by **phenytoin**. ↑ blood levels of **simvastatin**. Imatinib inhibits the following enzyme systems: CYP2C9, CYP2D6, CYP3A4/5 and may be expected to alter the effects of other drugs metabolized by these systems.

Route/Dosage
Chronic Myeloid Leukemia
PO (Adults): *Chronic phase*—400 mg once daily, may be increased to 600 mg once daily; *accelerated phase or blast crisis*—600 mg once daily; may be increased to 800 mg/day given as 400 mg twice daily based on response and circumstances.
PO (Children): *Newly diagnosed Ph+ CML*-340 mg/m²/day (not to exceed 600 mg); *CML recurrent after failure of bone marrow transplant or resistance to interferon-alpha*—260 mg/m²/day.

Hepatic Impairment
PO (Adults and Children): Decrease dose by 25% in patients with severe hepatic impairment.

Gastrointestinal Stromal Tumors
PO (Adults): 400 mg/day or 600 mg/day as a single dose.

Ph+ Acute Lymphoblastic Leukemia
PO (Adults): 600 mg/day.

Copyright © 2008 by F.A. Davis

Myelodysplastic/Myeloproliferative Diseases

PO (Adults): 400 mg/day.

Aggressive Systemic Mastocytosis

PO (Adults): 400 mg/day. *For patients with eosinophilia*—100 mg/day; increase to 400 mg if well tolerated and response insufficient.

Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia

PO (Adults): 400 mg/day. *For patients with FIP1L1–PDGFRa fusion kinase* 100 mg/day; increase to 400 mg if well tolerated and response insufficient.

Dermatofibrosarcoma Protuberans

PO (Adults): 800 mg/day.

Availability

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for fluid retention. Weigh regularly, and assess for signs of pleural effusion, pericardial effusion, pulmonary edema, ascites (dyspnea, periorbital edema, swelling in feet and ankles, weight gain). Evaluate unexpected weight gain. Edema is usually managed with diuretics. General fluid retention is usually dose related, more common in accelerated phase or blast crisis, and is more common in the elderly. Treatment usually involves diuretics, supportive therapy, and interruption of imatinib.
- Monitor vital signs; may cause fever.
- ***Lab Test Considerations:*** Monitor liver function before and monthly during treatment or when clinically indicated. May cause ↑ transamininases and bilirubin which usually lasts 1 wk and may require dose reduction or interruption. If bilirubin is >3 times the upper limit of normal or transaminases are >5 times the upper limit of normal withhold dose until bilirubin levels return to <1.5 times the upper limit of normal and transaminase levels to <2.5 times the upper limit of normal. Treatment may then be continued at reduced levels (patients on 400 mg/day should receive 300 mg/day and patients receiving 600 mg/day should receive 400 mg/day).
- Monitor CBC weekly for the first month, biweekly for the second month, and periodically during therapy. May cause neutropenia and thrombocytopenia, usually lasting 2–3 wk or 3–4 wk, respectively, and anemia. Usually requires dose reduction, but may require discontinuation. (see Implementation).
- May cause hypokalemia.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Therapy should be initiated by physician experienced in the treatment of patients with chronic myeloid leukemia.
- Patients requiring anticoagulation should receive low-molecular-weight or standard heparin, not warfarin.
- Treatment should be continued as long as patient continues to benefit.
- **PO:** Administer with food and a full glass of water to minimize GI irritation.
- Tablets may be dispersed in water or apple juice (50 ml for the 100 mg and 100 ml for the 400 mg tablet) and stirred with a spoon for patients unable to swallow pills. Administer immediately after suspension.
- Patients receiving *chronic phase, myelodysplastic/myeloproliferative disease, aggressive systemic mastocytosis, and hypereosinophilic syndrome and/or chronic eosinophilic leukemia* treatment who develop an ANC $<1.0 \times 10^9$/L and/or platelets $<50 \times 10^9$ L should stop imatinib until ANC $\geq 1.5 \times 10^9$/L and platelets are $\geq 75 \times 10^9$/L. Then resume imatinib treatment at 400 mg or 600 mg/day.
- *Patients receiving accelerated phase and blast crisis treatment or Ph+ acute lymphoblastic leukemia* who develop an ANC $<0.5 \times 10^9$/L and/or platelets $<10 \times 10^9$/L should determine if cytopenia is related to leukemia via marrow aspirate or biopsy. If cytopenia is unrelated to leukemia, reduce dose to 400 mg/day. If cytopenia persists for 2 wks, reduce dose to 300 mg/day. If cytopenia persists for 4 wks and is still unrelated to leukemia, stop imatinib until ANC $\geq 1 \times 10^9$/L and

Copyright © 2008 by F.A. Davis

platelets are ≥20 × 10^9 /L. Then resume imatinib treatment at 300 mg/day.

- *Patients receiving aggressive systemic mastocytosis with eosinophilia or hypereosinobpilic syndrome and/or chronic eosinophilic leukemia with FIP1L1–PDGFRa fusion kinase* who develop ANC <1.0 x 10^9 /L and platelets <50 x 10^9 /L should stop imatinib until ANC ≥1.5 x 10^9 /L and platelets ≥75 x 10^9 /L. Resume treatment at previous dose.

Patient/Family Teaching

- Explain purpose of imatinib to patient.

Evaluation/Desired Outcomes

- Decrease in production of leukemic cells in patients with CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

imipenem/cilastatin

(i-me-**pen**-em/sye-la-**stat**-in)
Primaxin

Classification
Therapeutic: anti-infectives
Pharmacologic: carbapenems

Pregnancy Category C

Indications

Treatment of: Lower respiratory tract infections, Urinary tract infections, Abdominal infections, Gynecologic infections, Skin and skin structure infections, Bone and joint infections, Bacteremia, Endocarditis, Polymicrobic infections.

Action

Imipenem binds to the bacterial cell wall, resulting in cell death. Combination with cilastatin prevents renal inactivation of imipenem, resulting in high urinary concentrations. Imipenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like antiinfectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Spectrum is broad. Active against most grampositive aerobic cocci: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, *Enterococcus*, *Staphylococcus aureus*. Active against many gram-negative bacillary organisms: *Escherichia coli*, *Klebsiella*, *Acinetobacter*, *Proteus*, *Serratia*, *Pseudomonas aeruginosa*. Also displays activity against: *Salmonella*, *Shigella*, *Neisseria gonorrhoeae*, Numerous anaerobes.

Pharmacokinetics

Absorption: Well absorbed after IM administration (imipenem 95%, cilastatin 75%). IV administration results in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: *Imipenem and cilastatin*—70% excreted unchanged by the kidneys.
Half-life: *Imipenem and cilastatin*—1 hr (prolonged in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins and cephalosporins.
Use Cautiously in: Previous history of multiple hypersensitivity reactions; Seizure disorders; Geriatric patients; Renal impairment (dose reduction required if CCr ≤70 ml/min/1.73 m^2); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, somnolence. **CV:** hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rash, pruritus, sweating, urticaria. **Hemat:** eosinophilia. **Local:** phlebitis at IV site. **Misc:** allergic reaction including ANAPHYLAXIS, fever, superinfection.

Interactions

Drug-Drug: Do not admix with **aminoglycosides** (inactivation may occur). **Probenecid** ↓ renal excretion and ↑ blood levels. ↑ risk of seizures with **ganciclovir** or **cyclosporine** (avoid concurrent use of ganciclovir).

Route/Dosage

IV (Adults): *Mild infections*—250–500 mg q 6 hr. *Moderate infections*—500 mg q 6–8 hr *or* 1 g q 8 hr. *Serious infections*—500 mg q 6 hr to 1 g q 6–8 hr.
IV (Children ≥3 mo [non-CNS infections]): 15–25 mg/kg q 6 hr; higher doses have been used in older children with cystic fibrosis.
IV (Children 4 wk–3 mo): 25 mg/kg q 6 hr.
IV (Children 1–4 wk): 25 mg/kg q 8 hr.
IV (Children <1 wk): 25 mg/kg q 12 hr.
IM (Adults): 500–750 mg q 12 hr.
IM (Children): 10–15 mg/kg q 6 hr.

Copyright © 2008 by F.A. Davis

Renal Impairment

IV (Adults): If dose for normal renal function is 1 g/day *CCr 41–70 ml/min*—125–250 mg q 6–8 hr, *CCr 21–40 ml/min*—125–250 mg q 8–12 hr, *CCr 6–20 ml/min*—125–250 mg q 12 hr; if dose for normal renal function is 1.5 g/day *CCr 41–70 ml/min*—125–250 mg q 6–8 hr, *CCr 21–40 ml/min*—125–250 mg q 8–12 hr, *CCr 6–20 ml/min*—125–250 mg q 12 hr; if dose for normal renal function is 2 g/day *CCr 41–70 ml/min*—125–500 mg q 6–8 hr, *CCr 21–40 ml/min*—125–250 mg q 8–12 hr, *CCr 6–20 ml/min*—125–250 mg q 12 hr; if dose for normal renal function is 3 g/day *CCr 41–70 ml/min*—250–500 mg q 6–8 hr, *CCr 21–40 ml/min*—250–500 mg q 6–8 hr, *CCr 6–20 ml/min*—250–500 mg q 12 hr; if dose for normal renal function is 4 g/day *CCr 41–70 ml/min*—250–750 mg q 6–8 hr, *CCr 21–40 ml/min*—250–500 mg q 6–8 hr, *CCr 6–20 ml/min*—250 –250 mg q 12 hr.

Availability

Powder for IV injection: 250 mg imipenem/250 mg cilastatin, 500 mg imipenem/500 mg cilastatin. **Powder for IM injection:** 500 mg imipenem/500 mg cilastatin, 750 mg imipenem/750 mg cilastatin.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct Coombs' test.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- **IM: Only the IM formulation can be used for IM administration.** Reconstitute 500-mg vial with 2 ml and 750-mg vial with 3 ml of lidocaine without epinephrine. Shake well to form a suspension. Withdraw and inject entire contents of vial IM.

IV Administration

- **Intermittent Infusion: Only the IV formulation can be used for IV administration.** ***Diluent:*** Reconstitute each 250- or 500-mg vial with 10 ml of D5W or 0.9% NaCl and shake well. Further dilute in 100 ml of D5W or 0.9% NaCl. Solution may range from clear to yellow in color. Infusion is stable for 4 hr at room temperature and 24 hr if refrigerated. ***Concentration:*** 2.5 mg/ml (with 250-mg vial); 5 mg/ml (with 500-mg vial). ***Rate:*** Infuse doses ≤500 mg over 20–30 min. Infuse doses ≥750 mg over 40–60 min. Pedi: Infuse doses ≤500 mg over 15–30 min. Infuse doses >500 mg over 40–60 min.
- Rapid infusion may cause nausea and vomiting. If these symptoms develop, slow infusion.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, anidulafungin, atropine, aztreonam, bumetanide, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, cyclosporine, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, magnesium sulfate, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, morphine, nafcillin, nitroglycerin, norepinephrine, ondansetron, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, potassium chloride,

Copyright © 2008 by F.A. Davis

propranolol, propofol, protamine, ranitidine, remifentanil, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** alopurinol, amiodarone, amphotericin B cholesteryl sulfate, azithromycin, ceftriaxone, daptomycin, diazepam, drotrecogin, etoposide phosphate, fluconazole, galliun nitrate, ganciclovir, gemcitabine, haloperidol, lansoprazole, lorazepam, meperidine, midazolam, milrinone, phenytoin, prochlorperazine, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** May be inactivated if administered concurrently with aminoglycosides. If administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with antidiarrheals.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

imipramine (im-ip-ra-meen)

Apo-Imipramine, Impril, Norfranil, Novopramine, Tipramine, Tofranil, Tofranil PM

Classification

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Pregnancy Category C

Indications

Various forms of depression. Enuresis in children. **Unlabeled uses:** Adjunct in the management of chronic pain, incontinence (in adults), vascular headache prophylaxis, cluster headache, insomnia.

Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed. Probably crosses the placenta and enters breast milk.
Protein Binding: 89–95%.
Metabolism and Excretion: Extensively metabolized by the liver, mostly on first pass; some conversion to active compounds. Undergoes enterohepatic recirculation and secretion into gastric juices.
Half-life: 8–16 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO, IM	hours	2–6 wk	weeks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other antidepressants may occur; Angle-closure glaucoma; Hypersensitivity to tartrazine or sulfites (in some preparations); Recent MI, known history of QTc prolongation, heart failure.

Use Cautiously in: Pre-existing cardiovascular disease; Seizures or history of seizure disorder; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; OB: Drug is present in breast milk; discontinue imipramine or bottle feed; Pedi: Suicide risk may be greater in children or adolescents. Safety not established in children <6 yr; Geri: Geriatric patients (more susceptible to adverse reactions). Geriatric males with prostatic hyperplasia are more susceptible to urinary retention.

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue, agitation, confusion, hallucinations, insomnia. **EENT:** blurred vision, dry eyes. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, dry mouth, nausea, paralytic ileus, weight gain. **GU:** urinary reten-

Copyright © 2008 by F.A. Davis

tion, decreased libido. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to imipramine). Concurrent use with **SSRI antidepressants** may result in increased toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Imipramine is metabolized in the liver by the **cytochrome P450 2D6 enzyme** and its action may be affected by drugs that compete for metabolism by this enzyme including **other antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** (**propafenone**, **flecainide**); when used concurrently, dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of imipramine. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other CNS **depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking (nicotine)** may increase metabolism and alter effects.

Drug-Natural Products: Concomitant use of **kava kava, valerian,** or **chamomile can ↑ CNS depression. ↑ anticholinergic effects** with **jimson weed** and **scopolia.**

Route/Dosage

PO (Adults): 25–50 mg 3–4 times daily (not to exceed 300 mg/day); total daily dose may be given at bedtime.
PO (Geriatric Patients): 25 mg at bedtime initially, up to 100 mg/day in divided doses.
PO (Children >12 yr): *Antidepressant*—25–50 mg/day in divided doses (not to exceed 100 mg/day).
PO (Children 6–12 yr): *Antidepressant*—10–30 mg/day in 2 divided doses.
PO (Children ≥6 yr): *Enuresis*—25 mg once daily 1 hr before bedtime; increase if necessary by 25 mg at weekly intervals to 50 mg in children <12 yr, up to 75 mg in children >12 yr.
IM (Adults): Up to 100 mg/day in divided doses (not to exceed 300 mg/day).

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, ✱75 mg. **Capsules:** 75 mg, 100 mg, 125 mg, 150 mg. **Injection:** 12.5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse rate prior to and during initial therapy.
- Monitor plasma levels in treatment-resisant patients.
- Monitor weight and BMI initially and periodically throughout therapy.
- For overweight/obese individuals, obtain FBS and cholesterol levels Refer as appropriate for nutrition/weight management and medical management.
- Obtain weight and BMI initially and regularly throughout therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- Pedi, Geri: Monitor baseline and periodic ECGs in elderly patients or patients with heart disease and before increasing dose with children treated for enuresis. May cause prolonged PR and QT intervals and may flatten T waves.
- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Enuresis:** Assess frequency of bedwetting during therapy. Ask patient or caretaker to maintain diary.
- **Pain:** Assess location, duration, and severity of pain periodically during therapy. Use pain scale to monitor effectiveness of therapy.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts and renal and hepatic functions prior to and periodically during prolonged or high-dose therapy.

Copyright © 2008 by F.A. Davis

- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range for depression is 150–300 mg/ml.
- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea: Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for CHF, antiarrhythmics, and anticonvulsants.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Chronic pain (Indications)
Impaired urinary elimination (Indications, Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse imipramine with desipramine.
- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May be given as a single dose at bedtime to minimize sedation during the day.
- Taper to avoid withdrawal effects. Reduce by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation.
- **IM:** May be slightly yellow or red in color. Crystals may develop if solution is cool; place ampule under warm running water for 1 min to dissolve.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be needed during long-term therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake, as possible increase in appetite may lead to undesired weight gain. Inform patient that increased amounts of riboflavin in the diet may be required; consult health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to evaluate progress and improve coping skills.
- Pedi: Inform parents that the side effects most likely to occur include nervousness, insomnia, unusual tiredness, and mild nausea and vomiting. Notify health care professional if these symptoms become pronounced.
- Advise parents to keep medication out of reach of children to prevent inadvertent overdose.
- Refer to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Pain relief.
- Diminished incidence of enuresis.

Copyright © 2008 by F.A. Davis

- Improved sleep in patients treated for depression. Patient may require 2–6 wk of therapy before full therapeutic effects of medication are noticeable.
- Control of bedwetting in children >6 yr.
- Decrease in chronic neurogenic pain.

imiquimod (i-mi-kwi-mod)
Aldara

Classification
Therapeutic: antivirals
Pharmacologic: immune response modifiers

Pregnancy Category B

Indications
External genital or perianal warts/condylomata (condyloma acuminatum). Typical, nonhyperkeratotic, nonhypertrophic actinic keratoses on the face or scalp. Biopsy-confirmed, primary superficial basal cell carcinoma.

Action
May induce the formation of interferons that have antiproliferative and antiviral properties.
Therapeutic Effects: Regression of external genital or perianal warts/condylomata, actinic keratoses, or basal cell carcinoma lesions.

Pharmacokinetics
Absorption: Minimal absorption.
Distribution: Action is primarily local.
Metabolism and Excretion: <0.9% excreted in urine and feces.
Half-life: Unknown.

TIME/ACTION PROFILE (regression of lesions)

ROUTE	ONSET	PEAK	DURATION
Topical	days–wks	10–16 wk	unknown

Contraindications/Precautions
Contraindicated in: None known.
Use Cautiously in: Previous treatment/surgery in affected area (area should be healed prior to use); Pre-existing inflammatory skin lesions (may be exacerbated); Immunocompromised patients (safety not established); Pregnancy, lactation, or children <12 yr (safety not established).

Adverse Reactions/Side Effects
Local: irritation, pain, pruritis, burning, swelling, fungal infections (women).

Interactions
Drug-Drug: None known.

Route/Dosage

External Genital Warts
Topical (Adults and Children >12 yr): Apply thin layer to warts at bedtime every other day (3 times weekly); leave on for 6–10 hr, then rinse off with mild soap and water. Repeat until lesions are completely cleared or up to 16 wk.

Actinic Keratoses
Topical (Adults): Apply thin layer to clean, dry affected area twice weekly; leave on for 8 hr, then rinse off with mild soap and water. Continue for 16 wk.

Superficial Basal Cell Carcinoma
Topical (Adults): Apply thin layer to clean, dry affected area 5 times per week; leave on for 8 hr, then rinse off with mild soap and water. Continue for 6 wk.

Availability
Cream: 5% in single-use packets in boxes of 12. **Cost:** $185.59/box.

NURSING IMPLICATIONS

Assessment
- Assess affected area(s) prior to and periodically during therapy.

Potential Nursing Diagnoses
Risk for infection (Indications)
Risk for infection (Patient/Family Teaching)

Implementation
- **Topical:** Apply a thin film to clean and dry skin as directed prior to bedtime. Rub in well and leave on skin for time period specified. Remove by washing with mild soap and water. Discard unused cream from single-dose packet. A rest period of several days may be taken if required for patient comfort or severity of skin reaction. Resume therapy when reaction subsides.
- Do not use occlusive dressings. If covering is needed, use cotton gauze or cotton underclothes.

Patient/Family Teaching
- Instruct patient on proper application technique. Emphasize the importance of washing

Copyright © 2008 by F.A. Davis

hands before and after application and avoiding contact with eyes. Advise patient not to use more cream than was prescribed. Missed doses should be applied as soon as possible; then return to regular schedule.
- Advise patient to delay next dose for several days when experiencing discomfort or severe reactions. Notify health care professional if severe reactions occur.
- Advise patient to avoid sharing this medication with others.
- Instruct patient to avoid contact with affected areas while the cream is on the skin. Wash cream off of genital areas before engaging in sexual activities. Inform patient that oils in the cream weaken latex contraceptive devices, such as cervical caps, condoms, and diaphragms.
- Advise patient to avoid use of other topical medications on same treatment area unless recommended by health care professional.

Evaluation/Desired Outcomes
- Healing of genital or perianal warts. Treatment is continued until wart is healed or up to 16 wk.
- Healing of actinic keratosis. Treatment is continued for 16 wk.
- Resolution of superficial basal cell carcinoma lesions. Treatment is continued for 6 wk.

HIGH ALERT

INSULINS (rapid acting)
(**in**-su-lin)

insulin aspart, rDNA origin
Novolog

insulin lispro, rDNA origin
Humalog

insulin glulisine
Apidra

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

Pregnancy Category B (insulin aspart, insulin lispro), C (insulin glulisine)

See Appendix M for more information concerning insulins

Indications
Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action
Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lypolysis and proteolysis, enhanced protein synthesis. These are rapid-acting insulins with a more rapid onset and shorter duration than regular insulin; should be used with an intermediate- or long-acting insulin. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics
Absorption: Very rapidly absorbed from subcut administration sites.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: *Insulin aspart*—1–1.5 hr; *insulin lispro* -1 hr; *insulin glulisine*—42 min.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin aspart	10–20 min	1–3 hr	3–5 hr
Insulin glulisine	within 15 min	1 hr	2–4 hr
Insulin lispro	within 15 min	1–1.5 hr	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic dysfunction (may ↓ insulin requirements); OB: Pregnancy (may temporarily ↑ insulin requirements); Pedi: Children <3 yr (for insulin lispro), <6 yr (for insulin aspart) (safety not established).

Adverse Reactions/Side Effects
Endo: HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions
Drug-Drug: Beta blockers, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**,

Copyright © 2008 by F.A. Davis

oral hypoglycemic agents, and **salicylates**, may ↓ insulin requirements.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors. Only insulin aspart and insulin glulisine can be administered IV.
Subcut (Adults and Children): Total insulin dose determined by needs of patient; generally 0.5–1 unit/kg/day; 50–70% of this dose may be given as meal-related boluses of rapid-acting insulin, and the remainder as an intermediate or long-acting insulin. *Subcutaneous infusion pump* —~50% of total dose can be given as meal-related boluses and ~50% of total dose can be given as basal infusion .

Availability

Insulin aspart: 100 units/ml in 10 mL vials and 3 mL disposable delivery devices. **Cost:** $88.99/10-ml vial *NovoLog Pens (3 ml)*—$166.39/5 pens. **Insulin glulisine:** 100 units/mL in 10 mL vials and 3 ml disposable delivery devices. **Cost:** $79.99/10-ml vial. **Insulin lispro:** 100 units/mL in 10-mL vials and 3 mL disposable delivery device. **Cost:** $85.99/10-ml vial *Humalog Pens (3 ml)*—$172.05/5 pens. ***In combination with:*** **Insulin lispro 75/25 mix (Humalog Mix 75/25):** 75% lispro insulin protamine suspension and 25% insulin lispro mix 100 units/mL in 10 mL vials and 3 mL disposable delivery devices. **Cost:** $91.25/10-ml vial *Humalog Mix 75/25 Pens (3 ml)*—$147.50/5 pens. **Insulin lispro 50/50 mix (Humalog Mix 50/50):** 50% lispro insulin protamine suspension and 50% insulin lispro mix 100 units/mL in 10 ml vials and 3 mL disposable delivery devices.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Assess patient for signs of allergic reactions (rash, shortness of breath, wheezing, rapid pulse, sweating, low blood pressure) during therapy.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/ml.
- *Insulin aspart, insulin glulisine,* and *insulin lispro* may be mixed with NPH insulin. When mixing insulins, draw insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of rapid-acting insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store vials in refrigerator. Vials may also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Cartridges and pens should be stored

Copyright © 2008 by F.A. Davis

at room temperature and used within 28 days.
- Because of their short duration, *insulin lispro, insulin glulisine* and *insulin aspart*, must be used with a longer-acting insulin or insulin infusion pump. In patients with type 2 diabetes, *insulin lispro* may be used without a longer-acting insulin when used in combination with an oral sulfonylurea agent.
- **Subcut:** Administer into abdominal wall, thigh, or upper arm subcut. Rotate injection sites.
- Administer *insulin aspart* within 5–10 min before a meal.
- When used as meal time insulin, administer *insulin glulisine* 15 min before or within 20 min after starting a meal.
- Administer *insulin lispro* within 15 min before or immediately after a meal.
- May also be administered subcut via external insulin pump. Do not mix with other insulins or solution when used with a pump. The insulin in the reservoir, the infusion set, and the infusion site should be changed q 48 hr. Discard cartridges after 48 hrs (7 days for insulin lispro), even if solution remains.
- **IV:** *Insulin aspart* and *insulin glulisine* may be administered IV in selected situations under appropriate medical supervision. Should be diluted to a concentration of 1 unit/ml in 0.9% NaCl (D5W may also be used with *insulin aspart*). *Insulin lispro* should not be administered IV.

Patient/Family Teaching
- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, external puml, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- Demonstrate technique for mixing insulins by drawing up insulin aspart, insulin glulisine, or insulin lispro first. Roll intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

Evaluation/Desired Outcomes
- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

indapamide (in-**dap**-a-mide)
Lozide, Lozol

Classification
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

Pregnancy Category B

Indications
Mild to moderate hypertension. Edema associated with CHF and other causes.

Action
Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients and diuresis with subsequent mobilization of edema.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed from the GI tract after oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Mostly metabolized by the liver. Small amounts (7%) excreted unchanged by the kidneys.
Half-life: 14–18 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO (single dose)	unknown	24 hr	unknown
PO (multiple dose)	1–2 wk	8–12 wk	up to 8 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with sulfonamides may occur; Anuria; Lactation.
Use Cautiously in: Renal or severe hepatic impairment; Geriatric patients (increased sensitivity); Pregnancy or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy. **CV:** arrhythmias, hypotension. **GI:** anorexia, cramping, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypochloremic alkalosis, hyponatremia, hypovolemia. **Metab:** hyperuricemia. **MS:** muscle cramps.

Interactions

Drug-Drug: Additive hypotension with other **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. Additive hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. ↓ the excretion of **lithium**; may cause toxicity. Hypokalemia may ↑ risk of **digoxin** toxicity.
Drug-Natural Products: Licorice and **stimulant laxative herbs (aloe, senna)** may ↑ risk of potassium depletion.

Route/Dosage

PO (Adults): *Hypertension*—1.25–5 mg daily in the morning; may be increased at 4-wk intervals up to 5 mg/day. *Edema secondary to CHF*—2.5 mg daily in the morning; may be increased after 1 wk to 5 mg/day.

Availability (generic available)

Tablets: 1.25 mg, 2.5 mg. **Cost:** *Generic*—1.25 mg $12.60/90, 2.5 mg $12.60/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, intake and output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion; report signs of electrolyte imbalance. Patients taking digoxin have an increased risk of digitalis toxicity due to the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels periodically throughout therapy. May cause decreased potassium, sodium, and chloride concentrations. May increase serum glucose; diabetic patients may require increased oral hypoglycemic or insulin dosage. Increases uric acid level an average of 1.0 mg/100 ml; may precipitate an episode of gout.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- **PO:** May be given with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take this medication at the same time each day. If a dose is missed, take as soon as remembered but not just before next dose is due. Do not double doses. Advise patients using indapamide for hypertension to continue taking the medication even if feeling well. Indapamide controls but does not cure hypertension.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen (avoid those containing PABA) and protective clothing

Copyright © 2008 by F.A. Davis

when in the sun to prevent photosensitivity reactions.
- Instruct patient to follow a diet high in potassium (see Appendix L).
- Advise patient to report muscle weakness, cramps, nausea, or dizziness to health care professional.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Instruct patient and family on proper technique of blood pressure monitoring. Advise them to check blood pressure at least weekly and to report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).

Evaluation/Desired Outcomes
- Control of hypertension.
- Decrease in edema secondary to CHF.

indomethacin
(in-doe-**meth**-a-sin)
Apo-Indomethacin, Indameth, Indocid, Indocin, Indocin I.V, Indocin PDA, Indocin SR, Indochron E-R, Novo-Methacin, Nu-Indo

Classification
Therapeutic: antirheumatics, ductus arteriosus patency adjuncts (IV only), nonsteroidal anti-inflammatory agents

Pregnancy Category B (first trimester)

Indications
PO: Inflammatory disorders including: Rheumatoid arthritis, Gouty arthritis, Osteoarthritis, Ankylosing spondylitis. Generally reserved for patients who do not respond to less toxic agents. **IV:** Alternative to surgery in the management of patent ductus arteriosus in premature neonates.

Action
Inhibits prostaglandin synthesis. **Therapeutic Effects: PO:** Suppression of pain and inflammation. **IV:** Closure of patent ductus arteriosus.

Pharmacokinetics
Absorption: Well absorbed after oral administration in adults, incomplete oral absorption in neonates.
Distribution: Crosses the blood-brain barrier and the placenta. Enters breast milk.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Neonates <2 weeks: 20 hr; >2 weeks: 11 hr; Adults: 2.6–11 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	30 min	0.5–2 hr	4–6 hr
PO-ER (analgesic)	30 min	unknown	4–6 hr
PO (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
PO-ER (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
IV (closure of PDA)	up to 48 hr	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Known alcohol intolerance (suspension); Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Proctitis or recent history of rectal bleeding; Necrotizing enterocolitis in neonates; Intraventricular hemorrhage; Thrombocytopenia.
Use Cautiously in: Severe cardiovascular, renal, or hepatic disease; History of ulcer disease; Epilepsy; Hypertension; Geri: Geriatric patients are at increased risk for adverse reactions including dizziness and GI bleeding; Pregnancy or lactation (not recommended during 2nd half of pregnancy); Lactation.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, headache, psychic disturbances. **EENT:** blurred vision, tinnitus. **CV:** hypertension, edema. **GI:** *PO*— DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, vomiting, discomfort, necrotizing enterocolitis. **GU:** cystitis, hematuria, renal failure. **Derm:** rashes. **F and E:** hyperkalemia; *IV*— dilutional hyponatremia; *IV*— hypoglycemia. **Hemat:** thrombocytopenia, blood dyscrasias, prolonged bleeding time. **Local:** phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Concurrent use with **aspirin** may ↓ effectiveness. Additive adverse GI effects with **aspirin**, other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use of **acetaminophen** ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemia from **insulins** or **oral hypoglycemic agents**. May ↑ risk of toxicity from **lithium** or **zidovudine** (avoid concurrent use with zidovudine). ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from indomethacin. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytics**, **warfarin**, and **drugs affecting platelet function** including **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **potassium-sparing diuretics** may result in hyperkalemia. May ↑ levels of **digitalis glycosides methotrexate lithium** and **aminoglycosides** when used IV in neonates.
Drug-Natural Products: ↑ bleeding risk with **anise, arnica, chamomile, clove, dong quai, feverfew, garlic, ginger, ginkgo,** and **Panax ginseng.**

Route/Dosage

Anti-inflammatory

PO (Adults): *Antiarthritic*—25–50 mg 2–4 times daily *or* 75-mg extended-release capsule once or twice daily (not to exceed 200 mg or 150 mg of SR/day). A single bedtime dose of 100 mg may be used. *Antigout*—100 mg initially, followed by 50 mg 3 times daily for relief of pain, then decreased further.
PO (Children >2 yr): 1–2 mg/kg/day in 2–4 divided doses (not to exceed 4 mg/kg/day or 150–200 mg/day).

Closure of Patent Ductus Arteriosus

IV (Neonates): 0.2 mg/kg initially, then 2 subsequent doses at 12–24 hr intervals of 0.1 mg/kg if age <48 hr at time of initial dose; 0.2 mg/kg if 2–7 days at initial dose; 0.25 mg/kg if age >7 days at initial dose.

Availability (generic available)

Capsules: 25 mg, 50 mg. **Sustained-release capsules:** 75 mg. **Oral suspension (fruit mint, pineapple coconut mint flavors):** 25 mg/5 ml. **Powder for injection:** 1-mg vials.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- **Arthritis:** Assess limitation of movement and pain—note type, location, and intensity before and 1–2 hr after administration.
- **Patent Ductus Arteriosus:** Monitor respiratory status, heart rate, blood pressure, echocardiogram, and heart sounds routinely throughout therapy.
- Monitor intake and output. Fluid restriction is usually instituted throughout therapy.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, serum potassium levels, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, AST, and ALT tests may show ↑ levels. Blood glucose concentrations may be altered. Hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- Urine glucose and urine protein concentrations may be ↑.
- Leukocyte and platelet count may be ↓. Bleeding time may be prolonged for several days after discontinuation.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- If prolonged therapy is used, dose should be reduced to the lowest level that controls symptoms.
- **PO:** Administer after meals, with food, or with antacids to decrease GI irritation. Do not crush, break, or chew sustained-release capsules.
- Shake suspension before administration. Do not mix with antacid or any other liquid.

IV Administration

- **Direct IV:** ***Diluent:*** Preservative-free 0.9% NaCl or preservative-free sterile water. Reconstitute with 1 or 2 ml of diluent. ***Concentration:*** 0.5–1 mg/ml. Reconstitute imme-

Copyright © 2008 by F.A. Davis

diately before use and discard any unused solution. Do not dilute further or admix. Do not administer via umbilical catheter into vessels near the superior mesenteric artery, as these can cause vasoconstriction and compromise blood flow to the intestines. Do not administer intra-arterially. ***Rate:*** Administer over 20–30 min. Avoid extravasation, as solution is irritating to tissues.

- **Y-Site Compatibility:** furosemide, insulin, nitroprusside, potassium chloride, sodium bicarbonate.
- **Y-Site Incompatibility:** calcium gluconate, cimetidine, dobutamine, dopamine, gentamicin, levofloxacin, tobramycin, tolazoline.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, other NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if rash, itching, chills, fever, muscle aches, visual disturbances, weight gain, edema, abdominal pain, black stools, or persistent headache occurs.
- **Patent Ductus Arteriosus:** Explain to parents the purpose of medication and the need for frequent monitoring.

Evaluation/Desired Outcomes

- Decrease in severity of moderate pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require up to 1 mo of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Successful closure of patent ductus arteriosus.

infliximab (in-flix-i-mab)
Remicade

Classification
Therapeutic: antirheumatics (DMARDs), gastrointestinal anti-inflammatories—therapeutic
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Active rheumatoid arthritis (moderate to severe, with methotrexate). Active Crohn's disease (moderate to severe). Active psoriatic arthritis. Active ankylosing spondylitis. Active ulcerative colitis (moderate to severe) with inadequate response to conventional therapy: reducing signs and symptoms, and inducing and maintaining clinical remission and mucosal healing, and eliminating corticosteroid use. Plaque psoriasis (chronic severe).

Action

Neutralizes and prevents the activity of tumor necrosis factor-alpha (TNF-alpha), resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling, decreased rate of joint destruction and improved physical function in ankylosing spondylitis, rheumatoid or psoriatic arthritis. Reduction and maintenance of closure of fistulae in Crohn's disease. Decreased symptoms, maintaining remission and mucosal healing with decreased corticosteroid use in ulcerative colitis. Decrease in induration, scaling and erythema of psoriatic lesions.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Predominantly distributed within the vascular compartment.
Metabolism and Excretion: Unknown.
Half-life: 9.5 days.

TIME/ACTION PROFILE (symptoms of Crohn's disease)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 wk	unknown	12–48 wk†

†After infusion

Contraindications/Precautions

Contraindicated in: Hypersensitivity to infliximab, murine (mouse) proteins, or other components in the formulation; OB: Lactation; CHF.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Patients being retreated after 2 yr without treatment (increased risk of adverse reactions); History of tuberculosis or exposure (latent tuberculosis should be treated prior to infliximab therapy); Geri: Geriatric patients; OB: Pregnancy (use only if clearly needed); Pedi: Children (safety not established).

Adverse Reactions/Side Effects

CNS: fatigue, headache, anxiety, depression, dizziness, insomnia. **EENT:** conjunctivitis. **Resp:** upper respiratory tract infection, bronchitis, cough, dyspnea, laryngitis, pharyngitis, respiratory tract allergic reaction, rhinitis, sinusitis. **CV:** chest pain, hypertension, hypotension, pericardial effusion, tachycardia, CHF. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, dyspepsia, flatulence, hepatotoxicity, intestinal obstruction, oral pain, tooth pain, ulcerative stomatitis. **GU:** dysuria, urinary frequency, urinary tract infection. **Derm:** acne, alopecia, dry skin, ecchymosis, eczema, erythema, flushing, hematoma, increased sweating, hot flushes, pruritus, urticaria, rash. **Hemat:** neutropenia. **MS:** arthralgia, arthritis, back pain, involuntary muscle contractions, myalgia. **Neuro:** paresthesia. **Misc:** INFECTIONS (including reactivation tuberculosis, pneumonia and invasive fungal infections), fever, infusion reactions, chills, flu-like syndrome, herpes simplex, herpes zoster, hypersensitivity reactions, ↑ risk of lymphoma, lupus-like syndrome, moniliasis, pain, peripheral edema, vasculitis.

Interactions

Drug-Drug: None significant.

Route/Dosage

Rheumatoid arthritis

IV (Adults): 3 mg/kg followed by 3 mg/kg 2 and 6 wk after initial dose and then every 8 wk; dose may be adjusted in partial responders up to 10 mg/kg or treatment as often as every 4 wk (used with methotrexate).

Crohn's Disease

IV (Adults): *Moderate-to-severe Crohn's disease*—5 mg/kg as a single infusion. *Fistulizing Crohn's disease*—5 mg/kg repeated 2 and 6 wk after initial infusion; maintenance dose of 5 mg/kg may be given q 8 wk.

Ankylosing spondylitis

IV (Adults): 5 mg/kg given as an infusion repeated 2 and 6 wk later, then every 6 wk.

Psoriatic Arthritis

IV (Adults): 5 mg/kg given as an infusion repeated 2 and 6 weeks later, then every 8 wk thereafter (with or without methotrexate).

Ulcerative Colitis

IV (Adults): 5 mg/kg given as an infusion regimen at 0, 2 and 6 wk followed by a maintenance regimen of 5 mg/kg every 8 wk thereafter.

Psoriasis

IV (Adults): 5 mg/kg given as an infusion regimen at 0, 2 and 6 wk followed by a maintenance regimen of 5 mg/kg every 8 wk thereafter.

Availability

Powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infusion-related reactions (fever, chills, urticaria, pruritus) during and for 2 hr after infusion. Symptoms usually resolve when infusion is discontinued. Reactions are more common after 1st or 2nd infusion. Frequency of reactions may be reduced with immunosuppressant agents.
- Assess for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be initiated prior to therapy with infliximab.
- Observe patient for hypersensitivity reactions (urticaria, dyspnea, hypotension) during infusion. Discontinue infliximab if severe reaction occurs. Have medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment readily available in the event of a severe reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Crohn's Disease and Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- **Psoriasis:** Assess lesions periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ in positive ANA. Frequency may be decreased with baseline immunosuppressant therapy.
- Monitor liver function tests periodically during therapy. May cause mild to moderate AST

Copyright © 2008 by F.A. Davis

and ALT ↑ without progressing to liver dysfunction. If patient develops jaundice or liver enzyme elevations ≥5 times the upper limits of normal, discontinue infliximab.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue infliximab is symptoms of blood dyscrasias (persistent fever) occur.

Potential Nursing Diagnoses
Acute pain, chronic (Indications)
Diarrhea (Indications)

Implementation
IV Administration
- **Intermittent Infusion:** Calculate the total number of vials needed. ***Diluent:*** Reconstitute each vial with 10 ml of sterile water for injection using a syringe with a 21-gauge needle or smaller. Direct stream to sides of vial. Do not use if vacuum is not present in vial. Gently swirl solution by rotating vial to dilute; do not shake. May foam on reconstitution; allow to stand for 5 min. Solution is colorless to light yellow and opalescent; a few translucent particles may develop because infliximab is a protein. Do not use if opaque particles, discoloration, or other particles occur. Withdraw volume of total infliximab dose from infusion container containing 250 ml with 0.9% NaCl. ***Concentration:*** Slowly add total dose of infliximab for a concentration ranging from 0.4 to 4 mg/ml. Mix gently. Infusion should begin within 3 hr of preparation. Solution is incompatible with polyvinyl chloride equipment. Prepare in glass infusion bottle or polypropylene or polyolefin bags. Do not reuse or store any portion of infusion solution. ***Rate:*** Administer over at least 2 hr through polyethylene-lined administration set with an in-line, sterile, nonpyrogenic, low protein-building filter with ≤1.2-micron pore size.
- **Y-Site Incompatibility:** Do not administer concurrently in the same line with any other agents.

Patient/Family Teaching
- Advise patient that adverse reactions (myalgia, rash, fever, polyarthralgia, pruritus) may occur 3–12 days after delayed (>2 yr) retreatment with infliximab. Symptoms usually decrease or resolve within 1–3 days. Instruct patient to notify health care professional if symptoms occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

Evaluation/Desired Outcomes
- Decreased pain and swelling with decreased rate of joint destruction and improved physical function in patients with ankylosing spondylitis, psoriatic, or rheumatoid arthritis.
- Decrease in the signs and symptoms of Crohn's disease and a decrease in the number of draining enterocutaneous fistulas. Decreased symptoms, maintaining remission and mucosal healing with decreased corticosteroid use in ulcerative colitis.
- Decrease in induration, scaling and erythema of psoriatic lesions.

HIGH ALERT

INSULIN (mixtures)
(**in**-su-lin)

insulin lispro protamine suspension/insulin lispro solution mixtures, rDNA origin
Humalog Mix 75/25, Humalog Mix 50/50

insulin aspart protamine suspension/insulin aspart solution mixtures, rDNA origin
NovoLog Mix 70/30

NPH/regular insulin mixtures
Humulin 50/50, Humulin 70/30, Novolin 70/30

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

Pregnancy Category B (insulin lispro protamine/insulin lispro solution mixture), C (insulin aspart protamine/insulin aspart solution mixture. NPH/regular insulin mixture)

See Appenidx M for more information concerning insulins

Indications
Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action
Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition

Copyright © 2008 by F.A. Davis

of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed from subcutaneous administration sites. Absorption rate is determined by type of insulin, injection site, volume of injectate, and other factors.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr;).

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
insulin lispro protamine suspension/ insulin lispro solution mixture subcut	15–30 min	2.8 hr	24 hr
insulin aspart protamine suspension/ insulin aspart solution mixture subcut	15 min	1–4 hr	18–24 hr
NPH/Regular Insulin mixture subcutaneous	30 min	4–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy (may temporarily ↑ insulin requirements); Pedi: Children <18 yr (safety of Humalog not established).

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Beta blockers, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.
Subcut (Adults and Children): 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

Availability

NPH insulin/regular insulin suspension mixture: 70 units NPH/30 units regular insulin/ml—Novolin 70/30, Humulin 70/30 (100 units/ml total) in 10-ml vials and 3-ml disposable delivery devices[OTC], 50 units NPH/50 units regular insulin/ml—Humulin 50/50 (100 units/ml total) in 10-ml vials[OTC]. **Cost:** *Humulin 70/30 or Novolin 70/30*—$42.99/10-ml vial; *Humulin 50/50*—$36.99/10-ml vial; *Humulin 70/30 pen (3 ml)*—$117.03/5 pens; *Novolin 70/30 Penfill (3 ml)*—$116.72/5 pens. **Insulin lispro protamine suspension/insulin lispro solution mixture:** 75% insulin lispro protamine suspension and 25% insulin lispro solution mix—Humalog Mix 75/25 100 units/mL in 10-mL vials and 3-mL disposable delivery devices, 50% insulin lispro protamine suspension and 50% insulin lispro solution mix—Humalog Mix 50/50 100 units/mL in 10-mL vials and 3-mL disposable delivery devices. **Cost:** $91.25/10-ml vial *Humalog Mix 75/25 Pens (3 ml)*—$147.50/5 pens. **Insulin aspart protamine suspension/insulin aspart solution mixture:** 70% insulin aspart protamine suspension and 30% insulin aspart solution mix—NovoLog Mix 70/30 100 units/mL in 10-mL vials and 3-mL disposable delivery devices. **Cost:** *Novolog Mix 70/30 Pens (3 ml)*—$166.38/5 pens.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/ml.
- Store insulin in refrigerator. May also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Humalog pens must be discarded after 10 days. NovoLog pens must be discarded after 14 days.
- NPH insulins should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULINS (short acting)

(**in**-su-lin)

insulin, regular (injection, concentrated)

Humulin R, Humulin R U-500 (concentrated), Insulin-Toronto, Novolin R

Classification

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

Pregnancy Category B

See Appendix M for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes; can be used to treat diabetic ketoacidosis. *Concentrated insulin U-500*: Only for use in patients with insulin requirements >200 units/day. **Unlabeled uses:** Treatment of hyperkalemia.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Rapidly absorbed from subcutaneous administration sites.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 30–60 min.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Regular insulin IV	10–30 min	15–30 min	30–60 min
Regular insulin subcut	30–60 min	2–4 hr	5–7 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy (may temporarily ↑ insulin requirements).

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Beta blockers, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements. **Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Ketoacidosis—Regular Insulin Only (100 units/ml)

IV (Adults): 0.1 unit/kg/hr as a continuous infusion.
IV (Children): Loading dose-0.1 unit/kg, then maintenance continuous infusion 0.05–0.2 unit/kg/hr, titrate to optimal rate of decrease of serum glucose of 80–100 mg/dL/hr.

Maintenance Therapy

Subcut (Adults and Children): 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

Treatment of Hyperkalemia

Subcut, IV (Adults and Children): dextrose 0.5–1 g/kg combined with insulin 1 unit for every 4–5 g dextrose given.

Availability

Insulin injection (regular insulin): 100 units/ml in 10 ml vials and 3 ml disposable delivery devices OTC. **Regular (concentrated) insulin injection:** 500 units/ml in 20-ml vials.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses). Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Do not confuse regular **concentrated (U-500)** insulin with regular insulin.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/ml. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- When mixing insulins, draw regular insulin into syringe first to avoid contamination of regular insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store insulin in refrigerator. May also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.
- Administer *regular insulin* within 15–30 min before a meal.

IV Administration

- **IV:** Regular insulin is the *only* insulin that can be administered IV.
- ***High Alert:*** Regular (concentrated) insulin U-500 should not be given IV.
- **Direct IV:** May be administered IV undiluted directly into vein or through Y-site. ***Rate:*** Administer up to 50 units over 1 min.
- **Continuous Infusion:** ***Diluent:*** May be diluted in commonly used IV solutions as an infusion; however, insulin potency may be reduced by at least 20–80% by the plastic or glass container or tubing before reaching the venous system. ***Concentration:*** 0.2–1 unit/ml. ***Rate:*** Rate should be ordered by physician (usually 0.05–0.2 units/kg/hr), and infusion should be placed on an IV pump for accurate administration.
- Rate of administration should be decreased when serum glucose level reaches 250 mg/100 ml.
- **Y-Site Compatibility:** amiodarone, ampicillin, ampicillin-sulbactam, aztreonam, cefazolin, cefepime, ceftazidime, dobutamine, doxapram, esmolol, famotadine, gentamicin, heparin, imipenem-cilastatin, indomethacin, magnesium sulfate, meperidine, meropenem, midazolam, milrinone, morphine, nitroglycerin, nitroprusside, oxytocin, pantoprazole, pentobarbital, potassium chloride, propofol, ritodrine, sodium bicarbonate, tacrolimus, terbutaline, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vitamin B complex with C.
- **Y-Site Incompatibility:** dopamine, drotrecogin, nafcillin, norepinephrine, ranitidine.
- **Additive Compatibility:** May be added to total parenteral nutrition (TPN) solutions.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard sy-

Copyright © 2008 by F.A. Davis

ringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- Demonstrate technique for mixing insulins by drawing up regular insulin and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULINS (intermediate-acting) (in-su-lin)

NPH insulin (isophane insulin suspension)
Humulin N, Novolin ge NPH, Novolin N

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

Pregnancy Category B

See Appendix M for more information concerning insulins

I

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed from subcutaneous administration sites; rate of absorption may vary by site or volume of injection and other factors.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr).

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
NPH	1–2 hr	4–12 hr	18–24 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements; OB: Pregnancy (may temporarily ↑ insulin requirements).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **Local:** lipodystrophy, pruritus, erythema, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Beta blockers, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Subcut (Adults and Children): 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

Availability

Isophane insulin suspension (NPH insulin): 100 units/ml in 10-ml vials and 3-ml disposable delivery devices. **Cost:** $42.99/10-ml vial *Humulin N pen (3 ml)*—$124.90/5 pens; *Novolin N Penfill (3 ml)*—$107.13/5 pens. ***In combination with:*** regular insulin as 70/30 (NPH/Regular) mixture (Humulin 70/30, Novolin 70/30) and 50/50 mixture (Humulin 50/50).

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/ml.
- When mixing insulins, draw regular insulin, insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of regular insulin vial. Mix insulin glulisine *only* with NPH insulin. Mixed insulins should never be used in a pump or for IV infusion.
- Store insulin vials in refrigerator. May also be kept at room temperature for up to 28 days. Humulin N pens should be kept at room temperature and should be discarded after 14 days. Do not use if cloudy, discolored, or unusually viscous.
- Because of short duration of *insulin lispro, insulin glulisine,* and *insulin aspart*, supplementation with longer-acting insulin may be necessary to control blood glucose levels.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- NPH insulin should not be used in the management of ketoacidosis.

Copyright © 2008 by F.A. Davis

- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.
- Administer *NPH insulin* within 30–60 min before a meal.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.

- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULINS (long-acting)

(**in**-su-lin)

insulin detemir
Levemir

insulin glargine
Lantus

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

Pregnancy Category C

See Appendix M for more information concerning insulins

I

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Physiochemical characteristics of long-acting insulins result in delayed and prolonged absorption.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 5–6 min (prolonged in patients with diabetes); biologic half-life is 1–1.5 hr; *insulin detemir* 5–7 hr (dose-dependent).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin detemir	3–4 hr	3–14 hr†	24 hr
Insulin glargine	3–4 hr	none†	24 hr

†Small amounts of insulin glargine and insulin detemir are slowly released, resulting in a relatively constant effect over time.

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy (may temporarily ↑ insulin requirements); Pedi: Children <6 yr (safety not established).

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **Local:** lipodystrophy, pruritis, erythema, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Beta blockers, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. **Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Insulin Detemir

Subcut (Adults and Children ≥6 yr): *Type 2 diabetes patients who are insulin-naive*—0.1–0.2 units/kg once daily in the morning *or* 10 units once or twice daily. *Patients with type 1 or 2 diabetes receiving basal insulin or basal bolus therapy*—May substitute on an equivalent unit-per-unit basis.

Insulin Glargine

Subcut (Adults and Children ≥6 yr): *Type 1 diabetes*—Administer 50–75% of daily insulin requirements once daily. *Initiation in patients with type 2 diabetes already being treated with oral antidiabetic agents*—10 units once daily; then adjust on the basis of the patient's needs (range 2–100 units/day). *Patients already receiving insulin*—When switching from once daily NPH, same dose of insulin glargine can be administered once daily. When switching from twice daily NPH, use 80% of the total daily NPH dose and administer once daily. Dose can then be adjusted on the basis of the patient's needs.

Availability

Insulin detemir: 100 units/ml in 10 ml vials and 3 ml cartidges or prefilled syringes. **Cost:** $84.15/10-ml vial. **Insulin glargine:** 100 units/ml in 10-ml vials and 3-ml cartridges or prefilled disposable pens. **Cost:** $84.99/10-ml vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of hypoglycemia (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; tiredness; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Recovery from hypoglycemia may be delayed due to the prolonged effect of long-acting insulins.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Copyright © 2008 by F.A. Davis

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/ml. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- ***High Alert:*** Do not mix *insulin glargine* or *insulin detemir* with any other insulin or solution, or use syringes containing any other medicinal product or residue. If giving with a short-acting insulin, use separate syringes and different injection sites. Solution should be clear and colorless with no particulate matter.
- Do not use if cloudy, discolored, or unusually viscous. Store unopened vials and cartridges of *insulin glargine* and *insulin detemir* in the refrigerator; do not freeze. If unable to refrigerate, the 10-ml vial of *insulin glargine* can be kept in a cool place unrefrigerated for up to 28 days. Once the cartridge is placed in an OptiPen One, do not refrigerate. After initial use, *insulin detemir* vials, cartridges, or a prefilled syringe may be stored in a cool place for 42 days. Do not store in-use cartridges and prefilled syringes in refrigerator or with needle in place. Keep away from direct heat and sunlight.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- NPH insulins should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites.
- Administer *insulin glargine* once daily at the same time each day.
- Administer *daily insulin detemir* with evening meal or at bedtime. With *twice daily insulin detemir*, administer evening dose with evening meal, at bedtime, or 12 hrs after morning dose.
- Do not administer *insulin detemir* or *insulin glargine* IV or in insulin pumps.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Patients taking insulin detemir should be given the *Patient Information* circular for this product.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.

Copyright © 2008 by F.A. Davis

- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

INTERFERONS, ALPHA

(in-ter-**feer**-onz)

peginterferon alpha-2a
Pegasys

interferon alpha-2b (recombinant)
Intron A

peginterferon alpha-2b (pegylated)
Pegintron

interferon alpha-n3 (human)
Alferon N

Classification
Therapeutic:
Pharmacologic: interferons

Pregnancy Category C

Indications

Peginterferon alpha–2a: Treatment of: Chronic hepatitis C (alone or with ribavirin), Chronic hepatitis B. **Interferon alpha-2b:** Treatment of: Hairy cell leukemia, Malignant melanoma, AIDS-related Kaposi's sarcoma, Condylomata acuminata (intralesional), Chronic hepatitis B, Chronic hepatitis C (with oral ribavirin) which has relapsed following previous treatment with interferon alone, Follicular non-Hodgkin's lymphoma. **Peginterferon alpha–2b:** Chronic hepatitis C (alone or with ribavirin). **Interferon alpha-n3:** Treatment of condylomata acuminata (intralesional).

Action

Interferons are proteins capable of modifying the immune response and have antiproliferative action against tumor cells. Interferon alpha-2b is produced by recombinant DNA techniques, peginterferon is a 'pegylated' formulation of interferon alpha-2b formulated to have a longer duration of action; interferon alpha-n3 is from pooled human leukocytes. Interferons also have antiviral activity. **Therapeutic Effects:** Antineoplastic, antiviral, and antiproliferative activity. Decreased progression of hepatic damage (for patients with hepatitis).

Pharmacokinetics

Absorption: Not absorbed orally. Well absorbed (>80%) following IM and subcut administration. Minimal systemic absorption follows intralesional administration.
Distribution: Unknown.
Metabolism and Excretion: Filtered by the kidneys and subsequently degraded in the renal tubule; *peginterferon alpha-2b*—30% renally excreted.
Half-life: *Peginterferon alpha-2a*—50–160 hr; *interferon alpha-2b*—2–3 hr; *peginterferon alpha-2b*–40 hr.

TIME/ACTION PROFILE (clinical effects)

ROUTE	ONSET	PEAK	DURATION
Interferon alpha-2b IM, subcut	1–3 mo	unknown	unknown (CR)
Interferon alpha-2b IM, subcut	unknown	3–5 days	3–5 days (BC)
Interferon alpha-2b IM, subcut	2 wk	unknown	unknown (LFT)
Interferon alpha-2b and n3	unknown	4–8 wk	unknown (IL)
peginterferon alpha-2b subcut	unknown	6 mos or more	unknown

BC = effects on platelet counts; CR = clinical response; IL= regression of lesions; LFT = effects on liver function in patients with hepatitis

Contraindications/Precautions

Contraindicated in: Hypersensitivity to alpha interferons or human serum albumin; Autoimmune hepatitis; Hepatic decompensation (Child-Pugh class B and C) before or during therapy; Pedi: Products containing benzyl alcohol should not be used in neonates.
Use Cautiously in: Severe cardiovascular, pulmonary, renal, or hepatic disease; Active infections; Underyling CNS pathology or psychiatric history; Decreased bone marrow reserve or underlying immunosuppression; Current history of chickenpox, herpes zoster, or herpes labialis (may reactivate or disseminate disease); Previous or concurrent radiation therapy; Autoimmune disorders (may ↑ risk of exacerbation); Geri: Increases risk of adverse reactions; OB, Pedi: Childbearing potential, pregnancy, lactation and children <3 yr (safety not established).

Copyright © 2008 by F.A. Davis

Exercise Extreme Caution in: History of depression/suicide attempt.

Adverse Reactions/Side Effects

All are more prominent with subcut, IV, or IM administration.

CNS: NEUROPSYCHIATRIC DISORDERS, confusion, depression, dizziness, fatigue, headache, insomnia, irritability, anxiety. **EENT:** blurred vision, nose bleeds, rhinitis. **CV:** ISCHEMIC DISORDERS, arrhythmias, chest pain, edema. **GI:** COLITIS, PANCREATITIS, anorexia, abdominal pain, diarrhea, dry mouth, nausea, taste disorder, vomiting, weight loss, drug-induced hepatitis, flatulence. **Derm:** alopecia, dry skin, pruritus, rash, sweating. **Endo:** thyroid disorders. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia, hemolytic anemia (with ribavirin). **MS:** arthralgia, myalgia, leg cramps. **Neuro:** paresthesia. **Resp:** cough, dyspnea. **Local:** injection site reactions. **Misc:** AUTOIMMUNE DISORDERS, INFECTIOUS DISORDERS, allergic reactions including ANAPHYLAXIS, chills, fever, flu-like syndrome.

Interactions

Drug-Drug: Additive myelosuppression with other **antineoplastic agents** or **radiation therapy**. ↑ CNS depression may occur with **CNS depressants**, including **alcohol**, **antihistamines**, **sedative/hypnotics**, and **opioids**. May ↓ metabolism and ↑ blood levels and toxicity of **theophylline** and **methadone**. ↑ risk of adverse reactions with **zidovudine**. **Ribavirin** ↑ risk of hemolytic anemia, especially if CCr <50 mL/min (avoid if possible). May ↓ effects of **immunosuppressant agents**.

Route/Dosage

Peginterferon Alpha-2a

Subcut (Adults): *Chronic hepatitis C*—180 mcg once weekly for 48 wk for Genotypes 1,4 (24 wk for Genotypes 2,3). *Patients with chronic hepatitis C co-infected with HIV*—180 mcg once weekly for 48 wk.

Interferon Alpha-2b

IV (Adults): *Malignant melanoma (induction)*—20 million units/m² for 5 days of each week for 4 wk initially, followed by subcut maintenance dosing.

IM, Subcut (Adults): *Hairy cell leukemia*—2 million units/m² IM or subcut 3 times weekly for up to 6 mo. *Malignant melanoma (maintenance)*—10 million units/m² subcut 3 times weekly for 48 wk, following initial IV dosing. *AIDS-related Kaposi's sarcoma*—30 million units/m² IM or subcut 3 times weekly until disease progression or maximum response has been achieved after 16 wk. *Chronic hepatitis C*—3 million units Im or subcut 3 times weekly. If normalization of ALT occurs after 16 wk of therapy, continue treatment for total of 18–24 mo. If normalization of ALT does not occur after 16 wk of therapy, may consider discontinuing treatment. *Chronic hepatitis B*—5 million units/day IM or subcut *or* 10 million units IM or subcut 3 times weekly for 16 wk. *Follicular non-Hodgkin's lymphoma*—5 million units subcut 3 times weekly for up to 18 mo (to be used following completion of anthracycline-containing chemotherapy).

Subcut (Children >3 yr): *Chronic hepatitis B*—3 million units/m² 3 times weekly for the first week of therapy then increase to 6 million units/m² 3 times weekly (not to exceed 10 million units/dose) for 16 to 24 weeks.

IL (Adults): *Condylomata acuminata*—1 million units/lesion 3 times weekly for 3 wk; treat only 5 lesions per course. An additional course of treatment may be initiated at 12–16 wk.

Peginterferon Alpha-2b

Monotherapy

Subcut (Adults): *137–160 kg*—150 mcg once weekly for 1 yr. *107–136 kg*—120 mcg once weekly for 1 yr. *89–106 kg*—96 mcg once weekly for 1 yr. *73–88 kg*—80 mcg once weekly for 1 year. *57–72 kg*—64 mcg once weekly for 1 yr. *46–56 kg*—50 mcg once weekly for 1 yr. *37–45 kg*—40 mcg once weekly for 1 yr.

In Combination with Ribavirin (Rebetol)

Subcut (Adults): *>85 kg*–150 mcg once weekly. *76–85 kg*—120 mcg once weekly. *61–75 kg*—96 mcg once weekly. *51–60 kg*—80 mcg once weekly. *40–50 kg*—64 mcg once weekly. *<40 kg*—50 mcg once weekly.

Interferon Alpha-n3

IL (Adults): 250,000 units/lesion twice weekly for up to 8 wk; for large lesions, divide dose and inject at several sites.

Availability

Peginterferon Alpha-2a

Solution for injection: 180 mcg/ml in single use vials. **Prefilled syringes:** 180 mcg/0.5 ml.

Copyright © 2008 by F.A. Davis

Interferon Alpha-2b
Powder for injection: 10-million-unit single-use vial, 18-million-unit single-use vial, 50-million-unit single-use vial. **Solution for injection:** 10-million-unit single-use vial, 18-million-unit single-use vial, 18-million-unit multidose pen, 25-million-unit multidose vial, 30-million-unit multidose pen, 60-million-unit multidose pen. ***In combination with:*** oral ribavarin (Rebetrol) as a combination package (Rebetron). See Appendix B. (in various dosage packages).

Peginterferon alpha-2b
Powder for injection (Redipen system or vials): 50 mcg/0.5 ml, 80 mcg/0.5 ml, 120 mcg/0.5 ml, 150 mcg/0.5 ml.

Interferon Alpha-n3
Solution for injection: 5 million units/ml.

NURSING IMPLICATIONS

Assessment

- Assess for signs of neuropsychiatric disorders (irritability, anxiety, depression, suicidal ideation, aggressive behavior). May require discontinuation of therapy.
- Monitor for signs of infection (vital signs, WBC) during therapy. Discontinue drug therapy in cases of severe infection, and antibiotic therapy instituted
- Assess for cardiovascular disorders (pulse, blood pressure, chest pain). An ECG should be performed before and periodically during the course of therapy in patients with a history of cardiovascular disease
- Assess for signs of colitis (abdominal pain, bloody diarrhea, fever) and pancreatitis (nausea, vomiting, abdominal pain) during therapy. Discontinue therapy if these occur; may be fatal. Colitis usually resolves within 1–3 wks of discontinuation
- Assess for development of flu-like syndrome (fever, chills, myalgia, headache). Symptoms often appear suddenly 3–6 hr after therapy. Symptoms tend to decrease, even with continued therapy. Acetaminophen may be used for control of these symptoms
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension
- May cause nausea and vomiting. Antiemetics may be used prophylactically. Monitor intake and output, daily weight, and appetite. Adjust diet as tolerated for anorexia. Encourage fluid intake of at least 2 liters/day
- Assess pulmonary status (lung sounds, respirations) periodically during therapy
- Perform a baseline eye exam in all patients prior to initiation of therapy. Eye exams should be performed periodically during therapy in patients with pre-existing diabetic or hypertensive retinopathy. Discontinue therapy if patients develop new or worsening eye disorders
- Assess for signs of thyroid dysfunction, as hypothyroidism or hyperthyroidism may occur. Discontinue therapy if the patient's thyroid function cannot be controlled with medications (e.g. thyroid hormone supplementation, antithyroid medications).
- **Kaposi's Sarcoma:** Monitor number, size, and character of lesions prior to and throughout therapy.
- ***Lab Test Considerations:*** **Systemic:** Monitor for CBC and differential prior to and periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, decreased hemoglobin and hematocrit, and hemolytic anemia. The nadirs of leukopenia and thrombocytopenia occur in 3–5 days, with recovery 3–5 days after withdrawal of *interferon alpha-2b.* For malignant melanoma, if granulocyte count >250/mm^3 but <500/mm^3, discontinue *interferon alpha-2b* until platelet or granulocyte counts return to normal or baseline levels, then reinstitute at 50% of dose. If granulocyte count <250/mm^3 with *interferon alpha-2b*, discontinue permanently. For follicular non-Hodgkin's lymphoma, if granulocyte count <1000/mm^3 or platelet count <50,000/mm^3, discontinue *interferon alpha-2b*. *Peginterferon alpha-2b* should be discontinued if granulocyte count <1000/mm^3 or platelet count <50,000/mm^3. *Peginterferon alpha-2a* should be discontinued if ANC<500/mm^3 or platelet count <25,000/mm^3 and then may be restarted at a lower dose if the ANC>1000/mm^3.
- Platelet count should be ≥90,000 cells/mm^3 and ANC ≥1500 cells/mm^3 prior to initiation of peginterferon therapy. Commonly causes ↓ hemoglobin, hematocrit, WBC, ANC, lym-

Copyright © 2008 by F.A. Davis

phocytes and platelet counts within first 2 wks of therapy.
- Monitor liver function tests (AST, ALT, LDH, bilirubin, alkaline phosphatase), triglycerides, and renal function tests (BUN, creatinine, uric acid, urinalysis) prior to and periodically during therapy. CCr should be >50 ml/min prior to initiation of peginterferon therapy.
- Monitor TSH at baseline and if patients develop symptoms consistent with hypothyroidism or hyperthyroidism.
- **Hairy Cell Leukemia:** Monitor number of peripheral blood hairy cells and bone marrow hairy cells prior to and during therapy.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix K).

Interferon Alpha-2b

- **IM, Subcut:** Subcut route is preferred for patients with a platelet count <50,000/mm^3.
- Reconstitute 10-, 18-, and 50-million-unit vials with 1 ml of diluent provided by manufacturer (sterile water for injection). Agitate gently. Solution may be colorless to light yellow. Solution should be used immediately; stable for up to 24 hr if refrigerated.
- The solution for injection vials do not require reconstitution prior to use and may be used for IM, subcut, or intralesional administration.
- The solution for injection in multidose pens are for subcut use only. Only the needles provided in the package should be used with the pen. A new needle should be used with each dose. Follow instructions in *Medication Guide* for use of multidose pens.
- **IL:** Reconstitute 10-million-unit vial with 1 ml of diluent provided by manufacturer (sterile water for injection). Use a TB syringe with 25–30-gauge needle to administer. Each 0.1-ml dose is injected into the center of the base of the wart using the intradermal injection approach. As many as 5 lesions can be treated at one time.

IV Administration

- **Intermittent Infusion:** (For malignant melanoma). ***Diluent:*** Add 1 ml of diluent provided by manufacturer (sterile water for injection) to vial. Further dilute appropriate dose in 100 ml of 0.9% NaCl. Solution should be used immediately; stable for 24 hr if refrigerated. The solution for injection vials are not recommended for IV administration. ***Concentration:*** Final concentration of infusion should not be less than 10 million units/100 ml. ***Rate:*** Infuse over 20 min.

Peginterferon Alpha–2a

- Vials and pre-filled syringes should be stored in refrigerator. Do not administer solution that is cloudy or contains a precipitate.
- Follow instructions in *Medication Guide* for use of pre-filled syringes.

Peginterferon Alpha–2b

- Reconstitute vial with 0.7 mL of diluent provided by manufacturer (sterile Water for injection). Administer immediately; stable for 24 hr if refrigerated. Solution should be clear and colorless. Discard unused solution.
- *For PEG Intron Redipen* To reconstitute the drug, hold the Redipen upright (dose button down) and press 2 halves of pen together until a click is heard. Gently invert the pen to mix the solution (do not shake). Solution should be clear and colorless. Follow instructions in *Medication Guide* for *RediPen* use. Dispose of *RediPen* and other materials in puncture-resistant container.

Interferon Alpha-N3

- Vials should be refrigerated.

Patient/Family Teaching

- Advise patient to take medication as directed. If a dose is missed, omit dose and return to the regular schedule. The patient should notify the health care professional if more than 1 dose is missed.
- **Home Care Issues:** Instruct patient and family on preparation and correct technique for administration of injection and care and disposal of equipment. Advise patient to read *Medication Guide* prior to administration and with each prescription refill to check for changes. Explain to patient that brands should not be switched without consulting health care professional; may result in a change of dose.

Copyright © 2008 by F.A. Davis

- Discuss possibility of flu-like reaction 3–6 hr after dose. Acetaminophen may be taken prior to injection and every 3–4 hr afterward as needed to control symptoms.
- Review side effects with patient. Interferon may be temporarily discontinued or dose decreased by 50% if serious side effects occur.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Inform patient of the potential for depression and advise patient to notify health care professional if depression occurs.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Explain to patient that fertility may be impaired and that contraception is needed during treatment to prevent potential harm to the fetus.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.
- Inform patient that peginterferon alpha-2a may not reduce the risk of transmission of HCV to others or prevent cirrhosis, liver failure, or liver cancer.

Evaluation/Desired Outcomes

- Normalized blood parameters (hemoglobin, neutrophils, platelets, monocytes, and bone marrow and peripheral hairy cells) in hairy cell leukemia. Response may not be seen for 6 mo with *interferon alpha-2b*.
- Decrease in the size and number of lesions in Kaposi's sarcoma. Therapy may be required for 6 months before full response is seen. Therapy is continued until disease progresses or a maximum response has been achieved after 4 mo of therapy.
- Improved hematologic parameters in patients with chronic myelogenous leukemia.
- Increase in time to relapse and overall survival in patients with malignant melanoma.
- Disappearance of or decrease in size and number of genital warts. Condylomata acuminata usually respond in 4–8 wk. A second course of therapy may be required if genital warts persist and laboratory values remain in acceptable limits.
- Decrease in symptoms and improvement in liver function tests and ↓ progression of hepatic damage in patients with hepatitis B or hepatitis C infection.

INTERFERONS, BETA

(in-ter-**feer**-on)

interferon beta-1a
Avonex, Rebif

interferon beta-1b
Betaseron

Classification
Therapeutic: anti–multiple sclerosis agents
Pharmacologic: interferons

Pregnancy Category C

Indications

Relapsing forms of multiple sclerosis.

Action

Antiviral and immunoregulatory properties produced by interacting with specific receptor sites on cell surfaces may explain beneficial effects. Produced by recombinant DNA technology.
Therapeutic Effects: Reduce incidence of relapse (neurologic dysfunction) and slow physical disability.

Pharmacokinetics

Absorption: *Interferon beta-1b*—50% absorbed following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: *Interferon beta-1a*—69 hr (subcut), 10 hr (IM); *interferon beta-1b*—8 min–4.3 hr.

TIME/ACTION PROFILE (serum concentrations)

ROUTE	ONSET	PEAK	DURATION
Interferon beta-1a IM, subcut	unknown	3–15 h	unknow
Interferon beta-1b subcut	rapid	16 h	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to natural or recombinant interferon beta or human albumin.

Copyright © 2008 by F.A. Davis

Use Cautiously in: History of suicide attempt or depression; History of seizures (interferon beta-1a); Cardiovascular disease; Liver disease (interferon beta-1a); History of alcohol abuse (interferon beta-1a); Patients with childbearing potential; Pregnancy, lactation, or children <18 yr (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES (↑ WITH INTERFERON BETA-1A), depression, dizziness, fatigue, headache, insomnia, drowsiness, incoordination, rigors, suicidal ideation. **EENT:** sinusitis, vision abnormalities. **Resp:** dyspnea, upper respiratory tract infection. **CV:** chest pain, edema, hypertension. **GI:** constipation, nausea, vomiting, abdominal pain, autoimmune hepatitis, dry mouth, elevated liver function tests. **GU:** cystitis, erectile dysfunction, polyuria, urinary incontinence. **Derm:** rashes, alopecia. **Endo:** menstrual disorders, hyperthyroidism, hypothyroidism, menorrhagia, spontaneous abortion. **Hemat:** neutropenia, anemia, eosinophilia, thrombocytopenia. **Local:** injection-site reactions, injection site necrosis. **MS:** myalgia, arthralgia, muscle spasm. **Misc:** allergic reactions including ANAPHYLAXIS, chills, fever, flu-like symptoms, pain.

Interactions

(All interactions below are for Interferon beta-1b)

Drug-Drug: ↑ myelosuppression may occur with other myelosuppressives including **antineoplastics**. Concurrent use of **hepatotoxic agents** may ↑ the risk of hepatotoxicity (↑ liver enzymes).

Drug-Natural Products: Avoid concommitant use with immmunomodulating natural products such as **astragalus**, **echinacea**, and **melatonin**.

Route/Dosage

Interferon Beta-1a

IM (Adults): *Avonex*—30 mcg once weekly.

Subcut (Adults): *Rebif (target dose of 22 mcg 3 times/wk)*—Start with 4.4 mcg 3 times/wk for 2 wk, then ↑ to 11 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 22 mcg 3 times/wk. *Rebif (target dose of 44 mcg 3 times/wk)*—Start with 8.8 mcg 3 times/wk for 2 wk, then ↑ to 22 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 44 mcg 3 times/wk.

Interferon Beta-1b

Subcut (Adults): *Betaseron*—Initiate with 0.0625 mg (2 million units) every other day and then ↑ dose by 0.0625 mg q 2 wk over a 6-wk period up to target dose of 0.25 mg (8 million units) every other day.

Availability

Interferon Beta-1a (Avonex)

Powder for injection: 30 mcg/vial. **Prefilled syringes (Avonex):** 30 mcg/0.5 ml. **Prefilled syringes (Rebif):** 22 mcg/0.5 ml, 44 mcg/0.5 ml, titration pack of 6 syringes prefilled with 8.8 mcg/0.2 ml and 6 syringes prefilled with 22 mcg/0.5 ml.

Interferon Beta-1b

Powder for injection (Betaseron): 0.3 mg (9.6 million units)/vial.

NURSING IMPLICATIONS

Assessment

- Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- Monitor patient for signs of depression during therapy. If depression occurs, notify physician or other health care professional immediately.
- ***Lab Test Considerations:*** Monitor hemoglobin, WBC, platelets, and blood chemistries including liver function tests prior to and 1, 3, and 6 mo after initiation of therapy and periodically thereafter. Therapy may be temporarily discontinued if the absolute neutrophil count is <750/mm^3, if AST or ALT exceeds 10 times the upper limit of normal, or if serum bilirubin exceeds 5 times the upper limit of normal. Once the absolute neutrophil count is >750/mm^3 or the hepatic enzymes have returned to normal, therapy can be restarted at 50% of the original dose.
- Thyroid function tests should be monitored every 6 mo, especially in patients with a history of thyroid abnormalities.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse products. Interferon beta-1a and interferon beta-1b are not interchangeable.

Copyright © 2008 by F.A. Davis

- **Interferon Beta-1a:** *Avonex:* Reconstitute with 1.1 ml of diluent and swirl gently to dissolve. Do not shake the vial. Inject into the thigh or upper arm. Keep reconstituted solution in refrigerator; inject within 6 hr of reconstitution.
- *Rebif:* Administer subcut via prefilled, single-use syringe at the same time (afternoon or evening) on the same days (Monday, Wednesday, Friday) at least 48 hr apart each wk. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portions. Store in refrigerator.
- **Interferon Beta-1b:** To reconstitute, inject 1.2 ml of diluent supplied into interferon beta-1b vial for a concentration of 0.25 mg/ml. Swirl gently to dissolve completely; do not shake. Do not use solutions that are discolored or contain particulate matter. Keep reconstituted solution refrigerated; inject within 3 hr of reconstitution.
- Following reconstitution, withdraw 1 ml into a syringe with a 27-gauge needle and inject subcut into arm, abdomen, hip, or thigh. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portion; vials are for single dose only.

Patient/Family Teaching

- **Home Care Issues:** Instruct patient in correct technique for injection and care and disposal of equipment. Caution patient not to reuse needles or syringes and provide patient with a puncture-resistant container for disposal.
- Instruct patient to take medication as directed; do not change dose or schedule without consulting health care professional. Patients should receive a medication guide with each product.
- Inform patient that flu-like symptoms (fever, chills, myalgia, sweating, malaise) may occur during therapy. Acetaminophen may be used for relief of fever and myalgias.
- Advise patient to notify health care professional if pregnancy is planned or suspected. May cause spontaneous abortion.

Evaluation/Desired Outcomes

- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

IODINE, IODIDE

potassium iodide†
Pima, SSKI, ThyroSafe, ThyroShield

strong iodine solution
Lugol's solution

Classification
Therapeutic: antithyroid agents
Pharmacologic: iodine containing agents

Pregnancy Category D

†For more information on potassium iodide as a radiation protectant see *Potassium Iodide as a Thyroid Blocking Agent in Radiation Emergencies* at www.fda.gov

Indications

Adjunct with other antithyroid drugs in preparation for thyroidectomy. Treatment of thyrotoxic crisis. Radiation protectant following radiation emergencies or administration of radioactive iodine.

Action

Rapidly inhibits the release and synthesis of thyroid hormones. Decreases the vascularity of the thyroid gland. Decreases thyroidal uptake of radioactive iodine following radiation emergencies or administration of radioactive isotopes of iodine. Iodine is a necessary component of thyroid hormone. **Therapeutic Effects:** Control of hyperthyroidism. Decreased bleeding during thyroid surgery. Decreased incidence of thyroid cancer following radiation emergencies.

Pharmacokinetics

Absorption: Converted in the GI tract and enters the circulation as iodine; also absorbed through skin and lungs; may also be obtained via recycling of iodothyronines.
Distribution: Concentrates in the thyroid gland and muscle; also found in skin, skeleton, breasts, and hair. Readily crosses the placenta; enters breast milk.
Metabolism and Excretion: Taken up by the thyroid gland, then eliminated via kidneys, liver, skin, lungs, and intestines.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on thyroid)

ROUTE	ONSET	PEAK	DURATION
PO	24 hr	10–15 days	variable†

†Radiation protection lasts 24 hr

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperkalemia; Pulmonary edema; Impaired renal function.

Use Cautiously in: Tuberculosis; Bronchitis; Cardiovascular disease; OB, Pedi: Pregnancy or lactation (although iodine is required during pregnancy, excess amounts may cause thyroid abnormalities/goiter in the newborn; excess use during lactation may cause skin rash or thyroid suppression in the infant).

Adverse Reactions/Side Effects

CNS: confusion, weakness. **GI:** GI BLEEDING, diarrhea, nausea, vomiting. **Derm:** acneiform eruptions. **Endo:** hypothyroidism, goiter, hyperthyroidism. **F and E:** hyperkalemia. **Neuro:** tingling. **MS:** joint pain. **Misc:** hypersensitivity, iodism.

Interactions

Drug-Drug: Use with **lithium** may cause ↑ hypothyroidism. ↑ antithyroid effect of **methimazole** and **propylthiouracil**. ↑ hyperkalemia may result from combined use with **potassium-sparing diuretics**, **ACE inhibitors**, **angiotensin II receptor antagonists** or **potassium supplements**.

Route/Dosage

Preparation for Thyroidectomy

PO (Adults and Children): *Strong iodine solution*—3–5 drops (0.1–0.3 ml) 3 times daily for 10 days prior to surgery. *Potassium iodide saturated solution* (SSKI)— 1–5 drops (50–250 mg) 3 times daily for 10 days prior to surgery.

Hyperthyroidism

PO (Adults and Children): *Strong iodine solution*—1 ml in water 3 times daily. *Potassium iodide saturated solution (SSKI)*—6–10 drops (300–500 mg) 3 times daily.

PO (Infants <1 yr): 3–5 drops (150–250 mg) 3 times daily.

Radiation Protectant to Radioactive Isotopes of Iodine

PO (Adults): *Pima*—195 mg once daily for 10 days (start 24 hr prior to exposure (continue until risk of exposure has passed or other measures have been implemented).

PO (Children >1 yr): 130 mg once daily for 10 days (start 24 hr prior to exposure).

PO (Infants <1 yr): 65 mg once daily for 10 days (start 24 hr prior to exposure).

Reduction of Thyroid Cancer after Nuclear Accident

PO (Adults and Children >68 kg, including pregnant/lactating women): *Iosat, ThyroSafe, ThyroShield*—130 mg once daily (continue until risk of exposure has passed or other measures have been implemented).

PO (Children 3–18 yr): 65 mg once daily.

PO (Children 1 mo-3 yr): 32.5 mg once daily.

PO (Infants <1 mo): 16.25 mg once daily.

Availability

Potassium Iodide

Oral solution: 65 mg/ml (ThyroShield), 1 g potassium iodide/ml (SSKI). **Syrup (Pima) (black-raspberry flavor):** 325 mg potassium iodide/5 ml. **Tablets:** 65 mg[OTC], 130 mg[OTC] (available only through state and federal agencies).

Strong Iodine Solution

Oral solution: Iodine 50 mg/ml plus potassium iodide 100 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of iodism (metallic taste, stomatitis, skin lesions, cold symptoms, severe GI upset). Report these symptoms promptly to physician.
- Monitor response symptoms of hyperthyroidism (tachycardia, palpitations, nervousness, insomnia, diaphoresis, heat intolerance, tremors, weight loss).
- Monitor for hypersensitivity reaction (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician immediately if these problems occur.
- ***Lab Test Considerations:*** Monitor thyroid function before and periodically during therapy. May alter results of radionuclide thyroid imaging and may ↓ thyroidal uptake of ^{131}I, ^{123}I, and sodium pertechnetate ^{99m}Tc in thyroid uptake tests.
- Monitor serum potassium levels periodically during therapy.
- ***Lab Test Considerations:*** Monitor thyroid stimulating hormone (TSH) and free T_4 in neonates (within the first month of life) treated with potassium iodide for development of hypothyroidism. Thyroid hormone therapy should be instituted if hypothyroidism develops.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse iodine with Lodine (etodolac).
- For protection against inhaled radioiodines, administer potassium iodide prior to or immediately coincident with passage of the radioactive cloud, though a substantial protective effect lasts 3-4 hr after exposure.
- **PO:** Mix solutions in a full glass of fruit juice, water, broth, formula, or milk. Administer after meals to minimize GI irritation.
- Solution is normally clear and colorless. Darkening upon standing does not affect potency of drug. Solutions that are brownish yellow should be discarded.
- Crystals may form, especially if refrigerated, but redissolve upon warming and shaking.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible but not just before next dose; do not double doses.
- Instruct patient to report suspected pregnancy to health care professional before therapy is initiated.
- Advise patient to consult health care professional about avoiding foods high in iodine (seafood, iodized salt, cabbage, kale, turnips) or potassium (see Appendix L).
- Advise patient to consult health care professional before using OTC or herbal cold remedies. Some cold remedies use iodide as an expectorant.
- **Hyperthyroidism:** Instruct patient to take medication as ordered. Missing a dose may precipitate hyperthyroidism.

Evaluation/Desired Outcomes

- Resolution of the symptoms of thyroid crisis.
- Decrease in size and vascularity of the gland before thyroid surgery. Use of iodides in the treatment of hyperthyroidism is usually limited to 2 wk.
- Protection of the thyroid gland from the effects of radioactive iodine.

ipratropium

(i-pra-**troe**-pee-um)
Atrovent HFA

Classification
Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: anticholinergics

Pregnancy Category B

Indications

Inhaln: Maintenance therapy of reversible airway obstruction due to COPD, including chronic bronchitis and emphysema. **Intranasal:** Rhinorrhea associated with allergic and nonallergic perennial rhinitis (0.03% solution) or the common cold (0.06% solution). **Unlabeled uses: Inhaln:** Adjunctive management of bronchospasm caused by asthma.

Action

Inhaln: Inhibits cholinergic receptors in bronchial smooth muscle, resulting in decreased concentrations of cyclic guanosine monophosphate (cGMP). Decreased levels of cGMP produce local bronchodilation. **Intranasal:** Local application inhibits secretions from glands lining the nasal mucosa. **Therapeutic Effects: Inhaln:** Bronchodilation without systemic anticholinergic effects. **Intranasal:** Decreased rhinorrhea.

Pharmacokinetics

Absorption: Minimal systemic absorption (2% for inhalation solution; 20% for inhalation aerosol; <20% following nasal use).
Distribution: 15% of dose reaches lower airways after inhalation.
Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.
Half-life: 2 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhalation	1–3 min	1–2 hr	4–6 hr
Intranasal	15 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to ipratropium, atropine, belladonna alkaloids, or bromide. Avoid use during acute bronchospasm; **Note: Atrovent HFA has replaced the discontinued Atrovent CFC (chlorofluorocarbon). Soy and CFC-allergic patients can now safely use the Atrovent HFA formulation. However, Combivent (ipratropium/albuterol combination) MDI does contain soya lecithin and is contraindicated in pa-**

Copyright © 2008 by F.A. Davis

tients with a history of hypersensitivity to soy and peanut.
Use Cautiously in: Patients with bladder neck obstruction, prostatic hyperplasia, glaucoma, or urinary retention; Geri: May be more sensitive to effects.

Adverse Reactions/Side Effects

CNS: dizziness, headache, nervousness. **EENT:** blurred vision, sore throat; *nasal only*— epistaxis, nasal dryness/irritation. **Resp:** bronchospasm, cough. **CV:** hypotension, palpitations. **GI:** GI irritation, nausea. **Derm:** rash. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ anticholinergic properties with other **drugs having anticholinergic properties (antihistamines, phenothiazines, disopyramide).**

Route/Dosage

Inhaln (Adults and Children >12 yr): *Metered-dose inhaler (nonacute)*—2 inhalations 4 times daily (not to exceed 12 inhalations/24 hr or more frequently than q 4 hr). *Acute exacerbations*—4–8 puffs using a spacer device as needed. *Via nebulization (nonacute)*—2504 times daily given q 6 hr. *Acute exacerbations* —500 mcg q 30 min for 3 doses then q 2–4 hr as needed.
Inhaln (Children 5–12 yr): *Metered dose inhaler (nonacute)*—1–2 inhalations q 6 hr as needed (not to exceed 12 inhalations/24 hr). *Acute exacerbations*—4–8 puffs as needed *Via nebulization (nonacute)*—250–500 mcg 4 times daily given q 6 hr. *Acute exacerbations*—250 mcg q 20 min for 3 doses then q 2–4 hr as needed.
Inhaln (Infants): *Nebulization*—125–250 mcg 3 times a day.
Inhaln (Neonates): *Nebulization*—25 mcg/kg/dose 3 times a day.
Intranasal (Adults and Children >6 yr): *0.03 % solution*—2 sprays in each nostril 2–3 times daily (21 mcg/spray).
Inhaln (Adults and Children >5 yr): *0.06% solution* –2 sprays in each nostril 3–4 times daily (42 mcg/spray).

Availability (generic available)

Aerosol inhaler (HFA) (chlorofluorocarbon-free): 17 mcg/spray in 12.9-g canister (200 inhalations). **Inhalation solution:** 0.0125%, 0.02% in single-dose vials containing 500 mcg, 0.025%. **Nasal spray:** 0.03% solution—21 mcg/spray in 30-ml bottle (345 sprays/bottle), 0.06% solution—42 mcg/spray in 15-ml bottle (165 sprays). ***In combination with:*** albuterol (Combivent, Duoneb). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for allergy to atropine and belladonna alkaloids; patients with these allergies may also be sensitive to ipratropium. Atrovent HFA MDI does not contain CFC or soy and may be used safely in soy or CFC-allergic patients. However, Combivent MDI should be avoided in soy- or peanut-allergic patients.
- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult physician or other health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify physician or other health care professional immediately.
- **Nasal Spray:** Assess patient for rhinorrhea.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Activity intolerance (Indications)

Implementation

- Do not confuse Atrovent with Alupent (metaproterenol).
- **Inhaln:** See Appendix D for administration of inhalation medications.
- When ipratropium is administered concurrently with other inhalation medications, administer adrenergic bronchodilators first, followed by ipratropium, then corticosteroids. Wait 5 min between medications.
- Solution for *nebulization* can be diluted with preservative-free 0.9% NaCl. Diluted solution should be used within 24 hr at room temperature or 48 hr if refrigerated. Solution can be mixed with preservative-free albuterol, cromolyn, or metaproterenol if used within 1 hr of mixing.

Patient/Family Teaching

- Instruct patient in proper use of inhaler, nebulizer, or nasal spray and to take medication

Copyright © 2008 by F.A. Davis

as directed. Take missed doses as soon as remembered unless almost time for the next dose; space remaining doses evenly during day. Do not double doses.
- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Health care professional should be notified if stomatitis occurs or if dry mouth persists for more than 2 wk.
- **Inhalation:** Caution patient not to exceed 12 doses within 24 hr. Patient should notify health care professional if symptoms do not improve within 30 min after administration of medication or if condition worsens.
- Explain need for pulmonary function tests prior to and periodically during therapy to determine effectiveness of medication.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision or irritation.
- Advise patient to inform health care professional if cough, nervousness, headache, dizziness, nausea, or GI distress occurs.
- **Nasal Spray:** Instruct patient in proper use of nasal spray. Clear nasal passages gently before administration. Do not inhale during administration, so medication remains in nasal passages. Prime pump initially with 7 actuations. If used regularly, no further priming is needed. If not used in 24 hr, prime with 2 actuations. If not used for >7 days, prime with 7 actuations.
- Advise patient to contact health care professional if symptoms do not improve within 1–2 wk or if condition worsens.

Evaluation/Desired Outcomes
- Decreased dyspnea.
- Improved breath sounds.
- Decrease in rhinorrhea from perennial rhinitis or the common cold.

irbesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

irinotecan (eye-ri-noe-**tee**-kan)
Camptosar

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Pregnancy Category D

Indications
Metastatic colorectal cancer (with 5-fluorouracil and leucovorin).

Action
Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: *Irinotecan*—30–68%; *SN–38 (active metabolite)*—95%.
Metabolism and Excretion: Converted by the liver to SN–38, its active metabolite, which is also metabolized by the liver. Small amounts excreted by kidneys.
Half-life: 6 hr.

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21–29 days	27–34 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation.
Use Cautiously in: Previous pelvic or abdominal irradiation or age ≥65 yr (increased risk of myelosuppression); Presence of infection, underlying bone marrow depression, or concurrent chronic illness; History of prior pelvic/abdominal irradiation and serum bilirubin >1–2 mg/dl (initial dosage reduction recommended); Geri: ↑ sensitivity to adverse effects (myelosuppression); initiate at lower dose; Previous severe myelosuppression or diarrhea (reinstitute at lower dose following resolution); Patients with genetically reduced UGT1A1 activity (↑ risk of neutropenia); OB: Patients with childbearing potential; Pedi: Children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache, insomnia, weakness. **EENT:** rhinitis. **Resp:** coughing, dyspnea. **CV:** edema, vasodilation. **GI:** DIARRHEA, ELEVATED LIVER ENZYMES, abdominal pain/cramping, anorexia, constipation, dyspepsia, flatulence, nausea, stomatitis, vomiting, abdominal enlargement, colonic ulceration. **Derm:** alopecia, rash, sweating. **F and E:** dehydration. **Hemat:** anemia, leukopenia, neutropenia, thrombocytopenia.

Copyright © 2008 by F.A. Davis

Local: injection site reactions. **Metab:** weight loss. **MS:** back pain. **Misc:** chills, fever.

Interactions

Drug-Drug: Combination with **fluorouracil** may result in serious toxicity (dehydration, neutropenia, sepsis). ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. **Laxatives** should be avoided (diarrhea may be ↑). **Diuretics** ↑ risk of dehydration (may discontinue during therapy). **Dexamethasone** used as an antiemetic ↑ risk of hyperglycemia and lymphocytopenia. **Prochlorperazine** given on the same day as irinotecan ↑ risk of akathisia.
Drug-Natural Products: St. John's wort ↑ increases levels and risk of toxicity.

Route/Dosage

Other regimens are used; careful modification required for all levels of toxicity/tolerance.

Single Agent

IV (Adults): *Weekly dosage schedule*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*—350 mg/m² once every 3 wk.
IV (Geriatric Patients >70 yr): Initiate at 300 mg/m² every 3 wk.

Hepatic Impairment

IV (Adults): *Bilirubin 1–2 mg/dl and history of prior pelvic/abdominal irradiation—Weekly dosage schedule*—Initiate therapy at lower dose (100 mg/m²); once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated with dose adjusted as tolerated. *Once-every-3-wk schedule*—300 mg/m² once every 3 wk, dose adjusted as tolerated as low as 200 mg/m² and further adjusted in 50-mg increments.

As Part of Combination Therapy with Leucovorin and 5-Fluorouracil

IV (Adults): *Regimen 1 (Bolus regimen)*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; *Regimen 2 (Infusional regimen)*—180 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

Availability

Solution for injection: 20 mg/ml in 2-ml[Rx] and 5-ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor closely for the development of diarrhea. Two types may occur. The early type occurs within 24 hr of administration and may be preceded by cramps and sweating. Atropine 0.25–1 mg IV may be given to decrease symptoms. Potentially life-threatening diarrhea may occur more than 24 hr after a dose and may be accompanied by severe dehydration and electrolyte imbalance. Loperamide 4 mg initially, followed by 2 mg every 2 hr until diarrhea ceases for at least 12 hr (or 4 mg every 4 hr if given during sleeping hours) should be administered promptly to treat late-occurring diarrhea. Do not administer loperamide at these doses for >48 hr. Careful fluid and electrolyte replacement should be instituted to prevent complications. Subsequent doses should be delayed in patients with active diarrhea until diarrhea is resolved for 24 hr. If diarrhea is grade 2, 3, or 4, decrease subsequent doses of irinotecan.
- Nausea and vomiting are common. Pretreatment with dexamethasone 10 mg along with agents such as ondansetron or granisetron should be started on the same day as irinotecan at least 30 min before administration. Prochlorperazine may be used on subsequent days but may increase risk of akathisia if given on the same day as irinotecan.
- Assess IV site frequently for inflammation. Avoid extravasation. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Flushing site with sterile water and applica-

Copyright © 2008 by F.A. Davis

tion of ice over the extravasated site are recommended.

- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to each dose. Temporarily discontinue irinotecan if absolute neutrophil count is <500 cells/mm^3 or if neutropenic fever occurs. Administration of a colony-stimulating factor may be considered if clinically significant decreases in WBC (<2000/mm^3), neutrophil count (<1000/mm^3), hemoglobin (<9 g/dl), or platelet count (<100,000 cells/mm^3) occur.
- May cause ↑ serum alkaline phosphatase and AST concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute before infusion with D5W or 0.9% NaCl. ***Concentration:*** 0.12–2.8 mg/ml. Usual diluent is 500 ml of D5W. Solution is pale yellow. Do not administer solutions that are cloudy or contain particulate matter. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. To prevent microbial contamination, solutions should be used within 24 hr of dilution if refrigerated or 6 hr at room temperature. Do not refrigerate solutions diluted with 0.9% NaCl. ***Rate:*** Administer dose over 90 min.
- **Y-Site Compatibility:** oxaliplatin, palonosetron.
- **Y-Site Incompatibility:** gemcitabine, pemetrexed.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

Patient/Family Teaching

- Instruct patient to report occurrence of diarrhea to health care professional immediately, especially if it occurs more than 24 hr after dose. Diarrhea may be accompanied by severe dehydration and electrolyte imbalance. It may be life-threatening and should be treated promptly.
- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify nurse of pain at injection site immediately.
- Instruct patient to notify health care professional if vomiting, fainting, or dizziness occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy.
- Instruct patient not to receive any vaccinations without consulting health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancy.

IRON SUPPLEMENTS

carbonyl iron (100%) (**kar**-bo-nil **eye**-ern)

iron sucrose (**eye**-ern**su**-krose)
Venofer

sodium ferric gluconate complex (**so**-dee-yum**ferr**-ic**gloo**-ko-nate)
Ferrlecit

Classification
Therapeutic: antianemics
Pharmacologic: iron supplements

Pregnancy Category A (ferrous gluconate, ferrous sulfate, iron polysaccharide), B (sodium ferric gluconate, iron sucrose), C (iron dextran)

Indications

PO: Prevention/treatment of iron-deficiency anemia. **IM, IV:** *Iron dextran*—Treatment of iron-deficiency anemia in patients who cannot tolerate or receive oral iron. *Sodium ferric gluconate complex*—Treatment of iron deficiency in patients undergoing chronic hemodialysis or peritoneal dialysis who are concurrently receiving erythropoietin. Treatment of iron-deficiency anemia in patients with chronic kidney disease including patients who are not on dialysis (with or without erythropoietin) and patients dependent on dialysis (with erythropoietin).

Action

An essential mineral found in hemoglobin, myoglobin, and many enzymes. Enters the bloodstream and is transported to the organs of the reticuloendothelial system (liver, spleen, bone marrow), where it is separated out and becomes part of iron stores. **Therapeutic Effects:** Prevention/treatment of iron deficiency.

Pharmacokinetics

Absorption: 5–10% of dietary iron is absorbed (up to 30% in deficiency states). Therapeutically administered PO iron may be 60% absorbed via an active and passive transport process. Well absorbed following IM administration.
Distribution: Remains in the body for many months. Crosses the placenta; enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Mostly recycled; small daily losses occurring via desquamation, sweat, urine, and bile.
Half-life: *Iron dextran, iron sucrose*—6 hr.

TIME/ACTION PROFILE (effects on erythropoiesis)

ROUTE	ONSET	PEAK	DURATION
PO	4 days	7–10 days	2–4 mo
IM, IV	4 days	1–2 wk	wks–mos

Contraindications/Precautions

Contraindicated in: Hemochromatosis, hemosiderosis, or other evidence of iron overload; Anemias not due to iron deficiency; Some products contain alcohol, tartrazine, or sulfites and should be avoided in patients with known intolerance or hypersensitivity.
Use Cautiously in: PO: Peptic ulcer; Ulcerative colitis or regional enteritis (condition may be aggravated); Alcoholism; Severe hepatic impairment; Severe renal impairment (oral products); Pre-existing cardiovascular disease (iron dextran) (may be exacerbated by adverse reactions to this drug); Significant allergies or asthma (iron dextran); Rheumatoid arthritis (iron dextran) (may have exacerbation of joint swelling); OB: Pregnancy or lactation (safety of some parenteral products not established); Pedi: Safety not established for infants <4 mo (iron dextran) or children <6 yr (sodium ferric gluconate complex); safety may not be established for other products in the pediatric population.

Adverse Reactions/Side Effects

CNS: *IM, IV*— SEIZURES, dizziness, headache, syncope. **CV:** *IM, IV*— hypotension, hypertension, tachycardia. **GI:** nausea; *PO*— constipation, dark stools, diarrhea, epigastric pain, GI bleeding; *IM, IV*— taste disorder, vomiting. **Derm:** *IM, IV*— flushing, urticaria. **Resp:** *IV*— cough, dyspnea. **Local:** pain at IM site (iron dextran), phlebitis at IV site, skin staining at IM site (iron dextran). **MS:** *IM, IV*— arthralgia, myalgia. **Misc:** *PO*— staining of teeth (liquid preparations); *IM, IV*— allergic reactions including ANAPHYLAXIS, fever, lymphadenopathy, sweating.

Interactions

Drug-Drug: Oral iron supplements ↓ absorption of **tetracyclines**, **bisphosphonates**, **fluoroquinolones**, **levothyroxine**, **mycophenolate mofetil**, and **penicillamine** (si-

Copyright © 2008 by F.A. Davis

multaneous administration should be avoided). ↓ absorption of and may ↓ effects of **levodopa** and **methyldopa**. Concurrent administration of **H_2 antagonists**, **proton pump inhibitors**, and **cholestyramine** may ↓ absorption of iron. Doses of **ascorbic acid** ≥200 mg may ↑ absorption of iron up to ≥30%. **Chloramphenicol** and **vitamin E** may ↓ hematologic response to iron therapy.
Drug-Food: Iron absorption is ↓ 33–50% by concurrent administration of food.

Route/Dosage

Oral Iron Dosage for Iron Deficiency (expressed as mg elemental iron, note individual salt forms, multiple ones exist—see approximate equivalent doses below for dose conversions).

Approximate Equivalent Doses (mg of iron salt): *Ferrous fumarate*—197; *Ferrous gluconate*—560; *Ferrous sulfate*—324; *Ferrous sulfate, exsiccated*—217.
PO (Adults): *Deficiency*—120–240 mg/day (2–3 mg/kg/day) in 2–4 divided doses. *Prophylaxis*—60–100 mg/day.
PO (Infants and Children): *Severe deficiency*—4–6 mg/kg/day in 3 divided doses. *Mild to moderate deficiency*—3 mg/kg/day in 1–2 divided doses. *Prophylaxis*—1–2 mg/kg/day in 1–2 divided dose (maximum: 15 mg/day).
PO (Neonates, Premature): 2–4 mg/kg/day in 1–2 divided doses, maximum: 15 mg/day.

Iron Dextran

IM, IV (Adults and Children): Test dose of 0.5 ml (25 mg) is given 1 hr prior to therapy.
IM, IV (Infants): Test dose of 0.25 ml (12.5 mg) is given 1 hr prior to therapy.
IM, IV (Adults and Children >15 kg): *Iron deficiency*—Total dose (ml) = 0.0442 × (desired Hgb − actual Hgb) × lean body weight (kg) + [0.26 × lean body weight (kg)]. Divided up and given in small daily doses until total is reached; not to exceed 100 mg/day. *Total dose IV infusion*—Total dose may be diluted and infused over 4–5 hr following a test dose of 10 drops (unlabeled).
IM, IV (Adults): *Blood loss*—Dose (ml) = (Blood loss [ml] × hematocrit) × 0.02.
IM, IV (Children 5–15 kg): *Iron deficiency*—Total dose (ml) = 0.042 (desired Hgb − actual Hgb) × weight (kg) + [0.26 × weight (kg)]. / Divided up and given in small daily doses until total is reached; not to exceed 25 mg/day in children <5 kg; 50 mg/day in children 5–10 kg; or 100 mg/day in children >10 kg.

Iron Polysaccharide Complex

PO (Adults): 50–100 mg twice daily of tablets/elixir or 150–300 mg/day of the capsules.
PO (Children >6yr): 50–100 mg/day (may be given in divided doses).
PO (Infants): 1–2 mg/kg/day.
PO (Adults—Pregnant Women): 30–60 mg/day.

Iron Sucrose

IV (Adults): *Hemodialysis dependent patients*—100 mg (5 ml) during each dialysis session for 10 doses (total of 1000 mg), additional smaller doses may be necessary; *Peritoneal dialysis dependent patients*— 300 mg (15 ml) infusion, followed by another 300 mg (15 ml) infusion 14 days later, followed by 400 mg (20 ml) infusion 14 days later; *Non-dialysis dependent patients*—200 mg (10 ml) on 5 different days within a 14 day period to a total of 1000 mg, may also be given as infusion of 500 mg on day 1 and day 14.

Sodium Ferric Gluconate Complex

IV (Adults): 10 ml (125 mg elemental iron) repeated during 8 sequential dialysis treatments to a total cumulative dose of 1 g.
IV (Children >6 yr): 0.12 ml/kg (not to exceed 125 mg/dose) repeated during 8 sequential dialysis treatments.

Availability

Carbonyl Iron (100% Iron)

Tablets: 50 mg[OTC]. **Oral suspension:** 15 mg/1.25 ml in 118-ml bottles[OTC].

Ferrous Fumarate (33% Elemental Iron)

Tablets: 63 mg[OTC], 195 mg[OTC], 200 mg[OTC], 324 mg[OTC], 325 mg[OTC]. **Chewable tablets:** 100 mg[OTC]. **Controlled-release capsules:** 325 mg[OTC]. **Suspension (butterscotch flavor):** 100 mg/5 ml[OTC], 🍁300 mg/5 ml[OTC]. **Drops:** 45 mg/0.6 ml[OTC], 🍁60 mg/1 ml[OTC].

Ferrous Gluconate (11.6% Elemental Iron)

Tablets: 300 mg[OTC], 320 mg[OTC], 325 mg[OTC]. **Sustained-release tablets:** 320 mg[OTC]. **Soft gelatin capsules:** 86 mg[OTC]. **Elixir:** 300 mg/5 ml[OTC]. **Syrup:** 🍁300 mg/5 ml[OTC].

Ferrous Sulfate (20–30% Elemental Iron)

Tablets: 195 mg[OTC], 300 mg[OTC], 325 mg[OTC]. **Capsules:** 150 mg[OTC], 250 mg[OTC]. **Timed-release tablets:** 525 mg[OTC]. **Syrup:** 90 mg/5 ml[OTC]. **Elixir:** 220 mg/5 ml[OTC]. **Drops:** 75 mg/0.6 ml[OTC], 125 mg/1 ml[OTC].

Copyright © 2008 by F.A. Davis

Iron Dextran
Injection: 50 mg/ml.
Iron Polysaccharide (mg Iron)
Capsules: 150 mg[OTC]. **Elixir:** 100 mg/5 ml[OTC].
Tablets: 50 mg[OTC].
Iron Sucrose
Aqueous complex for injection: 20 mg/ml in 5-ml single-use vial (100 mg).
Sodium Ferric Gluconate Complex
Injection: 62.5 mg/5 ml in 5-ml ampules.

NURSING IMPLICATIONS

Assessment

- Assess nutritional status and dietary history to determine possible cause of anemia and need for patient teaching.
- Assess bowel function for constipation or diarrhea. Notify health care professional and use appropriate nursing measures should these occur.
- **Iron Dextran, Iron Sucrose, and Sodium Ferric Gluconate Complex:** Monitor blood pressure and heart rate frequently following IV administration until stable. Rapid infusion rate may cause hypotension and flushing.
- Assess patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify physician immediately if these occur. Keep epinephrine and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** Monitor hemoglobin, hematocrit, and reticulocyte values prior to and every 3 wk during the first 2 mo of therapy and periodically thereafter. Serum ferritin and iron levels may also be monitored to assess effectiveness of therapy.
- Occult blood in stools may be obscured by black coloration of iron in stool. Guaiac test results may occasionally be false-positive.
- **Iron Dextran:** Monitor hemoglobin, hematocrit, reticulocyte values, transferrin, ferritin, total iron-binding capacity, and plasma iron concentrations periodically during therapy. Serum ferritin levels peak in 7–9 days and return to normal in 3 wk. Serum iron determinations may be inaccurate for 1–2 wk after therapy with large doses; therefore, hemoglobin and hematocrit are used to gauge initial response.
- May impart a brownish hue to blood drawn within 4 hr of administration. May cause false ↑ in serum bilirubin and false decrease in serum calcium values.
- Prolonged PTT may be calculated when blood sample is anticoagulated with citrate dextrose solution; use sodium citrate instead.
- **Iron Sucrose:** Monitor hemoglobin, hematocrit, serum ferritin, and transferritin saturation prior to and periodically during therapy. Transferrin saturation values increase rapidly after IV administration; therefore, serum iron values may be reliably obtained 48 hr after IV administration. Withhold iron therapy if evidence of iron overload occurs.
- May cause ↑ liver enzymes.
- ***Toxicity and Overdose:*** Early symptoms of overdose include stomach pain, fever, nausea, vomiting (may contain blood), and diarrhea. Late symptoms include bluish lips, fingernails, and palms; drowsiness; weakness; tachycardia; seizures; metabolic acidosis; hepatic injury; and cardiovascular collapse. Patient may appear to recover prior to the onset of late symptoms. Therefore, hospitalization continues for 24 hr after patient becomes asymptomatic to monitor for delayed onset of shock or GI bleeding. Late complications of overdose include intestinal obstruction, pyloric stenosis, and gastric scarring: If patient is comatose or seizing, gastric lavage with sodium bicarbonate is performed. Deferoxamine is the antidote. Additional supportive treatments to maintain fluid and electrolyte balance and correction of metabolic acidosis are also indicated, If signs of overdose occur during IV administration of iron sucrose, treatment includes IV fluids, corticosteroids, and/or antihistamines. Administering at a slower rate usually relieves symptoms.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Implementation

- Discontinue oral iron preparations prior to parenteral administration.
- Sodium ferric gluconate and iron sucrose are for IV use only.
- **PO:** Oral preparations are most effectively absorbed if administered 1 hr before or 2 hr after meals. If gastric irritation occurs, administer with meals. Take tablets and capsules with a full glass of water or juice. Do not crush or chew enteric-coated tablets and do not open capsules.

Copyright © 2008 by F.A. Davis

- Liquid preparations may stain teeth. Dilute in water or fruit juice, full glass (240 ml) for adults and ½ glass (120 ml) for children, and administer with a straw or place drops at back of throat.
- Avoid using antacids, coffee, tea, dairy products, eggs, or whole-grain breads with or within 1 hr after administration of ferrous salts. Iron absorption is decreased by 33% if iron and calcium are given with meals. If calcium supplementation is needed, calcium carbonate does not decrease absorption of iron salts if supplements are administered between meals.
- **Iron Dextran:** The 2-ml ampule may be used for IM or IV administration.
- Prior to initial IM or IV dose, a test dose of 25 mg should be given by the same route as the dose will be given, to determine reaction. The IV test dose should be administered over 5 min. The IM dose should be administered in the same injection site and by same technique as the therapeutic dose. The remaining portion may be administered after 1 hr, if no adverse symptoms have occurred.
- **IM:** Inject deeply via Z-track technique into upper outer quadrant of buttock, never into arm or other exposed areas. Use a 2–3 in, 19- or 20-gauge needle. Change needles between withdrawal from container and injection to minimize staining of subcut tissues. Stains are usually permanent.

IV Administration

- **IV: Iron Dextran:** Following IV administration, patient should remain recumbent for at least 30 min to prevent orthostatic hypotension
- **Direct IV:** ***Diluent:*** May administer undiluted or dilute in 0.9% NaCl or D5W. ***Concentration:*** 50 mg/ml. ***Rate:*** Administer slowly at a rate of 50 mg (1 ml) over at least 1 min.
- **Intermittent Infusion:** May be diluted in 200–1000 ml of 0.9% NaCl or D5W; 0.9% NaCl is the preferred diluent; dilution in D5W increases incidence of pain and phlebitis. ***Rate:*** Administer over 1–6 hr following a test dose of 10 drops/min for 10 min. Flush line with 10 ml of 0.9% NaCl at completion of infusion.
- **Y-Site Incompatibility:** Discontinue other IV solutions during infusion.
- **Additive Incompatibility:** Manufacturers recommend that iron dextran not be mixed with other solutions; however, iron dextran has been added to total parenteral nutrition solutions. **Sodium Ferric Gluconate Complex:** ***Diluent:*** Dilute test dose in 50 ml of 0.9% NaCl and administer IV over 60 min
- To administer therapeutic dose of 10 ml (125 mg of elemental iron) dilute in 100 ml of 0.9% NaCl. Dialysis patients frequently require a cumulative dose of 1 g of elemental iron, administered over 8 sessions of sequential dialysis. ***Concentration:*** 12.5 mg/ml. ***Rate:*** Administer at a maximum rate of 12.5 mg/min. **Iron Sucrose:** Each 5-ml vial contains 100 mg of elemental iron.
- *Hemodialysis*—Most patients require a minimum cumulative dose of 1000 mg of elemental iron, administered over 10 sequential dialysis sessions, to achieve a favorable hemoglobin or hematocrit response.
- Solution is brown. Inspect for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored.
- **Direct IV:** May be administered undiluted by slow injection into dialysis line. ***Rate:*** Administer at a rate of 1 ml undiluted solution per minute, not to exceed one vial per injection. Discard any unused portion.
- **Intermittent Infusion:** May also be administered via infusion, into dialysis line for hemodialysis patients. May reduce risk of hypotensive episodes. ***Diluent:*** Each vial must be diluted in a maximum of 100 ml of 0.9% NaCl immediately prior to infusion. Unused diluted solution should be discarded. ***Concentration:*** 1–2 mg/ml. ***Rate:*** Infuse at a rate of 100 mg of iron over at least 15 min, large doses (500 mg) should be given over 3.5–4 hrs.
- **Intermittent Infusion:** *For peritoneal dialysis patients*—***Diluent:*** Dilute each dose in a maximum of 250 mL of 0.9% NaCl. ***Rate:*** Administer doses of 300 mg over 1.5 hrs and doses of 400 mg over 2.5 hrs.
- **Direct IV:** *For non-dialysis dependent patients*—May be administered as a slow injection of 200 mg undiluted. ***Rate:*** Administer over 2–5 min.
- **Intermittent Infusion:** Dilute 500 mg in 250 ml 0.9% NaCl. ***Rate:*** Infuse over 3.5–4 hr on days 1 and 14. May cause hypotension; monitor closely.
- **Additive Incompatibility:** Do not mix iron sucrose with other medications or add to parenteral nutrition solutions for IV infusion.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Explain purpose of iron therapy to patient.
- Encourage patient to comply with medication regimen. Take missed doses as soon as remembered within 12 hr; otherwise, return to regular dosing schedule. Do not double doses.
- Advise patient that stools may become dark green or black and that this change is harmless.
- Instruct patient to follow a diet high in iron (see Appendix L).
- Discuss with parents the risk of children's overdosing on iron. Medication should be stored in the original childproof container and kept out of reach of children. Do not refer to vitamins as candy. In the event of a suspected overdose, parents or guardians should contact the poison control center (1-800-222-1222) or emergency medical services (911) immediately.
- **Iron Dextran:** Delayed reaction may occur 1–2 days after administration and last 3–4 days if IV route used, 3–7 days with IM route. Instruct patient to contact physician if fever, chills, malaise, muscle and joint aches, nausea, vomiting, dizziness, and backache occur.
- **Iron sucrose and sodium ferric gluconate complex:** Instruct patient to immediately report symptoms of hypersensitivity reaction to health care professional.

Evaluation/Desired Outcomes

- Increase in hemoglobin, which may reach normal parameters after 1–2 mo of therapy. May require 3–6 mo for normalization of body iron stores.
- Improvement in iron deficiency anemia or anemia of chronic renal failure.

isocarboxazid, See MONOAMINE OXIDASE (MAO) INHIBITORS.

isoniazid (eye-soe-**nye**-a-zid)

INH, Isotamine, Nydrazid, PMS Isoniazid, Laniazid

Classification

Therapeutic: antituberculars

Pregnancy Category C

Indications

First-line therapy of active tuberculosis, in combination with other agents. Prevention of tuberculosis in patients exposed to active disease (alone).

Action

Inhibits mycobacterial cell wall synthesis and interferes with metabolism. **Therapeutic Effects:** Bacteriostatic or bactericidal action against susceptible mycobacteria.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration.
Distribution: Widely distributed; readily crosses the blood-brain barrier. Crosses the placenta; enters breast milk in concentrations equal to plasma.
Metabolism and Excretion: 50% metabolized by the liver at rates that vary widely among individuals; 50% excreted unchanged by the kidneys.
Half-life: 1–4 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	up to 24 hr
IM	rapid	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease; Previous hepatitis from isoniazid.
Use Cautiously in: History of liver damage or chronic alcohol ingestion; Black and Hispanic women, women in the postpartum period, or patients >50 yr (increased risk of drug-induced hepatitis); Severe renal impairment (dosage reduction may be necessary); Malnourished patients, patients with diabetes, or chronic alcoholics (increased risk of neuropathy); Pregnancy and lactation (although safety is not established, isoniazid has been used with ethambutol to treat tuberculosis in pregnant women without harm to the fetus).

Adverse Reactions/Side Effects

CNS: psychosis, seizures. **EENT:** visual disturbances. **GI:** DRUG-INDUCED HEPATITIS, nausea, vomiting. **Derm:** rashes. **Endo:** gynecomastia. **Hemat:** blood dyscrasias. **Neuro:** peripheral neuropathy. **Misc:** fever.

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Additive CNS toxicity with other **antituberculars**. **BCG vaccine** may not be effective during isoniazid therapy. Isoniazid inhibits the metabolism of **phenytoin**. **Aluminum-containing antacids** may decrease absorption. Psychotic reactions and coordination difficulties may result with **disulfiram**. Concurrent administration of **pyridoxine** may prevent neuropathy. Increased risk of hepatotoxicity with other **hepatotoxic agents** including **alcohol** and **rifampin**. Isoniazid may decrease blood levels and effectiveness of **ketoconazole**. Concurrent use with **carbamazepine** increases carbamazepine blood levels and risk of hepatotoxicity.

Drug-Food: Severe reactions may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix L).

Route/Dosage

PO, IM (Adults): 300 mg/day (5 mg/kg) *or* 15 mg/kg (up to 900 mg) 2–3 times weekly.

PO, IM (Children): 10–20 mg/kg/day (up to 300 mg/day) *or* 20–40 mg/kg (up to 900 mg) 2–3 times weekly.

Availability (generic available)

Tablets: 50 mg, 100 mg, 300 mg. **Syrup (orange, raspberry flavor):** 50 mg/5 ml. **Injection:** 100 mg/ml. ***In combination with:*** rifampin (Rifamate) or with rifampin and pyrazinamide (Rifater). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance.
- ***Lab Test Considerations:*** Hepatic function should be evaluated prior to and monthly throughout therapy. Increased AST, ALT, and serum bilirubin may indicate drug-induced hepatitis. Black and Hispanic women, postpartal women, and patients >50 yr are at highest risk. The risk is lower in children; therefore, liver function tests are usually ordered less frequently for children.
- ***Toxicity and Overdose:*** If isoniazid overdosage occurs, treatment with pyridoxine (vitamin B) is instituted.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be administered with food or antacids if GI irritation occurs, although antacids containing aluminum should not be taken within 1 hr of administration.
- **IM:** Medication may cause discomfort at injection site. Massage site after administration and rotate injection sites.
- Solution may form crystals at low temperatures; crystals will redissolve upon warming to room temperature.

Patient/Family Teaching

- Advise patient to take medication exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose; do not double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Therapy may be continued for 6 mo–2 yr.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, dark urine, unusual tiredness, or weakness) or peripheral neuritis (numbness, tingling, paresthesia) occur. Pyridoxine may be used concurrently to prevent neuropathy. Any changes in visual acuity, eye pain, or blurred vision should also be reported immediately.
- Caution patient to avoid the use of alcohol during this therapy, as this may increase the risk of hepatotoxicity. Ingestion of Swiss or Cheshire cheeses, fish (tuna, skipjack, and sardinella), and possibly tyramine-containing foods (see Appendix L) should also be avoided, as they may result in redness or itching of the skin; hot feeling; rapid or pounding heartbeat; sweating; chills; cold, clammy feeling; headache; or light-headedness.
- Emphasize the importance of regular follow-up physical and ophthalmologic exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.
- Prevention of activation of tuberculosis in persons known to have been exposed.

Copyright © 2008 by F.A. Davis

ISOSORBIDE

isosorbide dinitrate
(eye-soe-**sor**-bide dye-**nye**-trate)
Apo-ISDN, Cedocard-SR, Coronex, Dilatrate-SR, Isordil, Novosorbide, PMS-Isosorbide

isosorbide mononitrate
(eye-soe-**sor**-bide mo-noe-**nye**-trate)
Apo-ISMN, IMDUR, ISMO, Monoket

Classification
Therapeutic: antianginals
Pharmacologic: nitrates

Pregnancy Category C

Indications
Acute treatment of anginal attacks (SL only). Prophylactic management of angina pectoris. Treatment of chronic CHF (unlabeled).

Action
Produce vasodilation (venous greater than arterial). Decrease left ventricular end–diastolic pressure and left ventricular end–diastolic volume (preload). Net effect is reduced myocardial oxygen consumption. Increase coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions.
Therapeutic Effects: Relief and prevention of anginal attacks.

Pharmacokinetics
Absorption: Isosorbide dinitrate undergoes extensive first-pass metabolism by the liver, resulting in 25% bioavailability; isosorbide mononitrate has 100% bioavailability (does not undergo first-pass metabolism).
Distribution: Unknown.
Metabolism and Excretion: Isosorbide dinitrate is metabolized by the liver to 2 active metabolites (5–mononitrate and 2–mononitrate). Isosorbide mononitrate is primarily meteabolized by the liver to inactive metabolites; primarily excreted in urine as metabolites.
Half-life: *Isosorbide dinitrate*—1 hr; *isosorbide mononitrate*—5 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
ISDN-SL	2–10 min	unknown	1–2 hr
ISDN-PO	45–60 min	unknown	4 hr
ISDN-PO-ER	30 min	unknown	up to 12 hr
ISMN-PO	30–60 min	unknown	7 hr
ISMN-ER	unknown	unknown	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of sildenafil, vardenafil or tadalafil.
Use Cautiously in: Volume depleted patients; Right ventricular infarction; Hypertrophic cardiomyopathy; Geri: Older patients may be more sensitive to hypotension (start with lower doses); OB: Pregnancy (may compromise maternal/fetal circulation) or lactation; Pedi: Children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache. **CV:** hypotension, tachycardia, paradoxic bradycardia, syncope. **GI:** nausea, vomiting. **Misc:** flushing, tolerance.

Interactions
Drug-Drug: Concurrent use of **sildenafil**, **tadalafil**, or **vardenafil** may result in significant and potentially fatal hypotension (do not use these drugs within 24 hr of isosorbide dinitrate or mononitrate). Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**.

Route/Dosage

Isosorbide Dinitrate
SL (Adults): *Acute attack of angina pectoris*—2.5–5 mg may be repeated q 5–10 min for 3 doses in 15–30 min. *Prophylaxis of angina pectoris*—2.5–5 mg given 15 mm prior to activities known to provoke angina.
PO (Adults): *Prophylaxis of angina pectoris*—5–20 mg 2–3 times daily; usual maintenance dose is 10–40 mg q 6 hr (immediate-release) or 40–80 mg q 8–12 hr (sustained-release).

Isosorbide Mononitrate
PO (Adults): *ISMO, Monoket*—5–20 mg twice daily with the 2 doses given 7 hr apart. *Imdur*—30–60 mg once daily; may increase to 120 mg once daily (maximum dose = 240 mg/day).

Copyright © 2008 by F.A. Davis

Availability (generic available)

Isosorbide Dinitrate

Sublingual tablets: 2.5 mg, 5 mg. **Cost:** *Generic*—2.5 mg $39.16/100, 5 mg $18.59/100. **Tablets:** 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Isordil*—40 mg $91.49/100; *Generic*—5 mg $31.23/100, 10 mg $35.45/100, 20 mg $18.85/100, 30 mg $23.32/100. **Extended-release tablets:** ✱20 mg, 40 mg. **Cost:** *Generic*—40 mg $71.29/100. **Sustained-release capsules:** 40 mg. ***In combination with:*** hydralazine (BiDil). See Appendix B.

Isosorbide Mononitrate

Tablets (ISMO, Monoket): 10 mg, 20 mg. **Cost:** *Generic*—10 mg $45.99/180, 20 mg $48.98/180. **Extended-release tablets (Imdur):** 30 mg, 60 mg, 120 mg. **Cost:** *Generic*—30 mg $35.99/90, 60 mg $34.97/90, 120 mg $46.97/90.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor blood pressure and pulse routinely during period of dosage adjustment.
- ***Lab Test Considerations:*** Excessive doses may ↑ methemoglobin concentrations.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Activity intolerance (Indications)

Implementation

Isosorbide Dinitrate

- **PO:** Extended-release capsules should be swallowed whole. Do not crush, break, or chew. **SL:** tablets should be held under tongue until dissolved.
- Avoid eating, drinking, or smoking until tablet is dissolved. Replace tablet if inadvertently swallowed.

Isosorbide Mononitrate

- Do not confuse Imdur with Imuran, Inderal, or K-Dur. Do not confuse Monoket with Mono-pril (fosinopril).
- **PO:** Extended-release tablets should be swallowed whole. Do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered; doses of isosorbide dinitrate should be taken at least 2 hr apart (6 hr with extended-release preparations); daily doses of isosorbide mononitrate should be taken 7 hr apart. Do not double doses. Do not discontinue abruptly.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to take last dose of day (when taking 2–4 doses/day) no later than 7 pm to prevent the development of tolerance.
- Advise patient to avoid concurrent use of alcohol with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking isosorbide.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

isradipine (is-**ra**-di-peen)

DynaCirc, DynaCirc CR

Classification

Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications

Management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed following oral administration but extensively metabolized, resulting in decreased bioavailability.

Copyright © 2008 by F.A. Davis

Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Completely metabolized by the liver.
Half-life: 8 hr.

TIME/ACTION PROFILE (cardiovascular effects†)

ROUTE	ONSET	PEAK	DURATION
PO	<2 hr	2–3 hr	12 hr
PO-CR	2 hr	8–10 hr	24 hr

†For single doses, maximal antihypertensive effect during chronic dosing may take 2–4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Blood pressure <90 mm Hg.
Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Geri: Geriatric patients (dose reduction recommended for most agents; increased risk of hypotension); Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** abnormal liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be decreased by concurrent use of **NSAIDs**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF.
Drug-Food: Grapefruit and **grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 2.5 mg twice daily; may be increased q 2–4 wk by 5 mg/day (not to exceed 20 mg/day) *or* 5 mg once daily as CR tablets; may be increased q 2–4 wk by 5 mg/day (not to exceed 20 mg/day).

Availability

Capsules: 2.5 mg, 5 mg. **Controlled-release tablets:** 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse prior to and periodically throughout therapy. Monitor ECG periodically in patients receiving prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess patient for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew controlled-release tablets.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications without consulting health care professional.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, rash, pronounced dizziness, nausea, constipation, or hypotension occurs.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Inform patient that anginal attacks may occur 30 min after administration because of reflex tachycardia. This is usually temporary and is not an indication for discontinuation.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis or if shortness of breath or persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

itraconazole (it-tra-**kon**-a-zole)
Sporanox

Classification
Therapeutic: antifungals (systemic)

Pregnancy Category C

Indications

Histoplasmosis. Blastomycosis. Aspergillosis. Onychomycosis of the fingernail or toenail caused by *tinea unguium* in nonimmunocompromised patients (oral capsules only). Oropharyngeal esophageal candidiasis.

Action

Inhibits enzymes necessary for integrity of the fungal cell membrane. **Therapeutic Effects:** Fungistatic effects against susceptible organisms. **Spectrum:** Active against *Histoplasma capsulatum*, *Blastomyces dermatitidis*, *Cryptococcus neoformans*, *Aspergillus fumigatus*, *Trichophyton* spp., *Candida*, and *Tinea unguium*.

Pharmacokinetics

Absorption: Oral absorption is enhanced by food.
Distribution: Tissue concentrations are higher than plasma concentrations. Does not enter CSF; enters breast milk.
Protein Binding: *Itraconazole*—99.8%; *hydroxyitraconazole*—99.5%.
Metabolism and Excretion: Mostly metabolized by the liver and excreted in feces. Hydroxyitraconazole, the major metabolite, has antifungal activity.
Half-life: 21 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr	12–24 hr
IV	unknown	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity with other azole antifungals (**miconazole**, **ketoconazole**) may occur; OB: Lactation; Concurrent **quinidine**, **dofetilide**,

Copyright © 2008 by F.A. Davis

pimozide, oral **midazolam**, **triazolam**, **ergot alkaloids** (**dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine**), **simvastatin**, or **lovastatin**; Severe renal impairment (CCr <30 ml/min); CHF or other evidence of ventricular dysfunction.

Use Cautiously in: Patients with hepatic impairment (dosage reduction may be required); Patients with achlorhydria or hypochlorhydria (absorption will be decreased); OB, Pedi: Pregnancy or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, malaise. **EENT:** tinnitus. **CV:** CHF, edema, hypertension. **GI:** HEPATOTOXICITY, nausea, abdominal pain, anorexia, diarrhea, flatulence, vomiting. **GU:** albuminuria, decreased libido, erectile dysfunction. **Derm:** TOXIC EPIDERMAL NECROLYSIS, photosensitivity, pruritus, rash. **Endo:** adrenal insufficiency. **F and E:** hypokalemia. **MS:** rhabdomyolysis. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Itraconazole is a potent inhibitor of the P450 3A hepatic enzyme, which can ↑ blood levels and effects of other drugs which are metabolized by this system. ↑ risk of potentially fatal arrhythmias with **quinidine**, **dofetilide**, or **pimozide** (concurrent use is contraindicated and may result in QTc prolongation, torsades de pointes, ventricular arrthythmias, and sudden death). ↑ risk of excessive sedation with **midazolam** or **triazolam**, ↑ risk of adverse CNS reactions with **pimozide**, and ↑ risk of myopathy with **simvastatin** or **lovastatin** (concurrent use contraindicated). Concurrent use with **ergot alkaloids (dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine)** ↑ risk of vasoconstriction and is contraindicated. May also ↑ blood levels and the risk of toxicity from **warfarin**, **ritonavir**, **indinavir**, **saquinavir**, **vinca alkaloids**, **busulfan**, **cilostazol diazepam**, **eletriptan felodipine**, **isradipine**, **nicardipine**, **nifedipine**, **nimodipine**, **cyclosporine vardenafil**, **tacrolimus**, **sildenafil methylprednisolone**, **digoxin**, and **quinidine**. May also ↓ metabolism and ↑ effects of **budesonide**, **dexamethasone**, and **methylprednisolone**. Absorption ↓ by **antacids**, **histamine H_2 blockers**, **sucralfate**, **gastric acid-pump inhibitors**, or other **agents that increase gastric pH**, including the buffer in **didanosine** (take 2 hr after itraconazole). **Phenytoin**, **phenobarbital**, **isoniazid**, **rifampin**, **rifabutin**, and **carbamazepine** ↑ metabolism and ↓ blood levels of itraconazole (↑ dosage may be necessary). Itraconazole ↓ metabolism and may ↑ effects of **phenytoin** and **oral hypoglycemic agents**. If hypokalemia occurs, the risk of **digoxin** toxicity is ↑. Blood levels of itraconazole may be ↑ by **clarithromycin**, **erythromycin ritonavir**, and **indinavir**.

Drug-Food: Food ↑ absorption.

Route/Dosage

Aspergillosis

PO (Adults): 200 mg once or twice daily for a minimum of 3 mo.

Blastomycosis, Histoplasmosis

PO (Adults): 200 mg once daily; may be increased by 100 mg/day up to 200 mg twice daily.

Onychomycosis

PO (Adults): *Toenail fungus with or without fingernail fungus*—200 mg/day for 12 consecutive wk. *Fingernail fungus*—200 mg twice daily for 1 wk, then 3 wk without therapy, then 200 mg twice daily an additional wk–6 mo.

Candidiasis

PO (Adults): *Oropharyngeal candidiasis*—200 mg (20 ml) daily for 1–2 wk. *Oropharyngeal candidiasis unresponsive to fluconazole*—100 mg (10 ml) twice daily for at least 2–4 wk. *Esophageal candidiasis*—100 mg (10 ml) once daily for at least 3 wk.

Availability

Capsules: 100 mg. **Oral solution (cherry caramel):** 10 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of infection (vital signs, lung sounds, sputum, WBC, oral and pharyngeal mucosa, nail beds) before and periodically during therapy.
- Obtain specimens for culture before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor hepatic function tests before and periodically during therapy, especially in patients with pre-ex-

Copyright © 2008 by F.A. Davis

isting hepatic function abnormalities. Discontinue itraconazole if abnormal values persist or worsen.
- Monitor serum potassium. May cause hypokalemia.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not interchange capsules and oral solution. Only oral solution is effective for oropharyngeal candidiasis. Oral solution is not recommended for initial treatment of patients at risk for systemic candidiasis.
- **Capsules:** Administer with a full meal to minimize nausea and vomiting and to increase absorption.
- Do not administer with antacids or other medications that may increase gastric pH; may decrease absorption of itraconazole.
- **Oral Solution:** Administer without food if possible. Swish solution in mouth vigorously, 10 ml at a time, for several seconds, then swallow.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day.
- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) or CHF (dyspnea, peripheral edema, weight gain) occur. If signs of CHF occur, discontinue itraconazole and notify health care professional immediately.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal medications concurrently with itraconazole.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Minimal treatment for systemic fungal infections is 3 mo. Inadequate period of treatment may lead to recurrence of active infection.

Copyright © 2008 by F.A. Davis

kanamycin, See AMINOGLYCOSIDES.

ketoconazole (systemic)†

(kee-toe-**koe**-na-zole)
Nizoral

Classification
Therapeutic: antifungals (systemic)

Pregnancy Category C

†For topical use, see Antifungals (topical)

Indications

Treatment of: Candidiasis (disseminated and mucocutaneous), Chromomycosis, Coccidioidomycosis, Histoplasmosis, Paracoccidioidomycosis. **Unlabeled uses:** Treatment of advanced prostate cancer. Treatment of Cushing's syndrome.

Action

Disrupts fungal cell membrane. Interferes with fungal metabolism. Also inhibits the production of adrenal steroids. **Therapeutic Effects:** Fungistatic or fungicidal action against susceptible organisms, depending on organism and site of infection. **Spectrum:** Active against many pathogenic fungi, including: *Blastomyces*, *Candida*, *Coccidioides*, *Cryptococcus*, *Histoplasma*, many dermatophytes.

Pharmacokinetics

Absorption: Absorption from the GI tract is pH dependent; increasing pH decreases absorption.
Distribution: Widely distributed. CNS penetration is unpredictable and minimal. Crosses the placenta; enters breast milk.
Protein Binding: 99%.
Metabolism and Excretion: Partially metabolized by the liver. Excreted in feces via biliary excretion.
Half-life: 8 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation; Concurrent triazolam.
Use Cautiously in: History of liver disease; Achlorhydria or hypochlorhydria; Alcoholism.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness. **EENT:** photophobia. **GI:** DRUG-INDUCED HEPATITIS, nausea, vomiting, abdominal pain, constipation, diarrhea, flatulence. **GU:** azoospermia, decreased male libido, menstrual irregularities, oligospermia. **Derm:** rashes. **Endo:** gynecomastia.

Interactions

Drug-Drug: Ketoconazole inhibits the hepatic P450 3A4 enzyme system, which results in ↓ metabolism and possibly ↑ effects and/or toxicity from **cyclosporine**, **tacrolimus**, **corticosteroids** (dosage reduction may be necessary), **calcium channel blockers**, **sulfonylurea**, **oral hypoglycemic agents**, **quinidine**, **buspirone**, **clarithromycin**, **troleandomycin**, **erythromycin**, **cyclophosphamide**, **phenytoin**, **warfarin** (↑ risk of bleeding), **tamoxifen**, **tricyclic antidepressants**, **carbamazepine**, **nisoldipine**, **zolpidem**, **vinca alkaloids**, **ifosfamide**, some **benzodiazepines** (effect may persist for several days; use of **triazolam** is contraindicated), **alfentanil**, **fentanyl**, **sufentanil**, **donepezil**, **atorvastatin**, **lovastatin**, **simvastatin**, **amprenavir**, **indinavir** (dosage ↓ of indinavir recommended), **nelfinavir**, **ritonavir**, **saquinavir**, **quinidine**, **sildenafil** and **vardenafil** (dosage adjustments may be necessary). May alter the effectiveness of **hormonal contraceptives** (alternative method of contraception recommended). Drugs that ↑ gastric pH, including **antacids**, **histamine H_2 antagonists**, **didanosine** (chewable tablets, because of buffer), and **gastric acid–pump inhibitors** ↓ absorption (wait 2 hr before administration of ketoconazole). **Sucralfate** and **isoniazid** also ↓ bioavailability. ↑ hepatotoxicity with other **hepatotoxic agents**, including **alcohol**. Disulfiram-like reaction may occur with **alcohol**. **Rifampin** or **isoniazid** may ↓ levels and effectiveness. May ↓ absorption and effectiveness of **theophylline**.

Route/Dosage

PO (Adults): *Antifungal*—200–400 mg/day, single dose. *Prostate cancer*—400 mg 3 times daily (unlabeled).
PO (Children >2 yr): 3.3–6.6 mg/kg/day, single dose.

Copyright © 2008 by F.A. Davis

Availability (generic available)

Tablets: 200 mg. **Oral suspension:** ✱100 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of infection prior to and periodically during therapy.
- Specimens for culture should be taken prior to instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor hepatic function tests prior to and monthly for 3–4 mo and then periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphatase, and bilirubin concentrations. Ketoconazole should be discontinued if even minor abnormalities occur.
- May cause ↓ serum testosterone concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Nizoral (ketoconazole) with Neoral (cyclosporine).
- **PO:** Administer with meals or snacks to minimize nausea and vomiting.
- Shake suspension well prior to administration.
- Do not administer histamine H_2 antagonists or antacids within 2 hr of ketoconazole.
- For patients with achlorhydria, dissolve each tablet in 4 ml of aqueous solution of 0.2 N hydrochloric acid. Use a glass or plastic straw to avoid contact with teeth and follow with a glass of water, swished in mouth and swallowed.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling better. Take missed doses as soon as remembered; if almost time for next dose, space missed dose and next dose 10–12 hr apart.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking OTC antacids within 2 hr of ketoconazole.
- Caution patient to wear sunglasses and to avoid prolonged exposure to bright light to prevent photophobic reactions.
- Advise patient to use a nonhormonal form of contraception during ketoconazole therapy.
- Advise patient to avoid concurrent use of alcohol while taking ketoconazole; may cause a disulfiram-like reaction (flushing, rash, peripheral edema, nausea, headache) and increase the risk of hepatotoxicity.
- Instruct patient to notify health care professional if abdominal pain, fever, or diarrhea becomes pronounced or if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) occur.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections.
- Minimal treatment for candidiasis is 1–2 wk and for other systemic mycoses is 6 mo.
- Chronic mucocutaneous candidiasis usually requires maintenance therapy.

ketoconazole, See ANTIFUNGALS (TOPICAL).

ketoprofen (kee-toe-proe-fen)

Actron, ✱Apo-Keto, ✱Apo-Keto-E, Orudis, ✱Orudis-E, Orudis KT, ✱Orudis-SR, Oruvail, ✱Rhodis

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents
Pharmacologic: nonopioid analgesics

Pregnancy Category B (first trimester)

Indications

Inflammatory disorders, including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain, including dysmenorrhea and fever.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Reduction of fever.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Unknown.
Protein Binding: 99%.
Metabolism and Excretion: Mostly (60%) metabolized by the liver; some renal excretion.
Half-life: 2–4 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	within 60 min	1 hr	4–6 hr
PO (anti-inflammatory)	few days–1 wk	unknown	up to 24 hr (SR products)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Some products contain tartrazine and should be avoided in patients with known intolerance; Peri-operative pain from coronary artery bypass graft (CABG) surgery.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe renal, or hepatic disease; History of ulcer disease; Renal impairment (dosage reduction suggested); Geri: Extended-release product should not be used in geriatric patients, patients of small stature, or patients with renal impairment; Geriatric patients (increased risk of GI bleeding); Chronic alcohol use/abuse; OB, Pedi: Pregnancy, lactation, or children (safety not established; avoid use during 2nd half of pregnancy).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, dizziness. **EENT:** blurred vision, tinnitus. **CV:** edema. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, diarrhea, dyspepsia, nausea, vomiting, anorexia, discomfort, flatulence. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rashes. **Endo:** gynecomastia. **Hemat:** blood dyscrasias, prolonged bleeding time. **MS:** myalgia. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Aspirin alters distribution, metabolism, and excretion of ketoprofen (concurrent use not recommended). ↑ adverse GI effects with other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemic effects of **insulin** or **sulfonylurea oral hypoglycemic agents**. May ↑ serum **lithium** levels and increase the risk of toxicity. ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from ketoprofen (concurrent use not recommended). ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytic agents**, **clopidogrel**, **ticlopidine**, **eptifibatide**, **tirofiban**, or **anticoagulants**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**.

Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, and **Panax ginseng**.

Route/Dosage

PO (Adults): *Anti-inflammatory*—150–300 mg/day in 3–4 divided doses or 150–200 mg once daily as extended-release product. *Analgesic*—25–50 mg q 6–8 hr. *OTC analgesic/antipyretic*—12.5 mg q 4–6 hr; if relief is not obtained 1 hr after first dose, an additional dose may be given. An initial dose of 25 mg may be used (not to exceed 25 mg/4–6 hr or 75 mg/24 hr).

Availability (generic available)

Tablets: 12.5 mg[OTC]. **Capsules:** 25 mg, 50 mg, 75 mg. **Extended-release capsules:** 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, wheezing, and urticaria.
- **Arthritis:** Assess pain and range of motion prior to and 1 hr following administration.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests

Copyright © 2008 by F.A. Davis

may show ↑ levels. Blood glucose, hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May prolong bleeding time by 3–4 min.
- May alter results of urine albumin, bilirubin, 17-ketosteroid, and 17-hydroxycorticosteroid determinations.

Potential Nursing Diagnoses
Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation
- Do not confuse Oruvail (ketoprofen) with Elavil (amitriptyline).
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. Capsules may be administered with food, milk, or antacids containing aluminum hydroxide and magnesium hydroxide to decrease GI irritation.
- Extended-release capsules should be swallowed whole; do not open or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been proved effective.

Patient/Family Teaching
- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patients not to take OTC ketoprofen preparations for more than 10 days for pain or more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Caution patient that use of ketoprofen with 3 or more glasses of alcohol may increase risk of GI bleeding.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes
- Improved joint mobility.
- Decrease in severity of pain. Improvement in arthritis may be seen in a few days to 1 wk; 1–2 wk may be required for maximum effectiveness. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

ketorolac† (kee-toe-role-ak)
Toradol

Classification
Therapeutic: nonsteroidal anti-inflammatory agents, nonopioid analgesics
Pharmacologic: pyrroziline carboxylic acid

Pregnancy Category C

†See Appendix C for ophthalmic use

Indications
Short-term management of pain (not to exceed 5 days total for all routes combined).

Action
Inhibits prostaglandin synthesis, producing peripherally mediated analgesia. Also has antipyretic and anti-inflammatory properties. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics
Absorption: Rapidly and completely absorbed following all routes of administration.
Distribution: Enters breast milk in low concentrations.
Metabolism and Excretion: <50% metabolized by the liver. Ketorolac and its metabolites

Copyright © 2008 by F.A. Davis

are excreted primarily by the kidneys (92%); 6% excreted in feces.
Half-life: 4.5 hr (range 3.8–6.3 hr; increased in geriatric patients and patients with impaired renal function).

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	4–6 hr or longer
IM, IV	10 min	1–2 hr	6 hr or longer

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other NSAIDs may exist; OB: Labor, delivery or lactation; Pre- or perioperative use; Known alcohol intolerance (injection only); Perioperative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); History of GI bleeding; Renal impairment (dosage reduction may be required); Geri: Appears on Beers list. Geriatric patients have increased risk of GI bleeding; OB, Pedi: Pregnancy and children (use not recommended during 2nd half of pregnancy).

Adverse Reactions/Side Effects

CNS: drowsiness, abnormal thinking, dizziness, euphoria, headache. **Resp:** asthma, dyspnea. **CV:** edema, pallor, vasodilation. **GI:** GI BLEEDING, abnormal taste, diarrhea, dry mouth, dyspepsia, GI pain, nausea. **GU:** oliguria, renal toxicity, urinary frequency. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purpura, sweating, urticaria. **Hemat:** prolonged bleeding time. **Local:** injection site pain. **Neuro:** paresthesia. **Misc:** allergic reactions including, anaphylaxis.

Interactions

Drug-Drug: Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **clopidogrel**, **ticlopidine**, **tirofiban**, **eptifibatide**, **thrombolytic agents**, or **anticoagulants**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May ↑ risk of nephrotoxicity from **cyclosporine**. **Probenecid** ↑ ketorolac blood levels and the risk of adverse reactions (concurrent use should be avoided).
Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, and **Panax ginseng**.

Route/Dosage

Oral therapy is indicated only as a continuation of parenteral therapy; parenteral therapy should not exceed 20 doses/5 days. Total duration of therapy by all routes should not exceed 5 days.
PO (Adults <65 yr): 20 mg initially, followed by 10 mg q 4–6 hr as needed (not to exceed 40 mg/day).
PO (Adults ≥65 yr, <50 kg, or with renal impairment): 10 mg q 4–6 hr as needed (not to exceed 40 mg/day).
IM (Adults <65 yr): *Single dose*—60 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).
IM (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—30 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).
IV (Adults <65 yr): *Single dose*—30 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).
IV (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—15 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).

Availability (generic available)

Tablets: 10 mg. **Cost:** *Generic*—$16.66/20.
Injection: 15 mg/ml in 1-ml preloaded syringes, 30 mg/ml in 1- and 2-ml preloaded syringes.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.

Copyright © 2008 by F.A. Davis

- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Evaluate liver function tests, especially AST and ALT, periodically in patients receiving prolonged therapy. May cause ↑ levels.
- May cause prolonged bleeding time that may persist for 24–48 hr following discontinuation of therapy.
- May cause ↑ BUN, serum creatinine, or potassium concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse Toradol (ketorolac) with Torecan (thiethylperazine) or tramadol (Ultram).
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Duration of ketorolac therapy, by all routes combined, should not exceed 5 days. Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** Ketorolac therapy should always be given initially by the IM or IV route. Use oral therapy *only* as a continuation of parenteral therapy.

IV Administration

- **Direct IV:** Administer undiluted. ***Concentration:*** 15–30 mg/ml. ***Rate:*** Administer over at least 15 sec.
- **Syringe Compatibility:** sufentanil.
- **Syringe Incompatibility:** haloperidol, hydroxyzine, nalbuphine, prochlorperazine, promethazine, thiethylperazine.
- **Y-Site Compatibility:** cisatracurium, dexmedetomidine, fentanyl, hydromorphone, methadone, morphine, remifentanil, sufentanil.
- **Y-Site Incompatibility:** azithromycin, fenoldopam.
- **Solution Compatibility:** D5/0.9% NaCl, D5W, Ringer's injection, lactated Ringer's injection, 0.9% NaCl.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Do not take more than prescribed or for longer than 5 days.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Decrease in severity of pain. Patients who do not respond to one NSAID may respond to another.

Copyright © 2008 by F.A. Davis

HIGH ALERT

labetalol (la-bet-a-lole)
Trandate

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

Indications
Management of hypertension.

Action
Blocks stimulation of $beta_1$ (myocardial)- and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$-adrenergic blocking activity, which may result in more orthostatic hypotension. **Therapeutic Effects:** Decreased blood pressure.

Pharmacokinetics
Absorption: Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25% bioavailability.
Distribution: Some CNS penetration; crosses the placenta.
Metabolism and Excretion: Undergoes extensive hepatic metabolism.
Half-life: 3–8 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	20 min–2 hr	1–4 hr	8–12 hr
IV	2–5 min	5 min	16–18 hr

Contraindications/Precautions
Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment; Hepatic impairment; Geriatric patients (increased sensitivity to beta blockers; initial dosage reduction recommended); Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); Pregnancy, lactation, or children (safety not established; may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression).

Adverse Reactions/Side Effects
CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, decreased libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions
Drug-Drug: General anesthesia, IV, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). Effects may be ↑ by **propranolol** or **cimetidine**. Concurrent **NSAIDs** may ↓ antihypertensive action.

Route/Dosage
PO (Adults): 100 mg twice daily initially, may be increased by 100 mg twice daily q 2–3 days as needed (usual range 400–800 mg/day in 2–3 divided doses; doses up to 1.2–2.4 g/day have been used).
IV (Adults): 20 mg (0.25 mg/kg) initially, additional doses of 40–80 mg may be given q 10 min as needed (not to exceed 300 mg total dose) *or* 2 mg/min infusion (range 50–300 mg total dose required).

Availability (generic available)
Tablets: 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg $54.00/180, 200 mg $76.99/180, 300 mg $101.99/180. **Injection:** 5 mg/ml.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dose adjustment and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Check frequency of refills to determine compliance.
- Patients receiving *labetalol IV* must be supine during and for 3 hr after administration. Vital signs should be monitored every 5–15 min during and for several hours after administration.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels. Discontinue if jaundice or laboratory signs of hepatic function impairment occur.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur: Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not confuse labetalol with Lamictil.
- Discontinuation of concurrent clonidine should take place gradually, with beta blocker discontinued first. Then, after several days, discontinue clonidine.
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with meals or directly after eating to enhance absorption.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer slowly over 2 min.
- **Continuous Infusion:** ***Diluent:*** Add 200 mg of labetalol to 160 ml of diluent. May also be administered as undiluted drug. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, and LR. ***Concentration:*** Diluted: 1 mg/ml; Undiluted: 5 mg/ml. ***Rate:*** Administer at a rate of 2 mg/min. Titrate for desired response. Infuse via infusion pump to ensure accurate dosage.
- **Y-Site Compatibility:** amikacin, aminophylline, amiodarone, atropine, aztreonam, ampicillin, bivalirudin, bumetanide, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, ceftazidine, ceftizoxime, cimetidine, cyclosporine, daptomycin, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, ganciclovir, gentamicin, granisetron, hydromorphone, imipenem/cilastatin, isoproterenol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, milrinone, morphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, penicillin G, palonosetron, phenylephrine, phytonadione, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate complex, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, dexamethasone sodium phosphate, diazepam, furosemide, hydrocortisone sodium succinate, insulin, ketorolac, lansoprazole, micafungin, nafcillin, pantoprazole, phenytoin, piperacillin/tazobactam, warfarin.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known. Caution patients receiving labetalol IV to call for assistance during ambulation or transfer.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased. Patients taking oral labetalol should be especially cautious when drinking alcohol, standing for long periods, or exercising, and during hot weather, because orthostatic hypotension is enhanced.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased blood pressure as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in blood pressure.

L

lactulose (lak-tyoo-lose)

Cephulac, Cholac, Chronulac, Constilac, Constulose, Duphalac, Enulose, Evalose, Heptalac, Kristalose, Lactulax, Lactulose PSE, Portalac

Classification

Therapeutic: laxatives
Pharmacologic: osmotics

Pregnancy Category B

Indications

Treatment of chronic constipation in adults and geriatric patients. Adjunct in the management of portal-systemic (hepatic) encephalopathy (PSE).

Action

Increases water content and softens the stool. Lowers the pH of the colon, which inhibits the diffusion of ammonia from the colon into the blood, thereby reducing blood ammonia levels. **Therapeutic Effects:** Relief of constipation. Decreased blood ammonia levels with improved mental status in PSE.

Pharmacokinetics

Absorption: Less than 3% absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Absorbed lactulose is excreted unchanged in the urine. Unabsorbed lactulose is metabolized by colonic bacteria to lactic, acetic, and formic acids.
Half-life: Unknown.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (relief of constipation)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Patients on low-galactose diets.

Use Cautiously in: Diabetes mellitus; Excessive or prolonged use (may lead to dependence); OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

GI: belching, cramps, distention, flatulence, diarrhea. **Endo:** hyperglycemia (diabetic patients).

Interactions

Drug-Drug: Should not be used with other **laxatives** in the treatment of hepatic encephalopathy (leads to inability to determine optimal dose of lactulose). **Anti-infectives** may diminish effectiveness in treatment of hepatic encephalopathy.

Route/Dosage

Constipation

PO (Adults): 15–30 ml/day up to 60 ml/day as liquid or 10–20 g as powder for oral solution (up to 40 g/day has been used).
PO (Children): 7.5 ml daily (unlabeled).

PSE

PO (Adults): 30–45 ml 3–4 times/day; may be given q 1–2 hr initially to induce laxation.
PO (Infants): 2.5–10 ml daily in divided doses (unlabeled).
PO (Children and Adolescents): 40–90 ml daily in divided doses (unlabeled).
Rect (Adults): 300 ml diluted and administered as a retention enema q 4–6 hr.

Availability (generic available)

Syrup (cola flavor): 10 g lactulose/15 ml.
Single-use packets (Kristalose): 10 g (equal to 15 mL liquid lactulose), 20 g (equal to 30 mL liquid lactulose).

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and normal pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **PSE:** Assess mental status (orientation, level of consciousness) before and periodically throughout course of therapy.
- ***Lab Test Considerations:*** Decreases blood ammonia concentrations by 25–50%.
- May cause increased blood glucose levels in diabetic patients.
- Monitor serum electrolytes periodically when used chronically. May cause diarrhea with resulting hypokalemia and hypernatremia.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- When used in hepatic encephalopathy, dosage should be adjusted until patient averages 2–3 soft bowel movements per day. During initial therapy, 30–45 ml may be given hourly to induce rapid laxation.
- Darkening of solution does not alter potency.
- **PO:** Mix with fruit juice, water, milk, or carbonated citrus beverage to improve flavor. Administer with a full glass (240 ml) of water or juice. May be administered on an empty stomach for more rapid results.
- Dissolve single dose packets (Kristalose) in 4 oz of water. Solution should be colorless to slightly pale yellow.
- **Rect:** To administer enema, use rectal balloon catheter. Mix 300 ml of lactulose with 700 ml of water or 0.9% NaCl. Enema should be retained for 30–60 min. If inadvertently evacuated, may repeat administration.

Patient/Family Teaching

- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Caution patients that this medication may cause belching, flatulence, or abdominal cramping. Health care professional should be notified if this becomes bothersome or if diarrhea occurs.

Evaluation/Desired Outcomes

- Passage of a soft, formed bowel movement, usually within 24–48 hr.
- Clearing of confusion, apathy, and irritation and improved mental status in PSE. Improvement may occur within 2 hr after enema and 24–48 hr after oral administration.

Copyright © 2008 by F.A. Davis

lamivudine (la-mi-vyoo-deen)
Epivir, Epivir HBV, 3TC

Classification
Therapeutic: antiretrovirals, antivirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

Pregnancy Category C

Indications
HIV infection (with other antiretrovirals). Chronic hepatitis B infection. **Unlabeled uses:** Part of HIV-postexposure prophylaxis with zidovudine and indinavir.

Action
After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load. Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

Pharmacokinetics
Absorption: Well absorbed after oral administration (86% in adults, 66% in infants and children).
Distribution: Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.
Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.
Half-life: *Adults*—3.7 hr; *children*—2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.9 hr†	12 hr

†On an empty stomach; peak levels occur at 3.2 hr if lamivudine is taken with food. Food does not affect total amount of drug absorbed

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation.
Use Cautiously in: Impaired renal function (increased dosing interval/decreased dose recommended if CCr <50 ml/min); Women, prolonged exposure, obesity, history of liver disease (increased risk of lactic acidosis and severe hepatomegaly with steatosis); Coinfection with hepatitis B (hepatitis may recur after discontinuation of lamivudine); Geriatric patients (dosage reduction may be necessary); Pregnancy or children <3 mo (safety not established).
Exercise Extreme Caution in: Pediatric patients with a history of pancreatitis (use only if no alternative).

Adverse Reactions/Side Effects
Noted for combination of lamivudine plus zidovudine.
CNS: SEIZURES, fatigue, headache, insomnia, malaise, depression, dizziness. **Resp:** cough. **GI:** HEPATOMEGALY WITH STEATOSIS, PANCREATITIS (↑ in pediatric patients), anorexia, diarrhea, nausea, vomiting, abdominal discomfort, abnormal liver function studies, dyspepsia. **Derm:** alopecia, erythema multiforme, rashes, urticaria. **Endo:** hyperglycemia. **F and E:** lactic acidosis. **Hemat:** anemia, neutropenia, pure red cell aplasia. **MS:** musculoskeletal pain, arthralgia, muscle weakness, myalgia, rhabdomyolysis. **Neuro:** neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME.

Interactions
Drug-Drug: Trimethoprim/sulfamethoxazole ↑ lamivudine blood levels (dosage alteration may be necessary in renal impairment). ↑ risk of pancreatitis with concurrent use of other **drugs causing pancreatitis**. ↑ risk of neuropathy with concurrent use of other **drugs causing neuropathy**. Combination therapy with **tenofovir** and **abacavir** may lead to virologic nonresponse and should not be used.

Route/Dosage
HIV infection
PO (Adults and Children >12 yr and ≥50 kg): 150 mg twice daily.
PO (Adults <50 kg): 2 mg/kg twice daily.
PO (Children 3 mo–12 yr): 4 mg/kg twice daily (up to 150 mg twice daily).

Renal Impairment
PO (Adults): *CCr 30–49 ml/min*—150 mg once daily; *CCr 15–29 ml/min*—150 mg first dose, then 10 mg once daily; *CCr 5–14 ml/min*—150 mg first dose, then 50 mg once daily; *CCr <5 ml/min*—50 mg first dose, then 25 mg once daily.

Chronic Hepatitis B
PO (Adults): 100 mg once daily.

Copyright © 2008 by F.A. Davis

Renal Impairment

PO (Adults): *CCr 30–49 ml/min*—100 mg first dose, then 50 mg once daily; *CCr 15–29 ml/min*—100 mg first dose, then 25 mg once daily; *CCr 5–14 ml/min*—35 mg first dose, then 15 mg once daily; *CCr <5 ml/min*—35 mg first dose, then 10 mg once daily.
PO (Children 2–17 yr): 3 mg/kg once daily (up to 100 mg/day).

Availability

Epivir
Tablets: 150 mg, 300 mg. **Oral solution (strawberry-banana flavor):** 10 mg/ml in 240-ml bottles.

Epivir HBV
Tablets: 100 mg. **Oral solution (strawberry-banana flavor):** 5 mg/ml in 240 ml bottles.
In combination with: zidovudine (Combivir); zidovudine and abacavir (Trizivir). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **HIV:** Assess patient for change in severity of symptoms of HIV infection and for symptoms of opportunistic infection during therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differentiate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy
- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- **Chronic Hepatitis B Infection:** Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 levels before and periodically during therapy.
- Monitor serum amylase, lipase, and triglycerides periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.
- Monitor liver function. May cause elevated levels of AST, ALT, CPK, bilirubin, and alkaline phosphatase, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.
- May rarely cause neutropenia and anemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse lamivudine with lamotrigine. Do not confuse Epivir tablets and oral solution with Epivir-HBV tablets and oral solutions. Epivir Tablets and Oral Solution contain a higher dose of the same active ingredient (lamivudine) than in Epivir-HBV Tablets and Oral Solution. Epivir-HBV was developed for patients with hepatitis B and should not be used for patients dually infected with HIV and hepatitis B; use may lead to lamivudine-resistant HIV due to subtherapeutic dose.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take lamivudine as directed, every 12 hr. Explain the difference between Epivir and Epivir-HBV to patients. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Caution patient not to share medication with others.
- Inform patient that lamivudine does not cure HIV disease or prevent associated or opportunistic infections. Lamivudine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HIV to others. Advise patient that the long-term effects of lamivudine are unknown at this time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy or pancreatitis occur.
- Advise patient not to take other OTC or prescription medications or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Slowing of the progression of HIV infection and its sequelae.

Copyright © 2008 by F.A. Davis

- Decrease in viral load and improvement in CD4 levels in patients with advanced HIV infection.
- Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

lamotrigine (la-moe-tri-jeen)
Lamictal

Classification
Therapeutic: anticonvulsants

Pregnancy Category C

Indications
Adjunct treatment of partial seizures in adults with epilepsy. Lennox-Gastaut syndrome. Primary generalized tonic-clonic seizures in adults and children ≥2 yrs. Conversion to monotherapy in adults with partial seizures receiving a single enzyme-inducing antiepileptic drug. Maintenance treatment of bipolar disorder.

Action
Stabilizes neuronal membranes by inhibiting sodium transport. **Therapeutic Effects:** Decreased incidence of seizures. Delayed time to recurrence of mood episodes.

Pharmacokinetics
Absorption: 98% absorbed following oral administration.
Distribution: Enters breast milk. Highly bound to melanin-containing tissues (eyes, pigmented skin).
Metabolism and Excretion: Mostly metabolized by the liver to inactive metabolites; 10% excreted unchanged by the kidneys.
Half-life: Children taking enzyme-inducing antiepileptic drugs (AEDs): 7–10 hr; Children taking enzyme inducers and valproic acid (VPA): 15–27 hr; Children taking VPA: 44–94 hr; Adults: 25.4 hr (during chronic therapy of lamotrigine alone).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.4–4.8 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation.

Use Cautiously in: Patients with reduced renal function, impaired cardiac function, and impaired hepatic function (lower maintenance doses may be required); Prior history of rash to lamotrigine; OB: Exposure during first trimester (may ↑ risk of cleft lip/palate).

Adverse Reactions/Side Effects
CNS: ataxia, dizziness, headache, behavior changes, depression, drowsiness, insomnia, tremor. **EENT:** blurred vision, double vision, rhinitis. **GI:** nausea, vomiting. **GU:** vaginitis. **Derm:** photosensitivity, rash (higher incidence in children, patients taking VPA, high initial doses, or rapid dose increases). **MS:** arthralgia. **Misc:** allergic or hypersensitivity reactions including Stevens-Johnson syndrome.

Interactions
Drug-Drug: Concurrent use with **carbamazepine** may result in ↓ levels of lamotrigine and ↑ levels of an active metabolite of carbamazepine. Lamotrigine levels are ↓ by concurrent use of **phenobarbital**, **phenytoin**, or **primidone**. Concurrent use with **valproic acid** results in a twofold ↑ in lamotrigine levels, ↑ incidence of rash, and a ↓ in valproic acid level (lamotrigine dose should be ↓ by at least 50%). **Oral contraceptives** may ↓ serum levels of lamotrigine (dose adjustments may be necessary when starting and stopping oral contraceptives).

Route/Dosage

Epilepsy

In Combination with Other Antiepileptic Agents

PO (Adults and Children >12 yr): *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone*—50 mg daily as a single dose for first 2 wk, then 50 mg twice daily for next 2 wk; then increase by 100 mg/day on a weekly basis to maintenance dose of 150–250 mg twice daily (not to exceed 500 mg/day). *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone with valproic acid*—25 mg every other day for first 2 wk, then 25 mg once daily for next 2 wk; then increase by 25–50 mg/day every 1–2 wk to maintenance dose of 50–200 mg twice daily (not to exceed 400 mg/day).
PO (Children 2–12 yr): *Patients taking carbamazepine, phenobarbital, phenytoin, or*

Copyright © 2008 by F.A. Davis

primidone—0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 1.2 mg/kg in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then increase by 1.2 mg/kg/day (rounded down to nearest whole tablet) q 1–2 wk to maintenance dose of 5–15 mg/kg day (not to exceed 400 mg/day in 2 divided doses). *Patients taking valproic acid*—0.15 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk; (if initial calculated dose is 2.5–5 mg/day, then initial dose should be 5 mg every other day for 2 wk; if patient weighs between 6.7–14 kg, use 2 mg every other day for 2 wk). Then 0.3 mg/kg in 1–2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then increase by 0.3 mg/kg/day (rounded down to nearest whole tablet) q 1–2 wk to maintenance dose of 1–5 mg/kg day (not to exceed 200 mg/day in 1–2 divided doses). *Patients taking antiepileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—0.3 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.6 mg/kg in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then increase by 0.6 mg/kg/day (rounded down to nearest whole tablet) q 1–2 wk to maintenance dose of 5–15 mg/kg day (not to exceed 300 mg/day in 2 divided doses).

Conversion to Monotherapy

PO (Adults ≥16 yr): 50 mg/day for 2 wk, then 50 mg twice daily for 2 wk, then increase by 100 mg/day q 1–2 wk to maintenance dose of 300–500 mg/day in 2 divided doses; when target level is reached, decrease other antiepileptic by 20% weekly over 4 wk.

Bipolar Disorder

Escalation Regimen

PO (Adults): *Patients not taking cabamazepine, valproate or other enzyme-inducing drugs*—25 mg/day for 2 wk, then 50 mg/day for 2 wk, then 100 mg/day for 1 wk, then 200 mg/day; *Patients taking valproate*—25 mg every other day for 2 wk, then 25 mg/day for 2 wk, then 50 mg/day for one wk, then 100 mg/day; *Patients taking cabamazepine (or other enzyme inducers), but not taking valporate* 50 mg/day for 2 wk, then 100 mg/day (in divided doses) for 2 wk, then 200 mg/day (in divided doses) for one wk, then 300 mg/day (in divided doses) for one week, then up to 400 mg/day (in divided doses).

Dosage Adjustment Following Discontinuation of Other Psychotropics

PO (Adults): *Following discontinuation of other psychotropics*—maintain previous dose; *following discontinuation of valproate*—100 mg/day, then increase to 150 mg/day for one wk, then 200 mg/day; *following discontinuation of carbamazepine or other enzyme-inducers*—400 mg/day for one wk, then 300 mg/day for one wk, then 200 mg/day.

Availability (generic available)

Tablets: 25 mg, 100 mg, 150 mg, 200 mg. **Cost:** 25 mg $668.97/180, 100 mg $708.97/180, 150 mg $819.90/180, 200 mg $905.89/180. **Chewable dispersible tablets:** 2 mg, 5 mg, 25 mg. **Cost:** *Generic*—5 mg $453.96/180, 25 mg $489.92/180.

NURSING IMPLICATIONS

Assessment

- Assess patient for skin rash frequently during therapy. Discontinue lamotrigine at first sign of rash; may be life threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Rash usually occurs during the initial 2–8 wk of therapy and is more frequent in patients taking multiple antiepileptic agents, especially valproic acid, and much more frequent in patients <16 yr.
- Monitor for hypersensitivity reactions (fever, lymphadenopathy with or without rash) If cause cannot be determined, discontinue lamotrigine immediately.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Bipolar disorders:** Assess mood, ideation, and behaviors frequently. Initiate suicide precautions if indicated.
- ***Lab Test Considerations:*** Lamotrigine plasma concentrations may be monitored periodically during therapy, especially in patients concurrently taking other anticonvulsants. Therapeutic plasma concentration range has not been established, proposed therapeutic range: 1–5 mcg/ml.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- Do not confuse lamotrigine (Lamictal) with terbinafine (Lamisil), diphenoxylate/atropine (Lomotil) or lamivudine (Epivir).

Copyright © 2008 by F.A. Davis

- **PO:** May be administered without regard to meals.
- Lamotrigine should be discontinued gradually over at least 2 wk, unless safety concerns require a more rapid withdrawal. Abrupt discontinuation may cause increase in seizure frequency.
- **Chewable/Dispersible Tablets:** May be swallowed whole, chewed, or dispersed in water or dispersed in fruit juice. If chewed, follow with water or fruit juice to aid in swallowing. Only use whole tablets, do not attempt to administer partial quantities of dispersible tablets.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures.
- Advise patient to notify health care professional immediately if skin rash, fever, or swollen lymph glands occur or if frequency of seizures increases.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if patient intends to breastfeed or is breastfeeding.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.
- Decreased incidence of mood swings in bipolar disorders.

lansoprazole

(lan-**soe**-pra-zole)
Prevacid

Classification
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications

Erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Active benign gastric ulcer. Short-term treatment of symptomatic GERD. Healing and risk reduction of NSAID-associated gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver to inactive compounds. Converted intracellularly to at least two other antisecretory compounds.
Half-life: Children: 1.2–1.5 hr; Adults: 1.3–1.7 hr (↑ in geriatric patients and patients with impaired hepatic function).

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.7 hr	more than 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Geri: Geriatric patients (maintenance dose should not exceed 30 mg/day unless additional acid suppression is required); Solutabs contain aspartame; use caution when used in phenylketonurics; Severe hepatic impairment (not to exceed 30 mg/day in

Copyright © 2008 by F.A. Davis

these patients); OB, Lactation, Pedi: Safety not established for pregnant or breastfeeding women or for children <1 yr.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** diarrhea, abdominal pain, nausea. **Derm:** rash.

Interactions

Drug-Drug: Sucralfate ↓ absorption of lansoprazole (take 30 min before sucralfate). May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **ampicillin esters**, **iron salts**, and **digoxin**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage

PO (Adults and Children ≥12 yr): *Short-term treatment of duodenal ulcer*—15 mg once daily for 4 wk; *H. pylori eradication to reduce the risk of duodenal ulcer recurrence*—30 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10–14 days (triple therapy) or 30 mg three times daily with 1000 mg amoxicillin three times daily for 14 days (dual therapy); *maintenance of healed duodenal ulcers*—15 mg once daily; *short-term treatment of gastric ulcers/healing of NSAID-associated gastric ulcer*—30 mg once daily for up to 8 wk; *risk reduction of NSAID-associated gastric ulcer*—15 mg once daily for up to 12 wk; *short-term treatment of symptomatic GERD*—15 mg once daily for up to 8 wk; *short-term treatment of erosive esophagitis*—30 mg once daily for up to 8 wk (8 additional weeks may be necessary); *maintenance of healing of erosive esophagitis*—15 mg once daily; *pathologic hypersecretory conditions*—60 mg once daily intially, up to 90 mg twice daily (daily dose >120 mg should be given in divided doses).

PO (Children 1–11 yr and >30 kg): *GERD*—30 mg once to twice daily.

PO (Children 1–11 yr and 10–30 kg): *GERD*—15 mg once or twice daily.

PO (Children 1–11 yr and <10 kg): *GERD*—7.5 mg once daily.

PO (Children 3 mo—14 yrs): *Altenative weight-based dosing*—0.5–1.6 mg/kg once daily.

Availability

Delayed-release capsules: 15 mg, 30 mg. **Cost:** 15 mg $136.28/30, 30 mg $444.38/100. **Delayed-release orally disintegrated tablets (SoluTabs):** 15 mg, 30 mg. **Delayed-release oral suspension packets:** 15 mg, 30 mg. ***In combination with:*** amoxicillin and clarithromycin as part of a compliance package (Prevpac), naproxen as part of a combination package (Prevacid NapraPac). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including increased AST, ALT, alkaline phosphatase, LDH, and bilirubin.
- May cause ↑ serum creatinine and ↑ or ↓ electrolyte levels.
- May alter RBC, WBC, and platelet levels.
- May also cause ↑ gastrin levels, abnormal A/G ratio, hyperlipidemia, and ↑ or ↓ cholesterol.
- Monitor INR and prothrombin time in patients taking warfarin.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse Prevacid (lansoprazole) with Pravachol (pravastatin).
- **PO:** Administer before meals. Capsules may be opened and sprinkled on 1 tbsp of applesauce, pudding, cottage cheese, or yogurt and swallowed immediately for patients with difficulty swallowing. Do not crush or chew capsule contents.
- For patients with an NG tube, capsules may be opened and intact granules may be mixed in 40 ml of apple, cranberry, grape, orange, pineapple, prune, or V8 vegetable juice and injected through the NG tube into stomach. Flush NG tube with additional apple juice to clear tube. If administered via jejunostomy tube, lansoprazole should be prepared as a suspension with 2.5 ml of 4.2% sodium bicarbonate and 2.5 ml water.
- *Orally disintegrating tablets* may be placed on tongue, allowed to disintegrate and swallowed with or without water. For administration via oral syringe or nasogastric tube, *Prevacid SoluTab* can be administered by placing a 15 mg tablet in oral syringe and drawing up 4 mL of water, or a 30 mg tablet in oral syringe and drawing up 10 mL of water. Shake gently to allow for a quick dispersal.

Copyright © 2008 by F.A. Davis

After tablet has dispersed, administer the contents within 15 minutes. Refill syringe with 2 mL (5 mL for the 30 mg tablet) of water, shake gently, and administer any remaining contents and flush nasogastric tube. .

- *Granules for oral suspension* may be prepared by emptying packet into 2 tbsp of water. Do not use other liquids or foods. Do not chew granules. Stir well and drink immediately. If material remains in glass, add water and drink immediately. Do not administer oral suspension through enteral tubes.
- Antacids may be used concurrently.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- May occasionally cause dizziness. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy. Therapy is continued for at least 2–4 wk. Therapy for pathologic hypersecretory conditions may be long term.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk, and an additional 8-wk course may be used for patients who do not heal in 8 wk or whose ulcer recurs.

lanthanum carbonate

(**lan**-than-um)
Fosrenol

Classification
Therapeutic: hypophosphatemics
Pharmacologic: phosphate binders

Pregnancy Category C

Indications

Reduction of serum phosphate levels associated with end-stage renal disease.

Action

Dissociates in the upper GI tract forming lanthanate ions, which form an insoluble complex with phosphate. **Therapeutic Effects:** Decreased serum phosphate levels.

Pharmacokinetics

Absorption: Negligible absorption.
Distribution: Stays within the GI tract.
Metabolism and Excretion: Eliminated almost entirely in feces.
Half-life: 53 hr (in plasma).

TIME/ACTION PROFILE (effect on phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 wk	unknown

Contraindications/Precautions

Contraindicated in: Children; Pregnancy.
Use Cautiously in: Peptic ulcer disease, ulcerative colitis, Crohn's disease, any predisposition to bowel obstruction; Lactation (safety not established).

Adverse Reactions/Side Effects

GI: nausea, vomiting, diarrhea.

Interactions

Drug-Drug: Drugs known to interact with antacids may interact with lanthanum carbonate; separate dosing by 2 hr.

Route/Dosage

PO (Adults): 750–1500 mg/day in divided doses; may be titrated upward every 2–3 wk in increments of 750 mg/day up to 3750 mg/day (usual range 1500–3000 mg/day).

Availability

Chewable tablets: 250 mg, 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea and vomiting during therapy.
- ***Lab Test Considerations:*** Monitor serum phosphate levels prior to and periodically during therapy.

Potential Nursing Diagnoses

Nausea (Side Effects)

Copyright © 2008 by F.A. Davis

Implementation
- Divide total daily dose and administer with meals.
- **PO:** Administer with or immediately after meals. Tablets should be chewed completely before swallowing; intact tablets should not be swallowed.

Patient/Family Teaching
- Instruct patient to take lanthanum as directed.

Evaluation/Desired Outcomes
- Decrease in serum phosphate to below than 6.0 mg/dL in patients with end-stage renal disease.

lapatinib (la-**pat**-i-nib)
Tykerb

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

Pregnancy Category D

Indications
Advanced metastatic breast cancer with tumor overexpression of the Human Epidermal Receptor Type 2 (HER2) and past therapy with an anthracycline, a taxane and trastuzumab; used in combination with capecitabine (Xeloda).

Action
Acts as an inhibitor of intracellular tyrosine kinase affecting Epidermal Growth Factor (EGFR, ErbB1) and HER2 (ErbB2). Inhibits the growth of ErbB-driven tumors. Effect is additive with capecitabine. **Therapeutic Effects:** Decreased/slowed spread of metastatic breast cancer.

Pharmacokinetics
Absorption: Incompletely and variably absorbed following oral administration blood levels are increased by food.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Extensively metabolized by, mostly by CYP3A4 and CYP3A5 enzyme systems; <2% excreted by kidneys.
Half-life: 24 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Decreased left ventricular ejection fraction (Grade 2 or greater); OB: Pregnancy or lactation.
Use Cautiously in: Concurrent use of CYP3A4 inhibitors including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritoanvir, saquinavir, telithromycin, and voriconazole should be avoided (if necessary, dosage reduction of lapatinib is required); Concurrent use of CYP3A4 inducers including dexamathasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentin and phenobarbital may decrease levels and effectiveness and should be avoided (if necassary, dosage of lapatinib may be titrated upward to 4500 mg/day as tolerated); Severe hepatic impairment (dosage reduction recommended for Child-Pugh Class C); Known QTc prolongation or co-existing risk factors of QTc prolongation including hypokalemia, hypomagnesemia, concurrent anti-arrhythmics or medications that are known to prolong QTc; Geri: Elderly patients may be more sensitive to effects; Pedi: Safety in children has not been established.

Adverse Reactions/Side Effects
CNS: fatigue, insomnia. **Resp:** dyspnea, interstitial lung disease, pneumonitis. **CV:** ↓ left ventricular ejection fraction. **GI:** diarrhea, nausea, vomiting, dyspepsia, ↑ liver enzymes, stomatitis. **Derm:** palmar-plantar erythrodysesthesia, rash, dry skin. **Hemat:** neutropenia. **MS:** back pain, extremity pain.

Interactions
Drug-Drug: Lapatinib inhibits CYP3A4, CYP28 and P-glycoprotein; concurrent use of drugs which are substrates for these enzyme should be undertaken with caution. Concurrent use of **CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, **telithromycin**, and **voriconazole** may ↑ blood levels and the risk of toxicity. Concurrent use should be avoided, but if necessary dosage of lapatinib should be decreased. Concurrent use of **CYP3A4 inducers** including **dexamathasone**, **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, **rifapentin**, and **phenobarbital** may ↓ blood levels

Copyright © 2008 by F.A. Davis

and effectiveness and should be avoided. If necassary, dosage of lapatinib may be titrated upward to 4500 mg/day as tolerated.
Drug-Food: Concurrent **grapefruit** may ↑ blood levels and the risk of toxicity and should be avoided.

Route/Dosage
PO (Adults): 1250 mg (5 tablets) once daily for 21 days.

Hepatic Impairment
PO (Adults): *Severe hepatic impairment*—750 mg/day.

Availability
Tablets: 250 mg.

NURSING IMPLICATIONS

Assessment
- Evaluate left ventricular ejection fraction (LVEF) prior to therapy to determine if within institution's normal limits. Continue to monitor periodically during therapy to ensure it does not fall below limits. If LVEF decreases to Grade 2 or greater discontinue therapy. If it returns to normal and patient is asymptomatic after 2 wks, may restart therapy at a reduced dose of 1000 mg/day.
- Monitor ECG prior to and periodically during therapy to monitor QT.
- Monitor for respiratory status for symptoms of interstitial lung disease and pneumonitis (dyspnea, cough); may require discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor serum potassium and magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses
Diarrhea (Adverse Reactions)

Implementation
- Administer anti-diarrheals prior to therapy to prevent severe diarrhea.
- Correct hypokalemia and hypomagnesemia prior to therapy.
- **PO:** Administer 5 tablets once daily at least 1 hr before or 1 hr after a meal for 21 days. Capecitabine is taken with food or 30 min after meals twice daily.

Patient/Family Teaching
- Instruct patient to take lapatinib as directed and to review the *Patient Information Sheet* prior to therapy and with each refill for new information If a dose is missed take as soon remembered that day. If a day is missed, skip the dose; do not double doses. Caution patient not to share this medication with others, even with same condition; may be harmful.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy.
- Advise patient to report signs or decreased LVEF (shortness of breath, palpitations, fatigue) to health care professional promptly.
- Instruct patient to notify health care professional before taking any Rx, OTC, or herbal products during therapy.
- Advise patient that lapatinib may cause diarrhea, which may become severe. Instruct patient in how to prevent and manage diarrhea.
- Advise female patients to notify health care professional if pregnancy is planned or suspected; therapy may be teratogenic.

Evaluation/Desired Outcomes
- Decreased/slowed spread of metastatic breast cancer.

L

leflunomide (le-**flu**-noe-mide)
Arava

Classification
Therapeutic: antirheumatics (DMARDs)
Pharmacologic: immune response modifiers

Pregnancy Category X

Indications
Rheumatoid arthritis (disease-modifying agent).

Action
Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects. **Therapeutic Effects:** Decreased pain and inflammation, slowed structural progression and improved physical function.

Pharmacokinetics
Absorption: Tablets are 80% absorbed following oral administration; rapidly converted to the M1 metabolite, which is responsible for pharmacologic activity.
Distribution: Crosses the placenta.
Protein Binding: 99%.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Extensively metabolized with metabolites excreted in urine (43%) and feces (48%). Also undergoes biliary recycling.
Half-life: 14–18 days.

TIME/ACTION PROFILE (antirheumatic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	wks–mos†

†Due to persistence of active metabolite

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Women who are or may become pregnant; Compromised immune function, including bone marrow dysplasia or severe uncontrolled infection; Concurrent vaccination with live vaccines; Pedi: Children <18 yr; OB: Lactation.
Use Cautiously in: Renal insufficiency; OB: Women with childbearing potential; OB: Men attempting to father a child.
Exercise Extreme Caution in: Significant hepatic impairment, including positive serology for hepatitis B or C; or concurrent use of other hepatotoxic agents (↑ risk of hepatotoxicity).

Adverse Reactions/Side Effects

CNS: headache, dizziness, weakness. **Resp:** bronchitis, increased cough, pharyngitis, pneumonia, respiratory infection, rhinitis, sinusitis. **CV:** chest pain, hypertension. **GI:** diarrhea, nausea, abdominal pain, abnormal liver enzymes, hepatotoxicity (rare), anorexia, dyspepsia, gastroenteritis, mouth ulcers, vomiting. **GU:** urinary tract infection. **Derm:** alopecia, rash, dry skin, eczema, pruritus. **F and E:** hypokalemia. **Metab:** weight loss. **MS:** arthralgia, back pain, joint disorder, leg cramps, synovitis, tenosynovitis. **Neuro:** paresthesia. **Misc:** allergic reactions, flu syndrome, infections including SEPSIS, pain.

Interactions

Drug-Drug: Cholestyramine and **activated charcoal** cause a rapid and significant ↓ in blood levels of active metabolite. Concurrent use of **methotrexate** and other **hepatotoxic drugs** ↑ risk of hepatotoxicity. Concurrent administration of **rifampin** ↑ blood levels of the active metabolite. May ↑ risk of bleeding with **warfarin**.

Route/Dosage

PO (Adults): *Loading dose*—100 mg daily for 3 days; *maintenance dosing*—20 mg/day (if intolerance occurs, dose may be decreased to 10 mg/day).

Availability

Tablets: 10 mg, 20 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor liver function throughout therapy. Assess ALT at baseline, then monthly during initial 6 mo of therapy, then every 6–8 wks. If given concurrently with methotrexate, monitor ALT, AST, and serum albumin monthly. May cause ↑ ALT and AST, which are usually reversible with reduction in dose or discontinuation, but may be fatal. If ALT is 2–3 times the upper limit of normal, reduce dose to 10 mg/day and continue therapy. Monitor closely after dose reduction; plasma levels may not ↓ for several weeks due to long half-life. If ALT ↑ of 2–3 times the upper limit of normal persists despite dose reduction or if ALT >3 times the upper limit of normal occurs, discontinue leflunomide and administer cholestyramine (see Toxicity and Overdose). Monitor closely and readminister cholestyramine as indicated.
- Monitor CBC with platelets monthly for 6 mo following initiation of therapy and every 6–8 wks thereafter. If used with methotrexate or other immunosuppressive therapy continue monitoring monthly. If bone marrow depression occurs, discontinue leflunomide and begin decreasing levels with cholestyramine (see Implementation).
- May rarely cause ↑ of alkaline phosphatase and bilirubin.
- ***Toxicity and Overdose:*** If overdose or significant toxicity occurs, cholestyramine 8 g 3 times a day for 24 hr, or activated charcoal orally or via nasogastric tube, 50 g every 6 hr for 24 hr, is recommended to accelerate elimination.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

Implementation

- **PO:** Initiate therapy with loading dose of 100 mg/day for 3 days, followed by 20 mg/day

Copyright © 2008 by F.A. Davis

dose. May decrease to 10 mg/day if not well tolerated.

- **Drug Elimination Procedure:** Recommended to achieve nondectable plasma levels <0.02 mg/L after stopping treatment with leflunomide. Administer cholestyramine 8 g 3 times daily for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. If plasma levels >0.02 mg/L, consider additional cholestyramine treatment. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

Patient/Family Teaching

- Instruct patient to take leflunomide as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patients of childbearing age that leflunomide has teratogenic effects. Women wishing to become pregnant must undergo the drug elimination procedure (see Implementation) and verify that the M1 metabolite plasma levels are <0.02 mg/L. Men wishing to father a child should also take cholestyramine 8 g 3 times daily for 11 days to minimize any possible risk.
- Advise patient to consult health care professional prior to taking other medications or herbal products concurrently with leflunomide. Aspirin, NSAIDs, or low-dose corticosteroids may be continued during therapy, but other agents for treatment of rheumatoid arthritis may require discontinuation.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of rheumatoid arthritis and slowing of structural damage as evidenced by x-ray erosions and joint narrowings.
- Improved physical function.

lepirudin (rDNA)

(le-**peer**-yoo-din)

Refludan

Classification

Therapeutic: anticoagulants

Pharmacologic: thrombin inhibitors

Pregnancy Category B

Indications

Management of thromboembolic disease and prevention of its complications in patients who have experienced heparin-induced thrombocytopenia.

Action

Acts as an anticoagulant by inhibiting the action of thrombin. Produced by recombinant DNA technology. **Therapeutic Effects:** Anticoagulation with prevention of thromboembolic complications.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Distributes mainly to extracellular fluids.

Metabolism and Excretion: Metabolized by release of amino acids caused by breakdown of drug; 48% excreted unchanged in urine.

Half-life: 1.3 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
IV	within 30–90 min	unknown	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Recent puncture of large vessels/organ biopsy; Vessel/organ anomaly; Recent CVA, stroke, intracerebral surgery or other neuroaxial procedure; Severe uncontrolled hypertension; Severe renal impairment (CCr <15 ml/min); Bacterial endocarditis; Hemorrhagic diatheses; Recent major surgery; Recent major bleeding; Severe liver impairment; Moderate renal impairment (reduced bolus and maintenance infusion rate recommended if CCr 15<50 ml/min); Pregnancy, lactation or children (safety not established).

Adverse Reactions/Side Effects

Hemat: BLEEDING. **Misc:** allergic reactions including ANAPHYLAXIS.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: ↑ risk of bleeding with **thrombolytic agents**, **NSAIDs**, **valproic acid**, **cefotetan**, **cefoperazone**, **platelet aggregation inhibitors** including **aspirin**, **dipyridamole**, **clopidogrel**, **ticlopidine**, **tirofiban**, and **eptifibatide**.

Route/Dosage

IV (Adults): 0.4 mg/kg (not to exceed 44 mg) as a bolus over 15–20 sec, followed by 0.15 mg/kg/hr (not to exceed 16.5 mg/hr) initially, further adjustments made on the basis of laboratory assessment (aPTT) but should not exceed infusion rate of 0.21 mg/kg/hr without checking for coagulation abnormalities.

Renal Impairment

IV (Adults): 0.2 mg/kg as a bolus over 15–20 sec, then if *CCr 45–60 ml/min*—0.075 mg/kg/hr; if *CCr 30–44 ml/min*—0.045 mg/kg/hr; if *CCr 15–29 ml/min*—0.0225 mg/kg/hr.

Availability

Powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of bleeding and hemorrhage (bleeding gums, nosebleed, unusual bruising, black tarry stools, hematuria, fall in hematocrit or blood pressure, guaiac-positive stools). Notify physician if these occur.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria). Report signs to physician.
- ***Lab Test Considerations:*** Dose is adjusted according to aPTT ratio (patient aPTT at a given time over aPTT reference value, usually median of laboratory normal range for aPTT). Target range for aPTT ratio during treatment should be 1.5–2.5.
- Determine baseline aPTT prior to therapy; therapy should not be started in patients with an aPTT ratio of >2.5.
- First aPTT should be drawn 4 hr after initiation of therapy, then at least daily during therapy. More frequent monitoring is required in patients with serious liver injury or renal impairment.
- If aPTT ratio is out of target range, confirm ratio before modifying dose, unless clinically necessitated. If the confirmed ratio is above the target range, stop infusion for 2 hr. Restart infusion at 50% of previous dose without bolus and determine aPTT ratio in 4 hr.
- If confirmed ratio is below target range, increase infusion in steps of 20% and determine ratio in 4 hr.
- ***Toxicity and Overdose:*** If life-threatening bleeding occurs and excessive plasma levels of lepirudin are suspected, immediately stop infusion, determine aPTT and other coagulation levels, determine hemoglobin and prepare for blood transfusion. No specific antidote for lepirudin is available.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

Implementation

- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. IM injections of other medications should be avoided, as hematomas may develop.
- In patients scheduled to receive coumadin derivatives for oral anticoagulation, lepirudin dose should be gradually decreased to reach an aPTT ratio just above 1.5 before initiating oral anticoagulant therapy.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each vial with 1 ml of sterile water for injection or 0.9% NaCl. Shake gently. Transfer contents of vial into a 10-ml syringe and dilute to a total volume of 10 ml with sterile water for injection, 0.9% NaCl, or D5W. Clear, colorless solution should be obtained within a few seconds to 3 min. Do not use solutions that are cloudy or contain particulate matter. Solution is stable for 24 hr at room temperature. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer slowly over 15–20 sec.
- **Continuous Infusion:** ***Diluent:*** Reconstitute 2 vials (50 mg each) with 1 ml each of sterile water for injection or 0.9% NaCl. Transfer the contents into an infusion bag containing 500 ml or 250 ml of 0.9% NaCl or D5W. Solution is stable for 24 hr at room temperature. ***Concentration:*** 0.2–0.4 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Use an infusion pump to ensure accuracy.
- **Y-Site Compatibility:** amiodarone.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.

Copyright © 2008 by F.A. Davis

- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during therapy.

Evaluation/Desired Outcomes

- Range of aPTT ratio from 1.5–2.5, without signs of hemorrhage.
- Treatment and prevention of thromboembolic disease and its sequelae.

letrozole (let-roe-zole)
Femara

Classification
Therapeutic: antineoplastics
Pharmacologic: aromatase inhibitors

Pregnancy Category D

Indications

First-line treatment of post-menopausal women with hormone receptor positive or hormone receptor unknown metastatic or advanced breast cancer. Advanced breast cancer in postmenopausal patients with disease progression despite antiestrogen therapy. Extended adjuvant treatment of post-menopausal early breast cancer already treated with 5 yr of tamoxifen.

Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen. **Therapeutic Effects:** Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer. Decreased risk of recurrence/metastatic disease.

Pharmacokinetics

Absorption: Rapidly and completely absorbed.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 2 days.

TIME/ACTION PROFILE (effect on lowering of serum estradiol levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Premenopausal women; OB: Pregnancy.

Use Cautiously in: Severe hepatic impairment; OB, Pedi: Lactation or children (safety not established).

Adverse Reactions/Side Effects

CNS: anxiety, depression, dizziness, drowsiness, fatigue, headache, vertigo, weakness. **Resp:** coughing, dyspnea, pleural effusion. **CV:** chest pain, edema, hypertension, cerebrovascular events, thromboembolic events. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, vomiting. **Derm:** alopecia, hot flashes, increased sweating, pruritus, rash. **F and E:** hypercalcemia. **Metab:** hypercholesterolemia, weight gain. **MS:** musculoskeletal pain, arthralgia, fractures.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 2.5 mg daily.

Availability

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically throughout therapy.
- ***Lab Test Considerations:*** May cause elevated GTT and cholesterol levels.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

- **PO:** May be taken without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- Inform patient of potential for adverse reactions and advise her to notify health care professional if side effects are problematic.
- Caution women who are perimenopausal or who recently became menopausal to use adequate contraception during therapy; letrozole may cause fetal harm.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.
- Decreased risk of recurrence/metastatic disease.

Copyright © 2008 by F.A. Davis

leucovorin calcium

(loo-koe-**vor**-in)
citrovorum factor, folinic acid, Wellcovorin

Classification
Therapeutic: antidotes (for methotrexate), vitamins
Pharmacologic: folic acid analogues

Pregnancy Category C

Indications

Minimizes hematologic effects of high-dose methotrexate therapy (leucovorin rescue). Advanced colorectal carcinoma (with 5-fluorouracil). Management of overdoses/prevention of toxicity from folic acid antagonists (pyrimethamine, trimethoprim, trimetrexate). Folic acid deficiency (megaloblastic anemia) unresponsive to oral replacement.

Action

The reduced form of folic acid that serves as a cofactor in the synthesis of DNA and RNA. **Therapeutic Effects:** Reversal of toxic effects of folic acid antagonists. Reversal of folic acid deficiency.

Pharmacokinetics

Absorption: Well absorbed (38%) following PO administration. Bioavailability decreases with larger doses. Oral absorption is saturated at doses >25 mg.
Distribution: Widely distributed. Concentrates in the CNS and liver.
Metabolism and Excretion: Extensively converted to tetrahydrofolic derivatives, including 5-methyltetrahydrofolate, a major storage form.
Half-life: 3.5 hr.

TIME/ACTION PROFILE (serum folate levels)

ROUTE	ONSET	PEAK	DURATION
PO	20–30 min	unknown	3–6 hr
IM	10–20 min	unknown	3–6 hr
IV	<5 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Preparations containing benzyl alcohol should not be used in neonates.
Use Cautiously in: Undiagnosed anemia (may mask the progression of pernicious anemia); Pregnancy and lactation (safety not established but has been used safely to treat megaloblastic anemia in pregnancy); Coadministration with high-dose methotrexate requires crucial timing of dosing and knowledge of methotrexate levels; Ascites; Renal failure; Dehydration; Pleural effusions; Urine pH <7.

Adverse Reactions/Side Effects

Hemat: thrombocytosis (intra-arterial methotrexate only). **Misc:** allergic reactions (rash, urticaria, wheezing).

Interactions

Drug-Drug: May ↓ anticonvulsant effect of **barbiturates**, **phenytoin**, or **primidone**. High doses of the liquid contain significant **alcohol** and may cause ↑ CNS depression when used with **CNS depressants**. Concurrent use with **trimethoprim/sulfamethoxazole** may result in ↓ anti-infective efficacy and poor therapeutic outcome when used to treat *Pneumocystis carinii* pneumonia in HIV patients. May ↑ therapeutic effects and toxicity of **fluorouracil**; therapy may be combined for this purpose.

Route/Dosage

High-Dose Methotrexate—Leucovorin Rescue. Must start within 24 hr of methotrexate.

PO, IM, IV (Adults and Children): *Normal methotrexate elimination*—10 mg/m² q 6 hr (1st dose IV/IM, then change to PO) until methotrexate level is $<5 \times 10^{-8}$ M (0.05 micromolar). Larger doses/longer duration may be required in patients with aciduria, ascites, dehydration, renal impairment, GI obstruction, pleural/peritoneal effusions. Dose of leucovorin should be determined on the basis of plasma methotrexate levels.

Advanced Colorectal Cancer

IV (Adults): 200 mg/m² followed by 5-fluorouracil 370 mg/m² or leucovorin 20 mg/m² is followed by 5-fluorouracil 425 mg/m². Regimen is given daily for 5 days q 4–5 wk.

Prevention of Hematologic Toxicity from Trimetrexate

PO, IV (Adults and Children): 20 mg/m² q 6 hr continued for 72 hr after last trimetrexate dose (oral doses should be rounded up to the next 25 mg); both trimetrexate and leucovorin doses require adjustment for hematologic toxicity.

Prevention of Hematologic Toxicity from Pyrimethamine

PO, IV (Adults and Children): 5–15 mg/day.

Copyright © 2008 by F.A. Davis

Inadvertent Overdose of Folic Acid Antagonists

IM, IV (Adults and Children): *Methotrexate–large doses*—75 mg IV followed by 12 mg IM q 6 hr for 4 doses; *methotrexate–average doses*—6–12 mg IM q 6 hr for 4 doses; *other folic acid antagonists*—amount equal in mg to folic acid antagonist.

Megaloblastic Anemia

PO, IM, IV (Adults and Children): Up to 1 mg/day (up to 6 mg/day for dihydrofolate reductase deficiency).

Availability (generic available)

Tablets: 5 mg, 10 mg, 15 mg, 25 mg. **Solution for injection:** 3 mg/ml in 1-ml ampules, 5 mg/ml. **Powder for injection:** 50-, 100-, and 350-mg vials.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea and vomiting secondary to methotrexate therapy or folic acid antagonists (pyrimethamine and trimethoprim) overdose. Parenteral route may be necessary to ensure that patient receives dose.
- Monitor for development of allergic reactions (rash, urticaria, wheezing). Notify physician if these occur.
- **Megaloblastic Anemia:** Assess degree of weakness and fatigue.
- **Leucovorin rescue:** Monitor serum methotrexate levels to determine dosage and effectiveness of therapy. Leucovorin calcium levels should be equal to or greater than methotrexate level. Rescue continues until serum methotrexate level is $<5 \times 10M$.
- Monitor CCr and serum creatinine prior to and every 24 hr during therapy to detect methotrexate toxicity. An increase >50% over the pretreatment concentration at 24 hr is associated with severe renal toxicity.
- Monitor urine pH every 6 hr during therapy; pH should be maintained >7 to decrease nephrotoxic effects of high-dose methotrexate. Sodium bicarbonate or acetazolamide may be ordered to alkalinize urine.
- *Megaloblastic anemia*—Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count prior to and periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Indications)
Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Do not confuse folinic acid (leucovorin calcium) with folic acid. Do not confuse leucovorin with leukeran (chlorambucil) or leukine (sargramostim).
- Make sure leucovorin calcium is available before administering high-dose methotrexate. Administration must be initiated within 24 hr of methotrexate therapy.
- Administer as soon as possible after toxic dose of folic acid antagonists (pyrimethamine and trimethoprim). Effectiveness of therapy begins to decrease 1 hr after overdose.
- **PO:** Parenteral therapy should be used in patients with GI toxicity, with nausea and vomiting, or with doses >25 mg.
- **IM:** IM route is preferred for treatment of megaloblastic anemia. Ampules of leucovorin calcium injection for IM use do not require reconstitution.

IV Administration

- **Direct IV:** ***Diluent:*** To reconstitute 50-mg vial of leucovorin calcium for injection, add 5 ml of bacteriostatic water or sterile water for injection for a concentration of 10 mg/ml. Use 10-ml diluent for 100-mg vial. The 350-mg vial should be reconstituted with 17 ml of diluent for a concentration of 20 mg/ml. If dose is >10 mg/m^2, do not use product containing benzyl alcohol. Use immediately if reconstituted with sterile water for injection. Stable for 7 days when reconstituted with bacteriostatic water. ***Concentration:*** 10 mg/ml. ***Rate:*** Rate should not exceed 160 mg/min.
- **Intermittent Infusion:** May be diluted in 100–500 ml of D5W, D10W, 0.9% NaCl, Ringer's or LR. Stable for 24 hr
- **Y-Site Compatibility:** amifostine, aztreonam, bleomycin, cefepime, cisplatin, cladribine, cyclophosphamide, docetaxel, doxorubicin, doxorubicin liposome, etoposide phosphate, filgrastim, fluconazole, fluorouracil, furosemide, gemcitabine, granisetron, heparin, linezolid, methotrexate, metoclopramide, mitomycin, oxaliplatin, piperacil-

Copyright © 2008 by F.A. Davis

lin/tazobactam, tacrolimus, teniposide, thiotepa, vinblastine, vincristine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, droperidol, foscarnet, lansoprazole, sodium bicarbonate.

Patient/Family Teaching
- Explain purpose of medication to patient. Emphasize need to take exactly as ordered. Advise patient to contact health care professional if a dose is missed.
- **Leucovorin Rescue:** Instruct patient to drink at least 3 liters of fluid each day during leucovorin rescue.
- **Folic Acid Deficiency:** Encourage patient to eat a diet high in folic acid (meat proteins; bran; dried beans; and green, leafy vegetables).

Evaluation/Desired Outcomes
- Reversal of bone marrow and GI toxicity in patients receiving methotrexate or in overdose of folic acid antagonists.
- Increased sense of well-being and increased production of normoblasts in patients with megaloblastic anemia.

leuprolide (loo-**proe**-lide)
Eligard, Lupron, Lupron Depot, Lupron Depot-PED, Lupron Depot-3 Month, Viadur

Classification
Therapeutic: antineoplastics
Pharmacologic: hormones, gonadotropin-releasing hormones

Pregnancy Category X

Indications
Injection, depot or implant: Advanced prostate cancer in patients who are unable to tolerate orchiectomy or estrogen therapy (may be used in combination with flutamide or bicalutamide): Management of central precocious puberty (CPP). **3.75-mg depot only:** Endometriosis: Uterine fibroids (with iron therapy).

Action
A synthetic analogue of luteinizing hormone–releasing hormone (LHRH). Initially causes a transient increase in testosterone; however, with continuous administration, testosterone levels are decreased. Reduces gonadotropins, testosterone, and estradiol. **Therapeutic Effects:** Decreased testosterone levels and resultant decrease in spread of prostate cancer. Reduction of pain/lesions in endometriosis. Decreased growth of fibroids. Delayed puberty.

Pharmacokinetics
Absorption: Rapidly and almost completely absorbed following subcut administration. More slowly absorbed following IM administration of depot form; consistent levels maintained following implant.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 3 hr.

TIME/ACTION PROFILE (effect on hormone levels)

ROUTE	ONSET†	PEAK‡	DURATION§
Subcut	within 1st week	2–4 wk	4–12 wk
IM	within 1st week	2–4 wk	4–12 wk
IM-depot	within 1st week	2–4 wk	4–12 wk
implant	3 days	2 wk	12 mos

†Initial transient increase in testosterone and estradiol levels
‡Maximum decline in testosterone and estradiol levels
§Restoration of normal pituitary–gonadal function; in amenorrheic patients, normal menses usually returns 60–90 days after treatment is discontinued

Contraindications/Precautions
Contraindicated in: Intolerance to synthetic analogues of LHRH (GnRH); Pregnancy or lactation (depot form).
Use Cautiously in: Hypersensitivity to benzyl alcohol (results in induration and erythema at subcut site).

Adverse Reactions/Side Effects
CNS: dizziness, headache, syncope; *depot*— drowsiness, personality disorder; *Subcut*— anxiety, blurred vision, lethargy, memory disorder, mood swings; *implant*— insomnia. **EENT:** blurred vision; *Subcut*— hearing disorder. **Resp:** hemoptysis; *depot*— epistaxis, throat nodules; *Subcut*— cough, pleural rub, pulmonary fibrosis, pulmonary infiltrate. **CV:** MI, PULMONARY EMBOLI, angina, arrhythmias; *depot*— vasodilation; *Subcut*— transient ischemic attack/stroke; *implant*— edema. **GI:** anorexia, diarrhea, dysphagia, nausea, vomiting; *depot*— gingivitis; *Subcut*— GI BLEEDING, hepatic dysfunction, peptic ulcer, rectal polyps, taste disorders. **GU:** decreased testicular size, dysuria, incontinence, testicular pain; *depot*— cervix disorder; *Subcut*— bladder spasm, penile swelling,

Copyright © 2008 by F.A. Davis

prostate pain, urinary obstruction. **Derm:** *depot*— hair growth, rash; *Subcut*— dry skin, hair loss, pigmentation, skin cancer, skin lesions. **Endo:** breast swelling, breast tenderness, diabetes. **F and E:** hypercalcemia, lower extremity edema. **Local:** burning, itching, swelling at injection site; *implant*— pain. **Hemat:** *implant*— anemia. **Metab:** *depot*— hyperuricemia, increased bone density. **MS:** fibromyalgia, transient increase in bone pain (prostate cancer only); *Subcut*— ankylosing spondylitis, joint pain, pelvic fibrosis, temporal bone pain. **Neuro:** *Subcut*— peripheral neuropathy. **Misc:** hot flashes, chills, decreased libido, fever; *depot*— body odor, epistaxis.

Interactions

Drug-Drug: ↑ antineoplastic effects with **antiandrogens (megestrol, flutamide)**.

Route/Dosage

Prostate Cancer

Subcut (Adults): 1 mg/day *or* 7.5 mg once monthly, 22.5 mg every 3 mo, 30 mg every 4 mo or 45 mg every 6 mo as long-acting/depot injection.
IM (Adults): 7.5 mg once monthly, 22.5 mg every 3 mo or 30 mg every 4 mo.
Implant (Adults): one implant (72 mg) every 12 months.

Endometriosis/Fibroids

IM (Adults): 3.75 mg once monthly, or 11.25 every 3 mo, or 30 mg every 4 mo.

Central Precocious Puberty (CPP)

Subcut (Children): 50 mcg/kg/day, may be increased by 10 mcg/kg/day as required.
IM (Children >37.5 kg): 15 mg q 4 wk.
IM (Children 25–37.5 kg): 11.25 mg q 4 wk.
IM (Children ≤25 kg): 7.5 mg q 4 wk.

Availability (generic available)

Solution for injection (Lupron and others): 5 mg/ml in 2.8-ml vial. **Lyophilized microspheres for depot injection (Lupron Depot):** 3.75-mg single-use vial, 7.5-mg single-use vial. **Lyophilized microspheres for pediatric depot injection (Lupron Depot-Ped):** 7.5-mg, 11.25-mg, 15—mg single-use kits. **Lyophilized microspheres for 3-mo depot injection (Lupron Depot—3 month):** 22.5-mg single-use kits. **Lyophilized microspheres for 4-mo depot injection (Lupron Depot—4 month:** 30 mg. **Polymeric matrix injectable formulation for subcut use (Eligard):** 7.5 mg, 22.5 mg, 30 mg, 45 mg. **Implant (Viadur):** 72 mg.

NURSING IMPLICATIONS

Assessment

- **Prostate Cancer:** Assess patient for an increase in bone pain, especially during the first few weeks of therapy. Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios; assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Fibroids:** Assess patient for severity of symptoms (bloating, pelvic pain, pressure, excessive vaginal bleeding) periodically during therapy.
- **Endometriosis:** Assess patient for endometrial pain prior to and periodically during therapy.
- **CPP:** Prior to therapy, diagnosis of CPP should be confirmed by onset of secondary sex characteristics in girls <8 yr or boys <9 yr; a complete physical and endocrinologic examination, including height, weight, hand and wrist x-ray; total sex steroid level (estradiol or testosterone); adrenal steroid level; beta human chorionic gonadotropin level; GnRH stimulation test; and computerized tomography of the head must be performed. These parameters are monitored after 1–2 mo and every 6–12 mo during therapy.
- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy. Dose is increased until no progression of the disease is noted either clinically or by lab test parameters, then usually maintained throughout therapy. Discontinuation of therapy should be considered before age 11 in girls and age 12 in boys.
- ***Lab Test Considerations:*** Initially ↑, then ↓ luteinizing hormone (LH) and follicle-stimulating hormone (FSH). This leads to castration levels of testosterone in boys 2–4 wk after initial increase in concentrations.
- Monitor testosterone, prostatic acid phosphate, and prostate-specific antigen (PSA) levels to evaluate response to therapy. Tran-

Copyright © 2008 by F.A. Davis

sient ↑ in levels may occur during the 1st month of therapy for prostate cancer.
- May cause ↑ BUN, serum calcium, uric acid, hypoproteinemia, LDH, alkaline phosphatase, AST, hyperglycemia, hyperlipidemia, hyperphosphatemia, WBC, PT, or PTT. May also cause ↓ platelets and serum potassium.

Potential Nursing Diagnoses

Sexual dysfunction (Side Effects)

Implementation

- **Subcut:** *Eligard subcut formulation:* Bring to room temperature before mixing. Assemble the Eligard kit and reconstitute solution using syringes provided, as directed by manufacturer. Mix in syringes as directed by manufacturer, do not shake. Solution must reach room temperature before administration and must be administered within 30 min of mixing, or be discarded. Solution is light tan to tan in color. Inject into abdomen, upper buttocks, or anywhere that has adequate amounts of subcut tissue without excessive pigment, nodules, lesions, or hair. Vary site with each injection.
- **IM:** Use syringe supplied by manufacturer. Rotate sites.
- Leuprolide depot is *only* for IM injection.
- *Lupron Depot formulation:* To reconstitute a single vial, use a 22-gauge needle; withdraw 1 ml of diluent and inject into vial to mix. To mix 2 or more vials, withdraw 0.5 ml and inject into each vial for a total volume of 1 ml. Do not use vial if clumping or caking of microspheres (powder) is evident. Shake each vial well; suspension will appear milky. Withdraw entire contents of all vials into syringe and inject immediately. Patients may store medication at room temperature.
- Store at room temperature; stable for 24 hr following reconstitution.
- *12-mo implant:* Implant is inserted in the inner aspect of the upper arm and provides continuous release of leuprolide for 12 mo. At the end of 12 mo, implant must be removed; a new implant may be inserted for continuous therapy.

Patient/Family Teaching

- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- **Prostate Cancer:** Instruct patient and family on subcut injection technique. Review patient insert provided with leuprolide patient-administration kit.
- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as remembered unless not remembered until next day.
- Advise patient that bone pain may increase at initiation of therapy. This will resolve with time. Patient should discuss with health care professional use of analgesics to control pain.
- Instruct patient to notify health care professional promptly if difficulty urinating, weakness, or numbness occurs.
- **Endometriosis:** Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected but does not guarantee contraception.
- **Central Precocious Puberty:** Instruct patient and family on the proper technique for subcut injection. Emphasize the importance of administering the medication at the same time each day. Rotate injection sites periodically.
- Inform patient and parents that if injections are not given daily, pubertal process may be reactivated.
- Advise patient and parents that during the first 2 mo of therapy patient may experience a light menstrual flow or spotting. Health care professional should be notified if this continues beyond 2nd mo.
- Instruct patient and parents to notify health care professional immediately if irritation at the injection site or unusual signs or symptoms occur.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.
- Resolution of the signs of CCP.
- Improvement in preoperative hematologic parameters in patients with anemia from uterine fibroids.

Copyright © 2008 by F.A. Davis

levalbuterol

(leev-al-**byoo**-ter-ole)
Xopenex

Classification
Therapeutic: bronchodilators
Pharmacologic: adrenergics

Pregnancy Category C

Indications

Bronchospasm due to reversible airway disease (short-term control agent).

Action

R-enantiomer of racemic albuterol. Binds to beta-2 adrenergic receptors in airway smooth muscle leading to activation of adenylcyclase and increased levels of cyclic-3', 5'-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes bronchial smooth muscle. **Therapeutic Effects:** Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta-2 (pulmonary) receptors.

Pharmacokinetics

Absorption: Some absorption occurs following inhalation.
Distribution: Unknown.
Metabolism and Excretion: Metabolized in the liver to an inactive sulfate and 3–6% excreted unchanged in the urine.
Half-life: 3.3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	10–17 min	90 min	5–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levalbuterol or albuterol.
Use Cautiously in: Cardiovascular disorders (including coronary insufficiency, hypertension, and arrhythmias); History of seizures; Hypokalemia; Hyperthyroidism; Diabetes mellitus; Unusual sensitivity to adrenergic amines; Pregnancy, lactation, or children <2 yr (safety not established).
Exercise Extreme Caution in: Concurrent use or use within 2 weeks of **tricyclic antidepressants** or **MAO inhibitors** (may increase the risk of adverse cardiovascular reactions).

Adverse Reactions/Side Effects

CNS: anxiety, dizziness, headache, nervousness. **Resp:** increased cough, paradoxical bronchospasm, turbinate edema. **CV:** tachycardia. **GI:** dyspepsia. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

Interactions

Drug-Drug: Concurrent use or use within 2 weeks of **tricyclic antidepressants** or **MAO inhibitors** may ↑ risk of adverse cardiovascular reactions (use with extreme caution). **Beta blockers** block the beneficial pulmonary effects of adrenergic bronchodilators (choose cardioselective beta blockers if necessary and with caution). May ↑ risk of hypokalemia from **potassium-losing diuretics**. May ↓ serum **digoxin** levels. May ↑ risk of arrhythmias with **hydrocarbon inhalation anesthetics** or **cocaine**.
Drug-Natural Products: Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

Inhaln (Adults and Children >12 yr): 0.63 mg via nebulization three times daily (every 6–8 hr); may be increased to 1.25 mg three times daily (every 6–8 hr).
Inhaln (Children 6–11 yr): 0.31 mg three times daily (not exceed 0.63 mg three times daily).
Inhaln (Children 2–11 yr): 0.16–1.25 mg single doses have been used safely.

Availability

Inhalation solution: 0.31 mg/3 ml in green foil pouch containing 12 vials, 0.63 mg/3 ml in yellow foil pouch containing 12 vials, 1.25 mg/3 ml in red foil pouch containing 12 vials, 1.25 mg/0.5 ml in unit-dose vials. **Cost:** 0.31 mg/3 ml $83.76/24 vials, 0.63 mg/3 ml $84.15/24 vials, 1.25 mg/3 ml $85.00/24 vials.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.

Copyright © 2008 by F.A. Davis

- Monitor pulmonary function tests before initiating therapy and periodically during course to determine effectiveness of medication.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify physician or other health care provider immediately.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and ↓ serum potassium.

Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

Implementation
Inhaln: Allow at least 1 min between inhalations of aerosol medication.
- For nebulization, levalbuterol solution does not require dilution prior to administration. Once the foil pouch is opened, vials must be used within 2 weeks; open vials may be stored for 1 week. Discard vial if solution is not clear or colorless.

Patient/Family Teaching
- Instruct patient in the proper use of the nebulizer (see Appendix D) and to take levalbuterol exactly as directed. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Advise patient to consult health care professional before taking any OTC medications or alcohol concurrently with this therapy. Caution patient to also avoid smoking and other respiratory irritants.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patients to use levalbuterol first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Instruct patient to notify health care professional if no response to the usual dose of levalbuterol.

Evaluation/Desired Outcomes
- Prevention or relief of bronchospasm.

levetiracetam
(le-ve-teer-**a**-se-tam)
Keppra

Classification
Therapeutic: anticonvulsants
Pharmacologic: pyrrolidines

Pregnancy Category C

Indications
Partial onset seizures (adjunct). Primary generalized tonic-clonic seizures in patients 6 yrs of age and older. Myoclonic seizures in adults with myoclonic epilepsy (adjunct).

Action
Appears to inhibit burst firing without affecting normal neuronal excitability and may selectively prevent hypersynchronization of epileptiform burst firing and propagation of seizure activity.
Therapeutic Effects: Decreased incidence and severity of seizures.

Pharmacokinetics
Absorption: Rapidly and completely absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 66% excreted unchanged by the kidneys; some metabolism by the liver (metabolites inactive).
Half-life: 7.1 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–1.5 hr†	12 hr

†1 hr in the fasting state, 1.5 hr when taken with food

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Lactation.
Use Cautiously in: Geri: Renal elimination decreased; dose reduction may be necessary; Renal impairment (dose reduction recommended if CCr ≤80 ml/minr.); Pedi: Children <4 yr (safety not established); OB: Use only during pregnancy if potential benefit justifies potential risk to fetus.

Adverse Reactions/Side Effects
CNS: dizziness, fatigue/somnolence, weakness, behavioral abnormalities. **Neuro:** coordination difficulties (adults only).

Interactions
Drug-Drug: None noted.

Route/Dosage
PO, IV (Adults): 500 mg twice daily initially; may be increased by 1000 mg/day at 2 wk intervals up to 3000 mg/day.

Copyright © 2008 by F.A. Davis

PO (Children 6–16 yrs): 10 mg/kg twice daily; may be increased at 2 wk intervals by 20 mg/kg increments up to 60 mg/kg/day.

Renal Impairment

PO (Adults): *CCr 50–80 ml/min*—500–1000 mg q 12 hr initially; *CCr 30–50 ml/min*—250–750 mg q 12 hr initially; *CCr <30 ml/min*—250–500 mg q 12 hr initially.

PO (Children and Adolescents 4–15 yr): 20 mg/kg/day in 2 divided doses initially, may be increaed by 20 mg/kg/day every 2 wk up to 60 mg/kg/day in 2 divided doses as tolerated.

Availability

Tablets: 250 mg, 500 mg, 750 mg, 100 mg. **Cost:** 250 mg $385.94/180, 500 mg $519.93/180, 750 mg $699.95/180, 1000 mg $1,021.30/180. **Oral solution (grape-flavored):** 100 mg/ml in 480-ml bottles. **Cost:** $282.43/480 ml. **Injection:** 100 mg/mL in 5 mL vials.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- Assess patient for CNS adverse effects throughout therapy. These adverse effects are categorized as somnolence and fatigue (asthenia), coordination difficulties (ataxia, abnormal gait, or incoordination), and behavioral abnormalities (agitation, hostility, anxiety, apathy, emotional lability, depersonalization, depression) and usually occur during the first 4 wk of therapy.
- ***Lab Test Considerations:*** May cause ↓ RBC and WBC and abnormal liver function tests.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

- Do not confuse Keppra with Kaletra (lopinavir/ritonavir).
- IV doses should be used temporarily when oral route is not feasible. To convert IV to PO, equivalent dose and frequency may be used.
- **PO:** May be administered without regard to meals.
- Administer tablets whole; do not administer partial tablets.
- Pedi: Patients <20 kg should receive oral solution. Administer with calibrated measuring device for accurate dose.
- Discontinue gradually to minimize the risk of increase in seizure frequency.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute dose in 100 mL of 0.9% NaCl, D5W, or LR. Do not administer solutions that are cloudy or contain particulate matter. ***Rate:*** Infuse over 15 min.
- **Y-Site Compatibility:** diazepam, lorazepam, valproate.

Patient/Family Teaching

- Instruct patient to take medication as directed. *Pedi:* Explain to parents the importance of using calibrated measuring device for accurate dosing. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures.
- May cause dizziness and somnolence. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.

levodopa (**lee**-voe-doe-pa)
Dopar, Larodopa, L-dopa

carbidopa/levodopa
(**kar**-bi-doe-pa/**lee**-voe-doe-pa)
Parcopa, Sinemet, Sinemet CR

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category, UK (levodopa), C (carbidopa/levodopa)

Indications
Parkinson's disease. Not useful for drug-induced extrapyramidal reactions.

Action
Levodopa is converted to dopamine in the CNS, where it serves as a neurotransmitter. Carbidopa, a decarboxylase inhibitor, prevents peripheral destruction of levodopa. **Therapeutic Effects:** Relief of tremor and rigidity in Parkinson's syndrome.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Widely distributed. *Levodopa*—enters the CNS in small concentrations. *Carbidopa*—does not cross the blood-brain barrier but does cross the placenta. Both enter breast milk.
Metabolism and Excretion: *Levodopa*—mostly metabolized by the GI tract and liver. *Carbidopa*—30% excreted unchanged by the kidneys.
Half-life: *Levodopa*—1 hr; *carbidopa*—1–2 hr.

TIME/ACTION PROFILE (antiparkinson effects)

ROUTE	ONSET	PEAK	DURATION
Carbidopa	unknown	unknown	5–24 hr
Levodopa	10–15 min	unknown	5–24 hr or more
Carbidopa/levodopa sustained release	unknown	2 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Angle-closure glaucoma; MAO inhibitor therapy; Malignant melanoma; Undiagnosed skin lesions; OB: Lactation; Some products contain tartrazine, phenylalanine or aspartame and should be avoided in patients with known hypersensitivity.
Use Cautiously in: History of cardiac, psychiatric, or ulcer disease; OB, Pedi: Pregnancy or children <18 yr (safety not established).

Adverse Reactions/Side Effects
CNS: involuntary movements, anxiety, dizziness, hallucinations, memory loss, psychiatric problems. **EENT:** blurred vision, mydriasis. **GI:** nausea, vomiting, anorexia, dry mouth, hepatotoxicity. **Derm:** melanoma. **Hemat:** hemolytic anemia, leukopenia. **Misc:** darkening of urine or sweat.

Interactions
Drug-Drug: Use with **MAO inhibitors** may result in hypertensive reactions. ↑ risk of arrhythmias with **inhalation hydrocarbon anesthetics** (especially **halothane**; if possible discontinue 6–8 hr before anesthesia). **Phenothiazines**, **haloperidol**, **papaverine**, **phenytoin**, and **reserpine** may ↓ effect of levodopa. Large doses of **pyridoxine** may ↓ beneficial effects of levodopa. Concurrent use with **methyldopa** may alter the effectiveness of levodopa and ↑ risk of CNS side effects. ↑ hypotension may result with concurrent **antihypertensives**. **Anticholinergics** may ↓ absorption of levodopa. ↑ risk of adverse reactions with **selegilene** or **cocaine**.
Drug-Natural Products: Kava kava may ↓ levodopa effectiveness.
Drug-Food: Ingestion of foods containing large amounts of **pyridoxine** may ↓ effect of levodopa.

Route/Dosage

Levodopa
PO (Adults): 250 mg 2–4 times daily; may increase by 100–750 mg q 3–7 days until desired effect is achieved (not to exceed 8 g/day).

Carbidopa/Levodopa
Tablets contain 10/100, 25/100, 25/250 mg
PO (Adults): *Patients not currently receiving levodopa*—10 mg carbidopa/100 mg levodopa 3–4 times daily or 25 mg carbidopa/100 mg levodopa 3 times daily; may be increased every 1–2 days until desired effect is achieved. *Conversion from levodopa alone (<1.5 g/day)*—25 mg carbidopa/100 mg levodopa 3–4 times daily; may be increased every 1–2 days until desired effect is achieved. *Conversion from levodopa alone (>1.5 g/day)*—25 mg carbidopa/250 mg levodopa 3–4 times daily; may be increased every 1–2 days until desired effect is achieved.

Copyright © 2008 by F.A. Davis

Carbidopa/Levodopa Extended-Release

Extended-release (ER) tablets contain 25/100 or 50/200 of carbidopa and levodopa, respectively

PO (Adults): *Patients not currently receiving levodopa*—50 mg carbidopa/200 mg levodopa twice daily (minimum of 6 hr apart) initially. *Conversion from levodopa alone*—initiate therapy at 25% of the daily dose of levodopa; for moderate disease start with 50 mg carbidopa/200 mg levodopa twice daily. *Conversion from standard carbidopa/levodopa*—initiate therapy with at least 10% more levodopa content/day (may need up to 30% more) given at 4–8 hr intervals while awake. Allow 3 days between dosage changes; some patients may require larger doses and shorter dosing intervals.

Availability

Levodopa

Tablets: 100 mg, 250 mg, 500 mg. **Capsules:** 100 mg, 250 mg, 500 mg.

Carbidopa/Levodopa

Tablets: 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Orally-disintegrating tablets (mint):** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Extended-release tablets:** 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa. ***In combination with:*** entacapone (Stalevo[Rx]. See Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. "On-off phenomenon" may cause symptoms to appear or improve suddenly.
- Assess blood pressure and pulse frequently during period of dose adjustment.
- ***Lab Test Considerations:*** May cause false-positive test results in Coombs' test, serum and urine uric acid, serum gonadotropin, urine norepinephrine, and urine protein concentrations.
- Dipstick for urine ketones may reveal false-positive results.
- Monitor hepatic and renal function and CBC periodically in patients on long-term therapy. May cause ↑ BUN, AST, ALT, bilirubin, alkaline phosphatase, LDH, and serum protein-bound iodine concentrations.
- ***Toxicity and Overdose:*** Assess for signs of toxicity (involuntary muscle twitching, facial grimacing, spasmodic eye winking, exaggerated protrusion of tongue, behavioral changes). Consult physician or other health care professional if symptoms occur.

Potential Nursing Diagnosis

Impaired physical mobility (Indications)
Risk for injury (Indications)

Implementation

- Do not confuse levodopa with methyldopa.
- In the carbidopa/levodopa combination, the number following the drug name represents the milligrams of each respective drug.
- Wait 8 hr after last levodopa dose before switching patient to carbidopa/levodopa. Carbidopa reduces the need for levodopa by 75%. Administering carbidopa shortly after a full dose of levodopa may result in toxicity.
- In preoperative patients or patients who are NPO, confer with physician or other health care professional about continuing medication administration.
- **PO:** Administer food shortly after medication to minimize gastric irritation; taking food before or concurrently may retard levodopa's effects but may be necessary to minimize GI irritation. If patient has difficulty swallowing, confer with pharmacist.
- Controlled-release tablets may be administered as whole or half tablets, but they should not be crushed or chewed.
- For *orally disintegrating tablets,* just prior to administration remove tablet from bottle with dry hands. Immediately place tablet on top of tongue. Tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.

Patient/Family Teaching

- Instruct patient to take this drug as directed. Take missed doses as soon as remembered, unless next scheduled dose is within 2 hr; do not double doses.
- Explain that gastric irritation may be decreased by eating food shortly after taking medications but that high-protein meals may

Copyright © 2008 by F.A. Davis

impair levodopa's effects. Dividing the daily protein intake among all the meals may help ensure adequate protein intake and drug effectiveness. Do not drastically alter diet during levodopa therapy without consulting health care professional.

- May cause drowsiness or dizziness. Advise patient to avoid driving and other activities that require alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Health care professional should be notified if orthostatic hypotension occurs.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Caution patient to monitor skin lesions for any changes. Health care professional should be notified promptly because carbidopa/levodopa may activate malignant melanoma.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies. Patients receiving only levodopa should avoid multivitamins. Large amounts of vitamin B_6 (pyridoxine) may interfere with the action of levodopa.
- Inform patient that harmless darkening of urine or sweat may occur.
- Advise patient to notify health care professional if palpitations, urinary retention, involuntary movements, behavioral changes, severe nausea and vomiting, or new skin lesions occur. Dosage reduction may be required.

Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms. Therapeutic effects usually become evident after 2–3 wk of therapy but may require up to 6 mo. Patients who take this medication for several years may experience a decrease in the effectiveness of this drug. Effectiveness may sometimes be restored after a "drug holiday."

levofloxacin, See FLUOROQUINOLONES.

levonorgestrel, See CONTRACEPTIVES, HORMONAL.

levothyroxine, See THYROID PREPARATIONS.

HIGH ALERT

LIDOCAINE

lidocaine (parenteral)
(**lye**-doe-kane)
LidoPen, Xylocaine, Xylocard

lidocaine (local anesthetic)
Xylocaine

lidocaine (mucosal)
Anestacon, Xylocaine Viscous

lidocaine patch
Lidoderm

lidocaine (topical)
L-M-X 4, L-M-X 5, Solarcaine Aloe Extra Burn Relief, Xylocaine, Zilactin-L

Classification
Therapeutic: anesthetics—topical/local, antiarrhythmics (class IB)

Pregnancy Category B

Indications

IV: Ventricular arrhythmias. **IM:** Self-injected or when IV unavailable (during transport to hospital facilities). **Local:** Infiltration/mucosal/topical anesthetic. **Patch:** Pain due to post-herpetic neuralgia.

Action

IV, IM: Suppresses automaticity and spontaneous depolarization of the ventricles during diastole by altering the flux of sodium ions across cell membranes with little or no effect on heart rate. **Local:** Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses.
Therapeutic Effects: Control of ventricular arrhythmias. Local anesthesia.

Pharmacokinetics

Absorption: Well absorbed after administration into the deltoid muscle; some absorption follows local use.
Distribution: Widely distributed. Concentrates in adipose tissue. Crosses the blood-brain barrier and placenta; enters breast milk.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Mostly metabolized by the liver; <10% excreted in urine as unchanged drug.
Half-life: Biphasic—initial phase, 7–30 min; terminal phase, 90–120 min; increased in CHF and liver impairment.

TIME/ACTION PROFILE (IV, IM = antiarrhythmic effects; local = anesthetic effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	immediate	10–20 min (up to several hours after continuous infusion)
IM	5–15 min	20–30 min	60–90 min
Local	rapid	unknown	1–3 hr

Contraindications/Precautions

Applies mainly to systemic use.
Contraindicated in: Hypersensitivity; cross-sensitivity may occur; Third-degree heart block.
Use Cautiously in: Liver disease, CHF, patients weighing <50 kg, and geriatric patients (reduce bolus and/or maintenance dose); Respiratory depression; Shock; Heart block; Pregnancy or lactation (safety not established); Children (safety not established for transdermal patch).

Adverse Reactions/Side Effects

Applies mainly to systemic use.
CNS: SEIZURES, confusion, drowsiness, blurred vision, dizziness, nervousness, slurred speech, tremor. **EENT:** *mucosal use*— decreased or absent gag reflex. **CV:** CARDIAC ARREST, arrhythmias, bradycardia, heart block, hypotension. **GI:** nausea, vomiting. **Resp:** bronchospasm. **Local:** stinging, burning, contact dermatitis, erythema. **Misc:** allergic reactions, including ANAPHYLAXIS.

Interactions

Applies mainly to systemic use.
Drug-Drug: ↑ cardiac depression and toxicity with **phenytoin, amiodarone, quinidine**, **procainamide**, or **propranolol**. **Cimetidine**, **azole antifungals**, **clarithromycin**, **erythromycin**, **fluoxetine**, **nefazodone**, **paroxetine**, **protease inhibitors**, **ritonavir**, **verapamil**, and **beta blockers** may ↓ metabolism and ↑ risk of toxicity. Lidocaine may ↑ levels of **calcium channel blockers**, certain **benzodiazepines**, **cyclosporine**, **fluoxetine**, **lovastatin**, **simvastatin**, **mirtazapine**, **paroxetine**, **ritonavir**, **tacrolimus**, **theophylline**, **tricyclic antidepressnts**, and **venlafaxine**. Effects of lidocaine may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin**.

Route/Dosage

Ventricular Tachycardia (with a Pulse) or Pulseless Ventricular Tachycardia/ Ventricular Fibrillation

IV (Adults): 1–1.5 mg/kg bolus; may repeat doses of 0.5–0.75 mg/kg q 5–10 min up to a total dose of 3 mg/kg; may then start continuous infusion of 1–4 mg/min.
Endotracheal (Adults): Give 2–2.5 times the IV loading dose down the endotracheal tube, followed by a 10-ml saline flush.
IV (Children): 1 mg/kg bolus (not to exceed 100 mg), followed by 20–50 mcg/kg/min continuous infusion (range 20–50 mcg/kg/min); may administer second bolus of 0.5–1 mg/kg if delay between bolus and continuous infusion.
Endotracheal (Children): Give 2–3 mg/kg down the endotracheal tube followed by a 5-ml saline flush.
IM (Adults and Children ≥50 kg): 300 mg (4.5 mg/kg); may be repeated in 60–90 min.

Local

Infiltration (Adults and Children): Infiltrate affected area as needed (increased amount and frequency of use increases likelihood of systemic absorption and adverse reactions).
Topical (Adults): Apply to affected area 2–3 times daily.
Mucosal (Adults): *For anesthetizing oral surfaces*—20 mg as 2 sprays/quadrant (not to exceed 30 mg/quadrant) may be used. 15 ml of the viscous solution may be used q 3 hr for oral or pharyngeal pain. *For anesthetizing the female urethra*—3–5 ml of the jelly or 20 mg as 2% solution may be used. *For anesthetizing the male urethra*—5–10 ml of the jelly or 5–15 ml of 2% solution may be used before catheterization or 30 ml of jelly before cystoscopy or similar procedures. Topical solutions may be used to anesthetize mucous membranes of the larynx, trachea, or esophagus.
Patch (Adults): Up to 3 patches may be applied once for up to 12 hr in any 24-hr period; consider smaller areas of application in geriatric or debilitated patients.

Copyright © 2008 by F.A. Davis

Availability (generic available)

Auto-injector for IM injection: 300 mg/3 ml. **Direct IV injection:** 10 mg/ml (1%), 20 mg/ml (2%). **For IV admixture:** 100 mg/ml (10%). **Premixed solution for IV infusion:** 4 mg/ml (0.4%), 8 mg/ml (0.8%). **Injection for local infiltration/nerve block:** 0.5%, 1%, 2%, 4%. ***In combination with:*** epinephrine for local infiltration. **Cream:** 4%[OTC]. **Gel:** 0.5%[OTC], 2.5%[OTC]. **Jelly:** 2%. **Liquid:** 5%. **Ointment:** 5%. **Transdermal system:** 5% patch. **Cost:** $189.98/box of 30 patches. **Solution:** 4%. **Spray:** 10%. **Viscous solution:** 2%. ***In combination with:*** prilocaine (as EMLA cream, Oraquix); with tetracaine (Synera); with bupivacaine (Duocaine); with epinephrine (LidoSite).

NURSING IMPLICATIONS

Assessment

- **Antiarrhythmic:** Monitor ECG continuously and blood pressure and respiratory status frequently during administration.
- **Anesthetic:** Assess degree of numbness of affected part.
- ***Lab Test Considerations:*** Serum electrolyte levels should be monitored periodically during prolonged therapy.
- IM administration may cause ↑ CPK levels.
- ***Toxicity and Overdose:*** Serum lidocaine levels should be monitored periodically during prolonged or high-dose IV therapy. Therapeutic serum lidocaine levels range from 1.5 to 5 mcg/ml: Signs and symptoms of toxicity include confusion, excitation, blurred or double vision, nausea, vomiting, ringing in ears, tremors, twitching, seizures, difficulty breathing, severe dizziness or fainting, and unusually slow heart rate, If symptoms of overdose occur, stop infusion and monitor patient closely.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

Implementation

- ***High Alert:*** Lidocaine is readily absorbed through mucous membranes. Inadvertent overdosage of lidocaine jelly and spray has resulted in patient harm or death from neurologic and/or cardiac toxicity. Do not exceed recommended dosages.
- **Throat Spray:** Ensure that gag reflex is intact before allowing patient to drink or eat.
- **IM:** IM injections are recommended only when ECG monitoring is not available and benefits outweigh risks. Administer IM injections only into deltoid muscle while frequently aspirating to prevent IV injection.

IV Administration

- **Direct IV:** Only 1% and 2% solutions are used for direct IV injection. ***Diluent:*** Administer undiluted. ***Rate:*** Administer loading dose over 2–3 min. Follow by IV continuous infusion.
- **Continuous Infusion:** ***Diluent:*** Lidocaine vials need to be further diluted. Dilute 2 g of lidocaine in 250 ml or 500 ml of D5W or 0.9% NaCl. Admixed infusion stable for 24 hr at room temperature. Premixed infusions are already diluted and ready to use. ***Concentration:*** 4–8 mg/ml. ***Rate:*** See Route/Dosage section. Administer via infusion pump for accurate dose.
- **Y-Site Compatibility:** alteplase, amikacin, aminophylline, amiodarone, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, streptokinase, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, van-

Copyright © 2008 by F.A. Davis

comycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate complex, caspofungin, diazepam, ganciclovir, lansoprazole, pantoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole.
- **Infiltration:** Lidocaine with epinephrine may be used to minimize systemic absorption and prolong local anesthesia.

Patient/Family Teaching
- May cause drowsiness and dizziness. Advise patient to call for assistance during ambulation and transfer.
- **IM:** Available in LidoPen Auto-Injector for use outside the hospital setting. Advise patient to telephone health care professional immediately if symptoms of a heart attack occur. Do not administer unless instructed by health care professional. To administer, remove safety cap and place back end on thickest part of thigh or deltoid muscle. Press hard until needle prick is felt. Hold in place for 10 sec, then massage area for 10 sec. Do not drive after administration unless absolutely necessary.
- **Topical:** Apply *Lidoderm Patch* to intact skin to cover the most painful area. Patch may be cut to smaller sizes with scissors before removing release liner. Clothing may be worn over patch. If irritation or burning sensation occurs during application, remove patch until irritation subsides. Wash hands after application; avoid contact with eyes. Dispose of used patch to avoid access by children or pets.

Evaluation/Desired Outcomes
- Decrease in ventricular arrhythmias.
- Local anesthesia.

lidocaine/prilocaine
(**lye**-doe-kane/**pri**-loe-kane)
EMLA

Classification
Therapeutic: anesthetics—topical/local

Pregnancy Category B

Indications
Produces local anesthesia prior to minor painful procedures including: Insertion of cannulae or needles, Arterial/venous/lumbar puncture, Intramuscular injections, Subcutaneous injections, Dermal procedures, Laser treatments, Circumcision. When applied to genital mucous membranes in preparation for superficial minor surgery or as preparation for infiltration anesthesia.

Action
Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. Combination of two anesthetics is applied as a system consisting of a cream under an occlusive dressing. Active drug is released into the dermal and epidermal skin layers, resulting in accumulation of local anesthetic in the regions of dermal pain receptors and nerve endings. **Therapeutic Effects:** Anesthetic action localized to the area of the application.

Pharmacokinetics
Absorption: Small amounts are systemically absorbed during 4-hr placement of EMLA system.
Distribution: Small amounts absorbed are widely distributed and cross the placenta and blood-brain barrier.
Metabolism and Excretion: *Lidocaine*—mostly metabolized by the liver. *Prilocaine*—metabolized by the liver and kidneys.
Half-life: *Lidocaine*—7–30 min first phase, 90–120 min terminal phase; *Prilocaine*—10–50 min.

TIME/ACTION PROFILE (local anesthesia)

ROUTE	ONSET	PEAK	DURATION†
Top	15 min	3 hr	1–2 hr

†Following removal of occlusive dressing

Contraindications/Precautions
Contraindicated in: Hypersensitivity to lidocaine, prilocaine, or any other amide-type local anesthetic; Hypersensitivity to any other product in the formulation; Should not be applied to middle ear; Pedi: Congenital or idiopathic methemoglobinemia; Infants <6 mo who are receiving methemoglobin-inducing agents.
Use Cautiously in: Repeated use or use on large areas of skin (more likely to result in systemic absorption); Geri: Elderly, acutely ill, or debilitated patients (increased risk of absorp-

Copyright © 2008 by F.A. Davis

tion and systemic effects); Severe liver disease; Any conditions associated with methemoglobinemia (including glucose-6-phosphate dehydrogenase deficiency); Pedi: Neonates and children <20 kg or 37 weeks gestation (area/duration of treatment should be limited); Lactation.

Adverse Reactions/Side Effects

Local: blanching, redness, alteration in temperature sensation, edema, itching, rash. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use with **class I antiarrhythmics** including **tocainide** and **mexiletine** may result in adverse cardiovascular effects. Concurrent use with other **local anesthetics** may result in ↑ toxicity. Concurrent use with **sulfonamides** in children ↑ the risk of methemoglobinemia (avoid concurrent use in children <12 mo).

Route/Dosage

Topical (Adults and Children): *Minor dermal procedures including venipuncture and IV cannulation*—2.5 g (½ of the 5-g tube) applied to 20–25 cm^2 (2 in by 2 in) area of skin, covered with an occlusive dressing applied for at least 1 hr. *Major dermal procedures including split-thickness skin graft harvesting*—2 g/10 cm^2 area of skin, covered with an occlusive dressing for at least 2 hr. *Adult male genital skin*—as an adjunct prior to local anesthetic infiltration, apply a thick layer (1 g/10 cm^2) to skin surface for 15 min; local infiltration anesthesia should be performedimmediately after removal of cream. *Adult female genital mucous membranes*—apply a thick layer (5–log) for 5–10 min.

Topical (Children 7–12 yr and >20 kg): Dose should not exceed 20 g over more than 200 cm^2 for more than 4 hr.

Topical (Children 1–6 yr and >10 kg): Dose should not exceed 10 g over more than 100 cm^2 for more than 4 hr.

Topical (Children 3 mo–12 mo and >5 kg): Dose should not exceed 2 g over more than 20 cm^2 for more than 4 hr.

Topical (Children 0–3 mo or <5 kg): Dose should not exceed 1 g over more than 10 cm^2 for more than 1 hr.

Availability (generic available)

Cream: 2.5% lidocaine with 2.5% prilocaine in 5- and 30-g tubes.

NURSING IMPLICATIONS

Assessment

- Assess application site for open wounds. Apply only to intact skin.
- Assess application site for anesthesia following removal of system and prior to procedure.

Potential Nursing Diagnosis

Acute pain (Indications)

Implementation

- **Topical:** When used for minor dermal procedures (venipuncture, IV cannulation, arterial puncture, lumbar puncture), apply the 2.5-g tube of cream (½ of the 5-g tube) to each 2 in. by 2 in. area of skin in a *thick* layer at the site of the impending procedure. Remove the center cutout piece from an occlusive dressing (supplied with the 5-g tube) and peel the paper liner from the paper-framed dressing. Cover the lidocaine/prilocaine cream so that there is a *thick* layer of cream underneath the occlusive dressing. Do not spread out or rub in the cream. Smooth the dressing edges carefully and ensure it is secure to avoid leakage. Remove the paper frame and mark the time of application on the occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 1 hr* before the start of a minor dermal procedure (venipuncture, IV cannulation). Anesthesia may be more profound with 90 min–2 hr application. Remove the occlusive dressing and wipe off the lidocaine/prilocaine cream. Clean the entire area with antiseptic solution and prepare the patient for the procedure.
- For major dermal procedures (skin graft harvesting), follow the same procedure using larger amounts of lidocaine/prilocaine cream and the appropriate-size occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 2 hr* before major dermal procedures.

Patient/Family Teaching

- Explain the purpose of cream and occlusive dressing to patient and parents. Inform the patient that lidocaine/prilocaine cream may block all sensations in the treated skin. Caution patient to avoid trauma to the area from scratching, rubbing, or exposure to extreme heat or cold temperatures until all sensation has returned.

Copyright © 2008 by F.A. Davis

- **Home Care Issues:** Instruct patient or parent in proper application. Provide a diagram of location for application.

Evaluation/Desired Outcomes

- Anesthesia in the area of application.

lindane (lin-dane)

gamma benzene hexachloride, ♣GBH, G-Well, ♣Hexit, ♣PMS Lindane, Scabene

Classification

Therapeutic: pediculocides, scabicides

Pregnancy Category B

Indications

Second-line treatment of parasitic arthropod infestation (scabies and head, body, and crab lice) for use only in patients who are intolerant to or do not respond to less toxic agents.

Action

Causes seizures and death in parasitic arthropods. **Therapeutic Effects:** Cure of infestation by parasitic arthropods.

Pharmacokinetics

Absorption: Significant systemic absorption (9–13%) greater with topical application to damaged skin.
Distribution: Stored in fat.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 17–22 hr (infants and children).

TIME/ACTION PROFILE (antiparasitic action)

ROUTE	ONSET	PEAK	DURATION
Top	rapid	6 hr	190 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Areas of skin rash, abrasion, or inflammation (absorption is increased); History of seizures; Lactation; Premature neonates (increased risk of CNS toxicity).
Use Cautiously in: Pregnancy (do not exceed recommended dose; do not use >2 courses of therapy); Children ≤2 yr, geriatric patients, patients with skin conditions (increased risk of systemic absorption and CNS side effects).

Adverse Reactions/Side Effects

All adverse reactions except dermatologic are signs of systemic absorption and toxicity.
CNS: SEIZURES, headache. **CV:** tachycardia. **GI:** nausea, vomiting. **Derm:** contact dermatitis (repeated application), local irritation.

Interactions

Drug-Drug: Concurrent use of **medications that lower seizure threshold** (may ↑ risk of seizures). Simultaneous topical use of **skin, scalp,** or **hair** products may increase systemic absorption.

Route/Dosage

Scabies

Topical (Adults and Children >1 month): 1% lotion applied to all skin surfaces from neck to toes; wash off 6 hr after application in infants, after 6–8 hr in children or after 8–12 hr in adults; may require a 2nd treatment 1 wk later.

Head Lice or Crab Lice

Topical (Adults and Children): 15–30 ml of shampoo applied and lathered for 4 min; may require a 2nd treatment 1 wk later.

Availability (generic available)

Lotion: 1%. **Shampoo:** 1%.

NURSING IMPLICATIONS

Assessment

- Assess skin and hair for signs of infestation before and after treatment.
- Examine family members and close contacts for infestation. When used in treatment of pediculosis pubis or scabies, sexual partners should receive concurrent prophylactic therapy.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Implementation

- Due to serious side effects, no more than 2 oz may be dispensed at a time and no refills are allowed.
- **Topical:** When applying medication to another person, wear gloves to prevent systemic absorption.
- Do not apply to open wounds (scratches, cuts, sores on skin or scalp) to minimize systemic absorption. Avoid contact with the eyes. If eye contact occurs, flush thoroughly with

Copyright © 2008 by F.A. Davis

water and notify physician or other health care professional.
- Institute appropriate isolation techniques.
- **Lotion:** Instruct patient to bathe with soap and water. Dry skin well and allow to cool before application. Apply lotion in amount sufficient to cover entire body surface with a thin film from neck down (60 ml for an adult). Leave medication on for an age-appropriate time frame (see Route/Dosage), then remove by washing. If rash, burning, or itching develops, wash off medication and notify physician or other health care professional.
- **Shampoo:** Use a sufficient amount of shampoo to wet hair and scalp (30 ml for short hair, 45 ml for medium hair, 60 ml for long hair). Rub thoroughly into hair and scalp and leave in place for 4 min. Then use enough water to work up a good lather; follow with thorough rinsing and drying. If applied in shower or bath, do not let shampoo run down on other parts of body or into water in which patient is sitting. When hair is dry, use fine-toothed comb to remove remaining nits or nit shells. Shampoo may also be used on combs and brushes to prevent spread of infestation.

Patient/Family Teaching
- Instruct patient on application technique and provide with a medication guide. Patient should repeat therapy only at the recommendation of health care professional. Discuss hygienic measures to prevent and to control infestation. Discuss potential for infectious contacts with patient. Explain why household members should be examined and sexual partners treated simultaneously.
- Instruct patient to wash all recently worn clothing and used bed linens and towels in very hot water or to dry clean to prevent reinfestation or spreading.
- Instruct patient not to apply other oils or creams during therapy; these increase the absorption of lindane and may lead to toxicity.
- Explain to patient that itching may persist after treatment; consult health care professional about use of topical hydrocortisone or systemic antihistamines.
- Advise patient that eyelashes can be treated by applying petroleum jelly 3 times/day for 1 wk.
- Instruct patient not to reapply sooner than 1 wk if live mites appear.
- **Shampoo:** Advise patient that shampoo should not be used as a regular shampoo in the absence of infestation. Emphasize need to avoid contact with eyes.
- Pedi: Advise parents to monitor young children closely for evidence of CNS toxicity (seizures, dizziness, clumsiness, fast heartbeat, muscle cramps, nervousness, restlessness, irritability, nausea, vomiting) during and immediately after treatment.
- Pedi: Cover hands of young children to prevent accidental ingestion from thumbsucking.

Evaluation/Desired Outcomes
- Resolution of signs of infestation with scabies or lice.

linezolid (li-nez-o-lid)
Zyvox

Classification
Therapeutic: anti-infectives
Pharmacologic: oxazolidinones

Pregnancy Category C

Indications
Treatment of: Infections caused by vancomycin-resistant *Enterococcus faecium*, Nosocomial pneumonia caused by *S. aureus* (methicillin-susceptible and -resistant strains), Complicated skin/skin structure infections caused by *S. aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes* or *S. agalactiae* (including diabetic foot infections), Uncomplicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, Community-acquired pneumonia caused by *Streptococcus pneumoniae* (including multi-drug resistant strains) or *Staphylococcus aureus* (methicillin-susceptible strains only).

Action
Inhibits bacterial protein synthesis at the level of the 23S ribosome of the 50S subunit. **Therapeutic Effects:** Bactericidal action against streptococci; bacteriostatic action against enterococci and staphylococci.

Pharmacokinetics
Absorption: Rapidly and extensively (100%) absorbed following oral administration.
Distribution: Readily distributes to well-perfused tissues.
Metabolism and Excretion: 65% metabolized, mostly by the liver; 30% excreted unchanged by the kidneys.

Copyright © 2008 by F.A. Davis

Half-life: 6.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Phenylketonuria (suspension contains aspartame).
Use Cautiously in: Thrombocytopenia, concurrent use of antiplatelet agents or bleeding diathesis (platelet counts should be monitored more frequently); OB: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CV: headache, insomnia. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, increased liver function tests, nausea, taste alteration, vomiting. **F and E:** lactic acidosis. **Hemat:** thrombocytopenia. **Neuro:** optic neuropathy, peripheral neuropathy.

Interactions

Drug-Drug: Linezolid has monoamine oxidase inhibitory properties; response to **indirect-acting sympathomimetics**, **vasopressors**, **SSRIs** or **dopaminergic agents** may be ↑. Initial doses of **adrenergics** such as **dopamine** or **epinephrine** should be ↓ and carefully titrated.
Drug-Food: Because of monoamine oxidase inhibitory properties, consumption of large amounts of foods or beverages containing **tyramine** should be avoided (↑ risk of pressor response. See Appendix L).

Route/Dosage

Vancomycin-Resistant *Enterococcus faecium* Infections

PO, IV (Adults): 600 mg every 12 hr for 14–28 days.
PO, IV (Children birth–11 yr): (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Pneumonia, Complicated Skin/Skin Structure Infections

PO, IV (Adults): 600 mg every 12 hr for 10–14 days.
PO, IV (Children birth–11 yr): 10 mg/kg every 8 hr for 10–14 days (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Uncomplicated Skin/Skin Structure Infections

PO (Adults): 400 mg q 12 hr for 10–14 days.
PO, IV (Children 5–11 yr): 10 mg/kg every 12 hr for 10–14 days.
PO, IV (Children <5 yr): 10 mg/kg every 8 hr for 10–14 days (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Availability

Oral suspension (orange): 20 mg/ml. **Tablets:** 400 mg, 600 mg. **Cost:** 600 mg $2,213.46/30. **Premixed infusion:** 200 mg/100 ml, 400 mg/200 ml, 600 mg/300 ml.

L

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving.
- May cause lactic acidosis. Notify health care professional if recurrent nausea and vomiting, unexplained acidosis or low bicarbonate levels occur.
- Monitor visual function in patients receiving linezolid for ≥3 months or who report visual symptoms (changes in acuity or color vision, blurred vision, visual field defect) regardless of length of therapy. If optic neuropathy occurs therapy should be reconsidered.
- **Pseudomembranous Colitis:** Assess bowel status (bowel sounds, frequency and consistency of stools, presence of blood in stools) during therapy.
- ***Lab Test Considerations:*** May cause bone marrow suppression, anemia, leukopenia, pancytopenia. Monitor CBC and platelet count weekly, especially in patients who are at risk for increased bleeding, who have pre-existing bone marrow suppression, who receive concurrent medications that may cause myelosuppression, or who may require >2 weeks of therapy. Discontinue therapy if bone marrow suppression occurs or worsens.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase and BUN.

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Dose adjustment is not necessary when switching from IV to oral dose.
- **PO:** May be administered with or without food.
- Before using oral solution gently invert 3–5 times to mix; do not shake. Store at room temperature.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Premixed infusions are already diluted and ready to use. Solution is yellowish in color which may intensify over time without affecting its potency. ***Concentration:*** 2 mg/ml. ***Rate:*** Infuse over 30–120 minutes. Flush line before and after infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, aztreonam, buprenorphine, butorphanol, bumetanide, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, dexmedetomidinedoxorubicin, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, esmolol, dexmedetomidineetoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, paclitaxel, pentobarbital, phenobarbital, palonosetron, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, sufentanil, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, chlorpromazine, diazepam, pantoprazole, pentamidine, phenytoin.

Patient/Family Teaching

- Advise patients taking oral linezolid to take as directed, for full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to avoid large quantities of foods or beverages containing tyramine (see Appendix L). May cause hypertensive response.
- Instruct patient to notify health care professional if patient has a history of hypertension and before patient takes other Rx, OTC, or herbal products, especially cold remedies, decongestants, or antidepressants.
- Advise patient to notify health care professional if no improvement is seen in a few days.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

liothyronine, See THYROID PREPARATIONS.

liotrix, See THYROID PREPARATIONS.

lisinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

lithium (lith-ee-um)

Carbolith, Duralith, Eskalith, Lithizine, Lithobid

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: mood stabilizers

Pregnancy Category D

Indications
Manic episodes of manic depressive illness (treatment, maintenance, prophylaxis).

Action
Alters cation transport in nerve and muscle. May also influence reuptake of neurotransmitters.
Therapeutic Effects: Prevents/decreases incidence of acute manic episodes.

Pharmacokinetics
Absorption: Completely absorbed after oral administration.
Distribution: Widely distributed into many tissues and fluids; CSF levels are 50% of plasma levels. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.
Half-life: 20–27 hr.

TIME/ACTION PROFILE (antimanic effects)

ROUTE	ONSET	PEAK	DURATION
PO, PO–ER	5–7 days	10–21 days	days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe cardiovascular or renal disease; Dehydrated or debilitated patients; Should be used only where therapy, including blood levels, may be closely monitored; Some products contain alcohol or tartrazine and should be avoided in patients with known hypersensitivity or intolerance.
Use Cautiously in: Any degree of cardiac, renal, or thyroid disease; Diabetes mellitus; Pregnancy/Lactation: Safety not established; Geri: Initial dosage reduction recommended.

Adverse Reactions/Side Effects
CNS: SEIZURES, fatigue, headache, impaired memory, ataxia, sedation, confusion, dizziness, drowsiness, psychomotor retardation, restlessness, stupor. **EENT:** aphasia, blurred vision, dysarthria, tinnitus. **CV:** ARRHYTHMIAS, ECG changes, edema, hypotension. **GI:** abdominal pain, anorexia, bloating, diarrhea, nausea, dry mouth, metallic taste. **GU:** polyuria, glycosuria, nephrogenic diabetes insipidus, renal toxicity. **Derm:** acneiform eruption, folliculitis, alopecia, diminished sensation, pruritus. **Endo:** hypothyroidism, goiter, hyperglycemia, hyperthyroidism. **F and E:** hyponatremia. **Hemat:** leukocytosis. **Metab:** weight gain. **MS:** muscle weakness, hyperirritability, rigidity. **Neuro:** tremors.

Interactions
Drug-Drug: May prolong the action of **neuromuscular blocking agents**. ↑ risk of neurologic toxicity with **haloperidol** or **molindone**. **Diuretics**, **methyldopa**, **probenecid**, **fluoxetine**, and **NSAIDs** may ↑ risk of toxicity. Blood levels may be ↑ by **ACE inhibitors**. Lithium may ↓ effects of **chlorpromazine**. **Chlorpromazine** may mask early signs of lithium toxicity. Hypothyroid effects may be additive with **potassium iodide** or **antithyroid agents**. **Aminophylline**, **phenothiazines**, and **drugs containing large amounts of sodium** ↑ renal elimination and ↓ effectiveness. **Psyllium** can ↓ **lithium** levels.
Drug-Natural Products: Caffeine-containing herbs (**cola nut, guarana, mate, tea**, **coffee**) may ↓ **lithium** serum levels and efficacy.
Drug-Food: Large changes in **sodium** intake may alter the renal elimination of lithium. ↑ sodium intake will ↑ renal excretion.

Route/Dosage
Precise dosing is based on serum lithium levels. 300 mg lithium carbonate contains 8–12 mEq lithium.
PO (Adults and Children ≥12 yr): *Tablets/capsules*—300–600 mg 3 times daily initially; usual maintenance dose is 300 mg 3–4 times daily. *Slow-release capsules*—200–300 mg 3 times daily initially; increased up to 1800 mg/day in divided doses. Usual maintenance dose is 300–400 mg 3 times daily. *Extended-release tablets*—450–900 mg twice daily *or* 300–600 mg 3 times daily initially; usual maintenance dose is 450 mg twice daily *or* 300 mg 3 times daily.
PO (Children <12 yr): 15–20 mg (0.4–0.5 mEq)/kg/day in 2–3 divided doses; dosage may be adjusted weekly.

Availability (generic available)
Capsules: 150 mg, 300 mg, 600 mg. **Cost:** *Generic*—150 mg $18.88/100, 300 mg $17.77/100, 600 mg $42.30/100—$0. **Tablets:** 300 mg. **Controlled-release tablets:** 300 mg, 450 mg. **Cost:** *Generic*—300 mg

Copyright © 2008 by F.A. Davis

$39.97/100, 450 mg $48.32/100. **Slow-release tablets:** 300 mg. **Syrup:** 300 mg (8 mEq lithium)/5 ml. **Cost:** $60.00/500 ml.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) initially and periodically. Assess manic symptoms with Young Mania Rating Scale (YMRS) at baseline and periodically through treatment in patients with mania. Initiate suicide precautions if indicated.
- Monitor intake and output ratios. Report significant changes in totals. Unless contraindicated, fluid intake of at least 2000–3000 ml/day should be maintained. Weight should also be monitored at least every 3 mo.
- ***Lab Test Considerations:*** Evaluate renal and thyroid function, WBC with differential, serum electrolytes, and glucose periodically during therapy.
- ***Lab Test Considerations:*** EKG for patients >50 years old.
- ***Toxicity and Overdose:*** Monitor serum lithium levels twice weekly during initiation of therapy and every 2–3 mo during chronic therapy. Draw blood samples in the morning immediately before next dose. Therapeutic levels range from 0.5 to 1.5 mEq/L: Assess patient for signs and symptoms of lithium toxicity (vomiting, diarrhea, slurred speech, decreased coordination, drowsiness, muscle weakness, or twitching). If these occur, report before administering next dose.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Ineffective coping (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- Do not confuse Lithobid (lithium) with Levbid (hyoscyamine).
- **PO:** Administer with food or milk to minimize GI irritation. Extended-release preparations should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. Take missed doses as soon as remembered unless within 2 hr of next dose (6 hr if extended release).
- Lithium may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that psychotherapy is beneficial in improving coping skills.
- Low sodium levels may predispose patient to toxicity. Advise patient to drink 2000–3000 ml fluid each day and eat a diet with consistent and moderate sodium intake. Excessive amounts of coffee, tea, and cola should be avoided because of diuretic effect. Avoid activities that cause excess sodium loss (heavy exertion, exercise in hot weather, saunas). Notify health care professional of fever, vomiting, and diarrhea, which also cause sodium loss.
- Advise patient that weight gain may occur. Review principles of a low-calorie diet.
- Instruct patient to consult health care professional before taking OTC medications or herbal products concurrently with this therapy.
- Advise patient to use contraception and to consult health care professional if pregnancy is suspected.
- Review side effects and symptoms of toxicity with patient. Instruct patient to stop medication and report signs of toxicity to health care professional promptly.
- Explain to patients with cardiovascular disease or over 40 yr of age the need for ECG evaluation before and periodically during therapy. Patient should inform health care professional if fainting, irregular pulse, or difficulty breathing occurs.
- Emphasize the importance of periodic lab tests to monitor for lithium toxicity.

Evaluation/Desired Outcomes

- Resolution of the symptoms of mania (hyperactivity, pressured speech, poor judgment, need for little sleep).
- Decreased incidence of mood swings in bipolar disorders.
- Improved affect in unipolar disorders. Improvement in condition may require 1–3 wk.
- Remission of depressive symptoms.

loperamide (loe-**per**-a-mide)
Diar-aid Caplets, Imodium, Imodium A-D, Kaopectate II Caplets, Maalox Antidiarrheal Caplets, Neo-Diaral, Pepto Diarrhea Control

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antidiarrheals

Pregnancy Category B

Indications
Adjunctive therapy of acute diarrhea. Chronic diarrhea associated with inflammatory bowel disease. Decreases the volume of ileostomy drainage.

Action
Inhibits peristalsis and prolongs transit time by a direct effect on nerves in the intestinal muscle wall. Reduces fecal volume, increases fecal viscosity and bulk while diminishing loss of fluid and electrolytes. **Therapeutic Effects:** Relief of diarrhea.

Pharmacokinetics
Absorption: Not well absorbed following oral administration.
Distribution: Unknown. Does not cross the blood-brain barrier.
Protein Binding: 97%.
Metabolism and Excretion: Metabolized partially by the liver, undergoes enterohepatic recirculation; 30% eliminated in the feces. Minimal excretion in the urine.
Half-life: 10.8 hr.

TIME/ACTION PROFILE (relief of diarrhea)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2.5–5 hr	10 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Patients in whom constipation must be avoided; Abdominal pain of unknown cause, especially if associated with fever; Alcohol intolerance (liquid only).
Use Cautiously in: Hepatic dysfunction; Geri: Increased sensitivity to effects; OB, Pedi: Pregnancy, lactation, or children <2 yr (safety not established).

Adverse Reactions/Side Effects
CNS: drowsiness, dizziness. **GI:** constipation, abdominal pain/distention/discomfort, dry mouth, nausea, vomiting. **Misc:** allergic reactions.

Interactions
Drug-Drug: ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic properties with other **drugs having anticholinergic properties**, including **antidepressants** and **antihistamines**.
Drug-Natural Products: Kava kava, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage
PO (Adults): 4 mg initially, then 2 mg after each loose stool. Maintenance dose usually 4–8 mg/day in divided doses (not to exceed 8 mg/day for OTC use or 16 mg/day for Rx use).
PO (Children 9–11 yr or 30–47 kg): 2 mg initially; then 1 mg after each loose stool (not to exceed 6 mg/24 hr; OTC use should not exceed 2 days).
PO (Children 6–8 yr or 24–30 kg): 1 mg initially, then 1 mg after each loose stool (not to exceed 4 mg/24 hr; OTC use should not exceed 2 days).

Availability (generic available)
Tablets: 2 mg[OTC]. **Capsules:** 2 mg. **Liquid (mint):** 1 mg/5 ml[OTC]. ***In combination with:*** simethicone (Immodium Advanced[OTC], see Appendix B).

NURSING IMPLICATIONS

Assessment
- Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.

Potential Nursing Diagnoses
Diarrhea (Indications)
Risk for injury (Side Effects)

Implementation
- **PO:** Administer with clear fluids to help prevent dehydration, which may accompany diarrhea.

Patient/Family Teaching
- Instruct patient to take medication as directed. Do not take missed doses, and do not double doses. In acute diarrhea, medication may be ordered after each unformed stool.

Copyright © 2008 by F.A. Davis

Advise patient not to exceed the maximum number of doses.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid using alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or distention occurs.

Evaluation/Desired Outcomes
- Decrease in diarrhea.
- In acute diarrhea, treatment should be discontinued if no improvement is seen in 48 hr.
- In chronic diarrhea, if no improvement has occurred after at least 10 days of treatment with maximum dose, loperamide is unlikely to be effective.

lopinavir/ritonavir
(loe-**pin**-a-veer/ri-**toe**-na-veer)
Kaletra

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors, metabolic inhibitors

Pregnancy Category C

Indications
HIV infection (with other antiretrovirals).

Action
Lopinavir: Inhibits HIV viral protease. **Ritonavir:** Although ritonavir has antiretroviral activity of its own (inhibits the action of HIV protease and prevents the cleavage of viral polyproteins), it is combined with lopinavir to inhibit the metabolism of lopinavir thus increasing its plasma levels. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics
Absorption: Well absorbed following oral administration; food enhances absorption.
Distribution: *Ritonavir*—poor CNS penetration.
Protein Binding: *Lopinavir*—98–99 % bound to plasma proteins.
Metabolism and Excretion: *Lopinavir*—completely metabolized in the liver by cytochrome P450 P3A (CY P450 P3A); ritonavir is a potent inhibitor of this enzyme. *Ritonavir*—highly metabolized by the liver (by CY P450 P3A and CY P2D6 enzymes); one metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.
Half-life: *Lopinavir*—5–6 hr; *ritonavir*—3–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Lopinavir PO	rapid	4 hr	12 hr
Ritonavir PO	rapid	4 hr*	12 hr

*Non-fasting

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of dihydroergotamine, ergotamine, ergonovine, flecainide, methylergonovine, midazolam, pimozide, propafenone, amiodaroneand triazolam, which are highly dependent on CY P3A or CY P2D6 for metabolism and for which ↑ blood levels may result in serious and/or life-threatening events; Concurrent use with simastatin, lovastatin, St. John's wort (hypericum perforatum) is not recommended; Hypersensitivity or intolerance to alcohol or castor oil (present in capsules and liquid).
Use Cautiously in: Known alcohol intolerance (oral solution contains alcohol); Concurrent use with atorvastatin (may increase risk of rhabdomyolysis); Concurrent use of antiarrhythmics including lidocaine and quinidine (therapeutic blood level monitoring recommended); Concurrent use of anticonvulsants including carbamazepine, phenobarbital or phenytoin (may decrease effectiveness of lopinavir); Concurrent use of dihydropyridine calcium channel blockers including felodipine, nifedipine and nicardipine (clinical monitoring recommended due to increased levels of calcium channel blocker); Impaired hepatic function, history of hepatitis (for ritonavir content); OB: Pregnancy or lactation (safety not established; breastfeeding not recommended in HIV-infected patients).
Exercise Extreme Caution in: Concurrent use with sildenafil, vardenafil or tadalafil should be undertaken with extreme caution and may result in hypotension, syncope, visual changes and prolonged erection.

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: headache, insomnia, weakness. **GI:** diarrhea (↑ in children), abdominal pain, nausea, pancreatitis, taste aversion (in children), vomiting (↑ in children). **Derm:** rash.

Interactions

Drug-Drug: Concurrent use of **flecainide**, **amiodarone**, **propafenone**, **dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine**, **pimozide**, **midazolam**, and **triazolam**, is contraindicated because of the risk of potentially serious, life-threatening drug interactions. Concurrent use with **sildenafil**, **vardenafil** or **tadalafil** should be undertaken with extreme caution and may result in hypotension, syncope, visual changes and prolonged erection (dose reduction of sildenafil to 25 mg every 48 hr with monitoring recommended). Concurrent use with **rifampin** ↓ effectiveness of antiretroviral therapy and should not be undertaken. Should not be used concurrently with **simvastatin** or **lovastatin** due to ↑ risk of rhabdomyolysis; similar risk exists for **atorvastatin** (use lowest possible dose with careful monitoring). Concurrent use with **efavirenz** or **nevirapine** ↓ lopinavir/ritonavir levels and effectiveness; dose increase may be necessary. **Delavirdine** ↑ lopinavir levels. ↑ levels of **lidocaine** and **quinidine** (blood level monitoring recommended). Concurrent use of anticonvulsants including **carbamazepine**, **phenobarbital**, or **phenytoin** may ↓ effectiveness of lopinavir. ↑ levels of **dihydropyridine calcium channel blockers** including **felodipine**, **nifedipine**, and **nicardipine** (clinical monitoring recommended). May alter levels and effectiveness of **warfarin**. ↑ levels of **clarithromycin** (dose reduction recommended for patients with CCr ≤60 ml/min. ↑ blood levels of **itraconazole** and **ketoconazole** (high antifungal doses not recommended). ↑ levels of **rifabutin** (dose reduction recommended). ↓ blood levels of **atovaquone** (may require dosage increase). **Dexamethasone** ↓ blood levels and may ↓ effectiveness of lopinavir. Oral solution contains alcohol may produce intolerance when administered with **disulfiram** or **metronidazole**. May ↑ levels and risk of toxicity with immunosuppressant including **cyclosporine** or **tacrolimus** (blood level monitoring recommended). May ↓ levels and effects of **methadone** (dose of **methadone** may need to be ↑). May ↓ levels and contraceptive efficacy of some estrogen-based **hormonal contraceptives** including **ethinyl estradiol** (alternative or additional methods of contraception recommended). ↑ levels of **fluticasone** by inhalation; avoid concurrent use.

Drug-Natural Products: Concurrent use with **St. John's wort** may ↓ levels and beneficial effect of lopinavir/ritonavir.

Route/Dosage

PO (Adults and Children >40 kg): 400/100 mg (3 capsules or 5 ml oral solution) twice daily *or* may be given as a single daily dose of 800/200 mg (6 capsules or 10 ml oral solution); single dose approved for adults only.

PO (Children 15–40 kg): 10 mg/kg lopinavir content twice daily.

PO (Children 7–15 kg): 12 mg/kg lopinavir content twice daily.

With Concurrent Efavirenz or Nevirapine

PO (Adults and Children >40 kg): 533/133 mg (4 capsules or 6.5 ml oral solution) twice daily.

PO (Children 15–50 kg): 11 mg/kg lopinavir content twice daily.

PO (Children 7–15 kg): 13 mg/kg lopinavir content twice daily.

Availability

Capsules: 133.3 mg lopinavir/33 mg ritonavir.

Oral solution (cotton candy or vanilla): 80 mg lopinavir/20 mg ritonavir per ml (contains 42.4% alcohol) in 60-ml bottles.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- Monitor triglyceride and cholesterol levels prior to initiating therapy and periodically during therapy.
- May cause hyperglycemia.

Copyright © 2008 by F.A. Davis

- May cause ↑ serum AST, ALT, GGT, and total bilirubin concentrations.

Potential Nursing Diagnosis

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse with Kaletra (lopinavir/ritonavir) with Keppra (levetiracetam).
- Patients taking concurrent didanosine should take didanosine 1 hr before or 2 hr after taking lopinavir/ritonavir.
- **PO:** Administer with food to enhance absorption.
- Oral solution is light yellow to orange.
- Capsules and oral solution are stable if refrigerated until expiration date on label or 2 months at room temperature.

Patient/Family Teaching

- Emphasize the importance of taking lopinavir/ritonavir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount, and do not stop taking this or other antiretrovirals without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that lopinavir/ritonavir should not be shared with others.
- Advise patient to avoid taking other medications, Rx, OTC, or herbal products, especially St. John's wort, without consulting health care professional.
- Inform patient that lopinavir/ritonavir does not cure AIDS or prevent associated or opportunistic infections. Lopinavir/ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of lopinavir/ritonavir are unknown at this time.
- Inform patient that lopinavir/ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; or increased urination occurs.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during lopinavir/ritonavir therapy.
- Caution patients taking sildenafil of increased risk of sildenafil-associated side effects (hypotension, visual changes, sustained erection). Notify health care professional promptly if these occur.
- Inform patient that redistribution and accumulation of body fat may occur causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct patient to notify health care professional if pregnancy is planned or suspected of if breastfeeding an infant.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

loratadine (lor-**a**-ta-deen)

Alavert, Claritin, Claritin 24–Hour Allergy, Claritin Hives Relief, Children's Loratidine, Claritin Reditabs, Clear-Atadine, Dimetapp Children's ND Non-Drowsy Allergy, Non-Drowsy Allergy Relief for Kids, Tavist ND

Classification
Therapeutic: antihistamines

Pregnancy Category B

Indications

Relief of symptoms of seasonal allergies. Management of chronic idiopathic urticaria. Management of hives.

Action

Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness; red, swollen eyes, itching).

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration (80%).
Distribution: Unknown.
Protein Binding: *Loratadine*—97%; *descarboethoxyloratadine*—73–77%.
Metabolism and Excretion: Rapidly and extensively metabolized during first pass through

Copyright © 2008 by F.A. Davis

the liver. Much is converted to descarboethoxyloratadine, an active metabolite.
Half-life: *Loratadine*—7.8–11 hr; *descarboethoxyloratadine*—20 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 hr	8–12 hr	>24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Lactation.
Use Cautiously in: Patients with hepatic impairment or CCr <30 ml/min (↓ dose to 10 mg every other day); Patients receiving drugs known to affect hepatic metabolism of drugs; Geri: ↑ risk of adverse reactions; OB, Pedi: Pregnancy or children <2 yr (safety not established).

Adverse Reactions/Side Effects
CNS: confusion, drowsiness (rare), paradoxical excitation. **EENT:** blurred vision. **GI:** dry mouth, GI upset. **Derm:** photosensitivity, rash. **Metab:** weight gain.

Interactions
Drug-Drug: The following interactions may occur, but are less likely to occur with loratidine than with more sedating antihistamines. **MAO inhibitors** may intensify and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**.
Drug-Natural Products: Kava kava, valerian, or **chamomile** can ↑ CNS depression.

Route/Dosage
PO (Adults and Children ≥6 yr): 10 mg once daily.
PO (Children ≥2–5 yr): 5 mg once daily.

Renal Impairment
PO (Adults): *CCr <30 ml/min*—10 mg every other day.

Hepatic Impairment
PO (Adults): 10 mg every other day.

Availability (generic available)
Rapidly disintegrating tablets (mint): 5 mg, 10 mg[OTC]. **Tablets:** 10 mg[OTC], 10 mg. **Chewable tablets:** 5 mg[OTC] (grape flavored). **Syrup (mint, fruit):** 5 mg/5 ml[OTC]. ***In combination with:*** pseudoephedrine (Claritin-D)[OTC]. See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result on allergy skin testing.

Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

Implementation
- **PO:** Administer once daily.
- *For rapidly disintegrating tablets (Alavert, Claritin Reditabs)*—place on tongue. Tablet disintegrates rapidly. May be taken with or without water.

Patient/Family Teaching
- Instruct patient to take medication as directed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional immediately if dizziness, fainting, or fast or irregular heartbeat occurs or if symptoms persist.

Evaluation/Desired Outcomes
- Decrease in allergic symptoms.
- Management of chronic idiopathic urticaria.
- Management of hives.

Copyright © 2008 by F.A. Davis

lorazepam (lor-az-e-pam)

Apo-Lorazepam, Ativan, Novo-Lorazem, Nu-Loraz

Classification

Therapeutic: anesthetic adjuncts, antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications

Anxiety disorder (oral). Preoperative sedation (injection). Decreases preoperative anxiety and provides amnesia. **Unlabeled uses: IV:** Antiemetic prior to chemotherapy. Insomnia, panic disorder, as an adjunct with acute mania or acute psychosis.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Sedation. Decreased anxiety. Decreased seizures.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rapidly and completely absorbed following IM administration. Sublingual absorption is more rapid than oral and is similar to IM.
Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Highly metabolized by the liver.
Half-life: Full–term neonates: 18–73 hr; older children: 6–17 hr; adults: 10–16 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	1–6 hr	8–12 hr
IM	30–60 min	1–2 hr†	8–12 hr
IV	15–30 min	15–20 min	8–12 hr

†Amnestic response

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Severe hypotension; Sleep apnea; OB: Use in pregnancy and lactation may cause CNS depression, flaccidity, feeding difficulties, hypothermia, seizures, and respiratory problems in the neonate; Lactation: Recommend to discontinue drug or bottle-feed.
Use Cautiously in: Severe hepatic/renal/pulmonary impairment; Myasthenia gravis; Depression; Psychosis; History of suicide attempt or drug abuse; COPD; Sleep apnea; Pedi: Use cautiously in children under 12 yr. In higher doses, benzyl alcohol in injection may cause potentially fatal "gasping syndrome" in neonates; Geri: Lower doses recommended for geriatric or debilitated patients; Hypnotic use should be short-term; **OVERDOSE:** Administer Flumazenil (do not use with patients with seizure disorder. May induce seizures.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, lethargy, hangover, headache, ataxia, slurred speech, forgetfulness, confusion, mental depression, rhythmic myoclonic jerking in pre-term infants, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** *rapid IV use only*— APNEA, CARDIAC ARREST, bradycardia, hypotension. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, **clozapine**, and other **sedative/hypnotics** including other **benzodiazepines.** May ↓ the efficacy of **levodopa**. **Smoking** may ↑ metabolism and ↓ effectiveness. **Valproate** can ↑ serum concentrations and ↓ clearance (↓ dose by 50%). **Probenecid** may ↓ metabolism of lorazepam, enhancing its actions (↓ dose by 50%). **Oral contraceptives** may increase clearance and decrease concentration of lorazepam.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian** or, **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Anxiety*—1–3 mg 2–3 times daily (up to 10 mg/day). *Insomnia*—2–4 mg at bedtime.
PO (Geriatric or Debilitated Patients): *Anxiety*—0.5–2 mg/day in divided doses initially. *Insomnia*—0.25–1 mg initially, increased as needed.
PO (Children): *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr.

Copyright © 2008 by F.A. Davis

Preoperative sedation—0.02–0.09 mg/kg/dose.
PO (Infants): *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr. *Preoperative sedation*—0.02–0.09 mg/kg/dose.
SL (Adults and Adolescents >18 yr): *Anxiety*— 2–3 mg/day in divided doses, not to exceed 6 mg/day; *preoperative sedation*—0.05 mg/kg, up to 4 mg total given 1–2 hr before surgery.
SL (Geriatric and Debilitated Patients): 0.5 mg/day, dose may be adjusted as necessary.
IM (Adults): *Preoperative sedation*—50 mcg (0.05 mg)/kg 2 hr before surgery (not to exceed 4 mg).
IM (Children): *Preoperative sedation*—0.02–0.09 mg/kg/dose.
IM (Infants): *Preoperative sedation*—0.02–0.09 mg/kg/dose.
IV (Adults): *Preoperative sedation*—44 mcg (0.044 mg)/kg (not to exceed 2 mg) 15–20 min before surgery. *Operative amnestic effect*—up to 50 mcg/kg (not to exceed 4 mg). *Antiemetic*—2 mg 30 min prior to chemotherapy; may be repeated q 4 hr as needed (unlabeled). *Anticonvulsant*—50 mcg (0.05 mg)/kg, up to 4 mg; may be repeated after 10–15 min (not to exceed 8 mg/12 hr; unlabeled).
IV (Children): *Preoperative sedation*—0.02–0.09 mg/kg/dose; may use smaller doses (0.01–0.03 mg/kg) and repeat q 20 min. *Antiemetic*—Single dose: 0.04–0.08 mg/kg/dose prior to chemotherapy (not to exceed 4 mg). Multiple doses: 0.02–0.05 mg/kg/dose q 6 hr prn (not to exceed 2 mg). *Anxiety/sedation*—0.02–0.1 mg/kg (not to exceed 2 mg) q 4–8 hr. *Status epilepticus*—0.1 mg/kg over 2–5 min (not to exceed 4 mg); may repeat with 0.05 mg/kg if needed.
IV (Infants): *Preoperative sedation*—0.02–0.09 mg/kg/dose; may use smaller doses (0.01–0.03 mg/kg) and repeat q 20 min. *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr. *Status epilepticus*—0.1 mg/kg over 2–5 min (not to exceed 4 mg); may repeat with 0.05 mg/kg if needed.
IV (Neonates): *Status epilepticus*—0.05 mg/kg over 2–5 min; may repeat in 10–15 min.

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **Concentrated oral solution:** 0.5 mg/5 ml, 2 mg/ml. **Sublingual tablets:** 0.5 mg, 1 mg, 2 mg. **Injection:** 2 mg/ml, 4 mg/ml.

NURSING IMPLICATIONS

Assessment

- Conduct regular assessment of continued need for treatment.
- Pedi: Assess neonates for prolonged CNS depression related to inability to metabolize lorazepam.
- Geri: Assess geriatric patients carefully for CNS reactions as they are more sensitive to these effects. Assess falls risk.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically throughout therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- **Status Epilepticus:** Assess location, duration, characteristics, and frequency of seizures. Institute seizure precautions.
- ***Lab Test Considerations:*** Patients on high-dose therapy should receive routine evaluation of renal, hepatic, and hematologic function.

Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse Ativan (lorazepam) with Atarax (hydroxyzine).
- Following parenteral administration, keep patient supine for at least 8 hr and observe closely.
- **PO:** Tablet may also be given sublingually (unlabeled) for more rapid onset.
- Take concentrated liquid solution with water, soda, pudding, or applesauce.
- **IM:** Administer IM doses deep into muscle mass at least 2 hr before surgery for optimum effect.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute immediately before use with an equal amount of sterile water for injection, D5W, or 0.9% NaCl for injection. Pedi: To decrease the amount of benzyl alcohol delivered to neonates, dilute the 4 mg/mL injection with preservative-free sterile

Copyright © 2008 by F.A. Davis

water for injection to make a 0.4 mg/mL dilution for IV use. Do not use if solution is colored or contains a precipitate. ***Rate:*** Administer at a rate not to exceed 2 mg/min or 0.05 mg/kg over 2–5 min. Rapid IV administration may result in apnea, hypotension, bradycardia, or cardiac arrest.

- **Y-Site Compatibility:** acyclovir, albumin, allopurinol, amifostine, amikacin, amiodarone, amphotericin B cholesteryl sulfate complex, amsacrine, anakinra, argatroban, atracurium, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, clindamycin, cladribine, clonidine, cyclophosphamide, cytarabine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, magnesium sulfate, melphalan, meropenem, methadone, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, oxaliplatin, paclitaxel, palonosetron, pancuronium, pemetrexed, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** aldesleukin, ampicillin, ampicillin/sulbactam, aztreonam, caspofungin, hydralazine, idarubicin, imipenem/cilastatin, lansoprazole, omeprazole, ondansetron, pantoprazole, phenytoin, potassium phosphate, sargramostim, sufentanil.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and not to skip or double up on missed doses. If medication is less effective after a few weeks, check with health care professional; do not increase dose.
- Advise patient that lorazepam is usually prescribed for short-term use and does not cure underlying problem.
- Advise patient to taper lorazepam by 0.05 mg q 3 days to decrease withdrawal symptoms; abrupt withdrawal may cause tremors, nausea, vomiting, and abdominal and muscle cramps.
- Teach other methods to decrease anxiety, such as increased exercise, support groups, relaxation techniques. Emphasize that psychotherapy is beneficial in addressing source of anxiety and improving coping skills.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety without excessive sedation.
- Reduction of preoperative anxiety.
- Postoperative amnesia.
- Improvement in sleep patterns.

losartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

lovastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

MAGNESIUM AND ALUMINUM SALTS

magaldrate (with simethicone)
(**mag**-al-drate)
Riopan Plus, ♣Riopan Plus Double Strength

magnesium hydroxide/aluminum hydroxide
(mag-**nee**-zhum hye-**drox**-ide/ a-**loo**-mi-num hye-**drox**-ide)
Alamag, ♣Diovol Ex, ♣Gelusil Extra Strength, Maalox, ♣Mylanta, Rulox

Classification
Therapeutic: antiulcer agents
Pharmacologic: antacids

Pregnancy Category C

Indications
Useful in a variety of GI complaints, including: Hyperacidity, Indigestion, GERD, Heartburn.

Action
Neutralize gastric acid following dissolution in gastric contents. Inactivate pepsin if pH is raised to ≥4. **Therapeutic Effects:** Neutralization of gastric acid with healing of ulcers and decrease in associated pain.

Pharmacokinetics
Absorption: During routine use, antacids are nonabsorbable. With chronic use, 15–30% of magnesium and smaller amounts of aluminum may be absorbed.
Distribution: Small amounts absorbed are widely distributed, cross the placenta, and appear in breast milk. Aluminum concentrates in the CNS.
Metabolism and Excretion: Excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effect on gastric pH)

ROUTE	ONSET	PEAK	DURATION
Aluminum PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)
Magnesium PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)

Contraindications/Precautions
Contraindicated in: Severe abdominal pain of unknown cause, especially if accompanied by fever; Renal failure (CrCl <30 ml/min); Products containing tartrazine or sugar in patients with known intolerance.
Use Cautiously in: Antacids containing magnesium in patients with any degree of renal insufficiency; Decreased bowel motility; Dehydration; Upper GI hemorrhage; Pedi: Children <12 yr (safety not established).

Adverse Reactions/Side Effects
GI: *aluminum salts*— constipation; *magnesium salts*— diarrhea. **F and E:** *magnesium salts*— hypermagnesemia; *aluminum salts*— hypophosphatemia.

Interactions
Drug-Drug: Absorption of **tetracyclines**, **phenothiazines**, **ketoconazole**, **itraconazole**, **iron salts**, **fluoroquinolones**, and **isoniazid** may be ↓ (separate by at least 2 hr).

Route/Dosage

Magaldrate/Simethicone
PO (Adults): 5–10 ml (540–1080 mg) between meals and at bedtime.

Magnesium Hydroxide/Aluminum Hydroxide
PO (Adults and Children ≥12 yr): 5–30 ml or 1–2 tablets 1–3 hr after meals and at bedtime.

Availability

Magaldrate/Simethicone
Suspension: 540 mg magaldrate/20 mg simethicone/5 ml[OTC], 1080 mg magaldrate/40 mg simethicone/5 ml[OTC].

Magnesium Hydroxide/Aluminum Hydroxide
Chewable Tablets: 300 mg aluminum hydroxide/150 mg magnesium hydroxide[OTC]. **Suspension:** 225 mg aluminum hydroxide/200 mg magnesium hydroxide/5 ml[OTC], 500 mg aluminum hydroxide/500 mg magnesium hydroxide/5 ml[OTC]. ***In combination with:*** simethicone[OTC]. See Appendix B.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.
- ***Lab Test Considerations:*** Monitor serum phosphate, potassium, and calcium levels periodically during chronic use. May cause increased serum calcium and decreased serum phosphate concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Magnesium and aluminum are combined as antacids to balance the constipating effects of aluminum with the laxative effects of magnesium.
- **PO:** To prevent tablets from entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- Shake suspensions well before administration.
- For an antacid effect, administer 1–3 hr after meals and at bedtime.

Patient/Family Teaching

- Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- Advise patient not to take this medication within 2 hr of taking other medications.
- Pedi: Aluminum- or magnesium-containing medicines can cause serious side effects in children, especially when given to children with renal disease or dehydration. Advise parents or caregivers not to administer OTC antacids to children without a doctor's order.

Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.

magnesium salicylate, See SALICYLATES.

MAGNESIUM SALTS (ORAL)

magnesium chloride (12% Mg; 9.8 mEq Mg/g)
(mag-**nee**-zhum **klor**-ide)
Chloromag, Slo-Mag

magnesium citrate (16.2% Mg; 4.4 mEq Mg/g)
(mag-**nee**-zhum **si**-trate)
Citrate of Magnesia, Citroma, Citromag

magnesium gluconate (5.4 % Mg; 4.4 mEq/g)
Almoate, Magtrate, Magonate

magnesium hydroxide (41.7% Mg; 34.3 mEq Mg/g)
(mag-**nee**-zhum hye-**drox**-ide)
Dulcolax Magnesia Tablets, Phillips Magnesia Tablets, Phillips Milk of Magnesia, MOM

magnesium oxide (60.3% Mg; 49.6 mEq Mg/g)
(mag-**nee**-zhum **ox**-ide)
Mag-Ox 400, Maox, Uro-Mag

Classification
Therapeutic: mineral and electrolyte replacements/supplements, laxatives
Pharmacologic: salines

Pregnancy Category UK

Indications

Treatment/prevention of hypomagnesemia. As a: Laxative, Bowel evacuant in preparation for surgical/radiographic procedures. Milk of Magnesia has also been used as an antacid.

Action

Essential for the activity of many enzymes. Play an important role in neurotransmission and muscular excitability. Are osmotically active in GI tract, drawing water into the lumen and causing peristalsis. **Therapeutic Effects:** Replacement in deficiency states. Evacuation of the colon.

Pharmacokinetics

Absorption: Up to 30% may be absorbed orally.
Distribution: Widely distributed. Cross the placenta and are present in breast milk.
Metabolism and Excretion: Excreted primarily by the kidneys.
Half-life: Unknown.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	3–6 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block; OB: Active labor or within 2 hr of delivery (unless used for preterm labor).

Use Cautiously in: Any degree of renal insufficiency.

Adverse Reactions/Side Effects

GI: diarrhea. **Derm:** flushing, sweating.

Interactions

Drug-Drug: Potentiates **neuromuscular blocking agents**. May ↓ absorption of **fluoroquinolones**, **nitrofurantoin**, and **tetracyclines** and **penicillamine**.

Route/Dosage

Prevention of Deficiency (in mg of Magnesium)

PO (Adults and Children >10 yr): *Adolescent and adult men*—270–400 mg/day; *adolescent and adult women*—280–300 mg/day; *pregnant women*—320 mg/day; *breastfeeding women*—340–355 mg/day.

PO (Children 7–10 yr): 170 mg/day.

PO (Children 4–6 yr): 120 mg/day.

PO (Children birth–3 yr): 40–80 mg/day.

Treatment of Deficiency (expressed as mg of Magnesium)

PO (Adults): 200–400 mg/day in 3–4 divided doses.

PO (Children 6–11 yr): 3–6 mg/kg/day in 3–4 divided doses.

Laxative

PO (Adults): *Magnesium citrate*—240 ml; *magnesium hydroxide (Milk of Magnesia)*—30–60 ml single or divided dose or 10–20 ml as concentrate.

PO (Children 6–12 yr): *Magnesium citrate*—100 ml; *magnesium hydroxide (Milk of Magnesia)*—15–30 ml single or divided dose.

PO (Children 2–5 yr): *magnesium hydroxide (Milk of Magnesia)*—5–15 ml single or divided dose.

Availability

Magnesium Chloride

Sustained-release tablets: 535 mg (64 mg magnesium) OTC. **Enteric-coated tablets:** 833 mg (100 mg magnesium) OTC.

Magnesium Citrate

Oral solution: 240-, 296-, and 300-ml bottles (77 mEq magnesium/100 ml) OTC.

Magnesium Gluconate

Tablets: 500 mg OTC. **Liquid:** 54 mg/5 ml OTC.

Magnesium Hydroxide

Liquid: 400 mg/5 ml (164 mg magnesium/5 ml) OTC. **Concentrated liquid:** 800 mg/5 ml (328 mg magnesium/5 ml) OTC. **Chewable tablets:** 300 mg (130 mg magnesium) OTC, 600 mg (260 mg magnesium) OTC.

Magnesium Oxide

Tablets: 400 mg (241.3 mg magnesium) OTC.

Capsules: 140 mg (84.5 mg magnesium) OTC.

NURSING IMPLICATIONS

Assessment

- **Laxative:** Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- **PO:** To prevent tablets entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- *Magnesium citrate:* Refrigerate solutions to ensure they retain potency and palatability. May be served over ice. Magnesium citrate in an open container will lose carbonation upon standing; this will not affect potency but may reduce palatability.
- *Magnesium hydroxide:* Shake solution well before administration.
- **Antacid:** Administer 1–3 hr after meals and at bedtime.
- Powder and liquid forms are considered more effective than tablets.

Copyright © 2008 by F.A. Davis

- **Laxative:** Administer on empty stomach for more rapid results. Follow all oral laxative doses with a full glass of liquid to prevent dehydration and for faster effect. Do not administer at bedtime or late in the day.

Patient/Family Teaching

- Advise patient not to take this medication within 2 hr of taking other medications, especially fluoroquinolones, nitrofurantoin, and tetracyclines.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Laxatives:** Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid intake, and mobility. Normal bowel habits are individualized; frequency of bowel movement may vary from 3 times/day to 3 times/wk.
- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbalance (muscle cramps or pain, weakness, dizziness) occur.

Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.
- Passage of a soft, formed bowel movement, usually within 3–6 hr.
- Prevention and treatment of magnesium deficiency.

HIGH ALERT

magnesium sulfate (IV, parenteral) (9.9% Mg; 8.1 mEq Mg/g)

(mag-**nee**-zhum **sul**-fate)

Classification

Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: minerals/electrolytes

Pregnancy Category D

Indications

Treatment/prevention of hypomagnesemia. Treatment of hypertension. Anticonvulsant associated with severe eclampsia, pre-eclampsia, or acute nephritis. **Unlabeled uses:** Preterm labor. Treatment of Torsade de pointes. Adjunctive treatment for bronchodilation in moderate to severe acute asthma.

Action

Essential for the activity of many enzymes. Plays an important role in neurotransmission and muscular excitability. **Therapeutic Effects:** Replacement in deficiency states. Resolution of eclampsia.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; well absorbed from IM sites.
Distribution: Widely distributed. Crosses the placenta and is present in breast milk.
Metabolism and Excretion: Excreted primarily by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	60 min	unknown	3–4 hr
IV	immediate	unknown	30 min

Contraindications/Precautions

Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block; Active labor or within 2 hr of delivery (unless used for preterm labor).
Use Cautiously in: Any degree of renal insufficiency; Digitalized patients.

Adverse Reactions/Side Effects

CNS: drowsiness. **Resp:** decreased respiratory rate. **CV:** arrhythmias, bradycardia, hypotension. **GI:** diarrhea. **MS:** muscle weakness. **Derm:** flushing, sweating. **Metab:** hypothermia.

Interactions

Drug-Drug: Potentiate **calcium channel blockers** and **neuromuscular blocking agents**.

Route/Dosage

Treatment of Deficiency (expressed as mg of Magnesium)

IM, IV (Adults): *Severe deficiency*—8–12 g/day in divided doses; *mild deficiency*—1 g q 6 hr for 4 doses or 250 mg/kg over 4 hr.

Copyright © 2008 by F.A. Davis

IM, IV (Children >1 month): 25–50 mg/kg/dose q 4–6 hr for 3–4 doses, maximum single dose: 2 g.
IV (Neonates): 25–50 mg/kg/dose q 8–12 hr for 2–3 doses.

Seizures/Hypertension

IM, IV (Adults): 1 g q 6 hr for 4 doses as needed.
IM, IV (Children): 20–100 mg/kg/dose q 4–6 hr as needed, may use up to 200 mg/kg/dose in severe cases.

Torsade de pointes

IV (Infants and Children): 25–50 mg/kg/dose, maximum dose: 2 g.

Bronchodilation

IV (Adults): 2 g single dose.
IV (Children): 25 mg/kg/dose, maximum dose: 2 g.

Eclampsia/Pre-Eclampsia

IV, IM (Adults): 4–5 g by IV infusion, concurrently with up to 5 g IM in each buttock; then 4–5 g IM q 4 hr *or* 4 g by IV infusion followed by 1–2 g/hr continuous infusion (not to exceed 40 g/day or 20 g/48 hr in the presence of severe renal insufficiency).

Part of Parenteral Nutrition

IV (Adults): 4–24 mEq/day.
IV (Children): 0.25–0.5 mEq/kg/day.

Availability (generic available)

Injection: 500 mg/ml (50%). **Premixed infusion:** 1 g/100 ml, 2 g/100 ml, 4 g/50 ml, 4 g/100 ml, 20 g/500 ml, 40 g/1000 ml.

NURSING IMPLICATIONS

Assessment

- **Hypomagnesemia/Anticonvulsant:** Monitor pulse, blood pressure, respirations, and ECG frequently throughout administration of parenteral magnesium sulfate. Respirations should be at least 16/min before each dose.
- Monitor neurologic status before and throughout therapy. Institute seizure precautions. Patellar reflex (knee jerk) should be tested before each parenteral dose of magnesium sulfate. If response is absent, no additional doses should be administered until positive response is obtained.
- Monitor newborn for hypotension, hyporeflexia, and respiratory depression if mother has received magnesium sulfate.
- Monitor intake and output ratios. Urine output should be maintained at a level of at least 100 ml/4 hr.
- ***Lab Test Considerations:*** Monitor serum magnesium levels and renal function periodically throughout administration of parenteral magnesium sulfate.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of IV magnesium has resulted in serious patient harm and death. Have second practitioner independently double-calculations, and infusion pump settings. Do not confuse milligram (mg), gram (g), or millequivalent (mEq) dosages.
- **IM:** Administer deep IM into gluteal sites. Administer subsequent injections in alternate sides. Dilute to a concentration of 200 mg/ml prior to injection.

IV Administration

- **Direct IV:** ***Diluent:*** 50% solution must be diluted in 0.9% NaCl or D5W to a concentration of ≤20% prior to administration. ***Concentration:*** ≤20%. ***Rate:*** Administer at a rate not to exceed 150 mg/min.
- **Continuous Infusion:** ***Diluent:*** Dilute in D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.5 mEq/ml (60 mg/ml) (may use maximum concentration of 1.6 mEq/ml (200 mg/ml) in fluid-restricted patients). ***Rate:*** Infuse over 2-4 hr. Do not exceed a rate of 1 mEq/kg/hr (125 mg/kg/hr). When rapid infusions are needed (severe asthma or Torsade de pointes) may infuse over 10–20 min.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amikacin, ampicillin, atropine, aztreonam, bivalirudin, bumetanide, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, daptomycin, cefazolin, cefotaxime dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, cefazolin, cefotaxime docetaxel, dopamine, cefazolin, cefotaxime, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, cefazo-

Copyright © 2008 by F.A. Davis

lin, cefotaxime erythromycin, ertapenem, esmolol, cefazolin, cefotaxime etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gentamicin, granisetron, heparin, hydromorphone, hydroxyzine, idarubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, paclitaxel, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** aminophylline, amphotericin B cholesteryl sulfate complex, calcium chloride, cefepime, ceftriaxone, cefuroxime, ciprofloxacin, dexamethasone sodium phosphate, diazepam, drotrecogin, haloperidol, lansoprazole, methylprednisolone sodium succinate, phenytoin, phytonadione.

Patient/Family Teaching

- Explain purpose of medication to patient and family.

Evaluation/Desired Outcomes

- Normal serum magnesium concentrations.
- Control of seizures associated with toxemias of pregnancy.

mannitol (man-i-tol)
Osmitrol, Resectisol

Classification
Therapeutic: diuretics
Pharmacologic: osmotic diuretics

Pregnancy Category C

Indications

IV: Adjunct in the treatment of: Acute oliguric renal failure, Edema, Increased intracranial or intraocular pressure, Toxic overdose. **GU irrigant:** During transurethral procedures (2.5–5% solution only).

Action

Increases the osmotic pressure of the glomerular filtrate, thereby inhibiting reabsorption of water and electrolytes. Causes excretion of: Water, Sodium, Potassium, Chloride, Calcium, Phosphorus, Magnesium, Urea, Uric acid.
Therapeutic Effects: Mobilization of excess fluid in oliguric renal failure or edema. Reduction of intraocular or intracranial pressure. Increased urinary excretion of toxic materials. Decreased hemolysis when used as an irrigant after transurethral prostatic resection.

Pharmacokinetics

Absorption: IV administration produces complete bioavailability. Some absorption may follow use as a GU irrigant.
Distribution: Confined to the extracellular space; does not usually cross the blood-brain barrier or eye.
Metabolism and Excretion: Excreted by the kidneys; minimal liver metabolism.
Half-life: 100 min.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
IV	30–60 min	1 hr	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Anuria; Dehydration; Active intracranial bleeding.
Use Cautiously in: Pregnancy and lactation (safety not established).

Adverse Reactions/Side Effects

CNS: confusion, headache. **EENT:** blurred vision, rhinitis. **CV:** transient volume expansion, chest pain, CHF, pulmonary edema, tachycardia. **GI:** nausea, thirst, vomiting. **GU:** renal failure, urinary retention. **F and E:** dehydration, hyperkalemia, hypernatremia, hypokalemia, hyponatremia. **Local:** phlebitis at IV site.

Interactions

Drug-Drug: Hypokalemia increases the risk of **digoxin** toxicity.

Route/Dosage

IV (Adults): *Edema, oliguric renal failure*—50–100 g as a 5–25% solution; may precede with a test dose of 0.2 g/kg over 3–5 min. *Reduction of intracranial/intraocular pressure*—0.25–2 g/kg as 15–25% solution over 30–60 min (500 mg/kg may be sufficient in

Copyright © 2008 by F.A. Davis

small or debilitated patients). *Diuresis in drug intoxications*—50–200 g as a 5–25% solution titrated to maintain urine flow of 100–500 ml/hr.

IV (Children): *Edema, oliguric renal failure*—0.25–2 g/kg (60 g/m^2) as a 15–20% solution over 2–6 hr; may precede with a test dose of 0.2 g/kg over 3–5 min. *Reduction of intracranial/intraocular pressure*—1–2 g/kg (30–60 g/m^2) as a 15–20% solution over 30–60 min (500 mg/kg may be sufficient in small or debilitated patients). *Diuresis in drug intoxications*—up to 2 g/kg (60 g/m^2) as a 5–10% solution.

Availability (generic available)

IV injection: 5%, 10%, 15%, 20%. **GU irrigant:** 5%. ***In combination with:*** sorbitol for GU irrigation.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs, urine output, CVP, and pulmonary artery pressures (PAP) before and hourly throughout administration. Assess patient for signs and symptoms of dehydration (decreased skin turgor, fever, dry skin and mucous membranes, thirst) or signs of fluid overload (increased CVP, dyspnea, rales/crackles, edema).
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Report signs of electrolyte imbalance.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving this medication to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- ***Lab Test Considerations:*** Renal function and serum electrolytes should be monitored routinely throughout course of therapy.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

Implementation

- Observe infusion site frequently for infiltration. Extravasation may cause tissue irritation and necrosis.
- Do not administer electrolyte-free mannitol solution with blood. If blood must be administered simultaneously with mannitol, add at least 20 mEq NaCl to each liter of mannitol.
- Confer with physician regarding placement of an indwelling Foley catheter (except when used to decrease intraocular pressure).
- **IV:** Administer by IV infusion undiluted. If solution contains crystals, warm bottle in hot water and shake vigorously. Do not administer solution in which crystals remain undissolved. Cool to body temperature. Use an in-line filter for 15%, 20%, and 25% infusions.
- **Test Dose:** Administer over 3–5 min to produce a urine output of 30–50 ml/hr. If urine flow does not increase, administer 2nd test dose. If urine output is not at least 30–50 ml/hr for 2–3 hr after 2nd test dose, patient should be re-evaluated.
- **Oliguria:** Administration rate should be titrated to produce a urine output of 30–50 ml/hr. Administer child's dose over 2–6 hr.
- **Increased Intracranial Pressure:** Infuse dose over 30–60 min in adults and children.
- **Intraocular Pressure:** Administer dose over 30 min. When used preoperatively, administer 60–90 min before surgery.
- **Y-Site Compatibility:** amifostine, aztreonam, fludarabine, fluorouracil, idarubicin, linezolid, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** cefepime, filgrastim.
- **Irrigation:** Add contents of two 50-ml vials of 25% mannitol to 900 ml of sterile water for injection for a 2.5% solution for irrigation. Use only clear solutions.

Patient/Family Teaching

- Explain purpose of therapy to patient.

Evaluation/Desired Outcomes

- Urine output of at least 30–50 ml/hr or an increase in urine output in accordance with parameters set by physician.
- Reduction in intracranial pressure.
- Reduction of intraocular pressure.
- Excretion of certain toxic substances.
- Irrigation during transurethral prostate resection.

Copyright © 2008 by F.A. Davis

maraviroc (ma-ra-**vi**-rok)
Selzentry

Classification
Therapeutic: antiretrovirals
Pharmacologic: CCR5 co-receptor antagonists

Pregnancy Category B

Indications
HIV infection (with other antiretrovirals), specifically in patients with only CCR5–tropic HIV-1 detectable, with evidence of viral replication and HIV-1 strains displaying multiple resistance to other antiretrovirals. Use should be determined by treatment history and tropism testing.

Action
Blocks a specific receptor on CD-4 and T-cell surfaces which prevents CCR5–tropic HIV-1 from entering. **Therapeutic Effects:** Decreased invasion of CD-4 and T-cells by CCR5–tropic HIV-1 virus resulting in viral replication.

Pharmacokinetics
Absorption: 2–33% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); 8% renal excretion as unchanged drug.
Half-life: 14–18 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–4 hr	1–2 hr

Contraindications/Precautions
Contraindicated in: Dual/mixed or CXCR4–tropic HIV-1; OB: Lactation (breastfeeding not recommended for HIV-infected patients).
Use Cautiously in: Pre-existing liver disease including Hepatitis B or C (may ↑ risk of hepatotoxicity; Cardiovascular disease or risk factors (increased risk of cardiovascular events); Hepatic impairment; Renal impairment (if CCr <50 ml/min and using a CYP3A inhibitor use only if necessary); Treatment-naive adults (safety/efficacy not established); Geri: Consider age-related decrease in renal/hepatic function, concurrent drug therapy and concomitant disease; OB: Use only if clearly needed; Pedi: Safe use in children <16 yr not established.

Adverse Reactions/Side Effects
CNS: dizziness. **Resp:** cough, upper respiratory tract infection. **GI:** abdominal pain, appetite disorder, HEPATOTOXICITY. **Derm:** RASH. **MS:** musculoskeletal pain. **Misc:** ALLERGIC REACTIONS, fever, immune reconstitution syndrome, ↑ risk of infection.

Interactions
Drug-Drug: Levels are ↑ by **CYP3A inhibitors** including **protease inhibitors** (excluding tipranavir/ritonavir), **delavirdine**, **ketoconazole**, **lopinavir/ritonavir**, **saquinavir**, and **atazanavir**. Levels are ↓ by **CYP3A inducers** including **efavirenz** and **rifampin**.

Route/Dosage
PO (Adults): *Concurrent CYP3A inhibitors (except tipranavir/ritonavir) or delavirdine*—150 mg twice daily; *Concurrent NRTIs, tipranavir/ritonavir, nevirapine and other drugs that are not strong inhibitors/inducers of CYP3A*—300 mg twice daily; *Concurrent CYP3A inducers including efavirenz*—600 mg twice daily.

Availability
Tablets: 150 mg, 300 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hepatitis or allergic reaction (pruritic rash, jaundice, dark urine, vomiting, abdominal pain). If symptoms occur, discontinue maraviroc immediately.
- ***Lab Test Considerations:*** Testing for CCR5–tropic HIV-1 should be obtained prior to initiating therapy.
- Monitor viral load and CD-4 cell count regularly during therapy.
- May cause ↑ AST, ALT, total bilirubin, amylase, and lipase.
- May cause ↓ absolute neutrophil count.

Potential Nursing Diagnoses
Risk for infection (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation
- **PO:** May be administered without regard to food. Tablets should be swallowed whole; do not crush, break, or chew.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Emphasize the importance of taking maraviroc as directed, at the same time each day. Advise patient to read the Patient Information that comes with the medication each time the Rx is refilled. Maraviroc must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. If a dose is missed, take as soon as remembered, then return to regular dose schedule. If it is within 6 hr of next dose, omit dose and take next dose at regular time. Do not double doses.
- Instruct patient that maraviroc should not be shared with others.
- Inform patient that maraviroc does not cure AIDS or prevent associated or opportunistic infections. Maraviroc does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. The long-term effects of maraviroc are unknown at this time. If new symptoms of infection develop after starting maraviroc, notify health care professional.
- Advise patient to discontinue maraviroc and notify health care professional if itchy rash, yellow colored skin or eyes, dark urine, vomiting, or abdominal pain occur.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize postural hypotension.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially St. John's Wort; may decrease effectiveness of maraviroc.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD-4 cell counts.

MAST CELL STABILIZERS

cromolyn† (**kroe**-moe-lin)
Apo-Cromolyn, Gastrocrom, Intal, NasalCrom

nedocromil† (ne-doe-**kroe**-mil)
Tilade

Classification
Therapeutic: antiasthmatics, allergy, cold, and cough remedies
Pharmacologic: mast cell stabilizers

Pregnancy Category B

†For ophthalmic use, see Appendix C

Indications

Inhalation: Management (long-term control) of asthma; prevention of exercise-induced bronchospasm. **Intranasal (cromolyn only):** Prevention and treatment of seasonal and perennial allergic rhinitis. **Oral (cromolyn only):** Mastocytosis.

Action

Prevents the release of histamine, leukotrienes, and slow-reacting substance of anaphylaxis (SRS-A) from sensitized mast cells. **Therapeutic Effects:** Decreased frequency and intensity of asthmatic episodes, allergic reactions, and mastocytosis.

Pharmacokinetics

Absorption: *Cromolyn*—Poorly absorbed (<1% with oral); action is local. Small amounts may reach systemic circulation after inhalation. *Nedocromil*—poorly absorbed systemically (<2%).
Distribution: Because only small amounts are absorbed, distribution of these agents is not known.
Metabolism and Excretion: Small amounts absorbed are excreted unchanged in urine and bile (urine only for nedocromil).
Half-life: *Cromolyn*—80–90 min; *nedocromil*—1.5 hr.

TIME/ACTION PROFILE (effects on symptoms)

ROUTE	ONSET	PEAK	DURATION
Cromolyn—inhalation	1–2 wk	2–4 wk	unknown
Cromolyn—nasal	1–2 wk	2–4 wk	unknown

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Cromolyn-oral	1–2 wk	2–6 wk	2–3 wk†
Nedocromil—inhalation	within 2 wk	unknown	unknown

†After treatment discontinued

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma (inhalation products).

Use Cautiously in: Will not relieve and may worsen acute attacks of bronchospasm (inhalation); Will not relieve and may worsen acute attacks of bronchospasm (inhalation); *Cromolyn*—Renal or hepatic dysfunction (oral only); OB, Lactation: Pregnancy and lactation (safety not established); Pedi: *Cromolyn*—Children <2 yr (safety not established); Pedi: *Nedocromil*—Children <6 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **CV:** chest pain. **EENT:** *intranasal*— nasal irritation, nasal congestion, pharyngitis, rhinitis, sneezing. **Resp:** *inhalation*— cough, cough, irritation of the throat and trachea, bronchospasm. **GI:** unpleasant taste, diarrhea, nausea, vomiting. **Derm:** erythema, rash, urticaria. **Misc:** allergic reactions including ANAPHYLAXIS or worsening of conditions being treated, fever.

Interactions

Drug-Drug: Not known.

Route/Dosage

Cromolyn

Inhaln (Adults and Children ≥2 yr): *Nebulized solution*—One ampule (20 mg) via nebulization 4 times daily. For prevention of bronchospasm, one ampule (20 mg) should be given via nebulization 10–15 min before exposure to known precipitating situation.

Inhaln (Adults and Children ≥5 yr): *Aerosol*—2 inhalations (0.8 mg/inhalation) 4 times daily; ↓ to 2–3 times daily once symptoms are well-controlled. For prevention of bronchospasm, use 2 inhalations 10–15 min before exposure to known precipitating situation.

Intranasal (Adults and Children ≥2 yr): 1 spray (5.2 mg/spray) each nostril 3–4 times daily (up to 6 times daily).

PO (Adults and Children >12 yr): 200 mg 4 times daily.

PO (Children 2–12 yr): 100 mg 4 times daily (not to exceed 40 mg/kg/day).

Nedocromil

Inhaln (Adults and Children ≥6 yr): 2 inhalations (1.75 mg/inhalation) 4 times daily; ↓ to 2–3 times daily once symptoms are well-controlled.

Availability

Cromolyn

Solution for nebulization: 10 mg/ml. **Aerosol for inhalation:** 800 mcg/actuation in 8.1-g (112 actuations) or 14.2-g (200 actuations) containers. **Nasal solution:** 40 mg/ml (5.2 mg/spray) in 13-ml (≥100 sprays) or 26-ml (≥200 sprays) containers[OTC]. **Oral solution:** 100 mg/5 ml.

Nedocromil

Aerosol for inhalation: 1.75 mg/actuation in 16.2-g canister (at least 104 inhalations).

NURSING IMPLICATIONS

Assessment

- **Inhaln:** Evaluate pulmonary function testing before initiating therapy in asthmatics.
- Assess lung sounds and respiratory function before and periodically during therapy.
- **Intranasal:** Assess for symptoms of rhinitis (stuffiness, rhinorrhea).
- **PO:** Assess for symptoms of mastocytosis (diarrhea, flushing, headache, vomiting, urticaria, abdominal pain, nausea, itching).

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Reduction in dose of other asthma medications may be possible after 2–4 wk of therapy.
- **Inhaln:** Medication should be used prophylactically, not during acute asthma attacks or status asthmaticus.
- Pretreatment with bronchodilator may be required to increase delivery of inhalation product.
- Do not use nebulizer solution that is cloudy or contains a precipitate.
- **PO:** Cromolyn should be taken 30 min before meals and at bedtime. Dose should be mixed in glass of water. Patient should drink all of the water. Plastic ampules should be stored in foil pouch until ready to use.

Patient/Family Teaching

- Medication must be used routinely and not more frequently than prescribed. Take missed doses as soon as remembered and space other doses at regular intervals. Do not

Copyright © 2008 by F.A. Davis

double doses. Do not discontinue therapy without consulting health care professional, or exacerbation of symptoms may occur.
- Instruct patient not to discontinue concurrent corticosteroid or bronchodilator therapy without consulting health care professional.
- If cromolyn is prescribed before contact with known allergen or exercise, explain that it should be administered 10–15 min, and no earlier than 60 min, in advance.
- **Inhaln:** Instruct patient in the proper use of the metered-dose inhaler. See Appendix D for instructions.
- Caution patient to notify health care professional if asthmatic symptoms do not improve within 4 wk, worsen, or recur.
- **Intranasal:** Instruct patient to clear nasal passages before administration and to inhale through nose during administration.
- Instruct patient to start using product up to 1 wk before coming into contact with allergen and to use every day while in contact with allergen.
- **PO:** Instruct patient that the beneficial effects of cromolyn are dependent upon its use at regular intervals.

Evaluation/Desired Outcomes
- Therapeutic effects, observable within 2–4 wk after beginning therapy, are demonstrated by:
- Reduction in symptoms of asthma.
- Prevention of exercise-induced bronchospasm (cromolyn only).
- Decrease in the symptoms of allergic rhinitis (cromolyn only).
- Reduction in symptoms of mastocytosis (cromolyn only).

meclizine (**mek**-li-zeen)
Antivert, Antrizine, ✱Bonamine, Bonine, Dramamine Less Drowsy Formula, Meni-D, Vergon

Classification
Therapeutic: antiemetics, antihistamines

Pregnancy Category B

Indications
Management/prevention of: Motion sickness, Vertigo.

Action
Has central anticholinergic, CNS depressant, and antihistaminic properties. Decreases excitability of the middle ear labyrinth and depresses conduction in middle ear vestibular-cerebellar pathways. **Therapeutic Effects:** Decreased motion sickness. Decreased vertigo from vestibular pathology.

Pharmacokinetics
Absorption: Absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 6 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pregnancy.
Use Cautiously in: Prostatic hyperplasia; Angle-closure glaucoma; Geriatric (increased sensitivity; increased risk of adverse reactions); Children or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: drowsiness, fatigue. **EENT:** blurred vision. **GI:** dry mouth.

Interactions
Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, other **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including some **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**.

Route/Dosage
PO (Adults): *Motion sickness*—25–50 mg 1 hr before exposure; may repeat in 24 hr; *vertigo*—25–100 mg/day in divided doses.

Availability
Tablets: 12.5 mg, 25 mg[Rx, OTC], 50 mg. **Cost:** 12.5 mg $4.09/100, 25 mg $5.40/100, 50 mg $6.99/100. **Chewable tablets:** 25 mg[Rx, OTC]. **Capsules:** 15 mg[OTC], 25 mg, 30 mg[OTC].

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess patient for level of sedation after administration.
- **Motion Sickness:** Assess patient for nausea and vomiting before and 60 min after administration.
- **Vertigo:** Assess degree of vertigo periodically in patients receiving meclizine for labyrinthitis.
- ***Lab Test Considerations:*** May cause false-negative results in skin tests using allergen extracts. Discontinue meclizine 72 hr before testing.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

- **PO:** Administer oral doses with food, water, or milk to minimize GI irritation. Chewable tablet may be chewed or swallowed whole.

Patient/Family Teaching

- Instruct patient to take meclizine exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dryness of mouth.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 1 hr before exposure to conditions that may cause motion sickness.

Evaluation/Desired Outcomes

- Prevention and relief of symptoms in motion sickness.
- Prevention and treatment of vertigo due to vestibular pathology.

medroxyPROGESTERone†

(me-**drox**-ee-proe-jess-te-rone)

Alti-MPA, Amen, Curretab, Cycrin, Depo-Provera, Depo-Sub Q Provera 104, Gen-Medroxy, Novo-Medrone, Provera, Prov-era Pak, Ratio-MPA

Classification

Therapeutic: antineoplastics, contraceptive hormones

Pharmacologic: hormones, progestins

Pregnancy Category X

†For contraceptive use see Contraceptives, Hormonal monograph

Indications

To decrease endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (0.625 mg/day conjugated estrogens). Treatment of secondary amenorrhea and abnormal uterine bleeding caused by hormonal imbalance. **IM:** Treatment of advanced unresponsive endometrial or renal carcinoma. Management of endometriosis-associated pain (Depo-Sub Q Provera 104 only). **Unlabeled uses:** Obesity-hypoventilation (pickwickian) syndrome, sleep apnea, hypersomnolence.

Action

A synthetic form of progesterone—actions include secretory changes in the endometrium, increases in basal body temperature, histologic changes in vaginal epithelium, relaxation of uterine smooth muscle, mammary alveolar tissue growth, pituitary inhibition, and withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Decreased endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (combination with estrogen decreases vasomotor symptoms and prevents osteoporosis). Restoration of hormonal balance with control of uterine bleeding. Management of endometrial or renal cancer. Prevention of pregnancy.

Pharmacokinetics

Absorption: 0.6–10% absorbed after oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: Metabolized by the liver.

Half-life: *1st phase*—52 min; *2nd phase*—230 min; *biological*—14.5 hr.

TIME/ACTION PROFILE (IM = antineoplastic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	wks–mos	mo	unknown†

Copyright © 2008 by F.A. Davis

SC	unknown	1 wk	3 mo

†Contraceptive effect lasts 3 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (IM suspension only); Pregnancy; Missed abortion; Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria. **Use Cautiously in:** History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression; Lactation: Lactation (when used as a contraceptive, wait until 6 wk after delivery if breastfeeding).

Adverse Reactions/Side Effects

CNS: depression. **EENT:** retinal thrombosis. **CV:** PULMONARY EMBOLISM, thromboembolism, thrombophlebitis. **GI:** drug-induced hepatitis, gingival bleeding. **GU:** cervical erosions. **Derm:** chloasma, melasma, rashes. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, hyperglycemia, spotting. **F and E:** edema. **Metab:** bone loss. **Misc:** allergic reactions including ANAPHYLAXIS and ANGIOEDEMA, weight gain, weight loss.

Interactions

Drug-Drug: May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea/amenorrhea. Contraceptive effectiveness may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, **rifampin**, or **rifabutin**. **Aminoglutethimide** may ↓ oral absorption.

Route/Dosage

Postmenopausal Women Receiving Concurrent Estrogen

PO (Adults): 2.5–5 mg daily concurrently with 0.625 mg conjugated estrogens (monophasic regimen) *or* 5 mg daily on days 15–28 of the cycle with 0.625 mg conjugated estrogens taken daily throughout cycle (biphasic regimen).

Secondary Amenorrhea

PO (Adults): 5–10 mg/day for 5–10 days; start at any time in cycle.

Dysfunctional Uterine Bleeding/Induction of Menses

PO (Adults): 5–10 mg/day for 5–10 days, starting on day 16 or day 21 of menstrual cycle.

Renal or Endometrial Carcinoma

IM (Adults): 400–1000 mg, may be repeated weekly; if improvement occurs, attempt to decrease dosage to 400 mg monthly.

Endometriosis-Associated pain

Subcut (Adults): 104 mg every 12–14 wk (3 mo), beginning on day 5 of normal menses (not recommended for more than 2 years).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, ✱100 mg. **Suspension for depot injection:** ✱50 mg/ml, ✱100 mg/ml, 150 mg/ml, 400 mg/ml. **Suspension for subcutaneous injection (Depo-Sub Q Provera 104):** 104 mg/0.65 ml in single-use syringes. ***In combination with:*** conjugated estrogens as Prempro (single combination tablet of 0.626 mg conjugated estrogens plus 2.5 or 5 mg medroxyprogesterone) or Premphase (0.625 mg conjugated estrogens tablet for 14 days followed by combination tablet of 0.625 mg conjugated estrogens plus 5 mg medroxyprogesterone for days 15–28) in convenience packages. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure periodically during therapy.
- Assess patient's usual menstrual history. Administration of drug may begin on any day of cycle in patients with amenorrhea and on day 16 or 21 of cycle in patients with dysfunctional bleeding
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- ***Lab Test Considerations:*** Monitor hepatic function before and periodically during therapy.
- May cause ↑ alkaline phosphatase levels. May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum LDL concentrations or ↓ HDL concentrations.
- May alter thyroid hormone assays.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)
Ineffective tissue perfusion (Side Effects)

Copyright © 2008 by F.A. Davis

Implementation

- Do not confuse Provera (medroxyprogesterone) with Covera (verapamil).
- Only the 150-mg/ml vial should be used for contraception.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 years. Injectable medroxyprogesterone should be used for >2 years only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 Seconds) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wks. If more than 14 wks elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection**.
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously before preparing IM dose. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- In patients with cancer, IM dose may initially be required weekly. Once stabilized, IM dose may be required only monthly.

Patient/Family Teaching

- Explain the dose schedule. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered, but do not double doses.
- Advise patients receiving medroxyprogesterone for menstrual dysfunction to anticipate withdrawal bleeding 3–7 days after discontinuing medication.
- Review patient package insert (PPI) with patient. Emphasize the importance of notifying health care professional if the following side effects occur: visual changes, sudden weakness, incoordination, difficulty with speech, headache, leg or calf pain, shortness of breath, chest pain, changes in vaginal bleeding pattern, yellow skin, swelling of extremities, depression, or rash. Patients receiving medroxyprogesterone for cancer may not receive PPI.
- Advise patient to keep a 1-mo supply of medroxyprogesterone available at all times.
- Instruct patient in correct method of monthly breast self-examination. Increased breast tenderness may occur.
- Advise patient that gingival bleeding may occur. Instruct patient to use good oral hygiene and to receive regular dental care and examinations.
- Instruct patient to notify health care professional if menstrual period is missed or if pregnancy is suspected. Patient should not attempt conception for 3 mo after discontinuing medication in order to decrease risk to fetus.
- Medroxyprogesterone may cause melasma (brown patches of discoloration) on face when patient is exposed to sunlight. Advise patient to avoid sun exposure and to wear sunscreen or protective clothing when outdoors.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic exams; and Papanicolaou smears every 6–12 mo.
- **IM, Subcut** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.

Evaluation/Desired Outcomes

- Regular menstrual periods.
- Decrease in endometrial hyperplasia in postmenopausal women receiving concurrent estrogen.
- Control of the spread of endometrial or renal cancer.

medroxyprogesterone, See CONTRACEPTIVES, HORMONAL.

megestrol (me-**jess**-trole)
Megace

Classification
Therapeutic: antineoplastics, hormones
Pharmacologic: progestins

Pregnancy Category D (tablets), X (suspension)

Indications

Palliative treatment of endometrial and breast carcinoma, either alone or with surgery or radiation (tablets only). Treatment of anorexia,

Copyright © 2008 by F.A. Davis

weight loss, and cachexia associated with AIDS (oral suspension only).

Action
Antineoplastic effect may result from inhibition of pituitary function. **Therapeutic Effects:** Regression of tumor. Increased appetite and weight gain in patients with AIDS.

Pharmacokinetics
Absorption: Well absorbed from the GI tract.
Distribution: Unknown.
Protein Binding: ≥90%.
Metabolism and Excretion: Completely metabolized by the liver.
Half-life: 38 hr (range 13–104 hr).

TIME/ACTION PROFILE (antineoplastic activity)

ROUTE	ONSET	PEAK	DURATION
PO	wk–mos	2 mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy, missed abortion, or lactation; Undiagnosed vaginal bleeding; Severe liver disease; Suspension contains alcohol and should be avoided in patients with known intolerance.
Use Cautiously in: Diabetes; Mental depression; Renal disease; History of thrombophlebitis; Cardiovascular disease; Seizure disorders.

Adverse Reactions/Side Effects
CV: THROMBOEMBOLISM, edema. **GI:** GI irritation. **Derm:** alopecia. **Endo:** asymptomatic adrenal suppression (chronic therapy). **Hemat:** thrombophlebitis. **MS:** carpal tunnel syndrome.

Interactions
Drug-Drug: None significant.

Route/Dosage
PO (Adults): *Breast carcinoma*—160 mg/day single dose or divided doses; *endometrial/ovarian carcinoma*—40–320 mg/day in divided doses; *anorexia associated with AIDS*—800 mg day; may decrease to 400 mg/day after 1 mo (range 400–800 mg/day).

Availability (generic available)
Tablets: 20 mg, 40 mg. **Cost:** *Generic*—20 mg $37.99/100, 40 mg $52.99/100. **Oral suspension (lemon-lime flavor):** 40 mg/ml in 10-ml, 20-ml, 240-ml, and 480-ml bottles, 125 mg/ml in 150-ml bottles (Megace ES). **Cost:** *Generic*—40 mg/ml $131.33/240 ml; *Megace ES*—125 mg/ml $526.89/150 ml.

NURSING IMPLICATIONS

Assessment
- Assess patient for swelling, pain, or tenderness in legs. Report these signs of deep vein thrombophlebitis.
- **Anorexia:** Monitor weight, appetite, and nutritional intake in patients with AIDS.

Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)

Implementation
- Because of high dose, suspension is most convenient form for patients with AIDS.
- Do not confuse Megace 800 mg/20 mL with Megace ES 625 mg/5 mL.
- **PO:** May be administered with meals if GI irritation becomes a problem.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed; do not skip or double up on missed doses. Missed doses may be taken as long as it is not right before next dose. Gradually decrease dose prior to discontinuation.
- Advise patient to report to health care professional any unusual vaginal bleeding or signs of deep vein thrombophlebitis.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 months after therapy is completed.
- Discuss with patient the possibility of hair loss. Explore methods of coping.

Evaluation/Desired Outcomes
- Slowing or arresting the spread of endometrial or breast malignancy. Therapeutic effects usually occur within 2 months of initiating therapy.
- Increased appetite and weight gain in patients with AIDS.

meloxicam (me-**lox**-i-kam)
Mobic

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: nonsteroidal anti-inflammatory agents
Pharmacologic: nonopioid analgesics

Pregnancy Category C

Indications
Relief of signs and symptoms of osteoarthritis and rheumatoid arthritis (including juvenile rheumatoid arthritis).

Action
Inhibits prostaglandin synthesis, probably by inhibiting the enzyme cyclooxygenase. **Therapeutic Effects:** Decreased pain and inflammation associated with osteoarthritis. Also decreases fever.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 99.4%.
Metabolism and Excretion: Mostly metabolized to inactive metabolites by the liver via the P450 enzyme system; metabolites are excreted in urine and feces.
Half-life: 20.1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK*	DURATION
PO	unknown	5–6 hr	24 hr

*Blood levels

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Severe renal impairment (CCr ≤15 ml/min); Concurrent use of aspirin (increased risk of adverse reactions); Peri-operative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use). Dehydration (correct deficits before initiating therapy); Geri: Impaired renal function, heart failure, liver dysfunction, geriatric patients (≥65 yr), concurrent ACE inhibitor or diuretic therapy (↑ risk of reversible renal dysfunction); Coagulation disorders or concurrent anticoagulant therapy (may ↑ risk of bleeding); Geriatric patients (↑ risk of GI bleeding); OB, Pedi: Pregnancy, lactation, or children <2 yr (safety not established; avoid use late in pregnancy).

Adverse Reactions/Side Effects
CV: edema. **GI:** GI BLEEDING, abnormal liver function tests, diarrhea, dyspepsia, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus. **Hemat:** anemia, leukopenia, thrombocytopenia.

Interactions
Drug-Drug: May ↓ antihypertensive effects of **ACE inhibitors**. May ↓ diuretic effects of **furosemide** or **thiazide diuretics**. Concurrent use with **aspirin** ↑ meloxicam blood levels and may ↑ risk of adverse reactions. Concurrent use with **cholestyramine** ↓ blood levels. ↑ plasma **lithium** levels (close monitoring recommended when meloxicam is introduced or withdrawn). May ↑ risk of bleeding with **anticoagulants**, including **warfarin**.

Route/Dosage
PO (Adults): 7.5 mg once daily; some patients may require 15 mg/day.
PO (Children 2–17 yr and >12 kg): 0.125 mg/kg once daily up to 7.5mg/day.

Availability (generic available)
Tablets: 7.5 mg, 15 mg. **Cost:** *Generic*—7.5 mg $43.83/90, 15 mg $18.90/90. **Oral suspension (raspberry flavor):** 7.5 mg/5 mL in 100-mL bottles.

NURSING IMPLICATIONS

Assessment
- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy. May cause anemia, thrombocytopenia, leukopenia, and abnormal liver or renal function tests.
- Bleeding time may be prolonged.

Potential Nursing Diagnoses
Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation
- Administration in higher than recommended doses does not provide increased effective-

Copyright © 2008 by F.A. Davis

ness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** May be administered without regard to food.
- Pedi: Use oral suspension to ensure accuracy of dosing in children.

Patient/Family Teaching
- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, weight gain, edema, black stools, or signs of hepatotoxicity (nausea, fatigue, lethargy, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.

Evaluation/Desired Outcomes
- Relief of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another.

melphalan (**mel**-fa-lan)
Alkeran, L-PAM, phenylalanine mustard

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications
Alone or with other therapies for: Multiple myeloma, Ovarian cancer. **Unlabeled uses:** Breast cancer. Prostate cancer. Testicular carcinoma. Chronic myelogenous leukemia. Osteogenic sarcoma.

Action
Inhibits DNA and RNA synthesis by alkylation (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics
Absorption: Incompletely and variably absorbed following oral administration.
Distribution: Rapidly distributed throughout total body water.
Protein Binding: ≤30%.
Metabolism and Excretion: Rapidly metabolized in the bloodstream. Small amounts (10%) excreted unchanged by the kidneys.
Half-life: 1.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	5 days	2–3 wk	5–6 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity to melphalan or chlorambucil; Pregnancy or lactation.
Use Cautiously in: Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Geri: Geriatric patients or patients with other chronic debilitating illnesses; Impaired renal function (dose reduction recommended if BUN ≥30 mg/dl); Pedi: Children (safety not established).

Adverse Reactions/Side Effects
Resp: bronchopulmonary dysplasia, pulmonary fibrosis. **GI:** diarrhea, hepatitis, nausea, stomatitis, vomiting. **GU:** infertility. **Derm:** alopecia, pruritus, rashes. **Endo:** menstrual irregularities. **Hemat:** leukopenia, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** allergic reactions, including ANAPHYLAXIS (more common after IV use).

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↑ the risk of pulmonary toxicity with **carmustine**. Concurrent IV use with **cyclosporine** may ↑ risk of renal failure. Risk of enterocolitis may be ↑ with concurrent **nalidixic acid**.

Copyright © 2008 by F.A. Davis

Route/Dosage

Multiple Myeloma

PO (Adults): 150 mcg (0.15 mg)/kg/day for 7 days, followed by 3-wk rest, then 50 mcg (0.05 mg)/kg/day maintenance dose *or* 100–150 mcg/kg/day or 250 mg (0.25 mg)/kg/day for 4 days followed by 2–4-wk rest, then 2–4 mg/day maintenance dose *or* 7 mg/m^2 *or* 250 mcg (0.25 mg)/kg daily for 5 days q 5–6 wk.
IV (Adults): 16 mg/m^2 q 2 wk for 4 doses, then q 4 wk.

Ovarian Carcinoma

PO (Adults): 200 mcg (0.2 mg)/kg/day for 5 days q 4–5 wk.

Availability

Tablets: 2 mg. **Powder for injection:** 50 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease uric acid levels.
- Anemia may occur. Monitor for increased fatigue and dyspnea.
- Assess patient for allergy to chlorambucil. Patients may have cross-sensitivity.
- ***Lab Test Considerations:*** Monitor CBC and differential weekly during therapy. The nadir of leukopenia occurs in 2–3 wk. Notify physician if leukocyte count is <3000/mm^3. The nadir of thrombocytopenia occurs in 2–3 wk. Notify physician if platelet count is <100,000/mm^3. Recovery of leukopenia and thrombocytopenia occurs in 5–6 wk.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid. Monitor periodically during therapy.
- May cause ↑ 5-hydroxyindoleacetic acid (5-HIAA) concentrations as a result of tumor breakdown.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated container.
- If solution contacts skin or mucosa, immediately wash skin or mucosa with soap and water.
- **PO:** May be ordered in divided doses or as a single daily dose.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute with 10 ml of diluent supplied for a concentration of 5 mg/ml and shake vigorously until solution is clear. ***Concentration:*** Dilute dose immediately with 0.9% NaCl for a concentration not to exceed 2 mg/ml for central line or 0.45 mg/ml for a peripheral line. Administer within 60 min of reconstitution. ***Rate:*** Administer over at least 15 min (not to exceed 10 mg/min).
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gentamicin, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, minocycline, mitomycin, mitoxantrone, morphine, nalbuphine, ondansetron, pentostatin, potassium chloride, prochlorperazine

Copyright © 2008 by F.A. Davis

edisylate, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, chlorpromazine.

Patient/Family Teaching

- Instruct patient to take melphalan as directed, even if nausea and vomiting occur. If vomiting occurs shortly after dose is taken, consult health care professional. If a dose is missed, do not take at all.
- Advise patient to notify health care professional if fever; chills; dyspnea; persistent cough; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify health care professional if rash, itching, joint pain, or swelling occurs.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Consult health care professional if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient that although fertility may be decreased, contraception should be used during melphalan therapy because of potential teratogenic effects on the fetus.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant tissue.

memantine (me-**man**-teen)
Namenda

Classification
Therapeutic: anti-Alzheimer's agents
Pharmacologic:

Pregnancy Category B

Indications
Moderate to severe Alzheimer's dementia.

Action
Binds to CNS N-methyl-D-aspartate (NMDA) receptor sites, preventing binding of glutamate, an excitatory neurotransmitter. **Therapeutic Effects:** Decreased symptoms of dementia. Does not slow progression. Cognitive enhancement. Does not cure disease.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: 57–82% excreted unchanged in urine by active tubular secretion moderated by pH dependent tubular reabsorption. Remainder metabolized; metabolites are not pharmacologically active.
Half-life: 60–80 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–7 hr	12 hr

Contraindications/Precautions
Contraindicated in: Severe renal impairment.
Use Cautiously in: Moderate renal impairment (consider ↓ dose); Concurrent use of other NMDA antagonists (amantadine, rimantadine, ketamine, dextromethorphan); Concurrent use of drugs or diets that cause alkaline urine; Conditions that ↑ urine pH including severe urinary tract infections or renal tubular acidosis (lead to ↓ excretion and ↑ levels); OB, Lactation, Pedi: Safety not established. Discontinue drug or bottle-feed.

Adverse Reactions/Side Effects
CNS: dizziness, fatigue, headache, sedation. **CV:** hypertension. **Derm:** rash. **GI:** weight gain. **GU:** urinary frequency. **Hemat:** anemia.

Interactions
Drug-Drug: Medications that ↑ urine pH lead to ↓ excretion and ↑ blood levels (**car-**

Copyright © 2008 by F.A. Davis

bonic anhydrase inhibitors, **sodium bicarbonate**).

Route/Dosage

PO (Adults): 5 mg once daily initially, increased at weekly intervals to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg once daily, 10 mg once daily as separate doses, then to target dose of 20 mg/day (as 10 mg twice daily).

Availability

Tablets: 5 mg, 10 mg, titration package containing twenty-eight 5-mg tablets and twenty-one 10-mg tablets. **Cost:** 5 mg $458.95/180, 10 mg $435.98/180. **Oral solution, sugar-free, alcohol-free (peppermint):** 2 mg/ml in 360-mL bottles.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- ***Lab Test Considerations:*** May cause anemia.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Risk for injury (Side Effects)
Impaired environmental interpretation syndrome

Implementation

- Dose increases should occur no more frequently than weekly.
- **PO:** May be administered without regard to food.
- Administer oral solution using syringe provided. Do not dilute or mix with other fluids.

Patient/Family Teaching

- Instruct caregivers on how and when to administer memantine and how to titrate dose. Provide caregiver with *Patient Instructions* sheet.
- Caution patient and caregiver that memantine may cause dizziness.
- Teach patient and caregivers that improvement in cognitive functioning may take months; degenerative process is not reversed.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

meperidine (me-**per**-i-deen)

Demerol, pethidine

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Moderate or severe pain (alone or with nonopioid agents). Anesthesia adjunct. Analgesic during labor. Preoperative sedation. **Unlabeled uses:** Rigors.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain.

Pharmacokinetics

Absorption: 50% from the GI tract; well absorbed from IM sites. Oral doses are about half as effective as parenteral doses.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Protein Binding: Neonates: 52%; Infants 3–18 months: 85%; Adults: 60–80%.
Metabolism and Excretion: Mostly metabolized by the liver; some converted to normeperidine, which may accumulate and cause seizures. 5% excreted unchanged by the kidneys.
Half-life: Neonates: 12–39 hr; Infants 3–18 months: 2.3 hr; Children 5–8 yr: 3 hr; Adults: 2.5–4 hr (prolonged in impaired renal or hepatic function [7–11 hr]).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	15 min	60 min	2–4 hr
IM	10–15 min	30–50 min	2–4 hr
Subcut	10–15 min	40–60 min	2–4 hr
IV	immediate	5–7 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bisulfites (some injectable products); Pregnancy or lactation (chronic use); Recent (14–21 days) MAO inhibitor therapy.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or

Copyright © 2008 by F.A. Davis

pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Appears on Beers list. Geriatric patients (morphine recommended); Debilitated patients (dose reduction suggested); Undiagnosed abdominal pain or prostatic hyperplasia; Labor (respiratory depression may occur in the newborn); Patients with renal impairment, or extensive burns; High dose or prolonged therapy (>600 mg/day or >2 days; increased risk of CNS stimulation and seizures due to accumulation of normeperidine); Sickle cell anemia (may require reduced initial doses); Pedi: Neonates (syrup contains benzyl alcohol); Children (increased risk of seizures due to accumulation of normeperidine).

Adverse Reactions/Side Effects

CNS: SEIZURES, confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Do not use in patients receiving **MAO inhibitors** or **procarbazine** (may cause fatal reaction—contraindicated within 14–21 days of MAO inhibitor therapy). ↑ CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of **agonist/antagonist opioid analgesics** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia. **Protease inhibitor antiretrovirals** may ↑ effects and adverse reactions (concurrent use should be avoided). **Phenytoin** ↑ metabolism and may ↓ effects. **Chlorpromazine** and **thioridazine** may ↑ the risk of adverse reactions (concurrent use should be avoided). May aggravate side effects of **isoniazid**. **Acyclovir** may ↑ plasma concentrations of meperidine and normeperidine.

Drug-Natural Products: Concomitant use of **kava kava, valerian** or **chamomile** can ↓ CNS depression. **St. John's wort** may increase serious side effects, concurrent use is not recommended.

Route/Dosage

PO, IM, Subcut, IV (Adults): *Analgesia*—50–150 mg q 3–4 hr. *Analgesia during labor*—50–100 mg IM or subcut when contractions become regular; may repeat q 1–3 hr. *Preoperative sedation*—50–100 mg IM or subcut 30–90 min before anesthesia.

PO, IM, Subcut, IV (Children): *Analgesia*—1–1.5 mg/kg q 3–4 hr (should not exceed 100 mg/dose). *Preoperative sedation*—1–2 mg/kg 30–90 min before anesthesia (not to exceed adult dose).

IV (Adults): 15–35 mg/hr as a continuous infusion; *PCA*—10 mg initially; with a range 0f 1–5 mg/incremental dose, recommended lockout interval is 6–10 min (minimum 5 min).

IV (Children): *Continuous infusion*—0.5–1 mg/kg loading dose followed by 0.3 mg/kg/hr, titrate to effect up to 0.5–0.7 mg/kg/hr.

Availability (generic available)

Tablets: 50 mg, 100 mg. **Cost:** 50 mg $99.04/100, 100 mg $188.37/100. **Syrup (banana flavor):** 50 mg/5 ml. **Injection:** ✱10 mg/ml, 25 mg/ml, 50 mg/ml, 75 mg/ml, 100 mg/ml. ***In combination with:*** promethazine (Mepergan) and atropine. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, and IM doses and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Pedi: Neonates and infants are more susceptible to respiratory depression. Assess respiratory rate frequently.

Copyright © 2008 by F.A. Davis

- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive meperidine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Monitor patients on chronic or high-dose therapy for CNS stimulation (restlessness, irritability, seizures) due to accumulation of normeperidine metabolite. Risk of toxicity increases with doses >600 mg/24 hr, chronic administration (>2 days), and renal impairment.
- Geri: Meperidine has been reported to cause delirium in the elderly; older adults are at increased risk for normeperidine toxicity. Monitor frequently.
- Pedi: Assess pediatric patient frequently; children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability and restlessness more frequently.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. In patients receiving meperidine chronically, naloxone may precipitate seizures by eliminating the CNS depressant effects of meperidine, allowing the convulsant activity of normeperidine to predominate. Monitor patient closely.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse with morphine or hydromorphone; fatalities have occurred. Pedi: Medication errors with opioid analgesics are common in the pediatric population and include misinterpretation or miscalculation of doses and use of inappropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Oral dose is <50% as effective as parenteral. When changing to oral administration, dose may need to be increased (see Appendix J).
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- May be administered via PCA pump.
- **PO:** Doses may be administered with food or milk to minimize GI irritation. Syrup should be diluted in half-full glass of water.
- **IM:** Administration of repeated subcut doses may cause local irritation.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute with sterile water or 0.9% NaCl for injection. ***Concentration:*** ≤10 mg/ml. ***Rate: High Alert:*** Administer slowly over at least 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Intermittent Infusion:** ***Diluent:*** Dilute with D5W, D10W, dextrose/saline combinations, dextrose/Ringer's or lactated Ringer's injection combinations, 0.45% NaCl, 0.9% NaCl, or Ringer's or LR. Administer via infusion pump. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer over 15–30 min.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, glycopyrrolate, hy-

Copyright © 2008 by F.A. Davis

droxyzine, ketamine, metoclopramide, midazolam, ondansetron, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** heparin, morphine, pantoprazole, pentobarbital.
- **Y-Site Compatibility:** amifostine, amikacin, ampicillin, ampicillin/sulbactam, atenolol, aztreonam bivalirudin, bumetanide, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cladribine, clindamycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, erythromycin lactobionate, etoposide phosphate, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, insulin, kanamycin, labetalol, lidocaine, linezolid, magnesium sulfate, melphalan, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, pemetrexed, penicillin G potassium, piperacillin/tazobactam, potassium chloride, propofol, propranolol, ranitidine, remifentanil, sargramostim, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, verapamil, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate, cefepime, cefoperazone, doxorubicin liposome, idarubicin, imipenem/cilastatin, lansoprazole.

Patient/Family Teaching
- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take meperidine as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise ambulatory patients that nausea and vomiting may be decreased by lying down.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes
- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

meropenem
(mer-oh-**pen**-nem)
Merrem

Classification
Therapeutic: anti-infectives
Pharmacologic: carbapenems

Pregnancy Category B

M

Indications
Treatment of: Intra-abdominal infections, Bacterial meningitis. Skin and skin structure infections. **Unlabeled uses:** Febrile neutropenia. Hospital-acquired pneumonia and sepsis.

Action
Binds to bacterial cell wall, resulting in cell death. Meropenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-positive organisms: *Staphylococcus aureus*, *Streptococcus pneumoniae*, Viridans group streptococci, *Enterococcus faecalis*. Also active against the following gram-negative pathogens: *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Neisseria meningitidis*, *Pseudomonas aeruginosa*, *Proteus mirabilis*. Active against the following anaerobes: *Bacteroides fragilis*, *B. fragilis* group, *Peptostreptococcus* species.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.

Copyright © 2008 by F.A. Davis

Distribution: Widely distributed into body tissues and fluids; enters CSF when meninges are inflamed.
Metabolism and Excretion: 65–83% excreted unchanged by the kidneys.
Half-life: Premature neonates: 3 hr; Term neonates: 2 hr; Infants 3 mo–2 yr: 1.4 hr; Children >2 yr and Adults: 1 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to meropenem or imipenem; Serious hypersensitivity to other beta-lactams (penicillins or cephalosporins; cross-sensitivity may occur).
Use Cautiously in: Renal impairment (↑ risk of thrombocytopenia and seizures; dose reduction recommended if CCr <50 ml/min); History of seizures, brain lesions, or meningitis; Pregnancy, lactation, or children <3 mo (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache. **Resp:** APNEA. **GI:** PSEUDOMEMBRANOUS COLITIS, constipation, diarrhea, glossitis (increased in children), nausea, thrush (increased in children), vomiting. **Derm:** moniliasis (children only), pruritus, rash. **Local:** inflammation at injection site, phlebitis. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and increases blood levels (coadministration not recommended).

Route/Dosage

IV (Adults): 0.5–1 g q 8 hr. *Meningitis*—2 g q 8 hr.
IV (Children ≥3 mo–12 yr): *Intra-abdominal infections*—20 mg/kg q 8 hr; *meningitis*—40 mg/kg q 8 hr (maximum 2 g q 8 hr).
IV (Neonates <7 days): 20 mg/kg/dose q 12 hr. *Neonates >7 days, 1200–2000 g*—20 mg/kg/dose q 12 hr. *Neonates >7 days, >2000 g*—20 mg/kg/dose q 8 hr.

Renal Impairment

IV (Adults): *CCr 26–50 ml/min*—1 g q 12 hr; *CCr 10–25 ml/min*—500 mg q 12 hr; *CCr <10 ml/min*—500 mg q 24 hr.

Availability

Powder for injection: 500 mg, 1 g.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Assess injection site for phlebitis, pain, and swelling periodically during administration.
- ***Lab Test Considerations:*** Monitor hematologic, hepatic, and renal functions periodically during therapy.
- BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct or indirect Coombs' test.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 500-mg and 1-g vials with 10 ml and 20 ml, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Vials reconstituted with sterile water for injection are stable for 2 hr at room temperature and 12 hr if refrigerated; if reconstituted with 0.9% NaCl, stable for 2 hr at room temperature and 18 hr if refrigerated; if reconstituted with D5W, stable for 1 hr at room temperature and 8 hr if refrigerated.

Copyright © 2008 by F.A. Davis

Concentration: 50 mg/ml. ***Rate:*** Administer over 3–5 min.

- **Intermittent Infusion:** ***Diluent:*** Reconstitute 500-mg and 1-g vials with 10 ml and 20 ml, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Further dilute in 0.9% NaCl or D5W to achieve concentration below. Infusions further diluted in 0.9% NaCl are stable for 4 hr at room temperature and 24 hr if refrigerated. Infusions further diluted in D5W are stable for 1 hr at room temperature and 4 hr if refrigerated. ***Concentration:*** Final concentration of infusion should be 1–20 mg/ml. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** aminophylline, anidulafungin, atropine, caspofungin, cimetidine, daptomycin, dexamethasone, digoxin, diltiazem, diphenhydramine, enalaprilat, fluconazole, furosemide, gentamicin, granisetron, heparin, hydromorphone, insulin, linezolid, lorazepam, metoclopramide, milrinone, morphine, norepinephrine, palonosetron, potassium chloride, tacrolimus, tirofiban, vancomycin, vasopressin, voriconazole.
- **Y-Site Incompatibility:** amphotericin B, diazepam, fenoldopam, metronidazole, quinupristin/dalfopristin.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

mesalamine (me-**sal**-a-meen)
Asacol, Canasa, Lialda, Pentasa, Rowasa, Salofalk

Classification
Therapeutic: gastrointestinal anti-inflammatories—therapeutic

Pregnancy Category B

Indications
Inflammatory bowel diseases including: Ulcerative colitis, Proctitis, Proctosigmoiditis.

Action
Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of inflammatory bowel disease.

Pharmacokinetics
Absorption: 28% absorbed following oral administration; 10–30% absorbed from the colon, depending on retention time, following rectal administration.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism occurs, site unknown; mostly eliminated unchanged in the feces.
Half-life: 12 hr PO (range 2–15 hr); 0.5–1.5 hr rectal.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	Duration
PO	unknown	unknown	6–8 hr
Extended release	2 hr	9–12 hrs	24 hr
Rectal	3–21 days	unknown	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity reactions to sulfonamides, salicylates, mesalamine, or sulfasalazine; Cross-sensitivity with furosemide, sulfonylurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; G6PD deficiency; Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria.
Use Cautiously in: Severe hepatic or renal impairment; OB: Pregnancy or lactation (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: headache, dizziness, malaise, weakness. **EENT:** pharyngitis, rhinitis. **CV:** pericarditis. **GI:** diarrhea, eructation (PO), flatulence, nausea, vomiting. **GU:** interstitial nephritis, pancreatitis, renal failure. **Derm:** hair loss, rash. **Local:** anal irritation (enema, suppository). **MS:** back pain. **Misc:** ANAPHYLAXIS, acute intolerance syndrome, fever.

Interactions

Drug-Drug: May ↓ metabolism and ↑ effects/toxicity of **mercaptopurine** or **thioguanine**.

Route/Dosage

PO (Adults): 800 mg 3 times daily for 6 wk as delayed-release tablets *or* 1 g 4 times daily as controlled-release capsules *or* 2–4 1.2-g tablets once daily with a meal for a total daily dose of 2.4 or 4.8 g of *Lialda*.

Rect (Adults): 4-g enema (60 ml) at bedtime, retained for 8 hr for 3–6 wk *or* 1-g suppository at bedtime.

Availability (generic available)

Delayed-release tablets: ♣250 mg, 400 mg, ♣500 mg, 1.2 g (Lialda). **Cost:** 400 mg $132.01/180, 1.2 g $515.96/120. **Controlled-release capsules:** 250 mg, 500 mg. **Cost:** 250 mg $387.98/480, 500 mg $351.32/240. **Suppositories:** 1 g. **Cost:** $326.96/30. **Rectal suspension:** 4 g/60 ml. **Cost:** *Generic*—$317.69/28 bottles.

NURSING IMPLICATIONS

Assessment

- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occurs.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Inflammatory Bowel Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy. Mesalamine may cause renal toxicity.
- Mesalamine may cause ↑ AST and ALT levels, serum alkaline phosphatase, GGTP, LDH, amylase, and lipase.

Potential Nursing Diagnoses

Acute pain (Indications)
Diarrhea (Indications)

Implementation

- Do not confuse Asacol (mesalamine) with Os-Cal (calcium carbonate).
- **PO:** Administer with a full glass of water. Tablets should be swallowed whole; do not break the outer coating, which is designed to remain intact. Take *Lialda* tablets with a meal. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional.
- **Rect:** Patient should empty bowel prior to administration of rectal dose forms.
- Avoid excessive handling of *suppository*. Remove foil wrapper and insert pointed end first into rectum with gentle pressure. Suppository should be retained for 1–3 hr or more for maximum benefit.
- Administer 60-mL retention enema once daily at bedtime. Solution should be retained for approximately 8 hr. Prior to administration of *rectal suspension*, shake bottle well and remove the protective cap. Have patient lie on left side with the lower leg extended and the upper leg flexed for support or place the patient in knee-chest position. Gently insert the applicator tip into the rectum, pointing toward the umbilicus. Squeeze the bottle steadily to discharge most of the preparation.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 months of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve.

Copyright © 2008 by F.A. Davis

If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.
- **Rect:** Instruct patient to use *rectal suspension* at bedtime and retain suspension all night for best results.
- Advise patient not to change brands of mesalamine without consulting health care professional.

Evaluation/Desired Outcomes
- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.

mesna (mes-na)
Mesnex, ✱Uromitexan

Classification
Therapeutic: antidotes
Pharmacologic: ifosfamide detoxifying agents

Pregnancy Category B

Indications
Prevention of ifosfamide-induced hemorrhagic cystitis (see Ifosfamide monograph). **Unlabeled uses:** May also prevent hemorrhagic cystitis from cyclophosphamide.

Action
Binds to the toxic metabolites of ifosfamide in the kidneys. **Therapeutic Effects:** Prevents hemorrhagic cystitis from ifosfamide.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability; 45–79% absorbed after oral administration. Following IV with PO dosing increases systemic exposure.
Distribution: Unknown.
Metabolism and Excretion: Rapidly converted to mesna disulfide, then back to mesna in the kidneys, where it binds to toxic metabolites of ifosfamide (18–26% excreted as free mesna in urine after IV and PO dosing).
Half-life: *Mesna*—0.36 hr (IV); 1.2—8.3 hr (IV followed by PO); *mesna disulfide*—1.17 hr.

TIME/ACTION PROFILE (detoxifying action)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	unknown	4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to mesna or other thiol (rubber) compounds.
Use Cautiously in: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, headache. **GI:** anorexia, diarrhea, nausea, unpleasant taste, vomiting. **Derm:** flushing. **Local:** injection site reactions. **Misc:** flu-like symptoms.

Interactions
Drug-Drug: None significant.

Route/Dosage
IV (Adults): Give a dose of mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide and 4 and 8 hr after.
PO, IV (Adults): Give a dose of IV mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide; then give PO mesna equal to 40% of the ifosfamide dose 2 and 6 hours after ifosfamide (total mesna dose is 100% of ifosfamide dose).

Availability
Tablets: 400 mg. **Injection:** 100 mg/ml in 2-, 4-, and 10-ml ampules. ***In combination with:*** ifosfamide (in a kit).

NURSING IMPLICATIONS

Assessment
- Monitor for development of hemorrhagic cystitis in patients receiving ifosfamide.
- ***Lab Test Considerations:*** Causes a false-positive result when testing urinary ketones.

Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation
- Initial IV bolus is to be given at time of ifosfamide administration.

Copyright © 2008 by F.A. Davis

- **PO:** If second and third doses are given orally, administer 2 and 6 hours after IV dose.
- If PO mesna is vomited within 2 hr of administration, repeat dose or use IV mesna.

IV Administration

- **Intermittent Infusion:** 2nd IV dose is given 4 hr later, 3rd dose is given 8 hr after initial dose. This schedule must be repeated with each subsequent dose of ifosfamide. ***Diluent:*** Dilute 2-, 4-, and 10-ml ampules, containing a concentration of 100 mg/ml in 8 ml, 16 ml, or 50 ml, respectively, of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.2% NaCl, D5/0.33% NaCl, or LR. ***Concentration:*** 20 mg/ml. Refrigerate to store. Use within 6 hr. Discard unused solution. ***Rate:*** Administer over 15–30 min or as a continuous infusion.
- **Syringe Compatibility:** ifosfamide.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cefepime, docetaxel, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, methotrexate, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl complex, lansoprazole.
- **Additive Compatibility:** ifosfamide.
- **Additive Incompatibility:** carboplatin, cisplatin.

Patient/Family Teaching

- Inform patient that unpleasant taste may occur during administration.
- Advise patient to notify health care professional if nausea, vomiting, or diarrhea persists or is severe.

Evaluation/Desired Outcomes

- Prevention of hemorrhagic cystitis associated with ifosfamide therapy.

mestranol/norethindrone, See CONTRACEPTIVES, HORMONAL.

metaxalone (me-**tax**-a-lone)
Skelaxin

Classification
Therapeutic: skeletal muscle relaxants (centrally acting)

Pregnancy Category UK

Indications
Muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

Action
Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; metabolites excreted in urine.
Half-life: 2–3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2 hr	4–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Significant hepatic/renal impairment; History of drug-induced hemolytic anemia or other anemia.
Use Cautiously in: History of seizures; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects; Pregnancy, lactation, or children ≤12 yr (safety not established; use only in pregnancy/lactation if possible benefits outweigh potential risks).

Adverse Reactions/Side Effects
CNS: drowsiness, dizziness, confusion, headache, irritability, nervousness. **GI:** nausea, anorexia, dry mouth, GI upset, vomiting. **GU:** urinary retention.

Interactions
Drug-Drug: ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage
PO (Adults): 800 mg 3–4 times daily.

Copyright © 2008 by F.A. Davis

Availability
Tablets: 800 mg. **Cost:** $299.97/100.

NURSING IMPLICATIONS

Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically during therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).
- ***Lab Test Considerations:*** Monitor hepatic function tests closely in patients with preexisting liver damage.
- May cause false-positive Benedict's tests.

Potential Nursing Diagnoses
Acute pain (Indications)
Impaired bed mobility (Indications)
Risk for injury (Side Effects)

Implementation
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Administer 3–4 times daily.

Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if skin rash or yellowish discoloration of the skin or eyes occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes
- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

metformin (met-**for**-min)
Fortamet, Glumetza, Glucophage, Glucophage XR, Novo-Metformin, Riomet

Classification
Therapeutic: antidiabetics
Pharmacologic: biguanides

Pregnancy Category B

Indications
Management of type 2 diabetes mellitus; may be used with diet, insulin, or sulfonylurea oral hypoglycemics.

Action
Decreases hepatic glucose production. Decreases intestinal glucose absorption. Increases sensitivity to insulin. **Therapeutic Effects:** Maintenance of blood glucose.

Pharmacokinetics
Absorption: 50–60% absorbed after oral administration.
Distribution: Enters breast milk in concentrations similar to plasma.
Metabolism and Excretion: Eliminated almost entirely unchanged by the kidneys.
Half-life: 17.6 hr.

TIME/ACTION PROFILE (blood levelse)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr
XR	unknown	4–8 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Metabolic acidosis; Dehydration, sepsis, hypoxemia, hepatic impairment, excessive alcohol use (acute or chronic); Renal dysfunction (serum creatinine >1.5 mg/dl in men or >1.4 mg/dl in women); Radiographic studies requiring IV iodinated contrast media (withhold metformin); CHF.
Use Cautiously in: Concurrent renal disease; Geri: Geriatric/debilitated patients (↓ doses may be required; avoid in patients >80 yr unless renal function is normal); Chronic alcohol use/abuse; Serious medical conditions (MI, stroke); Patients undergoing stress (infection, surgical procedures); Hypoxia; Pituitary deficiency or hyperthyroidism; OB, Pedi: Pregnancy, lacta-

Copyright © 2008 by F.A. Davis

tion, or children <10 yr (safety not established; extended release for use in patients >17 yr only).

Adverse Reactions/Side Effects

GI: abdominal bloating, diarrhea, nausea, vomiting, unpleasant metallic taste. **Endo:** hypoglycemia. **F and E:** LACTIC ACIDOSIS. **Misc:** decreased vitamin B_{12} levels.

Interactions

Drug-Drug: Acute or chronic **alcohol** ingestion or **iodinated contrast media** ↑ risk of lactic acidosis. **Amiloride**, **digoxin**, **morphine**, **procainamide**, **quinidine**, **ranitidine**, **triamterene**, **trimethoprim**, **calcium channel blockers**, and **vancomycin** may compete for elimination pathways with metformin. Altered responses may occur. **Cimetidine** and **furosemide** may ↑ effects of metformin. **Nifedipine** ↑ absorption and effects.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium,** and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults and Children >17 yr): 500 mg twice daily; may increase by 500 mg at weekly intervals up to 2000 mg/day. If doses >2000 mg/day are required, give in 3 divided doses (not to exceed 2500 mg/day) or 850 mg once daily; may increase by 850 mg at 2-wk intervals (in divided doses) up to 2550 mg/day in divided doses (up to 850 mg 3 times daily); *Extended-release tablets*—500–1000 mg once daily with evening meal, may increase by 500 mg at weekly intervals up to 2500 mg once daily. If 2000 mg once daily is inadequate, 1000 mg twice daily may be used.
PO (Children >10 yr): 500 mg twice daily, may be increased by 500 mg/day at 1-wk intervals, up to 2000 mg/day in 2 divided doses.

Availability (generic available)

Tablets: 500 mg, 850 mg, 1000 mg. **Cost:** 500 mg $86.72/100, 850 mg $149.95/100, 1000 mg $149.95/100. **Extended-release tablets (Fortamet, Glucophage XR, Glumetza):** 500 mg, 750 mg, 1000 mg. **Oral solution (cherry flavor):** 500 mg/5 ml in 120– and 480-ml bottles. ***In combination with:*** glyburide (Glucovance) glipizide (Metaglip), pioglitazone (ACTOplus), rosiglitazone (Avandamet) and sitagliptin (Janumet). See Appendix B.

NURSING IMPLICATIONS

Assessment

- When combined with oral sulfonylureas, observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Patients who have been well controlled on metformin who develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy. May cause false-positive results for urine ketones.
- Monitor blood glucose concentrations routinely by patient and every 3 mo by health care professional to determine effectiveness of therapy.
- Assess renal function before initiating and at least annually during therapy. Discontinue metformin if renal impairment occurs.
- Monitor serum folic acid and vitamin B_{12} every 1–2 yr in long-term therapy. Metformin may interfere with absorption.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold metformin and reinstitute after resolution of acute episode.
- Metformin therapy should be temporarily discontinued in patients requiring surgery involving restricted intake of food and fluids. Resume metformin when oral intake has resumed and renal function is normal.
- Withhold metformin before or at the time of studies requiring IV administration of iodinated contrast media and for 48 hr after study.
- **PO:** Administer metformin with meals to minimize GI effects.
- XR tablets must be swallowed whole; do not crush or chew.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take metformin at the same time each day, as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses.
- Explain to patient that metformin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required. Symptoms of lactic acidosis (chills, diarrhea, dizziness, low blood pressure, muscle pain, sleepiness, slow heartbeat or pulse, dyspnea, or weakness) should be reported to health care professional immediately.
- Caution patient to avoid taking other Rx, OTC, herbal products, or alcohol during metformin therapy without consulting health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Inform patient that metformin may cause an unpleasant or metallic taste that usually resolves spontaneously.
- Inform patients taking XR tablets that inactive ingredients resembling XR tablet may appear in stools.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Advise patient to report the occurrence of diarrhea, nausea, vomiting, and stomach pain or fullness to health care professional.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose, glycosylated hemoglobin, renal function, and hematologic parameters.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes. Control may be achieved within a few days, but full effect of therapy may be delayed for up to 2 wk. If patient has not responded to metformin after 4 wk of maximum dose therapy, an oral sulfonylurea may be added. If satisfactory results are not obtained with 1–3 months of concurrent therapy, oral agents may be discontinued and insulin therapy instituted.

M

HIGH ALERT

methadone (meth-a-done)
Methadose

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications
Severe pain. Suppresses withdrawal symptoms in opioid detoxification.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression.
Therapeutic Effects: Decrease in severity of pain. Suppression of withdrawal symptoms during detoxification and maintenance from heroin and other opioids.

Pharmacokinetics
Absorption: Well absorbed from all sites (50% absorbed following oral administration).

Copyright © 2008 by F.A. Davis

Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Protein Binding: High.
Metabolism and Excretion: Mostly metabolized by the liver; some metabolites are active and may accumulate with chronic administration.
Half-life: 15–25 hr; increases with chronic use.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	90–120 min	4–12 hr
IM, subcut	10–20 min	60–120 min	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known alcohol intolerance (some oral solutions); Concurrent MAO inhibitor therapy.
Use Cautiously in: Cardiac hypertrophy, concomitant diuretic use, hypokalemia, hypomagnesemia, history of cardiac conduction abnormalities, concurrent medications affecting cardiac conduction, or other risk factor of arrhythmias; Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia or ureteral stricture; OB: Use with addiction control: weigh risk against potential for illicit drug use. Counsel mother about potential harm to fetus; Lactation: Appears in breast milk. Weigh risks against potential for illicit drug use. Counsel mother about potential harm to infant and to wean breastfeeding slowly to prevent abstinence syndrome; Geri: Dose reduction suggested.

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia, QT prolongation, Torsades de Pointes. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in severe, unpredictable reactions—reduce initial dose of methadone to 25% of usual dose). Use with extreme caution with any drug known to potentially prolong QT interval, including **class I and III antiarrhythmics**, some **neuroleptics** and **tricyclic antidepressants**, and **calcium channel blockers**. Concurrent use **laxatives**, **diuretics**, **mineralocorticoids** may ↑ risk of hypomagnesemia or hypokalemia and ↑ risk of arrhythmias. ↑ CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of **agonist/antagonist opioids** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia. **Interferons (alpha)** may ↓ metabolism and ↑ effects. **Nevirapine**, **efavirenz**, **ritonavir**, **ritonavir/lopinavir**, **phenobarbital**, **carbamazepine phenytoin**, and **rifampin** may ↑ metabolism and decrease analgesia; withdrawal may occur. **Fluvoxamine** may increase CNS depression; with **fluvoxamine**, opioid withdrawal may occur. May increase blood levels and effects of **zidovudine** and **desipramine**. May ↓ level and effects of **didanosine** and **stavudine**.
Drug-Natural Products: St. John's Wort ↑ metabolism and ↓ blood levels, concurrent use may result in withdrawal. **Kava kava, valerian,** or **chamomile,** can ↑ CNS depression.

Route/Dosage

Larger doses may be required for analgesia during chronic therapy; interval may be decreased/dose increased if pain recurs.
PO (Adults and Children ≥50 kg): *Analgesic*—20 mg q 6–8 hr. *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be decreased q 1–2 days; maintenance dose is determined on an individual basis.
PO (Adults and Children <50 kg): *Analgesic*—0.2 mg/kg q 6–8 hr.
IM, Subcut (Adults and Children ≥50 kg): *Analgesic*—10 mg q 6–8 hr. *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be decreased q 1–2 days; maintenance dose is determined on an individual basis.
IM, Subcut (Adults and Children <50 kg): 0.1 mg/kg mg q 6–8 hr.

Availability (generic available)

Tablets: 5 mg, 10 mg. **Dispersible tablets (diskettes):** 40 mg (available only to licensed detoxification/maintenance programs). **Oral solution (contains alcohol) (citrus):** 5 mg/5 ml, 10 mg/5 ml. **Oral concentrate (cherry and unflavored):** 10 mg/ml.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- **Pain:** Assess type, location, and intensity of pain prior to and 1–2 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Cumulative effects of this medication may require periodic dose adjustments.
- Doses of methadone for patients on methadone maintenance prevent only withdrawal symptoms; *no analgesia is provided.* Additional opioid doses are required for treatment of pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive methadone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- **Opioid Detoxification:** Assess patient for signs of opioid withdrawal (irritability, runny nose and eyes, abdominal cramps, body aches, sweating, loss of appetite, shivering, unusually large pupils, trouble sleeping, weakness, yawning). Methadone maintenance is undertaken only by federally approved treatment centers. This does not preclude maintenance for addicts hospitalized for other conditions and who require temporary maintenance during their care.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe. For patients in chronic severe pain, the oral solution containing 5 or 10 mg/5 ml is recommended on a fixed dose schedule.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- Diskettes (dispersible tablets) are to be dissolved and used for detoxification and maintenance treatment only.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.

Copyright © 2008 by F.A. Davis

- Dilute each dose of 10 mg/ml oral concentrate with at least 30 ml of water or other liquid prior to administration.
- **Subcut:**
- **IM:** IM is the preferred parenteral route for repeated doses. Subcut administration may cause tissue irritation.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take methadone exactly as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient notify health care professional if signs of overdose (difficult or shallow breathing, extreme tiredness or sleepiness, blurred vision, inability to think, talk, or walk normally, and feelings of faintness, dizziness, or confusion) occur. Methadone has a prolonged action causing increased risk of overdose.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Prevention of withdrawal symptoms in detoxification from heroin and other opioid analgesics.

methimazole (meth-**im**-a-zole)
Tapazole

Classification
Therapeutic: antithyroid agents

Pregnancy Category D

Indications

Palliative treatment of hyperthyroidism. Used as an adjunct to control hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy.

Action

Inhibits the synthesis of thyroid hormones.
Therapeutic Effects: Decreased signs and symptoms of hyperthyroidism.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.
Distribution: Crosses the placenta and enters breast milk in high concentrations.
Metabolism and Excretion: Mostly metabolized by the liver; <10% eliminated unchanged by the kidneys.
Half-life: 3–5 hr.

TIME/ACTION PROFILE (effect on thyroid function)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	4–10 wk	wks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation.
Use Cautiously in: Patients with decreased bone marrow reserve; Patients >40 yr (increased risk of agranulocytosis); Pregnancy (may be used cautiously; however, thyroid problems may occur in the fetus).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, vertigo. **GI:** diarrhea, drug-induced hepatitis, loss of taste, nausea, parotitis, vomiting. **Derm:** rash, skin discoloration, urticaria. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** fever, lymphadenopathy.

Interactions

Drug-Drug: Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Antithyroid effect may be decreased by **potassium iodide** or **amiodarone**. Increased risk of agranulocytosis with **phenothiazines**. May alter response to **warfarin** and **digoxins**.

Route/Dosage

PO (Adults): *Thyrotoxic crisis*—15–20 mg q 4 hr during the first 24 hr (with other interventions). *Hyperthyroidism*—15–60 mg/day as a single dose or divided doses for 6–8 wk. *Maintenance*—5.30 mg/kg as a single dose or 2 divided doses.
PO (Children): *Initial*—400 mcg (0.4 mg)/kg/day in single dose or 2 divided doses. *Main-*

Copyright © 2008 by F.A. Davis

tenance—200 mcg/kg/day in single dose or 2 divided doses.

Availability

Tablets: 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response for symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess patient for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dosage adjustment may be required.
- Assess patient for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- ***Lab Test Considerations:*** Thyroid function studies should be monitored prior to therapy, monthly during initial therapy, and every 2–3 mo throughout therapy.
- WBC and differential counts should be monitored periodically throughout therapy. Agranulocytosis may develop rapidly; it usually occurs during the first 2 mo and is more common in patients over 40 yr and those receiving >40 mg/day. This necessitates discontinuation of therapy.
- May cause increased AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock. If a dose is missed, take as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Notify health care professional of significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, rash, or symptoms of hyperthyroidism or hypothyroidism promptly.
- Instruct patient to consult health care professional before taking any OTC medications.
- Advise patient to carry identification describing medication regimen at all times.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment from 6 mo to several years may be necessary, usually averaging 1 yr.

methocarbamol

(meth-oh-**kar**-ba-mole)
Carbacot, Robaxin

Classification

Therapeutic: skeletal muscle relaxants (centrally acting)

Pregnancy Category C

Indications

Adjunctive treatment of muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

Copyright © 2008 by F.A. Davis

Action

Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in small amounts.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2 hr	unknown
IM	rapid	unknown	unknown
IV	immediate	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polyethylene glycol (parenteral only); Renal impairment (parenteral form).
Use Cautiously in: Pregnancy, lactation, and children (safety not established); Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects; Seizure disorders (parenteral form).

Adverse Reactions/Side Effects

CNS: SEIZURES (IV, IM only), dizziness, drowsiness, light-headedness. **EENT:** blurred vision, nasal congestion. **CV:** *IV*—bradycardia, hypotension. **GI:** anorexia, GI upset, nausea. **GU:** brown, black, or green urine. **Derm:** flushing (IV only), pruritus, rashes, urticaria. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS (IM, IV use only), fever.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): 1.5 g qid initially (up to 8 g/day) for 2–3 days, then 4–4.5 g/day in 3–6 divided doses; may be followed by maintenance dosing of 750 mg q 4 hr or 1 g 4 times daily or 1.5 g 3 times daily.
IM, IV (Adults): 1–3 g/day for not more than 3 days; course may be repeated after a 48-hr rest.

Availability (generic available)

Tablets: 500 mg, 750 mg. **Injection:** ♣100 mg/ml in 10-ml ampules, 100 mg/ml in 10-ml vials. ***In combination with:*** aspirin (Robaxisal). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Monitor pulse and blood pressure every 15 min during parenteral administration.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).
- Assess patient for allergic reactions (skin rash, asthma, hives, wheezing, hypotension) after parenteral administration. Keep epinephrine and oxygen on hand in the event of a reaction.
- Monitor IV site. Injection is hypertonic and may cause thrombophlebitis. Avoid extravasation.
- ***Lab Test Considerations:*** Monitor renal function periodically during prolonged parenteral therapy (>3 days), because polyethylene glycol 300 vehicle is nephrotoxic.
- May cause falsely increased urinary 5-hydroxyindoleacetic acid (5-HIAA) and vanillylmandelic acid (VMA) determinations.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

Implementation

- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** May be administered with food to minimize GI irritation. Tablets may be crushed and mixed with food or liquids to facilitate swallowing. For administration via NG tube, crush tablet and suspend in water or saline.
- **IM:** Do not administer subcut. IM injections should contain no more than 5 ml (500 mg) at a time in the gluteal region.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 100 mg/ml. ***Rate:*** Admin-

Copyright © 2008 by F.A. Davis

ister at a maximum rate of 180 mg/m²/min but not >3 ml (300 mg)/min.
- **Intermittent Infusion:** ***Diluent:*** Dilute each dose in no more than 250 ml of 0.9% NaCl or D5W for injection. ***Concentration:*** 4 mg/ml for slower infusions. Do not refrigerate after dilution
- Have patient remain recumbent during and for at least 10–15 min after infusion to avoid orthostatic hypotension.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- May cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants.
- Inform patient that urine may turn black, brown, or green, especially if left standing.
- Instruct patient to notify health care professional if skin rash, itching, fever, or nasal congestion occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

HIGH ALERT

methotrexate

(meth-o-**trex**-ate)
amethopterin, Folex, Folex PFS, Rheumatrex, Trexall

Classification
Therapeutic: antineoplastics, antirheumatics (DMARDs), immunosuppressants
Pharmacologic: antimetabolites

Pregnancy Category X

Indications

Alone or with other treatment modalities in the treatment of: Trophoblastic neoplasms (choriocarcinoma, chorioadenoma destruens, hydatidiform mole), Leukemias, Breast carcinoma, Head carcinoma, Neck carcinoma, Lung carcinoma. Treatment of severe psoriasis and rheumatoid arthritis unresponsive to conventional therapy. Treatment of mycosis fungoides (cutaneous T-cell lymphoma).

Action

Interferes with folic acid metabolism. Result is inhibition of DNA synthesis and cell reproduction (cell-cycle S-phase–specific). Also has immunosuppressive activity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, and immunosuppression.

M

Pharmacokinetics

Absorption: Small doses are well absorbed from the GI tract. Larger doses incompletely absorbed.
Distribution: Actively transported across cell membranes, widely distributed. Does not reach therapeutic concentrations in the CSF. Crosses placenta; enters breast milk in low concentrations. Absorption in children is variable (23–95%) and dose-dependent.
Metabolism and Excretion: Excreted mostly unchanged by the kidneys.
Half-life: *Low dose*—3–10 hr; *high dose*—8–15 hr (increased in renal impairment).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	4–7 days	7–14 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation; Products containing benzyl alcohol should not be used in neonates.
Use Cautiously in: Renal impairment (CCr must be ≥60 ml/min prior to therapy); Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Geri: Geriatric patients or patients with other chronic debilitating illnesses.

Adverse Reactions/Side Effects

CNS: arachnoiditis (IT use only), dizziness, drowsiness, headaches, malaise. **EENT:** blurred

Copyright © 2008 by F.A. Davis

vision, dysarthria transient blindness. **Resp:** PULMONARY FIBROSIS, intestinal pneumonitis. **GI:** anorexia, hepatotoxicity, nausea, stomatitis, vomiting. **GU:** infertility. **Derm:** alopecia, painful plaque erosions (during psoriasis treatment), photosensitivity, pruritus, rashes, skin ulceration, urticaria. **Hemat:** APLASTIC ANEMIA, anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** osteonecrosis, stress fracture. **Misc:** nephropathy, chills, fever, soft tissue necrosis.

Interactions

Drug-Drug: The following drugs may ↑ hematologic toxicity of methotrexate: high-dose **salicylates**, **NSAIDs**, **oral hypoglycemic agents (sulfonylureas)**, **phenytoin**, **tetracyclines**, **probenecid**, **trimethoprim/sulfamethoxazole**, **pyrimethamine**, and **chloramphenicol**. ↑ hepatotoxicity with other **hepatotoxic drugs** including **azathioprine**, **sulfasalazine**, and **retinoids**. ↑ nephrotoxicity with other **nephrotoxic drugs**. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. **Radiation therapy** ↑ risk of soft tissue necrosis and osteonecrosis. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of neurologic reactions with **acyclovir** (IT methotrexate only). **Asparaginase** may ↓ effects of methotrexate.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. **Caffeine** may ↓ efficacy of methotrexate, similar effect may occur with **guarana.**

Route/Dosage

Trophoblastic Neoplasms

PO, IM (Adults): 15–30 mg/day for 5 days; repeat after 1 or more weeks for 3–5 courses.

Breast Cancer

IV (Adults): 40 mg/m² on days 1 and 8 (with other agents; many regimens are used).

Leukemia

PO (Adults): *Induction*—3.3 mg/m²/day, usually with prednisone.
PO, IM (Adults): *Maintenance*—20–30 mg/m² twice weekly.
IV (Adults): 2.5 mg/kg q 2 wk.
IT (Adults): 12 mg/m² or 15 mg.
IT (Children ≥3 yr): 12 mg.
IT (Children 2 yr): 10 mg.
IT (Children 1 yr): 8 mg.
IT (Children <1 yr): 6 mg.

Osteosarcoma

IV (Adults): 12 g/m² as a 4-hr infusion followed by leucovorin rescue, usually as part of a combination chemotherapeutic regimen (or increase dose until peak serum methotrexate level is 1×10^{-3} M/L but not to exceed 15 g/m²; 12 courses are given starting 4 wk after surgery and repeated at scheduled intervals.

Psoriasis

Therapy may be preceded by a 5–10-mg test dose.
PO (Adults): 2.5–5 mg q 12 hr for 3 doses *or* q 8 hr for 4 doses once weekly (not to exceed 30 mg/wk).
PO, IM, IV (Adults): 10–25 mg/weekly (not to exceed 30 mg/wk).

Arthritis

Therapy may be preceded by a 5–10-mg test dose in adults.
PO (Adults): 7.5 mg weekly (2.5 mg q 12 hr for 3 doses or single dose, not to exceed 20 mg/wk); when response is obtained, dosage should be decreased.
PO (Children): 10 mg/m² once weekly initially, may be increased up to 20–30 mg/m², however response may be better if doses >20 mg/m² are given IM or subcut.

Mycosis Fungoides

PO, IM, Subcut (Adults): 5–50 mg once weekly, if response is poor, dose may be changed to 15–37.5 mg twice weekly.
IM (Adults): 50 mg once weekly or 25 mg twice weekly.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg.
Injection: 2.5 mg/ml, 25 mg/ml, 20 mg, 50 mg, 100 mg, 250 mg, 1 g. **Preservative-free injection:** 25 mg/ml.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during administration. Report significant changes.
- Monitor for abdominal pain, diarrhea, or stomatitis; therapy may need to be discontinued.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for

Copyright © 2008 by F.A. Davis

signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of pulmonary toxicity, which may manifest early as a dry, nonproductive cough.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol and alkalinization of urine may be used to decrease uric acid levels.
- Assess nutritional status. Administering an antiemetic prior to and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- **IT:** Assess for development of nuchal rigidity, headache, fever, confusion, drowsiness, dizziness, weakness, or seizures.
- **Rheumatoid Arthritis:** Assess patient for pain and range of motion prior to and periodically during therapy.
- **Psoriasis:** Assess skin lesions prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and frequently during therapy. The nadir of leukopenia and thrombocytopenia occurs in 7–14 days. Leukocyte and thrombocyte counts usually recover 7 days after the nadirs. Notify health care professional of any sudden drop in values.
- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, and LDH) prior to and routinely during therapy. Urine pH should be monitored prior to high-dose methotrexate therapy and every 6 hr during leucovorin rescue. Urine pH should be kept above 7.0 to prevent renal damage.
- May cause ↑ serum uric acid concentrations, especially during initial treatment of leukemia and lymphoma.
- ***Toxicity and Overdose:*** Monitor serum methotrexate levels every 12–24 hr during high-dose therapy until levels are $<5 \times 10$ M. This monitoring is essential to plan correct leucovorin dose and determine duration of rescue therapy: With high-dose therapy, patient must receive leucovorin rescue within 24–48 hr to prevent fatal toxicity. In cases of massive overdose, hydration and urinary alkalization may be required to prevent renal tubule damage. Monitor fluid and electrolyte status. Intermittent hemodialysis using a high-flux dialyzer may be used for clearance until levels are <0.05 micromolar.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Methotrexate for non-oncologic use is given at a much lower dose and frequency—often just once a week. Do not confuse non-oncologic dosing regimens with dosing regimens for cancer patients.
- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix K).

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each vial with 25 ml of 0.9% NaCl. Use sterile preservative-free diluents for high-dose regimens to prevent complications from large amounts of benzyl alcohol. Do not use preparations that are discolored or that contain a precipitate. Reconstitute immediately before use. Discard unused portion. ***Concentration:*** <25 mg/ml for direct IV and intermittent/continuous infusions. ***Rate:*** Administer at a rate of 10 mg/min into Y-site of a free-flowing IV.
- **Intermittent/Continuous Infusion:** ***Diluent:*** Doses >100–300 mg/m² may also be diluted in D5W, D5/0.9% NaCl, or 0.9% NaCl and infused as intermittent or continuous infusion. ***Rate:*** Administration rates of 4–20 mg/hr have been used.
- **Syringe Compatibility:** bleomycin, cisplatin, cyclophosphamide, doxapram, doxorubicin, fluorouracil, furosemide, heparin, leucovorin, mitomycin, vinblastine, vincristine.
- **Syringe Incompatibility:** droperidol.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate, asparaginase, aztreonam, bleomycin, cefepime, ceftriaxone, cimetidine, cisplatin, cyclophosphamide, cytarabine, daunorubicin, diphenhydramine, doxorubicin, doxorubicin liposome, etoposide, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, granisetron, heparin, hydromorphone, imipenem/cilastatin, lansoprazole, leucovorin, linezolid, lorazepam, melphalan, mesna, methylprednisolone sodium succinate, metoclopramide, mitomycin, morphine, ondansetron, oxaliplatin, paclitaxel, piperacillin/tazobactam, prochlorperazine, ranitidine, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine.
- **Y-Site Incompatibility:** chlorpromazine, gemcitabine, idarubicin, ifosfamide, midazolam, nalbuphine, promethazine, propofol.
- **Additive Compatibility:** cyclophosphamide, cytarabine, fluorouracil, mercaptopurine, ondansetron, sodium bicarbonate, vincristine.
- **Additive Incompatibility:** bleomycin. **IT:** Reconstitute preservative-free methotrexate with preservative-free 0.9% NaCl, Elliot's B solution, or patient's CSF to a concentration not greater than 2 mg/ml. May be administered via lumbar puncture or Ommaya reservoir. To prevent bacterial contamination, use immediately.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it should be omitted. Consult health care professional if vomiting occurs shortly after a dose is taken.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or other NSAIDs; may precipitate gastric bleeding.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical therapy may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient to avoid the use of Rx, OTC, or herbal products without first consulting health care professional.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 3 mo for men and 1 ovulatory cycle for women after completion of therapy.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemia.
- Decrease in symptoms of meningeal involvement in leukemia.
- Decrease in size and spread of non-Hodgkin's lymphomas and other solid cancers.
- Resolution of skin lesions in severe psoriasis.
- Decreased joint pain and swelling.
- Improved mobility in patients with rheumatoid arthritis.
- Regression of lesions in mycosis fungoides.

methyldopa (meth-ill-**doe**-pa)

Aldomet, Apo-Methyldopa, Dopamet, Novamedopa, Nu-Medopa

Classification

Therapeutic: antihypertensives
Pharmacologic: centrally acting antiadrenergics

Pregnancy Category B

Indications

Management of moderate to severe hypertension (with other agents).

Copyright © 2008 by F.A. Davis

Action

Stimulates CNS alpha-adrenergic receptors, producing a decrease in sympathetic outflow to heart, kidneys, and blood vessels. Result is decreased blood pressure and peripheral resistance, a slight decrease in heart rate, and no change in cardiac output. **Therapeutic Effects:** Lowering of blood pressure.

Pharmacokinetics

Absorption: 50% absorbed from the GI tract. Parenteral form, methyldopate hydrochloride, is slowly converted to methyldopa.
Distribution: Crosses the blood-brain barrier. Crosses the placenta; small amounts enter breast milk.
Metabolism and Excretion: Partially metabolized by the liver, partially excreted unchanged by the kidneys.
Half-life: 1.7 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	12–24 hr	4–6 hr	24–48 hr
IV	4–6 hr	unknown	10–16 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active liver disease; Oral suspension contains alcohol and bisulfites and should be avoided in patients with known intolerance.
Use Cautiously in: Previous history of liver disease; Geri: ↑ risk of adverse reactions; consider age-related impairment of hepatic, renal and cardiovascular function as well as other chronic illnesses. Appears on Beers list. May cause bradycardia and exacerbate depression in geriatric patients; OB: Pregnancy (has been used safely); Lactation.

Adverse Reactions/Side Effects

CNS: sedation, decreased mental acuity, depression. **EENT:** nasal stuffiness. **CV:** MYOCARDITIS, bradycardia, edema, orthostatic hypotension. **GI:** DRUG-INDUCED HEPATITIS, diarrhea, dry mouth. **GU:** erectile dysfunction. **Hemat:** eosinophilia, hemolytic anemia. **Misc:** fever.

Interactions

Drug-Drug: Additive hypotension with other **antihypertensives**, acute ingestion of **alcohol**, **anesthesia**, and **nitrates**. **Amphetamines**, **barbiturates**, **tricyclic antidepressants**, **NSAIDs**, and **phenothiazines** may ↓ antihypertensive effect of methyldopa. ↑ effects and risk of psychoses with **haloperidol**. Excess sympathetic stimulation may occur with concurrent use of **MAO inhibitors** or other **adrenergics**. May ↑ effects of **tolbutamide**. May ↑ **lithium** toxicity. Additive hypotension and CNS toxicity with **levodopa**. Additive CNS depression may occur with **alcohol**, **antihistamines**, **sedative/hypnotics**, some **antidepressants**, and **opioid analgesics**. Concurrent use with **nonselective beta blockers** may rarely cause paradoxical hypertension.

Route/Dosage

PO (Adults): 250–500 mg 2–3 times daily (not to exceed 500 mg/day if used with other agents); may be increased q 2 days as needed; usual maintenance dose is 500 mg–2 g/day (not to exceed 3 g/day).
PO (Children): 10 mg/kg/day (300 mg/m²/day); may be increased q 2 days up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).
IV (Adults): 250–500 mg q 6 hr (up to 1 g q 6 hr).
IV (Children): 5–10 mg/kg q 6 hr; up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).

Availability (generic available)

Tablets: 125 mg, 250 mg, 500 mg. **Oral suspension (orange-pineapple flavor, contains bisulfites):** 250 mg/5 ml. **Injection:** 250 mg/5 ml in 5- and 10-ml vials. ***In combination with:*** hydrochlorothiazide (Aldoril) or chlorothiazide (Aldoclor). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine compliance.
- Monitor intake and output ratios and weight and assess for edema daily, especially at beginning of therapy. Report weight gain or edema; sodium and water retention may be treated with diuretics.
- Assess patient for depression or other alterations in mental status. Notify health care pro-

Copyright © 2008 by F.A. Davis

fessional promptly if these symptoms develop.
- Monitor temperature during therapy. Drug fever may occur shortly after initiation of therapy and may be accompanied by eosinophilia and hepatic function changes. Monitor hepatic function test if unexplained fever occurs.
- ***Lab Test Considerations:*** Monitor renal and hepatic function and CBC before and periodically during therapy.
- Monitor direct Coombs' test before and after 6 and 12 mo of therapy. May cause a positive direct Coombs' test, rarely associated with hemolytic anemia.
- May cause ↑ BUN, serum creatinine, potassium, sodium, prolactin, uric acid, AST, ALT, alkaline phosphatase, and bilirubin concentrations.
- May cause prolonged prothrombin times.
- May interfere with serum creatinine and AST measurements.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse methyldopa with levodopa or L-dopa.
- Fluid retention and expanded volume may cause tolerance to develop within 2–3 mo after initiation of therapy. Diuretics may be added to regimen at this time to maintain control.
- Dose increases should be made with the evening dose to minimize drowsiness.
- When changing from IV to oral forms, dose should remain consistent.
- **PO:** Shake suspension before administration.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in 100 ml of D5W, 0.9% NaCl, D5/0.9% NaCl, 5% sodium bicarbonate, or Ringer's solution. ***Concentration:*** ≤10 mg/ml. ***Rate:*** Infuse slowly over 30–60 min.
- **Y-Site Compatibility:** esmolol, heparin, meperidine, morphine, theophylline.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Methyldopa controls but does not cure hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes.
- Inform patient that urine may darken or turn red-black when left standing.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Drowsiness usually subsides after 7–10 days of continuous use.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth continues for >2 wk.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if fever, muscle aches, or flu-like syndrome occurs.

Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.

methylergonovine

(meth-ill-er-goe-**noe**-veen)
Methergine

Classification
Therapeutic: oxytocic
Pharmacologic: ergot alkaloids

Pregnancy Category C

Indications

Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or subinvolution.

Copyright © 2008 by F.A. Davis

Action

Directly stimulates uterine and vascular smooth muscle. **Therapeutic Effects:** Uterine contraction.

Pharmacokinetics

Absorption: Well absorbed following oral or IM administration.
Distribution: Unknown. Enters breast milk in small quantities.
Metabolism and Excretion: Probably metabolized by the liver.
Half-life: 30–120 min.

TIME/ACTION PROFILE (effects on uterine contractions)

ROUTE	ONSET	PEAK	DURATION
PO	5–15 min	unknown	3 hr
IM	2–5 min	unknown	3 hr
IV	immediate	unknown	45 min–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be used to induce labor.
Use Cautiously in: Hypertensive or eclamptic patients (more susceptible to hypertensive and arrhythmogenic side effects); Severe hepatic or renal disease; Sepsis.
Exercise Extreme Caution in: Third stage of labor.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** tinnitus. **Resp:** dyspnea. **CV:** HYPOTENSION, arrhythmias, chest pain, hypertension, palpitations. **GI:** nausea, vomiting. **GU:** cramps. **Derm:** diaphoresis. **Misc:** allergic reactions.

Interactions

Drug-Drug: Excessive vasoconstriction may result when used with heavy cigarette smoking (**nicotine**) or other **vasopressors** such as **dopamine**.

Route/Dosage

PO (Adults): 200–400 mcg (0.4–0.6 mg) q 6–12 hr for 2–7 days.
IM, IV (Adults): 200 mcg (0.2 mg) q 2–4 hr for up to 5 doses.

Availability

Tablets: 200 mcg (0.2 mg). **Injection:** 200 mcg (0.2 mg)/ml in 1-ml ampules.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, heart rate, and uterine response frequently during medication administration. Notify health care professional promptly if uterine relaxation becomes prolonged or if character of vaginal bleeding changes.
- Assess for signs of ergotism (cold, numb fingers and toes, chest pain, nausea, vomiting, headache, muscle pain, weakness).
- ***Lab Test Considerations:*** If no response to methylergonovine, calcium levels may need to be assessed. Effectiveness of medication is ↓ with hypocalcemia.
- May cause ↓ serum prolactin levels.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

IV Administration

- **IV:** IV administration is used for emergencies only. Oral and IM routes are preferred.
- **Direct IV:** ***Diluent:*** May be given undiluted or diluted in 5 ml of 0.9% NaCl and administered through Y-site. Do not add to IV solutions. Do not mix in syringe with any other drug. Refrigerate; stable for storage at room temperature for 60 days; deteriorates with age. Use only solution that is clear and colorless and that contains no precipitate. ***Concentration:*** 0.2 mg/ml. ***Rate:*** Administer at a rate of 0.2 mg over at least 1 min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, omit it and return to regular dose schedule.
- Advise patient that medication may cause menstrual-like cramps.
- Caution patient to avoid smoking, because nicotine constricts blood vessels.
- Instruct patient to notify health care professional if infection develops, as this may cause increased sensitivity to the medication.

Evaluation/Desired Outcomes

- Contractions that maintain uterine tone and prevent postpartum hemorrhage.

M

methylphenidate

(meth-ill-**fen**-i-date)
Concerta, Metadate CD, Metadate ER, Methylin, Methylin ER, ♣PMS-Methylphenidate, ♣Riphenidate, Ritalin, Ritalin LA, Ritalin-SR

Classification
Therapeutic: central nervous system stimulants

Schedule II

Pregnancy Category C

Indications
Treatment of ADHD (adjunct). Symptomatic treatment of narcolepsy. **Unlabeled uses:** Management of some forms of refractory depression.

Action
Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD. Increased motor activity, mental alertness, and diminished fatigue in narcoleptic patients.

Pharmacokinetics
Absorption: Slow and incomplete after oral administration; absorption of sustained or extended-release tablet (SR) is delayed and provides continuous release. *Metadate CD, Concerta, Ritalin LA*—provides initial rapid release followed by a second continuous release (biphasic release).
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized (80%) by the liver.
Half-life: 2–4 hr.

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	4–6 hr
PO-ER	unknown	4–7 hr	3–12 hr†

†depends on formulation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hyperexcitable states; Hyperthyroidism; Patients with psychotic personalities or suicidal or homicidal tendencies; Tourette's syndrome; Glaucoma; Motor tics; Concurrent use or use within 14 days of MAO inhibitors.

Use Cautiously in: History of cardiovascular disease; Hypertension; Diabetes mellitus; Geriatric or debilitated patients; Continual use (may result in psychological or physical dependence); Pedi: Growth suppression may occur in children with long term use; Seizure disorders (may lower seizure threshold); Concerta product should be used cautiously in patients with esophageal motility disorders or severe GI narrowing (may increase the risk of obstruction); Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: hyperactivity, insomnia, restlessness, tremor, dizziness, headache, irritability. **EENT:** blurred vision. **CV:** hypertension, palpitations, tachycardia, hypotension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **Derm:** rashes. **Neuro:** akathisia, dyskinesia. **Misc:** fever, hypersensitivity reactions, physical dependence, psychological dependence, suppression of weight gain (children), tolerance.

Interactions
Drug-Drug: ↑ sympathomimetic effects with other **adrenergics**, including **vasoconstrictors**, and **decongestants**. Use with **MAO inhibitors** or **vasopressors** may result in hypertensive crisis (concurrent use or use within 14 days of MAO inhibitors is contraindicated). Metabolism of **warfarin**, **phenytoin**, **phenobarbital, primidone, selective serotonin reuptake inhibitors**, and **tricyclic antidepressants** may be ↓ and effects ↑. Avoid concurrent use with **pimozide** (may mask cause of tics). Concurrent use with **clonidine** may result in serious EKG abnormalities (a 40% dose reduction of methylphenidate is necessary).
Drug-Natural Products: Use with **caffeine-containing** herbs (**guarana, tea, coffee**) ↑ stimulant effect. **St. John's Wort** may ↑ serious side effects (concurrent use is NOT recommended).
Drug-Food: Excessive use of **caffeine-containing** foods or beverages (**coffee, cola, tea**) may cause ↑ CNS stimulation.

Route/Dosage
PO (Adults): *ADHD*—5–20 mg 2–3 times daily as prompt-release tablets. When maintenance dose is determined, may change to extended-release formulation. *Narcolepsy*—10 mg 2–3 times/day; maximum dose 60 mg/day.
PO (Children >6 yr): *Prompt-release tablets*—0.3 mg/kg/dose or 2.5–5 mg before

Copyright © 2008 by F.A. Davis

breakfast and lunch; increase by 0.1 mg/kg/dose or by 5–10 mg/day at weekly intervals (not to exceed 60 mg/day or 2 mg/kg/day). When maintenance dose is determined, may change to extended-release formulation. *Ritalin SR, Metadate ER*—may be used in place of the Prompt-release tablets when the 8-hour dosage corresponds to the titrated 8-hour dosage of the Prompt-release tablets; *Ritalin LA*—can be used in place of twice daily regimen given once daily at same total dose, or in place of SR product at same dose; *Concerta (patients who have not taken methylphenidate previously)*—18 mg once daily in the morning initially, may be titrated as needed up to 54 mg/day. *Concerta (patients are currently taking other forms of methylphenidate)*—18 mg once daily in the morning if previous dose was 5 mg 2–3 times daily or 20 mg daily as SR product, 36 mg once daily in the morning if previous dose was 10 mg 2–3 times daily or 40 mg daily as SR product, 54 mg once daily in the morning if previous dose was 15 mg 2–3 times daily or 60 mg once daily as SR product. *Metadate CD*—20 mg once daily. Dosage may be adjusted in weekly 20-mg increments to a maximum of 60 mg/day taken once daily in the morning.

Availability (generic available)

Immediate-release tablets: 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg $37.90/100, 10 mg $52.90/100, 20 mg $74.90/100. **Extended-release tablets (Metadate ER, Methylin ER):** 10 mg, 20 mg. **Extended-release tablets (Concerta):** 18 mg, 27 mg, 36 mg, 54 mg. **Cost:** 18 mg $359.96/90, 27 mg $359.98/90, 36 mg $374.96/90, 54 mg $404.96/90. **Sustained-release tablets (Ritalin SR):** 20 mg. **Cost:** $173.96/90. **Extended-release capsules (Metadate CD):** 10 mg, 20 mg, 30 mg. **Cost:** 10 mg $236.97/90, 20 mg $299.99/90, 30 mg $299.95/90$34.68/30. **Extended-release capsules (Ritalin LA):** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 10 mg $299.97/90, 20 mg $299.97/90, 30 mg $299.95/90, 40 mg $299.95/90. **Chewable tablets (Methylin) (grape flavor):** 2.5 mg, 5 mg, 10 mg. **Oral solution (Methylin) (grape flavor):** 5 mg/5 ml, 10 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy.
- Pedi: Monitor growth, both height and weight, in children on long-term therapy
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Methylphenidate has high dependence and abuse potential. Tolerance to abuse of medication occurs rapidly; do not increase dose.
- **ADHD:** Pedi: Assess children for attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of episodes.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

Implementation

- **PO:** Immediate and sustained-release tablets should be administered on an empty stomach (30–45 min before a meal). Sustained-release tablets should be swallowed whole; do not crush, break, or chew. Metadate CD and Ritalin LA capsules may be opened and sprinkled on cool applesauce; entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use. Concerta may be administered without regard to food, but must be taken with water, milk, or juice.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6 PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- May cause dizziness or blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known.

Copyright © 2008 by F.A. Davis

- Inform patient and/or parents that shell of Concerta tablet may appear in the stool. This is no cause for concern.
- Advise patient to avoid using caffeine-containing beverages concurrently with this therapy.
- Advise patient to notify health care professional if nervousness, insomnia, palpitations, vomiting, skin rash, or fever occurs.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **ADHD:** Pedi: Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Decreased frequency of narcoleptic symptoms.
- Improved attention span and social interactions in ADHD.

methylPREDNISolone, See CORTICOSTEROIDS (SYSTEMIC).

metoclopramide

(met-oh-**kloe**-pra-mide)
Apo-Metoclop, Clopra, Emex, Maxeran, Octamide, Octamide-PFS, Reclomide, Reglan

Classification
Therapeutic: antiemetics

Pregnancy Category B

Indications

Prevention of chemotherapy-induced emesis. Treatment of postsurgical and diabetic gastric stasis. Facilitation of small bowel intubation in radiographic procedures. Management of esophageal reflux. Treatment and prevention of postoperative nausea and vomiting when nasogastric suctioning is undesirable. **Unlabeled uses:** Treatment of hiccups. Adjunct management of migraine headaches.

Action

Blocks dopamine receptors in chemoreceptor trigger zone of the CNS. Stimulates motility of the upper GI tract and accelerates gastric emptying. **Therapeutic Effects:** Decreased nausea and vomiting. Decreased symptoms of gastric stasis. Easier passage of nasogastric tube into small bowel.

Pharmacokinetics

Absorption: Well absorbed from the GI tract, from rectal mucosa, and from IM sites.
Distribution: Widely distributed into body tissues and fluids. Crosses blood-brain barrier and placenta. Enters breast milk in concentrations greater than plasma.
Metabolism and Excretion: Partially metabolized by the liver; 25% eliminated unchanged in the urine.
Half-life: 2.5–6 hr.

TIME/ACTION PROFILE (effects on peristalsis)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	1–2 hr
IM	10–15 min	unknown	1–2 hr
IV	1–3 min	immediate	1–2 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Possible GI obstruction or hemorrhage; History of seizure disorders; Pheochromocytoma; Parkinson's disease.
Use Cautiously in: History of depression; Diabetes (may alter response to insulin); Renal impairment (reduce dose in CCr <50 ml/min); OB, Lactation: Safety not established; Pedi: some syrup products contain benzoate, a metabolite of benzyl alcohol which can cause potentially fatal gasping syndrome in neonates. Prolonged clearance in neonates can result in high serum concentrations and increase the risk for methemoglobinemia. Side effects are more common in children especially extrapyramidal reactions; Geri: More susceptible to oversedation and extrapyramidal reactions.

Adverse Reactions/Side Effects

CNS: drowsiness, extrapyramidal reactions, restlessness, NEUROLEPTIC MALIGNANT SYNDROME, anxiety, depression, irritability, tardive dyskinesia. **CV:** arrhythmias (supraventricular tachycardia, bradycardia), hypertension, hypotension. **GI:** constipation, diarrhea, dry mouth, nausea. **Endo:** gynecomastia. **Hemat:** methemoglobinemia, neutropenia, leukopenia, agranulocytosis.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid anal-**

Copyright © 2008 by F.A. Davis

gesics, and **sedative/hypnotics**. May ↑ absorption and risk of toxicity from **cyclosporine**. May affect the GI absorption of other **orally administered drugs** as a result of effect on GI motility. May exaggerate hypotension during **general anesthesia**. ↑ risk of extrapyramidal reactions with agents such as **haloperidol** or **phenothiazines**. **Opioids** and **anticholinergics** may antagonize the GI effects of metoclopramide. Use cautiously with **MAO inhibitors** (causes release of catecholamines). May ↑ neuromuscular blockade from **succinylcholine**. May ↓ effectiveness of **levodopa**. May ↑ **tacrolimus** serum levels.

Route/Dosage

Prevention of Chemotherapy-Induced Vomiting

PO, IV (Adults and Children): 1–2 mg/kg 30 min before chemotherapy. Additional doses of 1–2 mg/kg may be given q 2–4 hr, pretreatment with diphenhydramine will decrease the risk of extrapyramidal reactions to this dosage.

Facilitation of Small Bowel Intubation

IV (Adults and Children >14 yr): 10 mg over 1–2 min.
IV (Children 6–14 yr): 2.5–5 mg (dose should not exceed 0.5 mg/kg) over 1–2 min.
IV (Children <6 yr): 0.1 mg/kg over 1–2 min.

Diabetic Gastroparesis

PO, IV (Adults): 10 mg 30 min before meals and at bedtime for 2–8 weeks.

Gastroesophageal Reflux

PO, IM, IV (Adults): 10–15 mg 30 min before meals and at bedtime (not to exceed 0.5 mg/kg/day). A single dose of 20 mg may be given preventively. Some patients may respond to doses as small as 5 mg.
PO, IM, IV (Neonates, Infants, and Children): 0.4–0.8 mg/kg/day in 4 divided doses.

Postoperative Nausea/Vomiting

IM, IV (Adults and Children >14 yr): 10 mg at the end of surgical procedure, repeat in 6–8 hr if needed.
IM, IV (Children <14 yr): 0.1–0.2 mg/kg/dose, repeat in 6–8 hr if needed.

Treatment of Hiccups

PO, IM (Adults): 10–20 mg 4 times daily PO; may be preceded by a single 10-mg dose IM (unlabeled).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Reglan*—5 mg $50.91/100, 10 mg $80.26/100; *generic*—5 mg $29.77/100, 10 mg $21.12/100. **Concentrated solution:** 10 mg/ml. **Syrup (apricot-peach flavor):** 5 mg/5 ml. **Injection:** 5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Assess patient for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout course of therapy. May occur weeks to months after initiation of therapy and are reversible on discontinuation. Dystonic reactions may occur within minutes of IV infusion and stop within 24 hr of discontinuation of metoclopramide. May be treated with 50 mg of IM diphenhydramine or diphenhydramine 1 mg/kg IV may be administered prophylactically 15 min before metoclopramide IV infusion.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Usually occurs after a year or more of continued therapy. Report immediately; may be irreversible.
- Monitor for neuroleptic malignant syndrome (hyperthermia, muscle rigidity, altered consciousness, irregular pulse or blood pressure, tachycardia, and diaphoresis).
- Assess patient for signs of depression periodically throughout therapy.
- ***Lab Test Considerations:*** May alter hepatic function test results.
- May cause ↑ serum prolactin and aldosterone concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Risk for injury (Side Effects)

Copyright © 2008 by F.A. Davis

Implementation

- **PO:** Administer doses 30 min before meals and at bedtime.
- **IM:** For prevention of postoperative nausea and vomiting, inject IM near the end of surgery.
- **Rect:** Suppositories may be made by pharmacist. Administer 1 suppository 30–60 min before each meal and at bedtime.

IV Administration

- **Direct IV:** Administer IV dose 30 min before administration of chemotherapeutic agent. ***Rate:*** Doses may be given slowly over 1–2 min. Rapid administration causes a transient but intense feeling of anxiety and restlessness followed by drowsiness.
- **Intermittent Infusion:** ***Diluent:*** May be diluted for IV infusion in 50 ml of D5W, 0.9% NaCl, D5/0.45% NaCl, Ringer's solution, or LR. Diluted solution is stable for 48 hr if protected from light or 24 hr under normal light. ***Concentration:*** May dilute to 0.2 mg/ml or give undiluted at 5 mg/ml. ***Rate:*** Infuse slowly (maximum rate 5 mg/min) over at least 15–30 min.
- **Syringe Compatibility:** atropine, benztropine, bleomycin, butorphanol, chlorpromazine, cisplatin, cyclophosphamide, cytarabine, dexamethasone, diphenhydramine, doxorubicin, droperidol, fentanyl, fluorouracil, heparin, hydrocortisone, hydromorphone, hydroxyzine, leucovorin, lidocaine, magnesium sulfate, meperidine, methylprednisolone sodium succinate, midazolam, mitomycin, morphine, ondansetron, pentazocine, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine, vinblastine, vincristine.
- **Syringe Incompatibility:** furosemide, pantoprazpole.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, aztreonam, bivalirudin, bleomycin, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, diltiazem, docetaxel, doxapram, doxorubicin, droperidol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, gemcitabine, granisetron, heparin, hydromorphone, idarubicin, leucovorin, levofloxacin, linezolid, melphalan, meperidine, meropenem, methadone, methotrexate, mitomycin, morphine, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, quinupristin/dalfopristin, remifentanil, sargramostim, sufentanil, tacrolimus, teniposide, thiotepa, topotecan, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate complex, amsacrine, cefepime, doxorubicin liposome, furosemide, lansoprazole, propofol.

Patient/Family Teaching

- Instruct patient to take metoclopramide as directed. Take missed doses as soon as remembered if not almost time for next dose.
- Pedi: Unintentional overdose has been reported in infants and children with the use of metoclopramide oral solution. Teach parents how to accurately read labels and administer medication.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.

Evaluation/Desired Outcomes

- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.
- Facilitation of small bowel intubation.
- Decreased symptoms of esophageal reflux.

metolazone (me-**tole**-a-zone)
Zaroxolyn

Classification
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

Pregnancy Category B

Indications

Mild to moderate hypertension. Edema associated with CHF or the nephrotic syndrome.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients.

Copyright © 2008 by F.A. Davis

Diuresis with subsequent mobilization of edema. Effect may continue in renal impairment.

Pharmacokinetics

Absorption: Absorption is variable.
Distribution: Unknown.
Metabolism and Excretion: Excreted mainly unchanged by the kidneys.
Half-life: 8 hr.

TIME/ACTION PROFILE (diuretic effect†)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2 hr	12–24 hr

†Full antihypertensive effect may take days–weeks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other sulfonamides may exist; Anuria; OB: Lactation.
Use Cautiously in: Severe hepatic impairment; Geri: Increased sensitivity; OB, Pedi: Pregnancy or children (safety not established; children may be more susceptible to diuretic and hypokalemic effects).

Adverse Reactions/Side Effects

CNS: drowsiness, lethargy. **CV:** chest pain, hypotension, palpitations. **GI:** anorexia, bloating, cramping, drug-induced hepatitis, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **Hemat:** blood dyscrasias. **Metab:** hyperuricemia. **MS:** muscle cramps. **Misc:** chills, pancreatitis.

Interactions

Drug-Drug: ↑ risk of hypotension with **nitrates**, acute ingestion of **alcohol**, or other **antihypertensives**. ↑ risk of hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. May ↑ the risk of **digoxin** toxicity. ↓ the excretion of **lithium**; may cause toxicity. May ↓ the effectiveness of **methenamine**. **Stimulant laxatives** (including **aloe, senna**) may ↑ risk of potassium depletion.
Drug-Food: Food may ↑ extent of absorption.

Route/Dosage

PO (Adults): *Hypertension*—2.5–5 mg/day; *edema*—5–20 mg/day.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $99.99/90, 5 mg $110.09/90, 10 mg $121.97/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, intake and output, and daily weight, and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify physician or other health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor blood pressure before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum creatinine and uric acid levels before and periodically during therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause an ↑ in serum bilirubin, calcium, creatinine, and uric acid, and a ↓ in serum magnesium, potassium, and sodium and urinary calcium concentrations.
- May cause ↓ serum protein-bound iodine (PBI) concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take metolazone at the same time each day. Take missed doses as

Copyright © 2008 by F.A. Davis

soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension; may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing in the sun to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix L).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patient to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly blood pressure.
- Advise patient to consult health care professional before taking OTC medication, especially cough or cold preparations, concurrently with this therapy.

Evaluation/Desired Outcomes
- Decrease in blood pressure.
- Increase in urine output.
- Decrease in edema.

HIGH ALERT

metoprolol (me-**toe**-proe-lole)
Beloc, Beloc-ZOK, Betaloc Durules, Betaloc-ZOK, Lopresor, Lopresor SR, Lopressor, Metoprol, Novo-metoprol, Seloken-ZOK, Toprol-XL

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

Indications
Hypertension. Angina pectoris. Prevention of MI and decreased mortality in patients with recent MI. Management of stable, symptomatic (class II or III) heart failure due to ischemic, hypertensive or cardiomyopathc origin (may be used with ACE inhibitors, diuretics and/or digoxin; Toprol XL 25 mg only). **Unlabeled uses:** Ventricular arrhythmias/tachycardia. Migraine prophylaxis. Tremors. Aggressive behavior. Drug-induced akathisia. Anxiety.

Action
Blocks stimulation of beta$_1$ (myocardial)-adrenergic receptors. Does not usually affect beta$_2$ (pulmonary, vascular, uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate. Decreased frequency of attacks of angina pectoris. Decreased rate of cardiovascular mortality and hospitalization in patients with heart failure.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Crosses the blood-brain barrier, crosses the placenta; small amounts enter breast milk.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 3–7 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO†	15 min	unknown	6–12 hr
PO–ER	unknown	6–12 hr	24 hr
IV	immediate	20 min	5–8 hr

†Maximal effects on BP (chronic therapy) may not occur for 1 wk. Hypotensive effects may persist for up to 4 wk after discontinuation

Contraindications/Precautions
Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment; Hepatic impairment; Geri: Geriatric patients (↑ sensitivity to beta blockers; initial dose reduction rec-

Copyright © 2008 by F.A. Davis

ommended); Pulmonary disease (including asthma; beta$_1$ selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB: Pregnancy, lactation, or children (safety not established; all agents cross the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression).

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastric pain, heartburn, increased liver function studies, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause ↑ myocardial depression. ↑ bradycardia may occur with **digoxin**. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent administration of **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial beta$_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

Route/Dosage

PO (Adults): *Antihypertensive/antianginal*—25–100 mg/day as a single dose initially or 2 divided doses; may be increased q 7 days as needed up to 450 mg/day (for angina, give in divided doses). Extended-release products are given once daily. *MI*—25–50 mg (starting 15 min after last IV dose) q 6 hr for 48 hr, then 100 mg twice daily for a minimum of 3 mo. *Heart failure*—12.5–25 mg once daily, can be doubled every 2 wk up to 200 mg/day. *Migraine prevention*—50–100 mg 2–4 times daily (unlabeled).

IV (Adults): *MI*—5 mg q 2 min for 3 doses, followed by oral dosing.

Availability (generic available)

Tablets (tartrate): 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $28.37/180, 50 mg $27.00/180, 100 mg $22.99/180. **Extended-release tablets (succinate; Toprol XL):** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic*—25 mg $66.97/90, 50 mg $73.97/90, 100 mg $99.92/90, 200 mg $176.98/90. **Injection:** 1 mg/ml. ***In combination with:*** hydrochlorothiazide (Lopressor HCT). See Appendix B.

M

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, ECG, and pulse frequently during dose adjustment and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- Monitor vital signs and ECG every 5–15 min during and for several hours after parenteral administration. If heart rate <40 bpm, especially if cardiac output is also decreased, administer atropine 0.25–0.5 mg IV.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Copyright © 2008 by F.A. Davis

Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order and dose calculations.
- ***High Alert:*** Do not confuse metoprolol with misoprostol. Do not confuse Toprol-XL (metoprolol) with Topomax (topiramate) or Tegretol (carbamazepine).
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer metoprolol with meals or directly after eating.
- Extended-release tablets should be swallowed whole; do not crush, break, or chew.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer over 1 min.
- **Y-Site Compatibility:** abciximab, acyclovir, alteplase, amikacin, aminophylline, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, diazepam, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of caffeinated coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.

metronidazole

(me-troe-**ni**-da-zole)
Apo-Metronidazole, Flagyl, Flagyl ER, Metric 21, MetroCream, MetroGel, MetroGel-Vaginal, MetroLotion, Metro IV, Metryl, Nidagel, Noritate, Novonidazol, Protostat, Trikacide

Classification
Therapeutic: anti-infectives, antiprotozoals, antiulcer agents

Pregnancy Category B

Indications

PO, IV: Treatment of the following anaerobic infections: Intra-abdominal infections (may be used with a cephalosporin), Gynecologic infections, Skin and skin structure infections, Lower respiratory tract infections, Bone and joint infections, CNS infections, Septicemia, Endocarditis. **IV:** Perioperative prophylactic agent in colorectal surgery. **PO:** Amebicide in the management of amebic dysentery, amebic liver abscess, and trichomoniasis. Treatment of peptic ulcer disease caused by *Helicobacter pylori*. **Topical:** Treatment of acne rosacea. **Vag:** Management of bacterial vaginosis. **Unlabeled uses:** Treatment of giardiasis. Treatment of anti-infective associated pseudomembranous colitis.

Action

Disrupts DNA and protein synthesis in susceptible organisms. **Therapeutic Effects:** Bactericidal, trichomonacidal, or amebicidal action. **Spectrum:** Most notable for activity against anaerobic bacteria, including: *Bacteroides*, *Clostridium*. In addition, is active against: *Trichomonas vaginalis*, *Entamoeba histolytica*, *Giardia lamblia*, *H. pylori*, *Clostridium difficile*.

Pharmacokinetics

Absorption: 80% absorbed after oral administration. Minimal absorption after topical or vaginal application.

Distribution: Widely distributed into most tissues and fluids, including CSF. Crosses the placenta and enters fetal circulation rapidly; enters breast milk in concentrations equal to plasma levels.

Metabolism and Excretion: Partially metabolized by the liver (30–60%), partially excreted unchanged in the urine, 6–15% eliminated in the feces.

Half-life: Neonates: 25–75 hr; Children and adults: 6–12 hr.

TIME/ACTION PROFILE (PO, IV = blood levels; topical = improvement in rosacea)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–3 hr	8 hr
PO-ER	rapid	unknown	up to 24 hr
IV	rapid	end of infusion	6–8 hr
Topical	3 wk	9 wk	12 hr
Vaginal	unknown	6–12 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (topical only); First trimester of pregnancy.

Use Cautiously in: History of blood dyscrasias; History of seizures or neurologic problems; Severe hepatic impairment (dose reduction suggested); Pregnancy (although safety not established, has been used to treat trichomoniasis in 2nd- and 3rd-trimester pregnancy—but not as single-dose regimen); Lactation (if needed, use single dose and interrupt nursing for 24 hr thereafter); Patients receiving corticosteroids or predisposed to edema (injection contains 28 mEq sodium/g metronidazole).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache. **EENT:** tearing (topical only). **GI:** abdominal pain, anorexia, nausea, diarrhea, dry mouth, furry tongue, glossitis, unpleasant taste, vomiting. **Derm:** rashes, urticaria; *topical only*— burning, mild dryness, skin irritation, transient redness. **Hemat:** leukopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy. **Misc:** superinfection, disulfiram-type reaction with alcohol.

Interactions

Drug-Drug: Cimetidine may ↓ the metabolism of metronidazole. **Phenobarbital** and **rifampin** ↑ metabolism and may ↓ effectiveness. Metronidazole ↑ the effects of

Copyright © 2008 by F.A. Davis

phenytoin, lithium, and **warfarin**. Disulfiram-like reaction may occur with **alcohol** ingestion. May cause acute psychosis and confusion with **disulfiram**. ↑ risk of leukopenia with **fluorouracil** or **azathioprine**.

Route/Dosage

PO (Adults): *Anaerobic infections*—7.5 mg/kg q 6 hr (not to exceed 4 g/day). *Trichomoniasis*—250 mg q 8 hr for 7 days *or* single 2-g dose *or* 1 g bid for 1 day. *Amebiasis*—500–750 mg q 8 hr for 5–10 days. *H. pylori*—250 mg 4 times daily *or* 500 mg twice daily for 1–2 wk (with other agents). *Bacterial vaginoses*—750 mg once daily as ER tablets for 7 days. *Antibiotic associated pseudomembranous colitis*—250–500 mg 3–4 times/day for 10–14 days.

PO (Infants and Children): *Anaerobic infections*—30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day. *Trichomoniasis*—15–30 mg/kg/day divided q 8 hr for 7–10 days. *Amebiasis*—35–50 mg/kg/day divided q 8 hr for 5–10 days (not to exceed 750 mg/dose). *Antibiotic associated pseudomembranous colitis*—30 mg/kg/day divided q 6 hr for 7–10 days. *H. pylori*—15–20 mg/kg/day divided twice daily for 4 weeks.

IV, PO (Neonates 0–4 weeks, <1200 g): 7.5 mg/kg q 48 hr. *Postnatal age <7 days, 1200–2000 g*—7.5 mg/kg/day q 24 hr. *Postnatal age <7 days, >2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, 1200–2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, >2000 g*—30 mg/kg/day divided q 12 hr.

IV (Adults): *Anaerobic infections*—Initial dose 15 mg/kg, then 7.5 mg/kg q 6–8 hr *or* 500 mg q 6–8 hr (not to exceed 4 g/day). *Perioperative prophylaxis*—Initial dose 15 mg/kg 1 hr before surgery, then 7.5 mg/kg 6 and 12 hr later. *Amebiasis*—500–750 mg q 8 hr for 5–10 days.

IV (Children): *Anaerobic infections*—30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day.

Topical (Adults): *Acne rosacea*—apply thin film to affected area bid.

Vag (Adults): *Bacterial vaginosis*—One applicatorful (5 g) 2 times daily for 5 days.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Cost:** *Generic*—250 mg $16.99/30, 500 mg $9.99/30. **Extended-release (ER) tablets:** 750 mg. **Cost:** $297.98/30. **Capsules:** 375 mg, ♣500 mg. **Premixed injection:** 500 mg/100 ml RTU (ready to use). **Topical gel:** 0.75% in 45-g and 60-g tubes. **Cost:** $132.99/60 g. **Topical cream:** 0.75% in 45-g tubes, 1% in 60-g tubes. **Cost:** *Generic*—$59.99/45 g. **Topical lotion:** 0.75% in 59-ml bottle. **Cost:** *Generic*—$79.99/59 ml. **Vaginal gel:** 0.75% (37.5 mg/5 g applicatorful) in 70-g tubes. **Cost:** $32.22/70 g. ***In combination with:*** bismuth subsalicylate tablets and tetracycline capsules (Helidac) as part of a compliance package; bismuth subcitrate potassium and tetracycline (Pylera). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results
- Monitor neurologic status during and after IV infusions. Inform physician if numbness, paresthesia, weakness, ataxia, or seizures occur
- Monitor intake and output and daily weight, especially for patients on sodium restriction. Each 500 mg of Flagyl IV for dilution contains 5 mEq of sodium; each 500 mg of Flagyl RTU contains 14 mEq of sodium.
- **Giardiasis:** Monitor three stool samples taken several days apart, beginning 3–4 wk after treatment.
- ***Lab Test Considerations:*** May alter results of serum AST, ALT, and LDH tests.

Potential Nursing Diagnoses

Risk for infection (Indications)
Diarrhea (Indications)

Implementation

- **PO:** Administer on an empty stomach, or may administer with food or milk to minimize GI irritation. Tablets may be crushed for patients with difficulty swallowing.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Flagyl IV RTU is prediluted and ready to use. Do not refrigerate. Once taken out of overwrap, premixed infusion stable for 30 days at room temperature. ***Concentration:*** 5 mg/ml. ***Rate:*** Infuse over 30–60 min.
- **Y-Site Compatibility:** acyclovir, anidulafungin, bivalirudin, cefepime, cisatracurium, diltiazem, dopamine, enalaprilat, ertapenam,

Copyright © 2008 by F.A. Davis

esmolol, fenoldopam, fluconazole, granisetron, heparin, hydromorphone, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone, midazolam, milrinone, morphine, nicardipine, palonosetron, piperacillin/tazobactam, tacrolimus, theophylline, tirofiban, vasopressin, voriconazole.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, aztreonam, caspofungin, daptomycin, filgrastim, lansoprazole, pantoprazole.
- **Topical:** Cleanse affected area before application. Apply and rub in a thin film twice daily, morning and evening. Avoid contact with eyes.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed with evenly spaced times between doses, even if feeling better. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered if not almost time for next dose.
- Advise patients treated for trichomoniasis that sexual partners may be asymptomatic sources of reinfection and should be treated concurrently. Patient should also refrain from intercourse or use a condom to prevent reinfection.
- Caution patient to avoid intake of alcoholic beverages or preparations containing alcohol during and for at least 1 day after treatment with metronidazole, including vaginal gel. May cause a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- May cause dizziness or light-headedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that medication may cause an unpleasant metallic taste.
- Advise patient not to take OTC medications concurrently without consulting health care professional.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Advise patient to inform health care professional if pregnancy is suspected before taking this medication.
- Inform patient that medication may cause urine to turn dark.
- Advise patient to consult health care professional if no improvement in a few days or if signs and symptoms of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) develop.
- **Vag:** Instruct patient in correct technique for intravaginal instillation. Advise patient to avoid intercourse during treatment with vaginal gel.
- **Topical:** Instruct patient on correct technique for application of topical gel. Cosmetics may be used after application of gel.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Significant results should be seen within 3 wk of application of topical gel. Application may be continued for 9 wk.

mexiletine (mex-il-e-teen)
Mexitil

Classification
Therapeutic: antiarrhythmics (class IB)

Pregnancy Category C

Indications
Prophylaxis/treatment of serious ventricular arrhythmias, including VT and PVCs. **Unlabeled uses:** Management of chronic neuropathic pain.

Action
Decreases the duration of the action potential and effective refractory period in cardiac conduction tissue by altering transport of sodium across myocardial cell membranes. Has little or no effect on heart rate. **Therapeutic Effects:** Control of ventricular arrhythmias.

Pharmacokinetics
Absorption: Well absorbed from the GI tract. **Distribution:** Enters breast milk in concentrations similar to plasma.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Mostly metabolized by the liver; 10% excreted unchanged by the kidneys.
Half-life: 10–12 hr.

TIME/ACTION PROFILE (antiarrhythmic effects†)

ROUTE	ONSET	PEAK	DURATION
PO	30 min–2 hr	2–3 hr	8–12 hr

†Provided a loading dose has been given

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cardiogenic shock; 2nd- or 3rd-degree heart block (if a pacemaker has not been inserted); Lactation.
Use Cautiously in: Sinus node or intraventricular conduction abnormalities; Hypotension; CHF; Severe hepatic impairment (dosage reduction suggested); Pregnancy or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, nervousness, confusion, fatigue, headache, sleep disorder. **EENT:** blurred vision, tinnitus. **Resp:** dyspnea. **CV:** ARRHYTHMIAS, chest pain, edema, palpitations. **GI:** HEPATIC NECROSIS, heartburn, nausea, vomiting. **Derm:** rashes. **Hemat:** blood dyscrasias. **Neuro:** tremor, coordination difficulties, paresthesia.

Interactions

Drug-Drug: Opioid analgesics, **atropine**, and **antacids** may slow absorption. **Metoclopramide** may speed absorption. **Phenytoin**, **rifampin**, **cigarette smoking**, or **phenobarbital** may ↑ metabolism and ↓ effectiveness. **Cimetidine** may ↑ or ↓ mexiletine levels. May ↑ blood levels and risk of toxicity from **theophylline**. Additive cardiac effects may occur with other **antiarrhythmics**. **Drugs that drastically alter urine pH** may alter blood levels (alkalinization ↑ reabsorption and blood levels; acidification ↑ excretion and ↓ blood levels).
Drug-Food: Foods that drastically alter urine pH may alter blood levels. Alkalinization ↑ reabsorption and ↑ blood levels. Acidification ↑ excretion and may ↓ effectiveness (see Appendix L).

Route/Dosage

PO (Adults): 400-mg loading dose initially, then 200 mg 8 hr later, then 200–400 mg q 8 hr; dosage alterations of 50–100 mg may be made q 2–3 days. If controlled on ≤300 mg q 8 hr, can give same daily dose at 12-hr intervals (not to exceed 1200 mg/day). Some patients may require q 6 hr dosing.

Availability

Capsules: 🍁100 mg, 150 mg, 200 mg, 250 mg.

NURSING IMPLICATIONS

Assessment

- Monitor pulse, blood pressure, and ECG periodically throughout therapy. Continuous Holter monitoring and chest x-ray examinations may be necessary to determine efficacy and aid in dosage adjustment.
- **Pain:** Assess type, location, and severity of pain prior to and periodically throughout therapy.
- ***Lab Test Considerations:*** May occasionally cause a positive ANA test result.
- May cause a transient increase in AST concentrations.
- May cause thrombocytopenia within a few days after initiation of therapy. Blood counts usually return to normal within 1 mo after discontinuation of therapy.
- ***Toxicity and Overdose:*** Serum mexiletine concentrations may be determined during dosage adjustment. Incidence of side effects is greater with concentrations >2 mcg/ml.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- When changing from other antiarrhythmic therapy, give the 1st dose of mexiletine 6–12 hr after the last dose of quinidine, 3–6 hr after last dose of procainamide, or 8–12 hr after last dose of tocainide. When changing from parenteral lidocaine, decrease lidocaine dose or discontinue lidocaine 1–2 hr after administration of mexiletine or administer lower initial doses of mexiletine.
- Transfer of patients with life-threatening arrhythmias from other antiarrhythmics to mexiletine should be managed in the hospital.
- **PO:** Administer with food or antacids to minimize GI irritation.

Patient/Family Teaching

- Advise patient to take medication exactly as directed, at evenly spaced intervals, even if feeling well. Missed doses should be taken

Copyright © 2008 by F.A. Davis

within 4 hr or omitted. Do not skip or double up on missed doses.
- Teach patients to monitor pulse. Advise patient to contact health care professional if pulse rate is <50 bpm or becomes irregular.
- May cause dizziness and light-headedness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to avoid changes in diet that may drastically acidify or alkalinize the urine (see Appendix L for foods included).
- Advise patient to notify health care professional of disease process and medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if general tiredness, yellowing of the skin or eyes, fever, sore throat, or persistent side effects occur.
- Patient should carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes
- Decrease in frequency or resolution of serious ventricular arrhythmias.
- Decrease in severity of chronic neurogenic pain.

micafungin (my-ka-fun-gin)
Mycamine

Classification
Therapeutic: antifungals
Pharmacologic: echinocandins

Pregnancy Category C

Indications
Esophageal candidiasis. Prophylaxis of *Candida* infections during hematopoetic stem cell transplantation.

Action
Inhibits synthesis of glucan required for the formation of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against the following *Candida* spp: *C. albicans*, *C. glabrata*, *C. krusei*, *C. parapsilosis*, *C. tropicalis*.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: >99 %.
Metabolism and Excretion: Mostly metabolized; 71% fecal elimination.
Half-life: 15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe hepatic impairment; Lactation or children (safety not established), pregnancy (use only if clearly needed).

Adverse Reactions/Side Effects
GI: worsening hepatic function/hepatitis. **GU:** renal impairment. **Hemat:** hemolysis/hemolytic anemia. **Local:** injection site reactions. **Misc:** allergic reactions including ANAPHYLAXIS (rare).

Interactions
Drug-Drug: ↑ blood levels and risk of toxicity with **sirolimus** and **nifedipine** (dose adjustments may be necessary).

Route/Dosage
IV (Adults): *Esophageal candidiasis*—150 mg/day for 15 days (range 10–30 days); *prevention of Candida infections in stem cell transplantation*—50 mg/day.

Availability
Lyophilized powder for injection: 50 mg/vial, 100 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess symptoms of esophageal candidiasis (dysphagia, odynophagia, retrosternal pain) prior to and during therapy.
- Monitor for signs of anaphylaxis (rash, pruritus, wheezing, laryngeal edema, abdominal pain). Discontinue micafungin and notify physician or health care professional immediately if these occur.
- Assess for injection site reactions (phlebitis, thrombophlebitis) during therapy. These occur more frequently in patients receiving micafungin via peripheral IV infusion.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, bilirubin, ALT,

Copyright © 2008 by F.A. Davis

AST, and LDH levels. If elevations occur, monitor for worsening liver function; may require discontinuation of therapy.
- May cause ↑ BUN and serum creatinine.
- May cause leukopenia, neutropenia, thrombocytopenia, and anemia. Monitor for worsening levels; may require discontinuation of therapy.
- May cause hypokalemia, hypocalcemia, and hypomagnesemia.

Potential Nursing Diagnoses
Risk for infection (Indications)

Implementation
IV Administration
- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 50-mg vial with 5 ml of 0.9% NaCl or D5W to achieve concentration of 10 mg/ml. Reconstitute each 100-mg vial with 5 ml of 0.9% NaCl or D5w to achieve concentration of 20 mg/ml. Dissolve by gently swirling vial; do not shake vigorously. Directions for further dilution based on indication for use. For prophylaxis of *Candida* infections, add 50 mg of micafungin to 100 ml of 0.9% NaCl or D5W. For treatment of esophageal candidiasis, add 150 mg of micafungin to 100 ml of 0.9% NaCl or D5W. Reconstituted vials and infusion are stable for 24 hr at room temperature. Protect diluted solution from light. ***Concentration:*** 0.5–1.5 mg/ml. ***Rate:*** Flush line with 0.9% NaCl prior to administration. Infuse over 1 hr. More rapid infusions may result in more frequent histamine mediated reactions.
- **Y-Site Compatibility:** aminophylline, bumetanide, calcium chloride, calcium gluconate, cyclosporine, dopamine, eptifibatide, esmolol, fenoldopam, furosemide, heparin, hydromorphone, lidocaine, lorazepam, magnesium sulfate, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride, potassium phosphate, tacrolimus, vasopressin.
- **Y-Site Incompatibility:** amiodarone, cisatracurium, diltiazem, dobutamine, epinephrine, insulin, labetalol, meperidine, midazolam, morphine, mycophenolate mofetil, nesiritide, nicardipine, octreotide, ondansetron, phenytoin, vecuronium.

Patient/Family Teaching
- Inform patient of the purpose of micafungin.
- Advise patient to notify health care professional immediately if signs of anaphylaxis occur.

Evaluation/Desired Outcomes
- Resolution of signs and symptoms of esophageal candidiasis.
- Prevention of *Candida* infections during hematopoetic stem cell transplantation.

miconazole, See ANTIFUNGALS (TOPICAL), ANTIFUNGALS (VAGINAL).

HIGH ALERT

midazolam (mid-**ay**-zoe-lam)
Versed

Classification
Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications
PO: Preprocedural sedation and anxiolysis in pediatric patients. **IM, IV:** Preoperative sedation/anxiolysis/amnesia. **IV:** Provides sedation/anxiolysis/amnesia during therapeutic, diagnostic, or radiographic procedures (conscious sedation). Aids in the induction of anesthesia and as part of balanced anesthesia. As a continuous infusion, provides sedation of mechanically ventilated patients during anesthesia or in a critical care setting, Status epilepticus.

Action
Acts at many levels of the CNS to produce generalized CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Short-term sedation. Postoperative amnesia.

Pharmacokinetics
Absorption: Rapidly absorbed following oral and nasal administration; undergoes substantial intestinal and first-pass hepatic metabolism. Well absorbed following IM administration; IV administration results in complete bioavailability.
Distribution: Crosses the blood-brain barrier and placenta.
Protein Binding: 97%.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Almost exclusively metabolized by the liver, resulting in conversion to hydroxymidazolam, an active metabolite, and 2 other inactive metabolites (metabolized by cytochrome P450 3A4 enzyme system); metabolites are excreted in urine.
Half-life: Preterm neonates: 2.6–17.7 hr; Neonates: 4–12 hr; Children: 3–7 hr; Adults: 2–6 hr (increased in renal impairment, CHF, or cirrhosis).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
IN	5 min	10 min	30–60 min
IM	15 min	30–60 min	2–6 hr
IV	1.5–5 min	rapid	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Shock; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Products containing benzyl alcohol should not be used in neonates; Pregnancy; Acute angle-closure glaucoma.
Use Cautiously in: Pulmonary disease; CHF; Renal impairment; Severe hepatic impairment; Obese pediatric patients (calculate dose on the basis of ideal body weight); Geriatric or debilitated patients (especially patients >70 yr) more susceptible to cardiorespiratory depressant effects; dosage reduction required; Lactation (safety not established).

Adverse Reactions/Side Effects

CNS: agitation, drowsiness, excess sedation, headache. **EENT:** blurred vision. **Resp:** APNEA, LARYNGOSPASM, RESPIRATORY DEPRESSION, bronchospasm, coughing. **CV:** CARDIAC ARREST, arrhythmias. **GI:** hiccups, nausea, vomiting. **Derm:** rashes. **Local:** phlebitis at IV site, pain at IM site.

Interactions

Drug-Drug: ↑ CNS depression with **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics** (↓ midazolam dose by 30–50% if used concurrently). ↑ risk of hypotension with **antihypertensives**, **opioid analgesics,** acute ingestion of **alcohol**, or **nitrates**. Midazolam is metabolized by the cytochrome P450 3A4 enzyme system; drugs that induce or inhibit this system may be expected to alter the effects of midazolam. **Carbamazepine**, **phenytoin**, **rifampin**, **rifabutin**, and **phenobarbital** ↓ levels of midazolam. The following agents ↓ midazolam metabolism and may ↑ its effects: **erythromycin**, **cimetidine**, **ranitidine**, **diltiazem**, **verapamil**, **fluconazole**, **itraconazole**, and **ketoconazole**.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression. Long-term use of **St. John's wort** may significantly decrease serum concentrations of oral midazolam.
Drug-Food: Grapefruit juice ↓ metabolism and may ↑ effects of midazolam.

Route/Dosage

Dose must be individualized, taking caution to reduce dose in geriatric patients and in those who are already sedated.

M

Preoperative Sedation/Anxiolysis/Amnesia

PO (Children 6 mo–16 yr): 0.25–0.5 mg/kg, may require up to 1 mg/kg (dose should not exceed 20 mg); *patients with cardiac/respiratory compromise or concurrent CNS depressants*—0.25 mg/kg.
IM (Adults Otherwise Healthy and <60 yr): 0.07–0.08 mg/kg 1 hr before surgery (usual dose 5 mg).
IM (Adults ≥60 yr, Debilitated or Chronically Ill): 0.02–0.03 mg/kg 1 hr before surgery (usual dose 1–3 mg).
IM (Children): 0.1–0.15 mg/kg up to 0.5 mg/kg 30–60 min prior to procedure; not to exceed 10 mg/dose.

Conscious Sedation for Short Procedures

IV (Adults and Children Otherwise Healthy >12 yr and <60 yr): 1–1.5 mg initially; dose may be increased further as needed. Total doses >3.5 mg are rarely needed (reduce dose by 30% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
IV (Children 6–12 yr): 0.025–0.05 mg/kg initially, then titrate dose carefully, may need up to 0.4 mg/kg total, maximum dose 10 mg.
IV (Children 6 mo–5 yr): 0.05 mg/kg initially, then titrate dose carefully, may need up to 0.6 mg/kg total, maximum dose 6 mg.
IV (Geriatric Patients ≥60 yr, Debilitated or Chronically Ill): 1–2.5 mg initially; dosage may be increased further as needed. Total doses

Copyright © 2008 by F.A. Davis

>5 mg are rarely needed (reduce dose by 50% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
Intranasal (Children): 0.2–0.3 mg/kg, may repeat in 5–15 min.

Status Epilepticus

IV (Children >2 months): 0.15 mg/kg load followed by a continuous infusion of 1 mcg/kg/min. Titrate dose upward q 5 min until seizure controlled, range: 1–18 mcg/kg/min.

Induction of Anesthesia (Adjunct)

May give additional dose of 25% of initial dose if needed
IV (Adults Otherwise Healthy and <55 yr): 300–350 mcg/kg initially (up to 600 mcg/kg total). If patient is premedicated, initial dose should be further reduced.
IV (Geriatric Patients >55 yr): 150–300 mcg/kg as initial dose. If patient is premedicated, initial dose should be further reduced.
IV (Adults—Debilitated): 150–250 mcg/kg initial dose. If patient is premedicated, initial dose should be further reduced.

Sedation in Critical Care Settings

IV (Adults): 0.01–0.05 mg/kg (0.5–4 mg in most adults) initially if a loading dose is required; may repeat q 10–15 min until desired effect is obtained; may be followed by infusion at 0.02–0.1 mg/kg/hr (1–7 mg/hr in most adults).
IV (Children): *Intubated patients only*—0.05–0.2 mg/kg initially as a loading dose; follow with infusion at 0.06–0.12 mg/kg/min (1–2 mcg/kg/min), titrate to effect, range:0.4–6 mcg/kg/min.
IV (Neonates >32 wk): *Intubated patients only*—0.06 mg/kg/hr (1 mcg/kg/min).
IV (Neonates <32 wk): *Intubated patients only*—0.03 mg/kg/hr (0.5 mcg/kg/min).

Availability (generic available)

Injection: 1 mg/ml, 5 mg/ml. **Syrup (cherry flavor):** 2 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess level of sedation and level of consciousness throughout and for 2–6 hr following administration.
- Monitor blood pressure, pulse, and respiration continuously during IV administration. Oxygen and resuscitative equipment should be immediately available.
- ***Toxicity and Overdose:*** If overdose occurs, monitor pulse, respiration, and blood pressure continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors. The effects of midazolam can be reversed with flumazenil (Romazicon).

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of oral midazolam syrup in children has resulted in serious harm and death. Do not accept orders prescribed by volume (5 mL or 1 tsp); instead, request dose be expressed in milligrams. Have second practitioner independently check original order and dose calculations. Midazolam syrup should only be administered by health care professionals authorized to administer conscious sedation. Do not confuse Versed (midazolam) with VePesid (etoposide).
- **PO:** To use the *Press-in Bottle Adaptor (PIBA),* remove the cap and push bottle adaptor into neck of bottle. Close bottle tightly with cap. Solution is a clear red to purplish-red cherry-flavored syrup. Then remove cap and insert tip of oral dispenser in bottle adaptor. Push the plunger completely down toward tip of oral dispenser and insert firmly into bottle adaptor. Turn entire unit (bottle and oral dispenser) upside down. Pull plunger out slowly until desired amount of medication is withdrawn into oral dispenser. Turn entire unit right side up and slowly remove oral dispenser from the bottle. Tip of dispenser may be covered with tip of cap until time of use. Close bottle with cap after each use.
- Dispense directly into mouth. Do not mix with any liquid prior to dispensing.
- **Intranasal:** Administer using a 1-ml needleless syringe into the nares over 15 sec. Using the 5 mg/ml injection, administer half dose into each nare.
- **IM:** Administer IM doses deep into muscle mass, maximum concentration 1 mg/ml.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted or diluted with D5W or 0.9% NaCl. ***Concentration:*** Undiluted: 1 mg/ml or 5 mg/ml. Di-

Copyright © 2008 by F.A. Davis

luted: 0.03–3 mg/ml. ***Rate:*** Administer slowly over at least 2–5 min. Titrate dose to patient response. Rapid injection, especially in neonates, has caused severe hypotension.

- **Continuous Infusion:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 0.5–1 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired level of sedation. Assess sedation at regular intervals and adjust rate up or down by 25–50% as needed. Dose should also be decreased by 10–25% every few hours to find minimum effective infusion rate, which prevents accumulation of midazolam and provides more rapid recovery upon termination.
- **Y-Site Compatibility:** abciximab, amikacin, amiodarone, anidulafungin, argatroban, atropine, aztreonam, bivalirudin, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, digoxin, diltiazem, diphenhydramine, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin lactobionate, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, heparin, hydromorphone, hydroxyzine, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, penicillin G potassium, phenylephrine, phytonadione, potassium chloride, procainamide, promethazine, propranolol, protamine, quinupristin/dalfopristin, ranitidine, rifampin, tobramycin, vancomycin, vecuronium.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate, aminophylline, ampicillin, ampicillin/sulbactam, bumetanide, cefepime, ceftazidime, cefuroxime, chloramphenicol, dexamethasone sodium phosphate, diazepam, ertapenem, furosemide, ganciclovir, ketorolac, lansoprazole, micafungin, pantoprazole, phenytoin, piperacillin/tazobactam, prochlorperazine, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Instruct patient to inform health care professional prior to administration if pregnancy is suspected.
- Advise patient to avoid alcohol or other CNS depressants for 24 hr following administration of midazolam.

Evaluation/Desired Outcomes

- Sedation during and amnesia following surgical, diagnostic, and radiologic procedures.
- Sedation and amnesia for mechanically ventilated patients in a critical care setting.

M

mifepristone

(mi-fe-**priss**-tone)
Mifeprex

Classification
Therapeutic: abortifacients
Pharmacologic: antiprogestational agents

Pregnancy Category UK

Indications

Medical termination of intrauterine pregnancy up to day 49 of pregnancy.

Action

Antagonizes endometrial and myometrial effects of progesterone. Sensitizes the myometrium to contraction-inducing activity of prostaglandins.
Therapeutic Effects: Termination of pregnancy.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration (69% bioavailability).
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Mostly metabolized by the liver (cytochrome CYP450 3A4 [CYP450 3A4] enzyme system).
Half-life: 18 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (termination of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	within 2 days	unknown

Contraindications/Precautions

Contraindicated in: Presence of an intrauterine device (IUD); Confirmed or suspected ectopic pregnancy; Undiagnosed adnexal mass; Chronic adrenal failure; Concurrent long-term corticosteroid therapy; Bleeding disorders or concurrent anticoagulant therapy; Inherited porphyrias.

Use Cautiously in: Chronic medical conditions such as cardiovascular, hypertensive, hepatic, renal, or respiratory disease (safety and efficacy not established); Women >35 yrs old or who smoke ≥10 cigarettes/day.

Adverse Reactions/Side Effects

CNS: dizziness, fainting, headache, weakness.
GI: abdominal pain, diarrhea, nausea, vomiting.
GU: uterine bleeding, uterine cramping, ruptured ectopic pregnancy, pelvic pain.

Interactions

Drug-Drug: Blood levels and therapeutic effectiveness may be ↑ by **ketoconazole**, **itraconazole**, and **erythromycin**. Blood levels and effects may be ↓ by **rifampin**, **dexamethasone**, **phenytoin**, **phenobarbital**, and **carbamazepine**. Mifepristone may ↓ metabolism and ↑ effects of other **drugs metabolized by the CYP 450 3A4 enzyme system**, including **some agents used during general anesthesia**.
Drug-Natural Products: Blood levels and effects may be ↓ by **St. John's wort**.
Drug-Food: Blood levels and effects may be ↑ by **grapefruit juice**.

Route/Dosage

PO (Adults): *Day 1*—600 mg (given as three 200 mg tablets) as a single dose, followed on *day 3* by 400 mcg misoprostol (Cytotec), unless abortion has occurred and has been confirmed by clinical or ultrasonographic examination (see misoprostol monograph).

Availability

Tablets: 200 mg.

NURSING IMPLICATIONS

Assessment

- Determine duration of pregnancy. Pregnancy is dated from the first day of the last menstrual period in a presumed 28-day cycle with ovulation occurring at mid-cycle and can be determined by menstrual history and clinical examination; use ultrasound if duration is uncertain or if ectopic pregnancy is suspected.
- Assess amount of bleeding and cramping during treatment. Determine if termination is complete on day 14.
- ***Lab Test Considerations:*** Decrease in hemoglobin, hematocrit, and RBCs may occur in women who bleed heavily.
- Changes in quantitative human chorionic gonadotropin (hCG) levels are not accurate until at least 10 days after mifepristone administration; complete termination of pregnancy must be confirmed by clinical examination.

Potential Nursing Diagnoses

Acute pain (Side Effects)

Implementation

- Mifepristone should be administered only by health care professionals who have read and understood the prescribing information, are able to assess gestational age of an embryo and diagnose ectopic pregnancies, and who are able to provide surgical intervention in cases of incomplete abortion or severe bleeding.
- Any IUD should be removed prior to mifepristone adminstration.
- Measures to prevent rhesus immunization, similar to those of surgical abortion, should be taken.
- **PO:** On *day 1*, after the patient has read the Medication Guide and signed the Patient Agreement, administer three 200-mg tablets of mifepristone as a single dose. On *day 3*, unless abortion has occurred and been confirmed by clinical examination or ultrasound, administer two 200-mcg tablets of misoprostol. On *day 14*, confirm that termination of pregnancy has occurred by clinical examination or ultrasound.

Patient/Family Teaching

- Advise patient of the treatment and its effects. Patients must be given a copy of the Medication Guide and Patient Agreement. Patient must understand the necessity of completing the treatment schedule of three office visits (day 1, day 3, and day 14).
- Inform patient that vaginal bleeding and uterine cramping will probably occur and that prolonged or heavy vaginal bleeding is not

Copyright © 2008 by F.A. Davis

proof of complete expulsion. Bleeding or spotting occurs for an average of 9–16 days; but may continue for more than 30 days. Advise patient that if the treatment fails, there is a risk of fetal malformation; medical abortion failures are managed by surgical termination.
- Caution patient to notify health care professional immediately if she develops weakness, nausea, vomiting, diarrhea, with or without abdominal pain or fever more than 24 hr after taking misoprostol; may indicate life-threatening sepsis.
- Instruct patient in the steps to take in an emergency situation, including precise instructions and a telephone number to call if she has problems or concerns.
- May cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that pregnancy can occur following termination of pregnancy and before resumption of normal menses. Contraception can be initiated as soon as pregnancy termination is confirmed or before sexual intercourse is resumed.
- Advise patient to notify health care professional if she smokes at least 10 cigarettes a day.

Evaluation/Desired Outcomes
- Termination of an intrauterine pregnancy of less than 49 days' duration.

miglitol (mi-gli-tole)
Glyset

Classification
Therapeutic: antidiabetics
Pharmacologic: alpha-glucosidase inhibitors

Pregnancy Category B

Indications
Management of non–insulin-dependent diabetes mellitus (type 2) in conjunction with dietary therapy; may be used concurrently with sulfonylurea oral hypoglycemic agents.

Action
Lowers blood glucose by inhibiting the enzyme alpha-glucosidase in the GI tract, resulting in delayed glucose absorption. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients, especially postprandial hyperglycemia.

Pharmacokinetics
Absorption: Completely absorbed at lower doses (25 mg); 50–70% absorbed at higher doses (100 mg).
Distribution: Distributes primarily into extracellular fluid; small amounts enter breast milk.
Metabolism and Excretion: Not metabolized; action is primarily local in the GI tract; amounts that are absorbed are excreted mostly unchanged in urine.
Half-life: 2 hr.

TIME/ACTION PROFILE (effect on glucose absorption)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	within 1 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Diabetic ketoacidosis; Inflammatory bowel disease or other chronic intestinal conditions resulting in impaired absorption or predisposition to obstruction; Lactation.
Use Cautiously in: Patients with fever, infection, trauma, or stress (may cause hyperglycemia requiring alternate therapy); Renal impairment (use not recommended if creatinine >2 mg/dl); Pregnancy or children (safety not established).

Adverse Reactions/Side Effects
GI: abdominal pain, diarrhea, flatulence. **Hemat:** low serum iron.

Interactions
Drug-Drug: May decrease absorption of **ranitidine** and **propranolol**. Effects may be decreased by **intestinal adsorbents** (such as **charcoal**) and **digestive enzyme products**; concurrent use should be avoided.
Drug-Food: Concurrent **carbohydrates** may increase diarrhea.

Route/Dosage
PO (Adults): 25 mg 3 times daily; may begin with 25 mg once daily; may be increased up to 100 mg 3 times daily.

Availability
Tablets: 25 mg, 50 mg, 100 mg.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety), especially when taking concurrently with other oral hypoglycemic agents.
- ***Lab Test Considerations:*** Serum glucose and glycosylated hemoglobin levels should be monitored periodically throughout therapy to evaluate effectiveness of therapy.
- ***Toxicity and Overdose:*** Symptoms of overdose are transient increase in flatulence, diarrhea, and abdominal discomfort. Miglitol alone does not cause hypoglycemia; however, other concurrently administered hypoglycemic agents may produce hypoglycemia requiring treatment. Mild hypoglycemia may be treated with administration of oral glucose.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Does not cause hypoglycemia when taken while fasting but may increase hypoglycemic effect of other hypoglycemic agents.
- **PO:** Administer miglitol 3 times daily with the first bite of each meal. Dose may be started lower and increased gradually to minimize GI effects.

Patient/Family Teaching

- Instruct patient to take miglitol at the same time each day, exactly as directed.
- Explain to patient that miglitol helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice, 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose or urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified of significant changes.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry a form of oral glucose (dextrose, D-glucose) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

milrinone (mill-ri-none)
Primacor

Classification
Therapeutic: inotropics

Pregnancy Category C

Indications

Short-term treatment of CHF unresponsive to conventional therapy with digoxin, diuretics, and vasodilators.

Action

Increases myocardial contractility. Decreases preload and afterload by a direct dilating effect on vascular smooth muscle. **Therapeutic Effects:** Increased cardiac output (inotropic effect).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: 80–90% excreted unchanged by the kidneys.
Half-life: 2.3 hr (increased in renal impairment).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	5–15 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe aortic or pulmonic valvular heart disease; Hypertrophic subaortic stenosis (may increase outflow tract obstruction).

Use Cautiously in: History of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters (↑ risk of ventricular arrhythmias); Renal impairment (reduced infusion rate recommended if CCr is <50 ml/min); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, tremor. **CV:** VENTRICULAR ARRHYTHMIAS, angina pectoris, chest pain, hypotension, supraventricular arrhythmias. **CV:** skin rash. **GI:** liver function abnormalities. **F and E:** hypokalemia. **Hemat:** thrombocytopenia.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults): *Loading dose*—50 mcg/kg followed by *infusion* at 0.50 mcg/kg/min (range 0.375–0.75 mcg/kg/min).

Availability

Injection: 1 mg/ml in 10-, 20-, and 50-ml vials.
Premixed infusion: 20 mg/100 ml, 40 mg/200 ml.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate and blood pressure continuously during administration. Milrinone should be slowed or discontinued if blood pressure drops excessively.
- Monitor intake and output and daily weight. Assess patient for resolution of signs and symptoms of CHF (peripheral edema, dyspnea, rales/crackles, weight gain) and improvement in hemodynamic parameters (increase in cardiac output and cardiac index, decrease in pulmonary capillary wedge pressure). Correct effects of previous aggressive diuretic therapy to allow for optimal filling pressure.
- Monitor ECG continuously during infusion. Arrhythmias are common and may be life threatening. The risk of ventricular arrhythmias is increased in patients with a history of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters.
- ***Lab Test Considerations:*** Monitor electrolytes and renal function frequently during administration. Hypokalemia should be corrected prior to administration to decrease the risk of arrhythmias.
- Monitor platelet count during therapy.
- ***Toxicity and Overdose: High Alert:*** Overdose manifests as hypotension. Dose should be decreased or discontinued. Supportive measures may be necessary.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- ***High Alert:*** Accidental overdose of milrinone can cause patient harm or death. Have second practitioner independently check original order, dose calculations, and infusion pump settings.

IV Administration

- **Direct IV:** ***Diluent:*** Loading dose may be administered undiluted. May also be diluted in 0.9% NaCl, 0.45% NaCl, or D5W for ease of administration. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer the loading dose over 10 min.
- **Continuous Infusion:** ***Diluent:*** Milrinone drawn from vials must be diluted. Dilute 10 mg (10 ml) of milrinone in 40 ml of diluent or 20 mg (20 ml) of milrinone in 80 ml of diluent. Compatible diluents include 0.45% NaCl, 0.9% NaCl, and D5W. Premixed infusions are already diluted and ready to use. Admixed solutions are stable for 72 hr at room temperature. Stability of premixed infusions based on manufacturer's expiration date. Do not use solutions that are discolored or contain particulate matter. ***Concentration:*** 200-mcg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate according to hemodynamic and clinical response.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** acyclovir, amikacin, amiodarone, ampicillin, argatroban, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, cefuroxime, cimetidine, ciprofloxacin, clindamycin, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, dobutamine, dopamine, epinephrine, ertapenem, fenoldopam, fentanyl, furosemide, gentamicin, granisetron, heparin, hydromorphone, insulin, isoproterenol, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, meropenem, methylprednisolone sodium succinate, metronidazole, micafungin, midazolam, morphine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, palonosetron, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, propranolol, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, tacrolimus, theophylline, thiopental, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, voriconazole.
- **Y-Site Incompatibility:** imipenem/cilastatin, lansoprazole, pantoprazole, procainamide.

Patient/Family Teaching

- Inform patient and family of reasons for administration. Milrinone is not a cure but is a temporary measure to control the symptoms of CHF.

Evaluation/Desired Outcomes

- Decrease in the signs and symptoms of CHF.
- Improvement in hemodynamic parameters.

minocycline, See TETRACYCLINES.

mirtazapine (meer-taz-a-peen)

Remeron, Remeron Soltabs

Classification

Therapeutic: antidepressants
Pharmacologic: tetracyclic antidepressants

Pregnancy Category C

Indications

Major Depressive Disorder. **Unlabeled uses:** Panic Disorder. Generalized Anxiety Disorder (GAD). Post-Traumatic Stress Disorder (PTSD).

Action

Potentiates the effects of norepinephrine and serotonin. **Therapeutic Effects:** Antidepressant action, which may develop only after several weeks.

Pharmacokinetics

Absorption: Well absorbed but rapidly metabolized, resulting in 50% bioavailability.
Distribution: Unknown.
Protein Binding: 85%.
Metabolism and Excretion: Extensively metabolized by the liver (P450 2D6, 1A2 and 3A enzymes involved); metabolites excreted in urine (75%) and feces (15%).
Half-life: 20–40 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	6 wk or more	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor therapy.
Use Cautiously in: History of seizures; History of suicide attempt; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; History of mania/hypomania; Patients with hepatic or renal impairment; OB: Safety not established; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established. Suicide risk may be greater in chilren or adolscents; Geri: ↑ sensitivity to CNS effects and oversedation. Begin at lower doses and titrate carefully.

Adverse Reactions/Side Effects

CNS: drowsiness, abnormal dreams, abnormal thinking, agitation, anxiety, apathy, confusion, dizziness, malaise, weakness. **EENT:** sinusitis. **Resp:** dyspnea, increased cough. **CV:** edema, hypotension, vasodilation. **GI:** constipation, dry mouth, increased appetite, abdominal pain, anorexia, elevated liver enzymes, nausea, vomiting. **GU:** urinary frequency. **Derm:** pruritus, rash. **F and E:** increased thirst. **Hemat:** AGRANULOCYTOSIS. **Metab:** weight gain, hypercholesterolemia, increased triglycerides. **MS:** arthralgia, back pain, myalgia. **Neuro:** hyperkinesia, hypesthesia, twitching. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: May cause hypertension, seizures, and death when used with **MAO inhibitors**; do

Copyright © 2008 by F.A. Davis

not use within 14 days of MAO inhibitor therapy. ↑ CNS depression with other **CNS depressants**, including **alcohol** and **benzodiazepines**. **Drugs affecting P450 enzymes**, **CYP2D6**, **CYP1A2**, and **CYP3A4** may alter the effects of mirtazapine.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression. ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 15 mg/day as a single bedtime dose initially; may be increased q 1–2 wk up to 45 mg/day.

Availability (generic available)

Tablets: 15 mg, 30 mg, 45 mg. **Cost:** *Generic*—15 mg $50.00/30, 30 mg $45.99/30, 45 mg $45.99/30. **Orally disintegrating tablets (orange flavor):** 15 mg, 30 mg, 45 mg. **Cost:** *Generic*—15 mg $70.38/30, 30 mg $65.99/30, 45 mg $71.49/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure and pulse rate periodically during initial therapy. Report significant changes.
- For overweight/obese individuals, obtain BFS and cholesterol levels. Refer as appropriate for nutritional/weight management and medical management.
- Monitor for seizure activity in patients with a history of seizures or alcohol abuse. Institute seizure precautions.
- ***Lab Test Considerations:*** Assess CBC and hepatic function before and periodically during therapy.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Anxiety (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- May be given as a single dose at bedtime to minimize excessive drowsiness or dizziness.
- May be taken without regard to food.
- For *orally disintegrating tablets*, do not attempt to push through foil backing; with dry hands, peal back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.

Patient/Family Teaching

- Instruct patient to take mirtazapine as directed. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular schedule. If single bedtime dose regimen is used, do not take missed dose in morning, but consult health care professional. Do not discontinue abruptly; gradual dose reduction may be required.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to consult health care professional before taking any OTC cold remedies or herbal products with this medication.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Therapy for depression may be prolonged. Emphasize the importance of follow-up exam to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Resolution of the symptoms of depression.
- Increased sense of well-being.

Copyright © 2008 by F.A. Davis

- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Therapeutic effects may be seen within 1 wk, although several wks are usually necessary before improvement is observed.

misoprostol

(mye-soe-**prost**-ole)
Cytotec

Classification
Therapeutic: antiulcer agents, cytoprotective agents
Pharmacologic: prostaglandins

Pregnancy Category X

Indications

Prevention of gastric mucosal injury from NSAIDs, including aspirin, in high-risk patients (geriatric patients, debilitated patients, or those with a history of ulcers). With mifepristone for termination of pregnancy. **Unlabeled uses:** Treatment of duodenal ulcers.

Action

Acts as a prostaglandin analogue, decreasing gastric acid secretion (antisecretory effect) and increasing the production of protective mucus (cytoprotective effect). Causes uterine contractions. **Therapeutic Effects:** Prevention of gastric ulceration from NSAIDs. With mifepristone terminates pregnancy of less than 49 days.

Pharmacokinetics

Absorption: Well absorbed following oral administration and rapidly converted to its active form (misoprostol acid).
Distribution: Unknown.
Protein Binding: 85%.
Metabolism and Excretion: Undergoes some metabolism and is then excreted by the kidneys.
Half-life: 20–40 min.

TIME/ACTION PROFILE (effect on gastric acid secretion)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins; Pregnancy or lactation (when used to prevent NSAID-induced gastric injury).

Use Cautiously in: Patients with childbearing potential; Children <18 yr (safety not established).
Exercise Extreme Caution in: When used for cervical ripening (unlabeled use) may cause uterine rupture; risk factors are late trimester pregnancy, previous cesarian section or uterine surgery or ≥5 previous pregnancies.

Adverse Reactions/Side Effects

CNS: headache. **GI:** abdominal pain, diarrhea, constipation, dyspepsia, flatulence, nausea, vomiting. **GU:** miscarriage, menstrual disorders.

Interactions

Drug-Drug: Increased risk of diarrhea with **magnesium-containing antacids**.

Route/Dosage

PO (Adults): *Antiulcer*—200 mcg 4 times daily with or after meals and at bedtime, *or* 400 mcg twice daily, with the last dose at bedtime. If intolerance occurs, dosage may be decreased to 100 mcg 4 times daily. *Termination of Pregnancy*—400 mcg single dose two days after mifepristone if abortion has not occurred.

Availability (generic available)

Tablets: 100 mcg (0.1 mg), 200 mcg (0.2 mg). ***In combination with:*** 50 mg diclofenac/200 mcg misoprostol and 75 mg diclofenac/200 mcg misoprostol (Arthrotec). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in the stool, emesis, or gastric aspirate.
- Assess women of childbearing age for pregnancy. Misoprostol is usually begun on 2nd or 3rd day of menstrual period following a negative pregnancy test result.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse Cytotec (misoprostol) with Cytoxan (cyclophosphamide).
- Misoprostol therapy should be started at the onset of treatment with NSAIDs.
- **PO:** Administer medication with meals and at bedtime to reduce severity of diarrhea.
- Antacids may be administered before or after misoprostol for relief of pain. Avoid those containing magnesium, because of increased diarrhea with misoprostol.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol will cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- Inform patient that diarrhea may occur. Health care professional should be notified if diarrhea persists for more than 1 wk. Also advise patient to report onset of black, tarry stools or severe abdominal pain.
- Advise patient to avoid alcohol and foods that may cause an increase in GI irritation.

Evaluation/Desired Outcomes

- The prevention of gastric ulcers in patients receiving chronic NSAID therapy.

mitomycin (mye-toe-**mye**-sin)
MitoExtra, Mutamycin

Classification
Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

Pregnancy Category UK

Indications

Used with other agents in the management of disseminated adenocarcinoma of the stomach or pancreas. **Unlabeled uses:** Palliative treatment of: Carcinoma of the colon or breast, Head and neck tumors, Advanced biliary, lung, and cervical squamous cell carcinomas.

Action

Primarily inhibits DNA synthesis by causing cross-linking; also inhibits RNA and protein synthesis (cell-cycle phase–nonspecific but is most active in S and G phases). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed, concentrates in tumor tissue. Does not enter CSF.
Metabolism and Excretion: Mostly metabolized by the liver. Small amounts (<10%) excreted unchanged by the kidneys and in bile.
Half-life: 50 min.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	3–8 wk	4–8 wk	up to 3 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation.
Use Cautiously in: Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Geri: Geriatric patients or patients with other chronic debilitating illnesses; Impaired liver function; History of pulmonary problems.

Adverse Reactions/Side Effects

Resp: PULMONARY TOXICITY. **CV:** edema. **GI:** nausea, vomiting, anorexia, stomatitis. **GU:** infertility, renal failure. **Derm:** alopecia, desquamation. **Hemat:** leukopenia, thrombocytopenia, anemia. **Local:** phlebitis at IV site. **Misc:** HEMOLYTIC UREMIC SYNDROME, fever, prolonged malaise.

Interactions

Drug-Drug: Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Concurrent or sequential use with **vinca alkaloids** may result in respiratory toxicity.

Route/Dosage

IV (Adults): 20 mg/m² every 6–8 wk.

Availability

Injection: 5-mg, 20-mg, and 40-mg vials.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure

Copyright © 2008 by F.A. Davis

to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor intake and output, appetite, and nutritional intake. Nausea and vomiting usually occur within 1–2 hr. Vomiting may stop within 3–4 hr; nausea may persist for 2–3 days. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess respiratory status and chest x-ray examination prior to and periodically throughout course of therapy. Cough, bronchospasm, hemoptysis, or dyspnea usually occurs after several doses and may be indicative of pulmonary toxicity, which may be life threatening.
- Monitor for potentially fatal hemolytic uremic syndrome in patients receiving long-term therapy. Symptoms include microangiopathic hemolytic anemia, thrombocytopenia, renal failure, and hypertension.
- ***Lab Test Considerations:*** Monitor CBC with differential, platelet count, and observation for fragmented RBCs on peripheral blood smears prior to and periodically throughout therapy and for several months following therapy.
- The nadirs of leukopenia and thrombocytopenia occur in 4–8 wk. Notify physician if leukocyte count is $<4000/mm^3$ or if platelet count is $<150,000/mm^3$ or is progressively declining. Recovery from leukopenia and thrombocytopenia occurs within 10 wk after cessation of therapy. Myelosuppression is cumulative and may be irreversible. Repeat courses of therapy are held until leukocyte count is $>4000/mm^3$ and platelet count is $>100,000/mm^3$.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy to detect hepatotoxicity and nephrotoxicity. Notify physician if creatinine is >1.7 mg/dl.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)
Disturbed body image (Side Effects)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Ensure patency of IV. Extravasation may cause severe tissue necrosis. If patient complains of discomfort at IV site, discontinue immediately and restart infusion at another site. Promptly notify physician of extravasation.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 5-mg vial with 10 ml and 10-mg vial with 40 ml of sterile water for injection or 0.9% NaCl. Shake the vial; may need to stand at room temperature for additional time to dissolve. Final solution is blue-gray. Reconstituted solution is stable for 7 days at room temperature, 14 days if refrigerated. ***Concentration:*** Dilute drug in vial to a concentration of 0.5–1 mg/ml and then may further dilute to 20–40 mcg/ml for administration. ***Rate:*** May be administered IV push over 5–10 min through free-flowing IV of 0.9% NaCl or D5W.
- **Y-Site Compatibility:** amifostine, bleomycin, cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, ondansetron, teniposide, thiotepa, vinblastine, vincristine.
- **Y-Site Incompatibility:** aztreonam, cefepime, etoposide phosphate, filgrastim, gemcitabine, piperacillin/tazobactam, sargramostim, topotecan, vinorelbine.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if decreased urine output, edema in lower extremities, shortness of breath, skin ulceration, or persistent nausea occurs.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs,

Copyright © 2008 by F.A. Davis

advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient that, although mitomycin may cause infertility, contraception during therapy is necessary because of teratogenic effects.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size and spread of malignant tissue.

mitoxantrone
(mye-toe-**zan**-trone)
Novantrone

Classification
Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

Pregnancy Category D

Indications
Acute nonlymphocytic leukemia (ANLL) in adults (with other antineoplastics). Initial chemotherapy for patients with pain associated with advanced hormone-refractory prostate cancer. Secondary (chronic) progressive, progressive relapsing, or worsening relapsing-remitting multiple sclerosis (MS). **Unlabeled uses:** Breast cancer, liver cancer, and non-Hodgkin's lymphoma.

Action
Inhibits DNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Decreased pain in patients with advanced prostate cancer. Decreased disability and slowed progression of MS.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed; limited penetration of CSF.
Metabolism and Excretion: Mostly eliminated by hepatobiliary clearance; <10% excreted unchanged by the kidneys.
Half-life: 5.8 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	10 days	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation.
Use Cautiously in: Previous cardiac disease; OB: Patients with childbearing potential; Active infections; Depressed bone marrow reserve; Previous mediastinal radiation; Geriatric patients or patients with other chronic debilitating illness; Pedi: Children (safety not established); Impaired hepatobiliary function or decreased blood counts (dose reduction required).

Adverse Reactions/Side Effects
CNS: SEIZURES, headache. **EENT:** blue-green sclera, conjunctivitis. **Resp:** cough, dyspnea. **CV:** CARDIOTOXICITY, arrhythmias, ECG changes. **GI:** abdominal pain, diarrhea, hepatic toxicity, nausea, stomatitis, vomiting. **GU:** blue-green urine, gonadal suppression, renal failure. **Derm:** alopecia, rashes. **Hemat:** anemia, leukopenia, secondary leukemia, thrombocytopenia. **Metab:** hyperuricemia. **Misc:** fever, hypersensitivity reactions.

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Risk of cardiomyopathy ↑ by previous **anthracycline antineoplastics** (**daunorubicin**, **doxorubicin**, **idarubicin**) or **mediastinal radiation**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Acute Nonlymphatic Leukemia
IV (Adults): *Induction*—12 mg/m²/day for 3 days (usually given with cytosine arabinoside 100 mg/m²/day for 7 days); if incomplete remission occurs, a 2nd induction may be given. *Consolidation*—12 mg/m²/day for 2 days (usually given with cytosine arabinoside 100 mg/m²/day

Copyright © 2008 by F.A. Davis

for 5 days), given 6 wk after induction with another course 4 wk later.

Advanced Prostate Cancer

IV (Adults): 12–14 mg/m² single dose as a short infusion (with corticosteroids).

Multiple Sclerosis

IV (Adults): 12 mg/m² q 3 mo.

Availability

Injection: 2 mg/ml in 10-, 12.5-, and 15-ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor for hypersensitivity reaction (rash, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Assess patient for nausea and vomiting. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Monitor chest x-ray, ECG, echocardiography or MUGA, and radionuclide angiography to determine ejection fraction prior to and periodically during therapy. Multiple sclerosis patients with baseline left ventricular ejection fraction (LVEF) <50% should not receive mitoxantrone. May cause cardiotoxicity, especially in patients who have received daunorubicin or doxorubicin. Assess for rales/crackles, dyspnea, edema, jugular vein distention, ECG changes, arrhythmias, and chest pain. Monitor LVEF with echocardiogram or MUGA if signs of CHF occur and prior to each dose in patients with multiple sclerosis. Potentially fatal CHF may occur during or for months or years after therapy. Risk is greater in patients receiving a cumulative dose >140 mg/m².
- Monitor for symptoms of gout (↑ uric acid levels and joint pain and swelling). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease serum uric acid levels.
- **Multiple sclerosis:** Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and periodically during therapy. The nadir of leukopenia usually occurs within 10 days, and recovery usually occurs within 21 days.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid concentrations. Monitor periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)
Disturbed body image (Side Effects)

Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- Clean all spills with an aqueous solution of calcium hypochlorite. Mix solution by adding 5.5 parts (per weight) of calcium hypochlorite to 13 parts water.

IV Administration

- **IV:** Monitor IV site. If extravasation occurs, discontinue IV and restart at another site. Mitoxantrone is not a vesicant
- **Direct IV:** ***Diluent:*** Dilute dark blue mitoxantrone solution in at least 50 ml of 0.9% NaCl or D5W. Discard unused solution appropriately. ***Rate:*** Administer slowly over at least 3 min into the tubing of a free-flowing IV of 0.9% NaCl or D5W.
- **Intermittent Infusion:** May be further diluted in D5W, 0.9% NaCl, or D5/0.9% NaCl and used immediately. ***Concentration:*** 0.02-0.5 mg/ml. ***Rate:*** Administer over 15–30 min.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** allopurinol, amifostine, cladribine, etoposide, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, ondansetron, oxaliplatin, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, aztreonam, cefepime, doxorubicin liposome, lansoprazole, paclitaxel, pemetrexed, piperacillin/tazobactam, propofol.
- **Additive Compatibility:** cyclophosphamide, cytarabine, etoposide, fluorouracil, hydrocortisone sodium succinate, potassium chloride.
- **Additive Incompatibility:** heparin.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDS; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, cough, diarrhea, or decreased urine output occurs.
- Inform patient that medication may cause the urine and sclera to turn blue-green.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient that, although mitoxantrone may cause infertility, contraception during therapy is necessary because of possible teratogenic effects.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in the production and spread of leukemic cells.
- Decreased pain in patients with prostate cancer.
- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

modafinil (mo-**daf**-i-nil)
Provigil

Classification
Therapeutic: central nervous system stimulants

Pregnancy Category C

M

Indications
To improve wakefulness in patients with excessive daytime drowsiness due to narcolepsy, obstructive sleep apnea, or shift work sleep disorder.

Action
Produces CNS stimulation. **Therapeutic Effects:** Decreased daytime drowsiness in patients with narcolepsy and obstructive sleep apnea. Decreased drowsiness during work in patients with shift work sleep disorder.

Pharmacokinetics
Absorption: Rapidly absorbed; bioavailability unknown.
Distribution: Well distributed; moderately (60%) bound to plasma proteins.
Metabolism and Excretion: Highly (90%) metabolized by the liver; <10% eliminated unchanged.
Half-life: 15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; History of left ventricular hypertrophy or ischemic ECG

Copyright © 2008 by F.A. Davis

changes, chest pain, arrhythmia, or other significant manifestations of mitral valve prolapse in association with CNS stimulant use.
Use Cautiously in: History of MI or unstable angina; Severe hepatic impairment with or without cirrhosis (dosage reduction recommended); Concurrent use of MAO inhibitors; Geriatric patients (lower doses may be necessary); Pregnancy, lactation, or children <16 yr (safety not established).

Adverse Reactions/Side Effects
CNS: headache, amnesia, anxiety, cataplexy, confusion, depression, dizziness, insomnia, nervousness. **EENT:** rhinitis, abnormal vision, amblyopia, epistaxis, pharyngitis. **Resp:** dyspnea, lung disorder. **CV:** arrhythmias, chest pain, hypertension, hypotension, syncope, vasodilation. **GI:** nausea, abnormal liver function, anorexia, diarrhea, gingivitis, mouth ulcers, thirst, vomiting. **GU:** abnormal ejaculation, albuminuria, urinary retention. **Derm:** dry skin, herpes simplex. **Endo:** hyperglycemia. **Hemat:** eosinophilia. **MS:** joint disorder, neck pain. **Neuro:** ataxia, dyskinesia, hypertonia, paresthesia, tremor. **Misc:** infection.

Interactions
Drug-Drug: May decrease the metabolism and increase the effects of **diazepam**, **phenytoin**, **propranolol**, or **tricyclic antidepressants** (dosage adjustments may be necessary). May increase metabolism and decrease effects of **hormonal contraceptives**, **cyclosporine**, and **theophylline** (dosage adjustments or additional methods of contraception may be necessary).
Drug-Natural Products: Use with **caffeine-containing** herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may increase stimulant effect.

Route/Dosage
PO (Adults): 200 mg/day as a single dose.

Hepatic Impairment
PO (Adults): *Severe hepatic impairment*—100 mg/day as a single dose.

Availability
Tablets: 100 mg, 200 mg. **Cost:** 100 mg $176.99/30, 200 mg $269.97/30.

NURSING IMPLICATIONS

Assessment
- Observe and document frequency of narcoleptic episodes.
- ***Lab Test Considerations:*** May cause elevated liver enzymes.

Potential Nursing Diagnoses
Disturbed thought process (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation
- **PO:** Administer as a single dose in the morning for patients with narcolepsy or obstructive sleep apnea. Administer 1 hour before the start of work shift for patients with shift work sleep disorder.

Patient/Family Teaching
- Instruct patient to take medication as directed.
- Medication may impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Nonhormonal methods of contraception should be used during and for 1 month following discontinuation of therapy. Instruct patient to notify health care professional promptly if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to avoid taking other prescription or OTC medication without consulting health care professional. If alcohol is used during therapy, intake should be limited to moderate amounts.
- Instruct patient to notify physician if rash, hives, or other allergic reactions occur.

Evaluation/Desired Outcomes
- Decrease in narcoleptic symptoms and an enhanced ability to stay awake.

moexipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

mometasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), CORTICOSTEROIDS (TOPICAL/LOCAL).

MONOAMINE OXIDASE (MAO) INHIBITORS

isocarboxazid
(eye-soe-kar-**boks**-a-zid)
Marplan

Copyright © 2008 by F.A. Davis

phenelzine (**fen**-el-zeen)
Nardil

tranylcypromine
(tran-ill-**sip**-roe-meen)
Parnate

Classification
Therapeutic: antidepressants
Pharmacologic: monamine oxidase (MAO) inhibitors

Pregnancy Category C

Indications
Depression in patients who have failed other modes of therapy (tricyclic antidepressants, SSRIs, SSNRIs, or electroconvulsive therapy). **Unlabeled uses:** Treatment-resistant depression, panic disorder, social anxiety disorder (social phobia).

Action
Inhibit the enzyme monoamine oxidase, resulting in an accumulation of various neurotransmitters (dopamine, epinephrine, norepinephrine, and serotonin) in the body. **Therapeutic Effects:** Improved mood in depressed patients.

Pharmacokinetics
Absorption: *Phenelzine*—well absorbed from the GI tract; *isocarboxazid* and *tranylcypromine*—unknown.
Distribution: *Phenelzine* and *tranylcypromine*—cross the placenta and enter breast milk; *isocarboxazid*—unknown.
Metabolism and Excretion: *Phenelzine*—metabolized by the liver and excreted in urine as metabolites and unchanged drug; *isocarboxazid* and *tranylcypromine*—unknown.
Half-life: *Phenelzine*—12 hr; *tranylcypromine*—90–190 min; *isocarboxazid*—unknown.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
Isocarboxazid	unknown	3–6 wk	unknown
Phenelzine	2–4 wk	3–6 wk	2 wk
Tranylcypromine	2 days–3 wk	2–3 wk	3–5 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Liver disease; Severe renal disease; Cardiovascular disease; Uncontrolled hypertension; Cerebrovascular disease; Pheochromocytoma; CHF; History of severe or frequent headache; Patients undergoing elective surgery requiring anesthesia (should be discontinued at least days before surgery); Concurrent meperidine, SSRI antidepressants, SSNRI antidepressants, tricyclic antidepressants, tetracyclic antidepressants, nefazodone, trazodone, procarbazine, selegilene, linezolid, carbamazepine, cyclobenzaprine, bupropion, buspirone, sympathomimetics, dextromethorphan, narcotics, alcohol, anesthetics, diuretics, tryptophan, or antihistamines; Excessive consumption of caffeine; Concurrent use of food containing high concentrations of tyramine (see Appendix L); Lactation: Safety not established; Pedi: Children <16 yr (isocarboxazid only; safety and effectiveness not established).
Use Cautiously in: Patients who may be suicidal or have a history of drug dependency; Schizophrenia; Bipolar disorder; Diabetes mellitus (↑ risk of hypoglycemia); Hyperthyroidism; Seizure disorders; OB, Lactation: Safety not established. Discontinue drug or bottle-feed.; Pedi: Safe use in children/adolescents not established. May ↑ risk of suicide attempt/ideation especially during first early treatment or dose adjustments; risk may be greater in children or adolescents. Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects
CNS: SEIZURES, dizziness, headache, anxiety, ataxia, confusion, drowsiness, euphoria, insomnia, restlessness, tremor, weakness. **EENT:** blurred vision, glaucoma, nystagmus. **CV:** HYPERTENSIVE CRISIS, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, weight gain, abdominal pain, anorexia, constipation, dry mouth, liver enzyme elevation, nausea, vomiting. **GU:** dysuria, sexual dysfunction, urinary incontinence, urinary retention. **Derm:** pruritis, rashes. **Endo:** hypoglycemia. **MS:** arthralgia. **Neuro:** paresthesia.

Interactions
Drug-Drug: Serious, potentially fatal adverse reactions may occur with concurrent use of other **antidepressants (SSRIs, SSNRIs, bupropion, tricyclics, tetracyclics, nefazodone, trazodone)**, **carbamazepine**, **cyclobenzaprine**, **sibutramine**, **linezolid**, **procarbazine**, or **selegiline**. Avoid using within 2 wk of each other (wait 5 wk from end of **fluoxetine** therapy). Hypertensive crisis may occur with

M

Copyright © 2008 by F.A. Davis

amphetamines, **methyldopa**, **levodopa**, **dopamine**, **epinephrine**, **norepinephrine**, **methylphenidate**, **reserpine**, or **vasoconstrictors**. Hypertension or hypotension, coma, seizures, respiratory depression, and death may occur with **meperidine** (avoid using within 2–3 wk of MAO inhibitor therapy). Concurrent use with **dextromethorphan** may produce psychosis or bizarre behavior. Hypertension may occur with concurrent use of **buspirone**; avoid using within 10 days of each other. Additive hypotension may occur with **antihypertensives**, **spinal anesthesia**, **opioids**, or **barbiturates**. Additive hypoglycemia may occur with **insulins** or **oral hypoglycemic agents**. Risk of seizures may be ↑ with **tramadol**.

Drug-Natural Products: Serious, potentially fatal adverse effects (serotonin syndrome) may occur with concomitant use of **St. John's wort** and **SAMe**. Hypertensive crises may occur with large amounts of **caffeine**-containing herbs (**cola nut**, **guarana**, **malt**, **coffee**, **tea**). Insomnia, headache, tremor, hypomania may occur with **ginseng**. Hypertensive crises, disorientation, and memory impairment may occur with **tryptophan** or supplements containing **tyrosine** or **phenylalanine**.

Drug-Food: Hypertensive crisis may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix L). Consumption of foods or beverages with high **caffeine** content increases the risk of hypertension and arrhythmias.

Route/Dosage

Isocarboxazid

PO (Adults and Children ≥16 yr): 10 mg twice daily; may be ↑ every 2–4 days by 10 mg, up to 40 mg/day by the end of the first wk, then may ↑ by up to 20 mg every wk, up to 60 mg/day in 2–4 divided doses. After optimal response is obtained, dose should be slowly decreased to lowest effective amount (40 mg/day or less).

Phenelzine

PO (Adults): 15 mg 3 times daily; ↑ to 60–90 mg/day in divided doses; after maximal benefit achieved, gradually reduce to smallest effective dose (15 mg/day or every other day).

Tranylcypromine

PO (Adults): 30 mg/day in 2 divided doses (morning and afternoon); after 2 wk can ↑ by 10 mg/day, at 1–3 wk intervals, up to 60 mg/day.

Availability

Isocarboxazid

Tablets: 10 mg.

Phenelzine

Tablets: 15 mg.

Tranylcypromine

Tablets: 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) and anxiety level frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure and pulse before and frequently during therapy. Report significant changes promptly. Headache is often first symptom of a hypertensive crisis.
- Monitor intake and output ratios and daily weight. Assess patient for urinary retention.
- Monitor weight and BMI initially and throughout treatment.
- For overweight/obese individuals, moitor fasting blood sugar and cholesterol levels.
- ***Lab Test Considerations:*** Assess hepatic function periodically during prolonged or high-dose therapy.
- Monitor serum glucose closely in diabetic patients; hypoglycemia may occur.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia, severe headache, nausea, vomiting, photosensitivity, neck stiffness, sweating, and enlarged pupils. Treatment includes IV phentolamine or a single dose of oral calcium channel blocker (nifedipine). Symptoms of overdose include anxiety, irritability, tachycardia, hypertension or hypotension, respiratory distress, dizziness, drowsiness, hallucinations, confusion, seizures, sluggish reflexes, fever, and diaphoresis. Treatment includes induction of vomiting or gastric lavage and supportive therapy as symptoms arise.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Copyright © 2008 by F.A. Davis

Ineffective therapeutic regimen management (Patient/Family Teaching)
Risk for falls (Side Effects)
Imbalanced nutrition: more than body requirements (Side Effects)
Sexual dysfunction (Side Effects)
Impaired oral mucous membrane (Side Effects)

Implementation

- Do not administer these medications in the evening because the psychomotor stimulating effects may cause insomnia or other sleep disturbances.
- **PO:** Tablets may be crushed and mixed with food or fluids for patients with difficulty swallowing.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses if remembered within 2 hr; otherwise, omit and return to regular dosage schedule. Do not discontinue abruptly as withdrawal symptoms (nausea, vomiting, malaise, nightmares, agitation, psychosis, seizures) may occur.
- Caution patient to avoid alcohol, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix L) or excessive caffeine during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Instruct patient to notify health care professional immediately if symptoms of hypertensive crisis (e.g. severe headache, palpitations, chest or throat tightness, sweating, dizziness, neck stiffness, nausea, or vomiting) develop.
- Instruct parents or guardians of children to contact health care professional if child exhibits any suicidal thoughts or behaviors (e.g. worsening depression, new or worsening anxiety, agitation, panic attacks, insomnia, new or worsening irritability, violent behavior, impulsive actions, excessive talking, unusual changes in mood or behavior).
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Instruct patient to consult with health care professional before taking any new Rx, OTC, or herbal product.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. If possible, therapy should be discontinued at least 2 wk before surgery.
- Instruct patient to carry identification describing medication regimen at all times.
- Emphasize the importance of participation in psychotherapy to improve coping skills. Refer for ophthalmic testing periodically during long-term therapy.
- Advise patient of possibility of weight gain and cholesterol elevation and recommend appropriate nutritional, weight, or medical management.
- Refer patient/family to local support group.

Evaluation/Desired Outcomes

- Improved mood in depressed patients.
- Increased sense of well-being.
- Decreased anxiety.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Patients may require 3–6 wk of therapy before therapeutic effects of medication are seen.

montelukast

(mon-te-**loo**-kast)
Singulair

Classification
Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: leukotriene antagonists

Pregnancy Category B

Indications

Prevention and chronic treatment of asthma. Management of seasonal allergic rhinitis. Prevention of exercise-induced bronchoconstriction in patients 15 yr and older.

Copyright © 2008 by F.A. Davis

Action

Antagonizes the effects of leukotrienes, which mediate the following: Airway edema, Smooth muscle constriction, Altered cellular activity. Result is decreased inflammatory process, which is part of asthma and allergic rhinitis.
Therapeutic Effects: Decreased frequency and severity of acute asthma attacks. Decreased severity of allergic rhinitis. Decreased attacks of exercise-induced bronchoconstriction.

Pharmacokinetics

Absorption: Rapidly absorbed (63–73%) following oral administration.
Distribution: Unknown.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver (by P450 3A4 and 2C9 enzyme systems); metabolites eliminated in feces via bile; negligible renal excretion.
Half-life: 2.7–5.5 hr.

TIME/ACTION PROFILE (improved symptoms of asthma)

ROUTE	ONSET	PEAK†	DURATION
PO (swallow)	within 24 hr	3–4 hr	24 hr
PO (chew)	within 24 hr	2–2.5 hr	24 hr

†Blood levels

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation.
Use Cautiously in: Acute attacks of asthma; Phenylketonuria (chewable tablets contain aspartame); Hepatic impairment (may need lower doses); Reduction of corticosteroid therapy (may increase the risk of eosinophilic conditions); Pregnancy, lactation, or children <1 yr (safety not established).

Adverse Reactions/Side Effects

CNS: fatigue, headache, weakness. **EENT:** otitis (children), sinusitis (children). **Resp:** cough, rhinorrhea. **GI:** abdominal pain, diarrhea (children), dyspepsia, nausea (children), increased liver enzymes. **Derm:** rash. **Misc:** eosinophilic conditions (including CHURG-STRAUSS SYNDROME), fever.

Interactions

Drug-Drug: Drugs which induce the CYP450 enzyme system (**phenobarbital** and **rifampin**) may decrease the effects of montelukast.

Route/Dosage

Asthma and Allergic Rhinitis

PO (Adults and Children ≥14 yr): 10 mg once daily.
PO (Children 6–14 yr): 5 mg once daily (as chewable tablet).
PO (Children 2–5 yr): 4 mg once daily (as chewable tablet or granules).
PO (Children 6–23 months): 4 mg once daily (as oral granules).

Exercise-Induced Bronchoconstriction (EIB)

PO (Adults and Children ≥15 yrs): 10 mg at least 2 hrs before exercise. Do not take within 24 hrs of another dose; if taking daily doses, do not take dose for EIB.

Availability

Tablets: 10 mg. **Cost:** $302.99/90. **Chewable tablets (cherry flavor):** 4 mg, 5 mg. **Cost:** 4 mg $294.97/90, 5 mg $305.97/90. **Oral granules:** 4 mg/packet in 30-packet cartons. **Cost:** $110.00/carton.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically throughout therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT concentrations.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.
- **PO:** For asthma, administer once daily in the evening. For allergic rhinitis, may be administered at any time of day.
- Administer granules directly into mouth or mixed in a spoonful of cold or room temperature foods (use only applesauce, mashed carrots, rice, or ice cream). Do not open packet until ready to use. After opening packet, administer full dose within 15 min. Do not store mixture. Discard unused portion. Do not dissolve granules in fluid, but fluid may be taken following administration. Granules may be administered without regard to meals.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Instruct patient to take medication daily in the evening, even if not experiencing symptoms of asthma. Do not double doses. Do not discontinue therapy without consulting health care professional.
- Instruct patient not to discontinue or reduce other asthma medications without consulting health care professional.
- Advise patient that montelukast is not used to treat acute asthma attacks, but may be continued during an acute exacerbation. Patient should carry rapid-acting therapy for bronchospasm at all times. Advise patient to notify health care professional if more than the maximum number of short-acting bronchodilator treatments prescribed for a 24-hr period are needed.

Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.
- Decrease in severity of allergic rhinitis.
- Prevention of exercise-induced bronchoconstriction.

HIGH ALERT

morphine (mor-feen)

Astramorph, Astramorph PF, Avinza, Duramorph, DepoDur, Epimorph, Infumorph, Kadian, M-Eslon, Morphine H.P, Morphitec, M.O.S, M.O.S.-S.R, MS, MS Contin, MS•IR, MSIR, MSO_4, OMS Concentrate, Oramorph SR, RMS, Roxanol, Roxanol Rescudose, Roxanol-T, Statex

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Severe pain. Pulmonary edema. Pain associated with MI.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression.
Therapeutic Effects: Decrease in severity of pain.

Pharmacokinetics

Absorption: Variably absorbed (about 30%) following oral administration. More reliably absorbed from rectal, subcut, and IM sites. Following epidural administration, systemic absorption and absorption into the intrathecal space via the meninges occurs.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in small amounts.
Protein Binding: Premature infants: <20%; Adults: 35%.
Metabolism and Excretion: Mostly metabolized by the liver. Active metabolites excreted renally.
Half-life: Premature neonates: 10–20 hr; Neonates: 7.6 hr; Infants 1–3 mo: 6.2 hr; Children 6 mo–2.5 yr: 2.9 hr; Children 3–6 yr: 1–2 hr; Children 6–19 yr with sickle cell disease: 1.3 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	60 min	4–5 hr
PO-ER, SR	unknown	3–4 hr	8–24 hr
IM	10–30 min	30–60 min	4–5 hr
Subcut	20 min	50–90 min	4–5 hr
Rect	unknown	20–60 min	3–7 hr
IV	rapid	20 min	4–5 hr
Epidural	6–30 min	1 hr	up to 24 hr (48 hr for liposomal injection)
IT	rapid (min)	unknown	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain tartrazine, bisulfites, or alcohol and should be avoided in patients with known hypersensitivity.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; History of substance abuse; Geri: Geriatric or debilitated patients (dose reduction suggested); Undiagnosed abdominal pain; Prostatic hyperplasia; Patients undergoing procedures that rapidly decrease pain (cordotomy, radiation); long-acting agents should be discontinued 24 hr before and replaced with short-acting agents; OB: Pregnancy or lactation (avoid

Copyright © 2008 by F.A. Davis

chronic use; has been used during labor but may cause respiratory depression in the newborn); Pedi: Children <18 yr (epidural liposomal injection only-not recommended); Neonates and infants <3 mo (more susceptible to respiratory depression); Neonates (oral solution contains sodium benzoate which can cause potentially fatal gasping syndrome).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, itching, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **extreme caution** in patients receiving **MAO inhibitors** within 14 days prior (may result in unpredictable, severe reactions— ↓ initial dose of morphine to 25% of usual dose). ↑ CNS depression with **alcohol**, **sedative/hypnotics**, **clomipramine**, **barbiturates**, **tricyclic antidepressants**, and **antihistamines**. Administration of **partial-antagonist opioid analgesics** may precipitate opioid withdrawal in physically dependent patients. **Buprenorphine**, **nalbuphine**, **butorphanol**, or **pentazocine** may ↓ analgesia. May ↑ the anticoagulant effect of **warfarin**. **Cimetidine** ↓ metabolism and may ↑ effects. Epidural test dose of lidocaine/epinephrine may alter release of liposomal injection.

Drug-Natural Products: Concomitant use of **kava kava**, **valerian** or **chamomile** can ↑ CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy.

PO, Rect (Adults ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—30 mg q 3–4 hr initially *or* once 24-hr opioid requirement is determined, convert to controlled, extended *or* sustained-release morphine by administering total daily oral morphine dose every 24 hr (as *Kadian* or *Avinza*), 50% of the total daily oral morphine dose every 12 hr (as *Oramorph SR, Kadian, MS Contin*), or 33% of the total daily oral morphine dose every 8 hr (as *MS Contin*). See equianalgesic chart, Appendix J. *Avinza* dose should not exceed 1600 mg/day because of fumaric acid in formulation.

PO, Rect (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.3 mg/kg q 3–4 hr initially.

PO (Children >1 mo): *Prompt-release tablets and solution*—0.2–0.5 mg/kg/dose q 4–6 hr as needed. *Controlled-release tablet*—0.3–0.6 mg/kg/dose q 12 hr.

IM, IV, Subcut (Adults ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—4–10 mg q 3–4 hr. *MI*—8–15 mg, for very severe pain additional smaller doses may be given every 3–4 hr.

IM, IV, Subcut (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.05–0.2 mg/kg q 3–4 hr, maximum: 15 mg/dose.

IM, IV, Subcut (Neonates): 0.05 mg/kg q 4–8 hr, maximum dose: 0.1 mg/kg. Use preservative-free formulation.

IV, Subcut (Adults): *Continuous infusion*—0.8–10 mg/hr; may be preceded by a bolus of 15 mg (infusion rates vary greatly; up to 400 mg/hr have been used).

IV, Subcut (Children >1 mo): *Continuous infusion, postoperative pain*—0.01–0.04 mg/kg/hr. *Continuous infusion, sickle cell or cancer pain*—0.02–2.6 mg/kg/hr.

IV (Neonates): *Continuous infusion*—0.01–0.03 mg/kg/hr.

Epidural: (Adults): *Intermittent injection*—5 mg/day (initially); if relief is not obtained at 60 min, 1–2 mg increments may be made; (total dose not to exceed 10 mg/day. *Continuous infusion*—2–4 mg/24 hr; may increase by 1–2 mg/day (up to 30 mg/day); *single-dose extended-release liposomal injection*—lower extremity orthopedic surgery: 15 mg, lower abdominal/pelvic surgery: 10–15 mg, cesarean section:10 mg. Use preservative-free formulation.

Epidural: (Children >1 mo): 0.03–0.05 mg/kg, maximum dose: 0.1 mg/kg or 5 mg/24 hr. Use preservative-free formulation.

IT (Adults): 0.2–1 mg. Use preservative-free formulation.

Availability (generic available)

Soluble tablets: 10 mg, 15 mg, 30 mg. **Tablets:** 15 mg, 30 mg. **Cost:** *MSIR*—15 mg $18.32/100, 30 mg $31.22/100. **Extended (controlled, sustained)-release tablets:** 15 mg, 30 mg, 60 mg, 100 mg, 200 mg. **Cost:** *MS*

Copyright © 2008 by F.A. Davis

Contin—15 mg $99.63/100, 30 mg $189.34/100, 60 mg $369.44/100, 100 mg $546.99/100, 200 mg $1001.71/100; *Oramorph SR*—15 mg $90.03/100, 30 mg $171.09/100, 60 mg $333.83/100, 100 mg $511.24/100. **Sustained-release capsules (Kadian):** 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 200 mg. **Cost:** *Kadian*—20 mg $105.49/60, 30 mg $119.00/60, 50 mg $223.05/60, 60 mg $227.39/60, 100 mg $383.80/60. **Extended-release capsules (Avinza):** 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Avinza*—30 mg $231.00/100, 60 mg $445.00/100, 90 mg $675.00/100, 120 mg $790.00/100. **Oral solution (Roxanol-T—20 mg/ml fruit and mint flavor; also unflavored):** 10 mg/5 ml, 20 mg/5 ml, 100 mg/5 ml, 2 mg/ml, 4 mg/ml, 20 mg/ml (concentrate). **Cost:** *Roxanol*—20 mg/ml $20.76/30 ml. **Rectal suppositories:** 5 mg, 10 mg, 20 mg, 30 mg. **Solution for IM, subcut, IV injection:** 1 mg/ml, 2 mg/ml, 4 mg/ml, 5 mg/ml, 8 mg/ml, 10 mg/ml, 15 mg/ml, 25 mg/ml, 50 mg/ml. **Solution for epidural, IV injection (preservative-free):** 0.5 mg/ml, 1 mg/ml. **Solution for epidural or IT use (continuous microinfusion device; preservative-free):** 10 mg/ml in 20-ml vial, 25 mg/ml in 20-ml vial. **Extended-release liposome injection for epidural use:** 10 mg/ml in 1–, 2.5– and 2-ml vials. **Solution for IV injection (PCA device):** 1 mg/ml, 2 mg/ml, 3 mg/ml, 5 mg/ml.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, IM, and 20 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting morphine, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion.
- Patients taking sustained-release morphine may require additional short-acting opioid doses for breakthrough pain. Doses should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- ***High Alert:*** Assess level of consciousness, blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Subsequent doses may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Geri: Assess geriatric patients frequently; older adults are more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently. Pedi: Assess pediatric patient frequently; children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability and restlessness more frequently.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive morphine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl

Copyright © 2008 by F.A. Davis

for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Do not confuse morphine with hydromorphone or meperidine—errors have resulted in death. Other errors associated with morphine include overdose and infusion pump miscalculations. Consider patients' previous analgesic use and current requirements, but clarify doses that greatly exceed normal range. Have second practitioner independently check original order, dose calculations and infusion pump settings. Pedi: Use only preservative-free formulations in neonates, and for epidural and intrathecal routes in all patients. Medication errors with opioid analgesics are common in the pediatric population and include misinterpretation or miscalculation of doses and use of inappropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- When transferring from other opioids or other forms of morphine to extended-release tablets, administer a total daily dose of oral morphine equivalent to previous daily dose (see Appendix J) and divided every 8 hr (MS Contin), every 12 hr (Kadian, MS Contin, Oramorph SR), every 24 hr (Kadian or Avinza).
- Morphine should be discontinued gradually to prevent withdrawal symptoms after long-term use.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Administer oral solution with properly calibrated measuring device; may be diluted in a glass of fruit juice just prior to administration to improve taste.
- Extended-release and controlled-release tablets should be swallowed whole; do not crush, break, dissolve or chew (could result in rapid release and absorption of a potentially toxic dose).
- *Kadian and Avinza* capsules may be opened and the pellets sprinkled onto applesauce immediately prior to administration. Patients should rinse mouth and swallow to assure ingestion of entire dose. Pellets should not be chewed, crushed, or dissolved. *Kadian* capsules may also be opened and sprinkled on approximately 10 ml of water and flushed while swirling through a pre-wetted 16 French gastrostomy tube fitted with a funnel at the port end. Additional water should be used to transfer and flush any remaining pellets. *Kadian* should not be administered via a nasogastric tube.
- **Rect:** *MS Contin* and *Oramorph SR* have been administered rectally.
- **IM, Subcut:** Use IM route for repeated doses, because morphine is irritating to subcut tissues.

IV Administration

- **IV:** Solution is colorless; do not administer discolored solution.
- **Direct IV:** ***Diluent:*** Dilute with at least 5 ml of sterile water or 0.9% NaCl for injection. ***Concentration:*** 0.5–5 mg/ml. ***Rate: High Alert:*** Administer 2.5–15 mg over 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Continuous Infusion:** ***Diluent:*** May be added to D5W, D10W, 0.9% NaCl, 0.45% NaCl, Ringer's or LR, dextrose/saline solution, or dextrose/Ringer's or LR. ***Concentration:*** 0.1–1 mg/ml or greater for continuous infusion. ***Rate:*** Administer via infusion pump to control the rate. Dose should be titrated to ensure adequate pain relief without excessive sedation, respiratory depression, or hypotension. May be administered via patient-controlled analgesia (PCA) pump.
- **Syringe Compatibility:** atropine, bupivacaine, cimetidine, diphenhydramine, droperidol, glycopyrrolate, hydroxyzine, ketamine, metoclopramide, midazolam, milrinone, ondansetron, perphenazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** pantoprazole, thiopental.
- **Y-Site Compatibility:** aldesleukin, allopurinol, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbac-

Copyright © 2008 by F.A. Davis

tam, amsacrine, argatroban, atenolol, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, epinephrine, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, insulin, kanamycin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, meropenem, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, phenobarbital, piperacillin/tazobactam, potassium chloride, propranolol, ranitidine, scopolamine, sodium bicarbonate, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine, vitamin B complex with C, warfarin, zidovudine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, azithromycin, doxorubicin liposome, lansoprazole, phenytoin, sargramostim.
- **Epidural:** Invert vial gently to re-suspend liposomal product immediately prior to administration; do not shake. Administer undiluted. If a lidocaine test dose is administered, flush catheter with 0.9% NaCl and wait 15 min before administration of *DepoDur*. Do not use an in-lint filter. Do not admix or administer other medications in epidural space for 48 hr after administration. Administer within 4 hr after removing from vial. Store in refrigerator; do not freeze.

Patient/Family Teaching

- Instruct patient how and when to ask for pain medication.
- ***High Alert:*** Instruct family not to administer PCA doses to the sleeping patient. Overmedication, sedation, and respiratory depression can result.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patients who are immobilized or on prolonged bedrest to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- **Home Care Issues:** ***High Alert:*** Explain to patient and family how and when to administer morphine and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- Emphasize the importance of aggressive prevention of constipation with the use of morphine.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Decrease in symptoms of pulmonary edema.

moxifloxacin, See FLUOROQUINOLONES.

mupirocin (myoo-**peer**-oh-sin)
Bactroban, Bactroban Nasal

Classification
Therapeutic: anti-infectives

Pregnancy Category B

Indications

Topical: Treatment of: Impetigo, Secondarily infected traumatic skin lesions (up to 10 cm in

Copyright © 2008 by F.A. Davis

length or 100 cm^2 area) caused by *Staphylococcus aureus* and *Streptococcus pyogenes*. **Intranasal:** Eradicates nasal colonization with methicillin-resistant *S. aureus*.

Action

Inhibits bacterial protein synthesis. **Therapeutic Effects:** Inhibition of bacterial growth and reproduction. **Spectrum:** Greatest activity against gram-positive organisms, including: *S. aureus*, Beta-hemolytic streptococci. Resolution of impetigo. Eradication of *S. aureus* carrier state.

Pharmacokinetics

Absorption: Minimal systemic absorption.
Distribution: Remains in the stratum corneum after topical use for prolonged periods of time (72 hr).
Metabolism and Excretion: Metabolized in the skin, removed by desquamation.
Half-life: 17–36 min.

TIME/ACTION PROFILE (anti-infective effect)

ROUTE	ONSET	PEAK	DURATION
Nasal	unknown	unknown	12 hr
Topical†	unknown	3–5 days	72 hr

†Resolution of lesions

Contraindications/Precautions

Contraindicated in: Hypersensitivity to mupirocin or polyethylene glycol.
Use Cautiously in: Pregnancy or lactation (safety not established); Impaired renal function; Burn patients.

Adverse Reactions/Side Effects

CNS: *nasal only*— headache. **EENT:** *nasal only*— cough, itching, pharyngitis, rhinitis, upper respiratory tract congestion. **GI:** nausea; *nasal only*— altered taste. **Derm:** *topical only*— burning, itching, pain, stinging.

Interactions

Drug-Drug: Nasal mupirocin should not be used concurrently with other **nasal products**.

Route/Dosage

Topical (Adults and Children ≥2 mo): *Ointment:*—Apply 3–5 times daily for 5–14 days.
Topical (Adults and Children ≥3 mo): *Cream:*—Apply small amount 3 times/day for 10 days.
Intranasal (Adults and Children ≥1 yr): Apply small amount nasal ointment to each nostril 2–4 times/day for 5–14 days.

Availability (generic available)

Ointment: 2% in 0.9-g, 15-g, 22-g, and 30-g tubes, 2% in 15- and 30-g tubes[OTC]. **Cost:** *Generic*—$34.99/22 g. **Cream:** 2% in 15- and 30-g tubes. **Cost:** $47.99/15 g, $77.13/30 g. **Nasal ointment:** 2% in 1-g single-use tubes.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)

Implementation

- **Topical:** Wash affected area with soap and water and dry thoroughly. Apply a small amount of mupirocin to the affected area 3 times daily and rub in gently. Treated area may be covered with gauze if desired.
- **Nasal:** Apply one half of the ointment from the single-use tube to each nostril twice daily (morning and evening) for 5 days. After application, close nostrils by pressing together and releasing sides of the nose repeatedly for 1 min.

Patient/Family Teaching

- Instruct patient on the correct application of mupirocin. Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible unless almost time for next dose. Avoid contact with eyes.
- **Topical:** Teach patient and family appropriate hygienic measures to prevent spread of impetigo.
- Instruct parents to notify school nurse for screening and prevention of transmission.
- Patient should consult health care professional if symptoms have not improved in 3–5 days.

Evaluation/Desired Outcomes

- Healing of skin lesions. If no clinical response is seen in 3–5 days, condition should be re-evaluated.
- Eradication of methicillin-resistant *S. aureus* carrier state in patients and health care workers during institutional outbreaks.

muromonab-CD3

(myoo-roe-**moe**-nab CD3)
Orthoclone OKT3

Classification
Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Acute renal allograft rejection reactions in transplant patients that have occurred despite conventional antirejection therapy. Acute corticosteroid-resistant hepatic or cardiac allograft rejection reactions.

Action

A purified immunoglobulin antibody that acts as an immunosuppressant by interfering with normal T-cell function. **Therapeutic Effects:** Reversal of graft rejection in transplant patients.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Eliminated by binding to T lymphocytes.
Half-life: 18 hr.

TIME/ACTION PROFILE (noted as levels of circulating CD3-positive T cells)

ROUTE	ONSET	PEAK	DURATION
IV	mins	2–7 days	1 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to muromonab-CD3, murine (mouse) proteins, or polysorbate; Previous muromonab therapy; Fluid overload; Fever >37.8°C or 100°F; Chickenpox or recent exposure to chickenpox; Herpes zoster.
Use Cautiously in: Active infections; Depressed bone marrow reserve; Chronic debilitating illnesses; CHF; Pregnancy, lactation, or children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: tremor, aseptic meningitis, dizziness. **Resp:** PULMONARY EDEMA, dyspnea, shortness of breath, wheezing. **CV:** chest pain. **GI:** diarrhea, nausea, vomiting. **Misc:** CYTOKINE RELEASE SYNDROME, INFECTIONS, chills, fever, hypersensitivity reactions, increased risk of lymphoma.

Interactions

Drug-Drug: Additive immunosuppression with other **immunosuppressives**. Concurrent **prednisone** and **azathioprine** dosages should be reduced during muromonab therapy (↑ risk of infection and lymphoproliferative disorders). **Cyclosporine** should be reduced or discontinued during muromonab-CD3 therapy (↑ risk of infection and lymphoproliferative disorders). ↑ risk of adverse CNS reactions with **indomethacin**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.
Drug-Natural Products: Concommitant use with **astragalus**, **echinacea**, and **melatonin** may interfere with immunosuppression.

Route/Dosage

IV (Adults): 5 mg/day for 10–14 days (pretreatment with corticosteroids, acetaminophen, and/or antihistamines recommended).
IV (Children): 0.1 mg (100 mcg)/kg/day for 10–14 days.

Availability

Solution for injection: 1 mg/ml in 5-ml ampules.

NURSING IMPLICATIONS

Assessment

- Assess for fluid overload (monitor weight and intake and output, assess for edema and rales/crackles). Notify physician if patient has experienced 3% or more weight gain in the previous week. Chest x-ray examination should be obtained within 24 hr before beginning therapy. Fluid-overloaded patients are at high risk of developing pulmonary edema. Monitor vital signs and breath sounds closely.
- Assess for cytokine release syndrome (CRS), usually manifested by high fever and chills, headache, tremor, nausea and vomiting, chest pain, muscle and joint pain, generalized weakness, shortness of breath, dizziness, abdominal pain, malaise, diarrhea, and trembling of hands, but may occasionally cause a severe, life-threatening, shock-like reaction. The severity of this reaction is greatest with initial dose. Reaction occurs within 30–48 hr

Copyright © 2008 by F.A. Davis

and may persist for up to 6 hr. Acetaminophen and antihistamines may be used to treat early reactions. Patient temperature should be maintained below 37.8°C (100°F) at administration of each dose. Manifestations of CRS may be prevented or minimized by pretreatment with methylprednisolone sodium succinate 8 mg/kg IV given 1–4 hr before 1st dose of muromonab-CD3. Hydrocortisone 100 mg IV may also be given 30 min after the 1st and possibly 2nd dose to control respiratory side effects. Serious symptoms of CRS may require oxygen, IV fluids, corticosteroids, vasopressors, antihistamines, and intubation.

- Monitor for signs of anaphylactic or hypersensitivity reactions at each dose. Resuscitation equipment should be readily available.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- Monitor for development of aseptic meningitis. Onset is usually within 3 days of beginning therapy. Assess for fever, headache, nuchal rigidity, and photophobia.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and periodically throughout therapy.
- Monitor assays of T cells (CD3, CD4, CD8); target CD3 is <25 cells/mm^3 or plasma levels as determined by ELISA daily; target levels should be ≥800 mg/ml.
- Monitor BUN, serum creatinine, and hepatic enzymes (AST, ALT, alkaline phosphatase, bilirubin), especially during the first 1–3 days of therapy. May cause transient ↑.

Potential Nursing Diagnoses

Risk for infection (Side Effects)
Excess fluid volume (Side Effects)

Implementation

- Physician will reduce dose of corticosteroids and azathioprine and discontinue cyclosporine during 10–14-day course of muromonab-CD3. Cyclosporine may be resumed 3 days before end of therapy.
- Initial dose is administered during hospitalization; patient should be monitored closely for 48 hr. Subsequent doses may be administered on outpatient basis.
- Keep medication refrigerated at 2–8°C. Do not shake vial. Solution may contain a few fine translucent particles that do not affect potency. Discard unused portion.

IV Administration

- **Direct IV:** Draw solution into syringe via low-protein-binding 0.2- or 0.22-micrometer filter to ensure removal of translucent protein particles that may be present. Discard filter and attach 20-gauge needle for IV administration. ***Concentration:*** 1 mg/ml (undiluted). ***Rate:*** Administer IV push over <1 min. Do not administer as an infusion. **Compatibility:** Do not admix; do not administer in IV line containing other medications. If line must be used for other medications, flush with 0.9% NaCl before and after muromonab-CD3.

Patient/Family Teaching

- Explain purpose of medication to patient. Inform patient of possible initial-dose side effects, which are markedly reduced in subsequent doses. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of muromonab-CD3 course.
- Inform patient of potential for CRS. Describe reportable symptoms.
- Instruct patient to continue to avoid crowds and persons with known infections, as this drug also suppresses the immune system.
- Advise patient to notify health care professional at first sign of rash, urticaria, tachycardia, dyspnea, or difficulty swallowing.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient not to receive any vaccinations and to avoid contact with persons receiving oral polio vaccine without advice of health care professional.

Evaluation/Desired Outcomes

- Reversal of the symptoms of acute organ rejection.

mycophenolate mofetil
(mye-koe-**fee**-noe-late **moe**-fe-til)
CellCept

mycophenolic acid
(mye-koe-**fee**-noe-lik)
Myfortic

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: immunosuppressants

Pregnancy Category C (mycophenolic acid), D (mycophenolate mofetil)

Indications

Mycophenolate mofetil: Prevention of rejection in allogenic renal, hepatic, and cardiac transplantation (used concurrently with cyclosporine and corticosteroids). **Mycophenolic acid:** Prevention of rejection in allogenic renal transplantation (used concurrently with cyclosporine and corticosteroids).

Action

Inhibits the enzyme inosine monophosphate dehydrogenase, which is involved in purine synthesis. This inhibition results in suppression of T- and B-lymphocyte proliferation. **Therapeutic Effects:** Prevention of heart, kidney, or liver transplant rejection.

Pharmacokinetics

Absorption: Following oral and IV administration, mycophenolate mofetil is rapidly hydrolyzed to mycophenolic acid (MPA), the active metabolite. Absorption of enteric-coated mycophenolic acid (Myfortic) is delayed compared to mycophenolate mofetil (CellCept).
Distribution: Cross the placenta and enter breast milk.
Protein Binding: *MPA*—97%.
Metabolism and Excretion: MPA is extensively metabolized; <1% excreted unchanged in urine. Some enterohepatic recirculation of MPA occurs.
Half-life: *MPA*—8–18 hr.

TIME/ACTION PROFILE (blood levels of MPA)

ROUTE	ONSET	PEAK	DURATION
mycophenolate mofetil-PO	rapid	0.25–1.25 hr	N/A
mycophenolic acid	rapid	1.5–2.75 hr	N/A

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polysorbate 80 (for IV mycophenolate mofetil); OB: Pregnancy or lactation.

Use Cautiously in: Active serious pathology of the GI tract (including history of ulcer disease or GI bleeding); Phenylketonuria (oral suspension contains aspartame); Severe chronic renal impairment (dose not to exceed 1 g twice daily (CellCept) if CCr <25 ml/min/1.73 m^2); careful monitoring recommended; Delayed graft function following transplantation (observe for increased toxicity); Geri: Increased risk of adverse reactions related to immunosuppression; OB: Pregnancy or patients with childbearing potential; Lactation: Lactation (safety not established); Pedi: Children (mycophenolate mofetil approved in children ≥3 mo for renal transplant; mycophenolic acid approved in children ≥5 yr for renal transplant; safety not established for other age groups).

Adverse Reactions/Side Effects

CNS: anxiety, dizziness, headache, insomnia, paresthesia, tremor. **CV:** edema, hypertension, hypotension, tachycardia. **Derm:** rashes. **Endo:** hypercholesterolemia, hyperglycemia, hyperkalemia, hypocalcemia, hypokalemia, hypomagnesemia. **GI:** GI BLEEDING, anorexia, constipation, diarrhea, nausea, vomiting, abdominal pain. **GU:** renal dysfunction. **Hemat:** leukocytosis, leukopenia, thrombocytopenia, anemia. **Resp:** cough, dyspnea. **Misc:** fever, infection, increased risk of malignancy.

Interactions

Drug-Drug: Combined use with **azathioprine** is not recommended (effects unknown). **Acyclovir** and **ganciclovir** compete with MPA for renal excretion and, in patients with renal dysfunction, may ↑ each other's toxicity. **Magnesium** and **aluminum hydroxide** antacids ↓ the absorption of MPA (avoid simultaneous administration). **Cholestyramine** and **colestipol** ↓ the absorption of MPA (avoid concurrent use). May interfere with the action of **oral contraceptives** (additional contraceptive method should be used). May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**, although influenza vaccine may be useful.
Drug-Food: When administered with food, peak blood levels of MPA are significantly ↓ (should be administered on an empty stomach).

Route/Dosage

Mycophenolate Mofetil (CellCept)

Renal Transplantation

PO, IV (Adults): 1 g twice daily; IV should be started ≤24 hr after transplantation and

Copyright © 2008 by F.A. Davis

switched to PO as soon as possible (IV not recommended for ≥14 days).
PO (Children 3 mo–18 yr): 600 mg/m² twice daily (not to exceed 2 g/day).

Hepatic Transplantation

PO, IV (Adults): 1 g twice daily IV, or 1.5 g twice daily PO. IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

Cardiac Transplantation

PO, IV (Adults): 1.5 g twice daily; IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

Renal Impairment

PO, IV (Adults): *CCr <25 ml/min*—daily dose should not exceed 2 g.

Mycophenolic Acid (Myfortic)

Mycophenolate mofetil and mycophenolic acid should not be used interchangeably without the advice of a health care professional

Renal Transplantation

PO (Adults): 720 mg twice daily.
PO (Children 5–16 yr and ≥1.19 m²): 400 mg/m² twice daily (not to exceed 720 mg twice daily).

Availability

Mycophenolate Mofetil (Cellcept)
Capsules: 250 mg. **Tablets:** 500 mg. **Oral suspension (fruit flavor):** 200 mg/ml in 225 ml bottles. **Powder for injection:** 500 mg vial.
Mycophenolic acid (Myfortic)
Delayed-release tablets (Myfortic): 180 mg, 360 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of organ rejection throughout therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential weekly during the 1st month, twice monthly for the 2nd and 3rd month of therapy, and then monthly during the 1st yr. Neutropenia occurs most frequently from 31–180 days post-transplant. If ANC is <1000/mm³, dose should be reduced or discontinued.
- Monitor hepatic and renal status and electrolytes periodically during therapy. May cause ↑ serum alkaline phosphatase, AST, ALT, LDH, BUN, and creatinine. May also cause hyperkalemia, hypokalemia, hypocalcemia, hypomagnesemia, hyperglycemia, and hyperlipidemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- The initial dose of mycophenolate (usually IV) should be given within 24 hr of transplant.
- Women of childbearing years should have a negative serum or urine pregnancy test within 1 wk prior to initiation of therapy.
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals. Capsules and delayed-release tablets should be swallowed whole; do not open, crush, or chew. Mycophenolate may be teratogenic; contents of capsules should not be inhaled or come in contact with skin or mucous membranes.
- Do not administer mycophenolate concurrently with antacids containing magnesium or aluminum.

IV Administration

- **IV:** IV route should only be used for patients unable to take oral medication and should be switched to oral dose form as soon as patient can tolerate capsules or tablets
- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial with 14 ml of D5W. Shake gently to dissolve. Solution is slightly yellow; discard if solution is discolored or contains particulate matter. Dilute contents of 2 vials (1-g dose) further with 140 ml of D5W or 3 vials (1.5-g dose) with 210 ml of D5W. ***Concentration:*** 6 mg/ml. Solution is stable for 4 hr. ***Rate:*** Administer via slow IV infusion over 2 hr.
- **Y-Site Incompatibility:** Do not admix or administer mycophenolate in same catheter as other medications.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Do not skip or double up on missed doses. Do not discontinue without consulting health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.

Copyright © 2008 by F.A. Davis

- Inform female patients of the importance of simultaneously using two reliable forms of contraception, unless abstinence is the chosen method, prior to beginning, during, and for 6 wk following discontinuation of therapy.
- Advise patient to avoid contact with persons with contagious diseases.
- Inform patient of the increased risk of lymphoma and other malignancies. Advise patient to use sunscreen and wear protective clothing to decrease risk of skin cancer.
- Advise patient to consult health care professional prior to taking other medications concurrently with mycophenolate.
- Emphasize the importance of routine follow-up laboratory tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted organs.

nabumetone

(na-**byoo**-me-tone)
Relafen

Classification
Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

Pregnancy Category C

Indications
Symptomatic management of rheumatoid arthritis and osteoarthritis.

Action
Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

Pharmacokinetics
Absorption: Nabumetone (a prodrug) is 80% absorbed after oral administration; 35% is rapidly converted to 6-methoxy-2-naphthylacetic acid (6-MNA), which is the active drug.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: 6-MNA is metabolized by the liver to inactive compounds.
Half-life: 24 hr (increased in severe renal impairment).

TIME/ACTION PROFILE (analgesia/anti-inflammatory effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 days	few days–2 wk	12–24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Use with other NSAIDs, including aspirin; cross-sensitivity may occur; Active GI bleeding or ulcer disease; Perioperative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Severe renal, or hepatic disease; History of ulcer disease; Pregnancy, lactation, or children (safety not established; avoid using during 2nd half of pregnancy).

Adverse Reactions/Side Effects
CNS: agitation, anxiety, confusion, depression, dizziness, drowsiness, fatigue, headache, insomnia, malaise, weakness. **EENT:** abnormal vision, tinnitus. **Resp:** dyspnea, hypersensitivity pneumonitis. **CV:** edema, fluid retention, vasculitis. **GI:** GI BLEEDING, abdominal pain, diarrhea, abnormal liver function tests, anorexia, constipation, dry mouth, dyspepsia, flatulence, gastritis, gastroenteritis, increased appetite, nausea, stomatitis, vomiting. **GU:** albuminuria, azotemia, interstitial nephritis. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, increased sweating, photosensitivity, pruritus, rash. **Hemat:** prolonged bleeding time. **Metab:** weight gain. **Neuro:** paresthesia, tremor. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIONEUROTIC EDEMA.

Interactions
Drug-Drug: ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemic effects of **insulins** or **oral hypoglycemic agents**. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **anticoagulants**, **ticlopidine**, **clopidogrel**, **eptifibatide**, **tirofiban**, or **thrombolytic agents**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. Concurrent use with **cyclosporine** may ↑ risk of renal toxicity.

Route/Dosage
PO (Adults): 1000 mg/day as a single dose or divided dose twice daily; may be increased up to 2000 mg/day; use lowest effective dose during chronic therapy.

Availability
Tablets: 500 mg, 750 mg.

NURSING IMPLICATIONS

Assessment
- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess pain and range of motion before and periodically throughout therapy.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests

Copyright © 2008 by F.A. Davis

may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May cause prolonged bleeding time.

Potential Nursing Diagnoses
Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation
- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Geri: Use lowest effective dose for shortest period of time.
- **PO:** Administer with meals or antacids to decrease GI irritation and increase absorption.

Patient/Family Teaching
- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness, dizziness, or visual disturbances. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes
- Decreased pain and improved joint mobility. Partial arthritic relief is usually seen within 1 wk, but maximum effectiveness may require 2 wk or more of continuous therapy. Patients who do not respond to one NSAID may respond to another.

nadolol (**nay**-doe-lole)
Corgard, ✱Syn-Nadolol

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Pregnancy Category C

Indications
Management of hypertension. Management of angina pectoris. **Unlabeled uses:** Arrhythmias. Migraine prophylaxis. Tremors (essential, lithium-induced, parkinsonian). Aggressive behavior. Antipsychotic-associated akathisia. Situational anxiety. Esophageal varices. Reduction of intraocular pressure.

Action
Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine) receptor sites. **Therapeutic Effects:** Decreased heart rate and blood pressure.

Pharmacokinetics
Absorption: 30% absorbed after oral administration.
Distribution: Minimal penetration of the CNS. Crosses the placenta and enters breast milk.
Metabolism and Excretion: 70% excreted unchanged by the kidneys.
Half-life: 10–24 hr (increased in renal impairment).

TIME/ACTION PROFILE (anithypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO†	up to 5 days	6–9 days	24 hr

†With chronic dosing

Contraindications/Precautions
Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal impairment (CCr <50 ml/min); Hepatic impairment; Geriatric patients (increased sensitivity to beta blockers; initial dosage reduction recommended); Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); Pregnancy, lactation, or children (safety not established; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, decreased libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, **diltiazem**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent use with **clonidine** increases hypotension and bradycardia. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor therapy** (may result in hypertension). Concurrent **NSAIDs** may ↓ antihypertensive action.

Route/Dosage

PO (Adults): *Antianginal*—40 mg once daily initially; may increase by 40–80 mg/day q 3–7 days as needed (up to 240 mg/day). *Antihypertensive*—40 mg once daily initially; may increase by 40–80 mg/day q 7 days as needed (up to 320 mg/day).

Renal Impairment

PO (Adults): *CCr 31–50 ml/min*—increase dosing interval to 24–36 hr; *CCr 10–30 ml/min*—increase dosing interval to 24–48 hr; *CCr <10 ml/min*—increase dosing interval to 40–60 hr.

Availability (generic available)

Tablets: 20 mg, 40 mg, 80 mg, 120 mg, 160 mg. ***In combination with:*** bendroflumethiazide (Corzide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dose adjustment and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Hypertension:** Check frequency of refills to determine compliance.
- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Discontinuation of concurrent clonidine should be done gradually, with beta blocker discontinued first; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- May be administered with food or on an empty stomach.
- Tablets may be crushed and mixed with food.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if

Copyright © 2008 by F.A. Davis

feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.

- Advise patient to ensure that enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet for emergencies.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or if blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Reduction in frequency of angina.
- Increase in activity tolerance. May require up to 5 days before therapeutic effects are seen.

nafarelin (na-**fare**-e-lin)
Synarel

Classification
Therapeutic: hormones
Pharmacologic: gonadotropin-releasing hormones

Pregnancy Category X

Indications
Management of endometriosis. Management of central precocious puberty (gonadotropin-dependent) in children.

Action
Acts as a synthetic analogue of gonadotropin-releasing hormone (GnRH). Initially increases pituitary production of luteinizing hormone (LH) and follicle-stimulating hormone (FSH), which cause ovarian steroid production. Chronic administration leads to decreased production of gonadotropins. Endometriotic lesions are sensitive to ovarian hormones. **Therapeutic Effects:** Reduction in lesions and associated pain in endometriosis. Arrest and regression of puberty in children with central precocious puberty.

Pharmacokinetics
Absorption: Well absorbed following intranasal administration.
Distribution: Unknown.
Metabolism and Excretion: 20–40% excreted in feces; 3% excreted unchanged by the kidneys.
Half-life: 3 hr.

TIME/ACTION PROFILE (decreased ovarian steroid production)

ROUTE	ONSET	PEAK	DURATION
Intranasal	within 4 wk	3–4 wk	3–6 mo†

†Relief of symptoms of endometriosis following discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity to GnRH, its analogues, or sorbitol; Pregnancy or lactation.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Rhinitis.

Adverse Reactions/Side Effects

CNS: emotional instability, headaches, depression, insomnia. **EENT:** nasal irritation. **CV:** edema. **GU:** vaginal dryness. **Derm:** acne, hirsutism, seborrhea. **Endo:** cessation of menses, impaired fertility, reduced breast size. **MS:** decreased bone density, myalgia. **Misc:** decreased libido, hot flashes, hypersensitivity reactions, weight gain.

Interactions

Drug-Drug: Concurrent **topical nasal decongestants** may reduce absorption of nafarelin (administer decongestant at least 2 hr after nafarelin).

Route/Dosage

Intranasal (Adults): *Endometriosis*—1 spray (200 mcg) in 1 nostril in the morning and 1 spray in the other nostril in the evening (400 mcg/day). May be increased to 1 spray in each nostril in the morning and evening (800 mcg/day).

Intranasal (Children): *Central precocious puberty*—2 sprays in each nostril in the morning and in the evening (1600-mcg/day); may be increased up to 1800 mcg/day (3 sprays in alternating nostrils 3 times daily).

Availability

Nasal spray: 2 mg/ml 10-ml bottle (200 mcg/spray).

NURSING IMPLICATIONS

Assessment

- **Endometriosis:** Assess patient for endometriotic pain periodically throughout therapy.
- **Central Precocious Puberty:** Prior to therapy, a complete physical and endocrinologic examination including height, weight, hand and wrist x-ray, total sex steroid level (estradiol or testosterone), adrenal steroid level, beta-human chorionic gonadotropin level, GnRH stimulation test, pelvic/adrenal/testicular ultrasound, and CTof the head must be performed. These parameters are monitored after 6–8 wk and every 3–6 mo during therapy.
- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically throughout therapy
- Nafarelin is discontinued when the onset of normal puberty is desired. Monitor the onset of normal puberty and assess menstrual cycle, reproductive function, and final adult height.

Potential Nursing Diagnoses

Acute pain (Indications)
Sexual dysfunction (Indications, Side Effects)

Implementation

- **Endometriosis:** Treatment should be started between days 2 and 4 of the menstrual cycle and continued for up to 6 mo.

Patient/Family Teaching

- Instruct patient on the correct technique for nasal spray: The head should be tilted back slightly; wait 30 sec between sprays.
- Advise patient to consult health care professional if rhinitis occurs during therapy. If a topical decongestant is needed, do not use decongestant until 2 hr after nafarelin dosing. If possible, avoid sneezing during and immediately after nafarelin dose.
- **Endometriosis:** Inform patient that 1 spray should be administered into 1 nostril in the morning and 1 spray into the other nostril in the evening for the 400 mcg/day dose. If dose is increased to 800 mcg/day, administer 1 spray to each nostril (2 sprays) morning and evening; 1 bottle should provide a 30-day supply at the 400 mcg/day dose.
- Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected. Instruct patient to notify health care professional if regular menstruation persists or if successive doses are missed.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- **Central Precocious Puberty:** Instruct patient on correct timing and number of sprays. The 1600 mcg/day dose is achieved by 2 sprays to each nostril in the morning (4 sprays) and 2 sprays to each nostril in the evening (4 sprays), for a total of 8 sprays. The 1800 mcg/day dose is achieved by 3 sprays into alternating nostrils 3 times per day, for a total of 9 sprays. Inform patient and parents that if doses are not taken as directed pubertal process may be reactivated. One bottle

Copyright © 2008 by F.A. Davis

should provide a 7-day supply at the 1600-mcg/day dose.
- Advise patient and parents that during 1st mo of therapy some signs of puberty (vaginal bleeding, breast enlargement) may occur. These should resolve after the 1st mo of therapy. If these signs persist after the 2nd mo of therapy, notify health care professional.

Evaluation/Desired Outcomes
- Reduction in lesions and associated pain in endometriosis.
- Resolution of the signs of precocious puberty.

nafcillin, See PENICILLINS, PENICILLINASE RESISTANT.

naftifine, See ANTIFUNGALS (TOPICAL).

HIGH ALERT

nalbuphine (nal-byoo-feen)
Nubain

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/analgesics

Pregnancy Category C

Indications
Moderate to severe pain. Also provides: Analgesia during labor, Sedation before surgery, Supplement to balanced anesthesia.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. In addition, has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics
Absorption: Well absorbed after IM and subcut administration.
Distribution: Probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver and eliminated in the feces via biliary excretion. Minimal amounts excreted unchanged by the kidneys.
Half-life: 5 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	<15 min	60 min	3–6 hr
Subcut	<15 min	unknown	3–6 hr
IV	2–3 min	30 min	3–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to nalbuphine or bisulfites; Patients who are physically dependent on opioids and have not been detoxified (may precipitate withdrawal).
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geriatric or debilitated patients (dose reduction suggested); Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; OB: Pregnancy (has been used during labor but may cause respiratory depression in the newborn); Lactation or children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache, sedation, confusion, dysphoria, euphoria, floating feeling, hallucinations, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, orthostatic hypotension, palpitations. **GI:** dry mouth, nausea, vomiting, constipation, ileus. **GU:** urinary urgency. **Derm:** clammy feeling, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in unpredictable, severe reactions—reduce initial dose of nalbuphine to 25% of usual dose). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioid agonists**. Avoid concurrent use with other **opioid analgesic agonists** (may diminish analgesic effect).
Drug-Natural Products: Concomitant use of **kava kava, valerian, skullcap, chamomile,** or **hops** can ↑ CNS depression.

Route/Dosage

Analgesia
IM, Subcut, IV (Adults): Usual dose is 10 mg q 3–6 hr (single dose not to exceed 20 mg; total daily dose not to exceed 160 mg).

Copyright © 2008 by F.A. Davis

Supplement to Balanced Anesthesia

IV (Adults): *Initial*—0.3–3 mg/kg over 10–15 min. *Maintenance*—0.25–0.5 mg/kg as needed.

Availability (generic available)

Injection: 10 mg/ml in 1- and 10-ml vials, 20 mg/ml in 1- and 10-ml vials and 1-ml preloaded syringes.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 1 hr after IM or 30 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 20 mg should be converted to an opioid agonist. Nalbuphine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Nalbuphine produces respiratory depression, but this does not markedly increase with increased doses.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive nalbuphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Disturbed sensory perception (visual, auditory) (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and permit lower opioid doses.
- **IM:** Administer deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **Direct IV:** May give IV undiluted. ***Concentration:*** 10–20 mg/ml. ***Rate:*** Administer slowly, each 10 mg over 3–5 min.
- **Syringe Compatibility:** atropine, cimetidine, diphenhydramine, droperidol, glycopyrrolate, hydroxyzine, lidocaine, midazolam, prochlorperazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** diazepam, ketorolac, pentobarbital.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** amifostine, aztreonam, bivalirudin, cisatracurium, cladribine, dexmedetomidine, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, lansoprazole, linezolid, melphalan, oxaliplatin, paclitaxel, propofol, remifentanil, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, docetaxel, methotrexate, pemetrexed, piperacillin/tazobactam, sargramostim, sodium bicarbonate.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.

Evaluation/Desired Outcomes

- Decrease in severity of pain without significant alteration in level of consciousness or respiratory status.

naloxone (nal-**ox**-one)
Narcan

Classification
Therapeutic: antidotes (for opioids)
Pharmacologic: opioid antagonists

Pregnancy Category B

Indications

Reversal of CNS depression and respiratory depression because of suspected opioid overdose.
Unlabeled uses: Opioid-induced pruritus (low dose IV infusion). Management of refractory circulatory shock.

Action

Competitively blocks the effects of opioids, including CNS and respiratory depression, without producing any agonist (opioid-like) effects.
Therapeutic Effects: Reversal of signs of opioid excess.

Pharmacokinetics

Absorption: Well absorbed after IM or subcut administration.
Distribution: Rapidly distributed to tissues. Crosses the placenta.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 60–90 min (up to 3 hr in neonates).

TIME/ACTION PROFILE (reversal of opioid effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	unknown	45 min
IM, Subcut	2–5 min	unknown	>45 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Cardiovascular disease; Patients physically dependent on opioids (may precipitate severe withdrawal); Pregnancy (may cause withdrawal in mother and fetus if mother is opioid dependent); Lactation (safety not established); Neonates of opioid-dependent mothers.

Adverse Reactions/Side Effects

CV: hypertension, hypotension, ventricular fibrillation, ventricular tachycardia. **GI:** nausea, vomiting.

Interactions

Drug-Drug: Can precipitate withdrawal in patients physically dependent on **opioid analgesics**. Larger doses may be required to reverse the effects of **buprenorphine**, **butorphanol**, **nalbuphine**, **pentazocine**, or **propoxyphene**. Antagonizes postoperative **opioid analgesics**.

Route/Dosage

Postoperative Opioid-Induced Respiratory Depression

IV (Adults): 0.02–0.2 mg q 2–3 min until response obtained; repeat q 1–2 hr if needed.
IV (Children): 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.
IM, IV, Subcut (Neonates): 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.

Copyright © 2008 by F.A. Davis

Opioid-Induced Respiratory Depression During Chronic (>1 wk) Opioid Use

IV, IM, Subcut (Adults >40 kg): 20–40 mcg (0.02–0.04 mg) given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

IV, IM, Subcut (Adults and Children <40 kg): 0.005–0.02 mg/dose given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

Overdose of Opioids

IV, IM, Subcut (Adults): *Patients not suspected of being opioid dependent*—0.4 mg (10 mcg/kg); may repeat q 2–3 min (IV route is preferred). Some patients may require up to 2 mg. *Patients suspected to be opioid dependent*—Initial dose should be decreased to 0.1–0.2 mg q 2–3 min. May also be given by IV infusion at rate adjusted to patient's response.

IV, IM, Subcut (Children >5 yr or >20 kg): 2 mg/dose, may repeat q 2–3 min.

IV, IM, Subcut (Infants up to 5 yr or 20 kg): 0.1 mg/kg, may repeat q 2–3 min.

Opioid-induced Pruritus

IV (Children): 2 mcg/kg/hr continuous infusion, may increase by 0.5 mcg/kg/hr every few hours if pruritus continues.

Availability (generic available)

Injection: 0.4 mg/ml in 1-ml prefilled syringes and 10-ml vials, 1 mg/ml in 2-ml prefilled syringes. ***In combination with:*** pentazocine (Talwin NX). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory rate, rhythm, and depth; pulse, ECG, blood pressure; and level of consciousness frequently for 3–4 hr after the expected peak of blood concentrations. After a moderate overdose of a short half-life opioid, physical stimulation may be enough to prevent significant hypoventilation. The effects of some opioids may last longer than the effects of naloxone, and repeat doses may be necessary.
- Patients who have been receiving opioids for >1 wk are extremely sensitive to the effects of naloxone. Dilute and administer carefully.
- Assess patient for level of pain after administration when used to treat postoperative respiratory depression. Naloxone decreases respiratory depression but also reverses analgesia.
- Assess patient for signs and symptoms of opioid withdrawal (vomiting, restlessness, abdominal cramps, increased blood pressure, and temperature). Symptoms may occur within a few minutes to 2 hr. Severity depends on dose of naloxone, the opioid involved, and degree of physical dependence.
- Lack of significant improvement indicates that symptoms are caused by a disease process or other non-opioid CNS depressants not affected by naloxone.
- ***Toxicity and Overdose:*** Naloxone is a pure antagonist with no agonist properties and minimal toxicity.

Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)
Ineffective coping (Indications)
Acute pain

Implementation

- Larger doses of naloxone may be necessary when used to antagonize the effects of buprenorphine, butorphanol, nalbuphine, pentazocine, and propoxyphene.
- Resuscitation equipment, oxygen, vasopressors, and mechanical ventilation should be available to supplement naloxone therapy as needed.
- Doses should be titrated carefully in postoperative patients to avoid interference with control of postoperative pain.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted for *suspected opioid overdose*. For *opioid-induced respiratory depression*, dilute with sterile water for injection. For children or adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of sterile water or 0.9% NaCl for injection. ***Concentration:*** 0.4 mg/ml, 1 mg/ml, or 10 mcg/mL (depending on preparation used). ***Rate:*** Administer over 30 seconds for patients with a *suspected opioid overdose*. For patients who develop *opioid-induced respiratory depression*, administer dilute solution of 0.4 mg/10 mL at a rate of 0.5 mL (0.02 mg) direct IV every 2 min. Titrate to avoid withdrawal and severe pain. Ex-

Copyright © 2008 by F.A. Davis

cessive dose in postoperative patients may cause excitement, pain, hypotension, hypertention, pulmonary edema, ventricular tachycardia and fibrillation, and seizures. For children and adults weighing <40 kg, administer 10 mcg/mL solution at a rate of 0.5 mcg/kg every 1–2 min.

- **Continuous Infusion:** ***Diluent:*** Dilute 2 mg of naloxone in 500 ml of 0.9% NaCl or D5W. Infusion is stable for 24 hr. ***Concentration:*** 4 mcg/ml. ***Rate:*** Titrate dose according to patient response.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, atropine, aztreonam, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydroxyzine, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.
- **Y-Site Incompatibility:** diazepam, lansoprazole, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Incompatible with preparations containing bisulfite, sulfite, and solutions with an alkaline pH.

Patient/Family Teaching

- As medication becomes effective, explain purpose and effects of naloxone to patient.

Evaluation/Desired Outcomes

- Adequate ventilation.
- Alertness without significant pain or withdrawal symptoms.

naproxen (na-**prox**-en)

Aleve, Anaprox, Anaprox DS, Apo-Napro-Na, Apo-Napro-Na DS, Apo-Naproxen, EC-Naprosyn, Naprelan, Napron X, Naprosyn, Naprosyn-E, Naprosyn-SR, Naxen, Novo-Naprox, Novo-Naprox Sodium DS, Nu-Naprox, Synflex, Synflex DS

Classification

Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents, antipyretics

Pregnancy Category B (first trimester)

Indications

Mild to moderate pain. Dysmenorrhea. Fever. Inflammatory disorders, including: Rheumatoid arthritis (adults and children), Osteoarthritis.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain. Reduction of fever. Suppression of inflammation.

Pharmacokinetics

Absorption: Completely absorbed from the GI tract. Sodium salt (Anaprox) is more rapidly absorbed.
Distribution: Crosses the placenta; enters breast milk in low concentrations.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Children <8 yr: 8–17 hr; Children 8–14 yr: 8–10 hr; Adults: 10–20 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	1 hr	unknown	8–12 hr
PO (anti-inflammatory)	14 days	2–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Lactation: Passes into breast milk and should not be used by nursing mothers.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Severe cardiovascular, renal, or hepatic disease; History of ulcer disease or any other history of gastrointestinal bleeding (may increase the risk of GI bleeding); Underlying cardiovascular disease (may increase the risk of MI or stroke); Chronic alcohol use/abuse; Geri: Increased risk of adverse reactions; OB: Avoid using during third trimester of pregnancy; may cause premature closure of the ductus arteriosis; Pedi: Children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **EENT:** tinnitus, visual disturbances. **Resp:** dyspnea. **CV:** edema, palpitations, tachycardia. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, anorexia, diarrhea, discomfort, flatulence, vomiting. **GU:** cystitis, hematuria, renal failure. **Derm:** photosensitivity, rashes, sweating, pseudoporphyria (12% incidence in children with juvenile rheumatoid arthritis—discontinue therapy if this occurs). **Hemat:** blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Concurrent use with **aspirin** ↓ naproxen blood levels and may ↓ effectiveness. ↑ risk of bleeding with **anticoagulants**, **thrombolytic agents**, **eptifibatide**, **tirofiban**, **cefotetan**, **cefoperazone**, **valproic acid**, **clopidogrel**, and **ticlopidine**. Additive adverse GI side effects with **aspirin**, **corticosteroids**, and other **NSAIDs**. **Probenecid** ↑ blood levels and may ↑ toxicity. ↑ risk of photosensitivity with other **photosensitizing agents**. May ↑ the risk of toxicity from **methotrexate**, **antineoplastics**, or **radiation therapy**. May ↑ serum levels and risk of toxicity from **lithium**. ↑ risk of adverse renal effects with **cyclosporine** or chronic use of **acetaminophen**. May ↓ response to **ACE Inhibitors**, **angiotensin II antagonists,** or **furosemide**. May ↑ risk of hypoglycemia with **insulin** or **oral hypoglycemic agents Oral potassium supplements** may ↑ GI adverse effects.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Dosage

275 mg naproxen sodium is equivalent to 250 mg naproxen.

Anti-inflammatory/Analgesic/Antidysmenorrheal

PO (Adults): *Naproxen*—250–500 mg bid (up to 1.5 g/day). *Delayed-release naproxen*—375–500 mg twice daily. *Naproxen sodium*—275–550 mg twice daily (up to 1.65 g/day).

PO (Children >2 yr): *Analgesia:* 5–7 mg/kg/dose every 8–12 hr. *Inflammatory disease:* 10–15 mg/kg/day divided q 12 hr, maximum: 1000 mg/day.

Antigout

PO (Adults): *Naproxen*—750 mg naproxen initially, then 250 mg q 8 hr. *Naproxen sodium*—825 mg initially, then 275 mg q 8 hr.

OTC Use (naproxen sodium)

PO (Adults): 200 mg q 8–12 hr or 400 mg followed by 200 mg q 12 hr (not to exceed 600 mg/24 hr).

PO (Geriatric Patients >65 yr): Not to exceed 200 mg q 12 hr.

Availability

Naproxen

Tablets (Naprosyn, {Apo-Naproxen, Naxen, Novo-Naprox, Nu-Naprox}): 🍁125 mg, 250 mg, 375 mg, 500 mg. **Controlled-release tablets (Naprelan):** 375 mg, 500 mg. **Delayed-release tablets (EC-Naprosyn, Naprosyn-E):** 🍁250 mg, 375 mg, 500 mg. **Extended-release tablets (Naprosyn-SR):** 🍁750 mg. **Oral suspension (Naprosyn):** 125 mg/5 ml. **Suppositories (Naprosyn, Naxen):** 🍁500 mg.

Naproxen Sodium

Tablets (Aleve, Anaprox, Anaprox DS, Apo-Napro-Na, Novo-Naprox Sodium, Novo-Naprox Sodium DS, Synaflex, Synaflex DS): 220 mg^{OTC}, 275 mg, 550 mg. ***In combination with:*** lansoprazole in a combination package (Prevacid NapraPac), pseudoephedrine (Aleve Cold and Sinus Tablets, Aleve Sinus and Headache Tablets). See Appendix B.

N

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- May ↑ serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests levels. May ↓ blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr.
- Bleeding time may be prolonged up to 4 days following discontinuation of therapy.
- May alter test results for urine 5-HIAA and urine steroid determinations.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Food slows but does not reduce the extent of absorption. Do not mix suspension with antacid or other liquid prior to administration.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional. Use of naproxen with 3 or more glasses of alcohol per day may increase risk of GI bleeding.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions (especially in children with juvenile rhumatoid arthritis [JRA]).
- Instruct patients not to take OTC naproxen preparations for more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Relief of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require 2–4 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

naratriptan (nar-a-**trip**-tan)
Amerge

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Pregnancy Category C

Indications

Acute treatment of migraine headache.

Copyright © 2008 by F.A. Davis

Action

Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed (70%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 60% excreted unchanged in urine; 30% metabolized by the liver.
Half-life: 6 hr (increased in renal impairment).

TIME/ACTION PROFILE (decreased migraine pain)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2–3 hr†	up to 24 hr

†3–4 hr during migraine attack

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Geriatric patients; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes; History of significant cardiovascular disease; Uncontrolled hypertension; Severe renal impairment (CCr <15 ml/min); Severe hepatic impairment; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine).
Use Cautiously in: Mild to moderate renal or hepatic impairment (dose should not exceed 2.5 mg/24 hr; initial dose should be decreased); Pregnancy, lactation, or children (safety not established).
Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, malaise/fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, myocardial ischemia. **GI:** nausea. **Neuro:** paresthesia. **Misc:** pain/pressure sensation in throat/neck.

Interactions

Drug-Drug: Concurrent use with **SSRI antidepressants** may result in weakness, hyperreflexia, and incoordination. **Cigarette smoking** ↑ the metabolism of naratriptan. Blood levels and effects are ↑ by **hormonal contraceptives**. Avoid concurrent use (within 24 hr of each other) with **ergot-containing drugs (dihydroergotamine)** may result in prolonged vasospastic reactions. Avoid concurrent (within 2 wk) use with **MAO inhibitors**; produces increased systemic exposure and risk of adverse reactions to naratriptan. Serotonin syndrome may occur with **sibutramine**.
Drug-Natural Products: ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 1 or 2.5 mg; dose may be repeated in 4 hr if response is inadequate (not to exceed 5 mg/24 hr or treatment of more than 4 headaches/mo).

Availability

Tablets: 1 mg, 2.5 mg. **Cost:** 1 mg $210.69/9, 2.5 mg $210.97/9.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets may be administered at any time after the headache starts.

Patient/Family Teaching

- Inform patient that naratriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer naratriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 4 hr between doses, and do not use more than

Copyright © 2008 by F.A. Davis

2 tablets in any 24-hr period. Do not use to treat more than 4 headaches per month.
- Advise patient that lying down in a darkened room following naratriptan administration may further help relieve headache.
- Caution patient not to use naratriptan if she is pregnant, suspects she is pregnant, or plans to become pregnant. Adequate contraception should be used during therapy.
- Advise patient to notify health care professional prior to next dose of naratriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more naratriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Instruct patient not to take additional naratriptan if no response is seen with initial dose without consulting health care professional. There is no evidence that 5 mg provides greater relief than 2.5-mg dose. Additional naratriptan doses are not likely to be effective and alternative medications, as previously discussed with health care professional, may be used.
- Naratriptan may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during naratriptan use.

Evaluation/Desired Outcomes
- Relief of migraine attack.

nateglinide (na-**teg**-li-nide)
Starlix

Classification
Therapeutic: antidiabetics
Pharmacologic: meglitinides

Pregnancy Category C

Indications
To improve glycemic control in patients with type 2 diabetes (with diet and exercise); may also be used with metformin or a thiazolidinedione (pioglitazone, rosiglitazole).

Action
Stimulates the release of insulin from pancreatic beta cells by closing potassium channels, which results in the opening of calcium channels in beta cells. This is followed by release of insulin. Requires functioning pancreatic beta cells.
Therapeutic Effects: Lowering of blood glucose.

Pharmacokinetics
Absorption: Well absorbed (73%) following oral administration; absorption is rapid.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Mostly metabolized by the liver (cytochrome P2 C9 and P3 A4 [CYP2 C9 and CYP3 A4] enzyme systems); 16% excreted unchanged in urine.
Half-life: 1.5 hr.

TIME/ACTION PROFILE (effect on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	within 20 min	1 hr	4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation (insulin recommended to control diabetes during pregnancy); Diabetic ketoacidosis; Type 1 diabetes.
Use Cautiously in: Geri: Elderly patients, malnourished patients, patients with pituitary or adrenal insufficiency (increased susceptibility to hypoglycemia); Strenuous physical exercise, insufficient caloric intake (increased risk of hypoglycemia); Autonomic neuropathy (hypoglycemia may be masked); Moderate to severe liver impairment; Fever, infection, trauma, or surgery (may lead to transient loss of glycemic control; insulin may be required); Pedi: Children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness. **Resp:** bronchitis, coughing, upper respiratory infection. **GI:** diarrhea. **Endo:** HYPOGLYCEMIA. **MS:** arthropathy, back pain. **Misc:** flu symptoms.

Interactions
Drug-Drug: Concurrent use with **beta blockers** may mask hypoglycemia. **Alcohol**, combination with other **antidiabetics**, **NSAIDs**, **MAO inhibitors**, **nonselective beta blockers** may ↑ the risk of hypoglycemia. Hypogly-

Copyright © 2008 by F.A. Davis

cemic effects may be ↓ by **thiazide diuretics**, **corticosteroids**, **thyroid supplements**, or **sympathomimetic (adrenergic) agents**.
Drug-Food: Blood levels and effects are significantly ↓ when administered prior to a **liquid meal**.

Route/Dosage

PO (Adults): 120 mg 3 times daily before meals; patients who are approaching glycemic control may be started at 60 mg 3 times daily.

Availability

Tablets: 60 mg, 120 mg.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- ***Lab Test Considerations:*** Monitor serum glucose and HbA_{1c} periodically during therapy to evaluate effectiveness.
- May cause ↑ uric acid levels.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Severe hypoglycemia should be treated with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dl.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** Administer 1–30 min prior to meals.
- May be administered concurrently with metformin, pioglitazone, or rosiglitazole.

Patient/Family Teaching

- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not take if unable to eat.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid other medications, especially aspirin and alcohol, while on this therapy without consulting health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the occurrence of hypoglycemic or hyperglycemic episodes.

nedocromil, See MAST CELL STABILIZERS.

nefazodone (neff-**a**-zoe-done)
Serzone

Copyright © 2008 by F.A. Davis

Classification
Therapeutic: antidepressants

Pregnancy Category C

Indications
Major depression. **Unlabeled uses:** Panic disorder, post-traumatic stress disorder (PSTD).

Action
Inhibits the reuptake of serotonin and norepinephrine by neurons. Antagonizes alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Antidepressant action, which may develop only after several weeks.

Pharmacokinetics
Absorption: Well absorbed but undergoes extensive and variable first-pass hepatic metabolism (bioavailability about 20%).
Distribution: Widely distributed; enters the CNS.
Protein Binding: ≥99%.
Metabolism and Excretion: Extensively metabolized. One metabolite (hydroxynefazodone) has antidepressant activity.
Half-life: *Nefazodone*—2–4 hr; *hydroxynefazodone*—1.5–4 hr.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	days–wks	several wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor therapy; Active liver disease or baseline elevated serum transaminases.
Use Cautiously in: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; History of suicide attempt or drug abuse; Underlying cardiovascular or cerebrovascular disease; History of mania; OB: Safety not established; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established in children; suicide risk may be greater in children and adolescents; Geri: Initiate therapy at lower doses.

Adverse Reactions/Side Effects
CNS: dizziness, insomnia, somnolence, agitation, confusion, weakness. **EENT:** abnormal vision, blurred vision, eye pain, tinnitus. **Resp:** dyspnea. **CV:** bradycardia, hypotension. **GI:** HEPATIC FAILURE, HEPATOTOXICITY, constipation, dry mouth, nausea, gastroenteritis. **GU:** erectile dysfunction. **Derm:** rashes. **Hemat:** decreased hematocrit.

Interactions
Drug-Drug: Serious, potentially fatal reactions may occur during concurrent use with **MAO inhibitors** (do not use concurrently or within 2 wk of MAO inhibitors; discontinue nefazodone at least 14 days before starting MAO inhibitor therapy). ↑ CNS depression with other CNS depressants including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. May ↑ blood levels and effects of **alprazolam** or **triazolam**. May increase serum **digoxin** levels. Additive hypotension may occur with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. May ↑ risk of myopathy with **HMG-CoA reductase inhibitors**. ↓ **antidepressant** action with concomitant use of **carbamazepine**. May ↓ clearance of **haloperidol**, so **haloperidol** dose may need to be decreased.
Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe. Kava kava, valerian,** or **chamomile** can ↑ CNS depression.

Route/Dosage
PO (Adults): 100 mg twice daily initially; may be increased weekly up to 600 mg/day in 2 divided doses.
PO (Geriatric Patients): 50 mg twice daily initially; may be increased weekly as tolerated.

Availability (generic available)
Tablets: 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

NURSING IMPLICATIONS

Assessment
- Assess mental status (orientation, mood, behavior) frequently. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure and pulse before and periodically during therapy.
- Monitor liver function tests prior to and routinely during therapy. Obtain LFTs at first sign of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine).

Copyright © 2008 by F.A. Davis

- Assess for sexual dysfunction throughout treatment.
- ***Lab Test Considerations:*** May cause decrease in hematocrit and leukopenia.
- Monitor liver function periodically. If serum AST or ALT levels are >3 times the upper limit of normal discontinue nefazodone.
- May also cause hypercholesterolemia and hypoglycemia.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Serzone (nefazodone) with Seroquel (quetiapine).
- Discontinue nefazodone prior to elective surgery to prevent potential interactions with general anesthesia.
- **PO:** Administer doses twice daily.

Patient/Family Teaching

- Instruct patient to take medication as directed. Several weeks may be required to obtain a full antidepressant response. Once response is obtained, therapy should be continued for at least 6 mo. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid taking alcohol or other CNS depressant drugs during therapy and not to take other prescription, OTC medications, or herbal products without consulting health care professional.
- Advise patient to notify health care professional immediately if signs of liver dysfunction (jaundice, anorexia, GI complaints, malaise, dark urine) occur.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional of signs of allergy (rash, hives) or if agitation, blurriness or other changes in vision, confusion, dizziness, unsteadiness, difficult or frequent urination, difficulty concentrating, or memory problems occur.
- Emphasize the importance of follow-up examinations to monitor progress. Encourage patient participation in psychotherapy.
- Refer to local support group.
- Inform patient that some side effects may go away with time.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require several weeks of therapy to obtain full response. Need for therapy should be periodically reassessed. Therapy is usually continued for 6 months or more.

N

neomycin, See AMINOGLYCOSIDES.

neostigmine

(nee-oh-**stig**-meen)
Prostigmin

Classification
Therapeutic: antimyasthenics
Pharmacologic: cholinergics

Pregnancy Category C

Indications

Improvement in muscle strength in symptomatic treatment of myasthenia gravis. Prevention and treatment of postoperative bladder distention and urinary retention or ileus. Reversal of nondepolarizing neuromuscular blockers.

Action

Inhibits the breakdown of acetylcholine so that it accumulates and has a prolonged effect. Effects include miosis, increased intestinal and skeletal muscle tone, bronchial and ureteral constriction, bradycardia, increased salivation, lacrimation, and sweating. **Therapeutic Effects:** Improved muscular function in patients with myasthenia gravis, improved bladder-emptying in patients with urinary retention, or reversal of nondepolarizing neuromuscular blockers.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Poorly absorbed following oral administration, necessitating large oral doses compared with parenteral doses.
Distribution: Probably does not cross the placenta or enter breast milk.
Metabolism and Excretion: Metabolized by plasma cholinesterases and the liver.
Half-life: *PO, IV*—40–60 min; *IM*—50–90 min.

TIME/ACTION PROFILE (cholinergic effects, increased muscle tone)

ROUTE	ONSET	PEAK	DURATION
PO	45–75 min	unknown	2–4 hr
IM	10–30 min	20–30 min	2–4 hr
IV	10–30 min	20–30 min	2–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Mechanical obstruction of the GI or GU tract.
Use Cautiously in: History of asthma; Ulcer disease; Cardiovascular disease; Epilepsy; Hyperthyroidism; OB: Pregnancy (may cause uterine irritability after IV administration near term; newborns may display muscle weakness); Lactation.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, weakness. **EENT:** lacrimation, miosis. **Resp:** bronchospasm, excess secretions. **CV:** bradycardia, hypotension. **GI:** abdominal cramps, diarrhea, excess salivation, nausea, vomiting. **Derm:** sweating, rashes.

Interactions

Drug-Drug: Action may be antagonized by **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. Prolongs action of **depolarizing muscle-relaxing agents (succinylcholine, decamethonium)**.

Route/Dosage

Myasthenia Gravis

PO (Adults): 15 mg q 3–4 hr initially; increase at daily intervals until optimal response is achieved. Usual maintenance dose is 150 mg/day (up to 375 mg/day may be needed).
PO (Children): 2 mg/kg/day (60 mg/m^2) in 6–8 divided doses.
Subcut, IM (Adults): 0.5 mg.
Subcut, IM (Children): 10–40 mcg/kg q 2–3 hr; may give with 10 mcg/kg atropine.

Bladder Atony, Abdominal Distention: Prevention

IM, Subcut (Adults): 250 mcg q 4–6 hr for 2–3 days.

Bladder Atony, Abdominal Distention: Treatment

IM, Subcut (Adults): 500 mcg as needed; may repeat q 3 hr for 5 doses after bladder has been emptied for bladder atony.

Antidote for Nondepolarizing Neuromuscular Blockers

IV (Adults): 0.5–2 mg slowly; pretreat with 0.6–1.2 mg atropine IV (may be repeated to a total dose of 5 mg).
IV (Children): 40 mcg/kg with 20 mcg/kg atropine.

Availability (generic available)

Tablets: 15 mg. **Injection:** 1:1000 in 10-ml vials, 1:2000 in 1-ml ampules and 10-ml vials, 1:4000 in 1-ml ampules. **In combination with:** atropine (Neostigmine Methylsulfate Min-I-Mix).

NURSING IMPLICATIONS

Assessment

- Assess pulse, respiratory rate, and blood pressure prior to administration. Report significant changes in heart rate.
- **Myasthenia Gravis:** Assess neuromuscular status, including vital capacity, ptosis, diplopia, chewing, swallowing, hand grasp, and gait, prior to administering and at peak effect. Patients with myasthenia gravis may be advised to keep a daily record of their condition and the effects of this medication.
- Assess patient for overdose and underdose or resistance. Both have similar symptoms (muscle weakness, dyspnea, dysphagia), but symptoms of overdose usually occur within 1 hr of administration, whereas underdose symptoms occur 3 or more hr after administration. Overdose (cholinergic crisis) symptoms may also include increased respiratory secretions and saliva, bradycardia, nausea, vomiting, cramping, diarrhea, and diaphoresis. A Tensilon test (edrophonium chloride) may be used to distinguish between overdose and underdose.
- **Postoperative Ileus:** Monitor abdominal status (assess for distention, auscultate bowel sounds). A rectal tube may be inserted to facilitate expulsion of flatus.

Copyright © 2008 by F.A. Davis

- **Postoperative Urinary Retention:** Assess for bladder distention. Monitor intake and output. If patient is unable to void within 1 hr of neostigmine administration, consider catheterization.
- **Antidote to Nondepolarizing Neuromuscular Blocking Agents:** Monitor reversal of effects of neuromuscular blocking agents with a peripheral nerve stimulator. Recovery usually occurs consecutively in the following muscles: diaphragm, intercostal muscles, muscles of the glottis, abdominal muscles, limb muscles, muscles of mastication, and levator muscles of the eyelids. Closely observe the patient for residual muscle weakness and respiratory distress throughout the recovery period. Maintain airway patency and ventilation until recovery of normal respiration occurs.
- ***Toxicity and Overdose:*** If overdose occurs, atropine is the antidote.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Ineffective breathing pattern (Indications)

Implementation

- Oral and parenteral doses are not interchangeable.
- When used as an antidote to nondepolarizing neuromuscular blocking agents, atropine may be used prior to or concurrently with neostigmine to prevent or treat bradycardia.
- **PO:** Administer with food or milk to minimize side effects. For patients who have difficulty chewing, neostigmine may be taken 30 min before meals.

IV Administration

- **Direct IV:** Administer doses undiluted. May be given through Y-site of an IV of D5W, 0.9% NaCl, Ringer's solution, or LR. ***Concentration:*** 0.5–1 mg/ml. ***Rate:*** Administer each 0.5 mg over 1 min.
- **Syringe Compatibility:** glycopyrrolate, heparin, ondansetron, pentobarbital, thiopental.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Do not skip or double up on missed doses. Patients with a history of dysphagia should have a nonelectric or battery-operated backup alarm clock to remind them of exact dosage time. Patients with dysphagia may not be able to swallow the medication if the dose is not taken exactly on time. Taking the dose late may result in myasthenic crisis. Taking the dose early may result in cholinergic crisis. Patients with myasthenia gravis must continue this regimen as lifelong therapy.
- Instruct patient with myasthenia gravis to space activities to avoid fatigue.
- Advise patient to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Relief of ptosis and diplopia.
- Improved chewing, swallowing, extremity strength, and breathing without the appearance of cholinergic symptoms in myasthenia gravis.
- Relief or prevention of postoperative gastrointestinal ileus.
- Relief of nonobstructive postoperative urinary retention.
- Reversal of nondepolarizing neuromuscular blocking agents in general anesthesia.

N

HIGH ALERT

nesiritide (ne-**sir**-i-tide)
Natrecor

Classification
Therapeutic: none assigned
Pharmacologic: vasodilators (human B-type natriuretic peptide)

Pregnancy Category C

Indications

Acutely decompensated CHF in hospitalized patients who have dyspnea at rest or with minimal activity; has been used with digoxin, diuretics, and ACE inhibitors. Should not be used for intermittent outpatient infusion, scheduled repetitive use, as a diuretic, or to improve renal function.

Action

Binds to guanyl cyclase receptors in vascular smooth muscle and endothelial cells, producing increased intracellular guanosine 3′5′-cyclic monophosphate (cGMP) and smooth muscle

Copyright © 2008 by F.A. Davis

cell relaxation. cGMP acts as a "second messenger" to dilate veins and arteries. **Therapeutic Effects:** Dose-dependent reduction in pulmonary capillary wedge pressure (PCWP) and systemic arterial pressure in patients with heart failure with resultant decrease in dyspnea.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Cleared from circulation by binding to cell surface clearance receptors resulting in cellular internalization and proteolysis, proteolytic breakdown by endopeptidases, and renal filtration.
Half-life: 18 min.

TIME/ACTION PROFILE (effects on cardiovascular parameters)

ROUTE	ONSET	PEAK	DURATION
IV	15 min	1 hr	60 min†

†Longer with higher than recommended doses

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cardiogenic shock; Systolic blood pressure <90 mm Hg; Low cardiac filling pressure, significant valvular stenosis, restrictive/subtractive cardiomyopathy, constrictive pericarditis/cardiac tamponade, or other conditions in which cardiac output is dependent on venous return.
Use Cautiously in: Heart failure where renal function is dependent on activity of the renin/angiotensin/aldosterone system (may cause azotemia); BP <90 mm Hg (increased risk of hypotension); Geri: Geriatric patients (some may be more sensitive to effects); Cardiogenic shock (should not be used as primary therapy); OB: Pregnancy, lactation; Pedi: Children (safety not established).

Adverse Reactions/Side Effects

CNS: anxiety, confusion, dizziness, headache, hypotension (dose related), insomnia, drowsiness. **EENT:** amblyopia. **Resp:** APNEA, cough, hemoptysis. **CV:** hypotension, arrhythmias, bradycardia. **GI:** abdominal pain, nausea, vomiting. **GU:** ↑ creatinine, renal failure. **Derm:** itching, rash, sweating. **Hemat:** anemia. **Local:** injection site reactions. **MS:** back pain, leg cramps. **Neuro:** paresthesia, tremor. **Misc:** fever.

Interactions

Drug-Drug: None reported.

Route/Dosage

IV (Adults): 2 mcg/kg bolus followed by 0.01 mcg/kg/min as a continuous infusion. May increase by 0.005 mcg/kg/min every 3 hr up to a maximum infusion rate of 0.03 mcg/kg/min (based on response).

Availability

Lyophilized powder for injection (requires reconstitution): 1.5 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, ECG, respiratory rate, cardiac index, PCWP, and central venous pressure frequently during administration. May cause hypotension, especially in patients with a BP <100 mm Hg. Reduce dose or discontinue nesiritide if patient develops hypotension. Hypotension may cause renal compromise. Use IV fluids and changes in body position to support blood pressure if symptomatic hypotension occurs. Nesiritide may be restarted at a dose reduced by 30% with no bolus administration once patient is stabilized. Hypotension may be prolonged for hours, requiring a period of monitoring prior to restarting administration.
- Monitor intake and output and weigh daily. Assess for decrease in signs of CHF (dyspnea, rales/crackles, peripheral edema, weight gain).
- ***Lab Test Considerations:*** Monitor BUN and serum creatinine. May cause ↑ in serum creatinine; ↑ serum creatinine may be dose-related.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Activity intolerance (Indications)
Excess fluid volume (Indications)

Implementation

- ***High Alert:*** Intravenous vasoactive medications have an increased potential for causing harm. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Administer only in settings where blood pressure can be closely monitored.
- Prime the IV tubing with an infusion of 25 ml prior to connecting to the patient's vascular access port and prior to administering bolus or infusion. Flush catheter between administration of nesiritide and other medications. Do not administer through a central heparin-

Copyright © 2008 by F.A. Davis

coated catheter as nesiritide binds to heparin. Concomitant administration of a heparin infusion through a separate catheter is acceptable.

IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 1.5-mg vial of nesiritide by adding 5 ml of diluent removed from a prefilled 250-ml plastic IV bag containing D5W, 0.9% NaCl, D5/0.45% NaCl, or D5/0.2% NaCl. Do not shake vial; rock gently so all surfaces including stopper are in contact with diluent to ensure complete reconstitution. Withdraw entire content of reconstituted vial and add back to 250-ml plastic IV bag. Invert IV bag several times to ensure complete mixing of solution. Infusion stable for 24 hr. After preparation of infusion bag, withdraw bolus volume from infusion bag. To calculate amount: bolus volume (ml) = 0.33 × patient weight (kg). ***Concentration:*** 6 mcg/ml. ***Rate:*** Administer bolus over 60 seconds through a port in the IV tubing.
- **Intermittent Infusion:** ***Diluent:*** See Diluent section under Direct IV section above for preparation instructions for infusion bag. Immediately follow bolus with infusion. ***Concentration:*** 6 mcg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** amiodarone, argatroban, digoxin, diltiazem, metoprolol, milrinone, nicardipine, nitroglycerin, nitroprusside, palonosetron, propranolol, tirofiban, torsemide, verapamil.
- **Y-Site Incompatibility:** bumetanide, daptomycin, enalaprilat, ethacrynic acid, furosemide, heparin, hydralazine, insulin, micafungin.

Patient/Family Teaching

- Explain purpose of nesiritide to patient and family.

Evaluation/Desired Outcomes

- Improvement in dyspnea and reduction in mean PCWP in patients with decompensated CHF.

nevirapine (ne-**veer**-a-peen)
Viramune

Classification
Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

Pregnancy Category C

Indications
Management of HIV infection in combination with a nucleoside analogue.

Action
Binds to the enzyme reverse transcriptase, which results in disruption of DNA synthesis.
Therapeutic Effects: Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics
Absorption: >90% absorbed after oral administration.
Distribution: Crosses placenta and enters breast milk; CSF levels are 45% of those in plasma.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); minor amounts excreted unchanged in urine.
Half-life: 25–30 hr (during multiple dosing).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent ketoconazole or rifampin; Women with CD4+ cell counts >250 cells/mm^3 (↑ risk of liver toxicity).
Use Cautiously in: Women (↑ risk of liver toxicity); Hepatic or renal impairment; Concurrent clarithromycin, fluconazole, methadone or rifabutin (careful monitoring required; alternative therapy should be considered); OB, Pedi: Pregnancy, lactation, or children (safety not established; breastfeeding not recommended in HIV-infected patients).

Adverse Reactions/Side Effects
Reflects combination therapy.
CNS: headache. **GI:** HEPATOXICITY, elevated liver enzyme levels, nausea, abdominal pain, diarrhea, hepatitis, ulcerative stomatitis. **Derm:** RASH (MAY PROGRESS TO TOXIC EPIDERMAL NECROLYSIS). **Hemat:** granulocytopenia (increased in children).

Copyright © 2008 by F.A. Davis

MS: myalgia. **Neuro:** paresthesia, peripheral neuropathy. **Misc:** STEVENS-JOHNSON SYNDROME, fever.

Interactions

Drug-Drug: Nevirapine induces the hepatic CYP3A4 enzyme system and can affect the behavior of drugs metabolized by this system. Significantly ↓ **ketoconazole** levels (concurrent use contraindicated). May induce **methadone** withdrawal within 2 weeks of starting therapy in patients physically dependent on methadone. May ↓ levels and effectiveness **hormonal contraceptives** (concurrent use of hormonal contraceptives should be avoided). **Rifampin** significantly ↓ levels and effectiveness of nevirapine (concurrent use contraindicated). ↓ levels and effectiveness of **clarithromycin** (consider other agents). Also may ↓ levels and effectiveness of the following: **lopinavir**, **saquinavir**, **nelfnavir**, **indinavir**, **efavirenz**, **amiodarone**, **disopyramide**, **lidocaine**, **itraconazole**, **carbamazepine**, **clonazepam**, **ethosuximide**, **diltiazem**, **nifedipine**, **verapamil**, **cyclosporine**, **tacrolimus**, **sirolimus**, **cyclophosphamide**, **ergotamine**, **fentanyl**, **rifabutin** (use together only with careful monitoring). **Fluconazole** ↑ nevirapine levels and risk of toxcity. May ↑ risk of bleeding with **warfarin**. Use of **prednisone** during first 2 wk of therapy may ↑ risk of rash. Initiating other **drugs that often cause rash**, including **trimethoprim/sulamethoxazole** and **abacavir** simultaneously with nevirapine may ↑ risk of rash.

Drug-Natural Products: St. John's wort may ↓ efficacy.

Route/Dosage

PO (Adults): 200 mg daily for the first 2 wk, then 200 mg twice daily (in combination with a nucleoside analogue antiretroviral).

PO (Children ≥8 yr): 4 mg/kg once daily for first 2 wk, then 4 mg/kg twice daily.

PO (Children 2 mo–8 yr): 4 mg/kg once daily for first 2 wk, then 7 mg/kg twice daily.

Availability

Tablets: 200 mg. **Oral suspension:** 50 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for rash (mild to moderate rash = erythema or maculopapular rash; urticaria, pruritic raised rash with welts; constitutional symptoms—fever, blistering, oral erosive lesions, conjunctivitis, facial edema, myalgia, arthralgia), especially during 1st 6 wks of therapy. If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately. Prednisone and antihistamines are not effective in preventing or treating the rash. Nevirapine may be continued if rash is mild to moderate without constitutional symptoms or increased ALT or AST, but should not be restarted if stopped. If rash is severe or accompanied by constitutional symptoms, organ dysfunction, or increased AST or ALT, nevirapine should be permanently discontinued.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor for liver function at baseline and frequently during the first 18 wks for toxicity, especially during first 6 wks of therapy. May be asymptomatic with ↑ AST and ALT without clinical signs or symptoms, or symptomatic with ↑ liver enzymes and at least one symptom (rash, flu-like symptoms, fever). May progress to liver failure and death. If signs of liver toxicity occur, permanently discontinue nevirapine.
- Assess patient for hepatitis B and C. Patients with HBV and/or HCV are at risk for liver toxicity.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse nevirapine (Viramune) with nelfinavir (Viracept).
- **PO:** May be administered with or without food.
- Shake oral solution prior to administration. Use an oral dosing syringe for amounts <5 ml. Rinse syringe or cup and readminister to ensure patient receives full dose.
- If therapy is interrupted for more than 7 days, restart therapy at 200 mg daily for 14 days, then increase dose to 200 mg twice daily.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Emphasize the importance of taking nevirapine as directed, at evenly spaced times throughout day. Instruct patient to read the *Medication Guide* prior to initiating therapy and with each Rx refill. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient not to share nevirapine with others.
- Advise patient to avoid taking other Rx, OTC, and herbal products without consulting health care professional.
- Inform patient that nevirapine does not cure AIDS or prevent associated or opportunistic infections. Nevirapine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of nevirapine are unknown at this time.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during nevirapine therapy.
- Instruct patient to notify health care professional immediately if signs and symptoms of hepatitis (flu-like symptoms, tiredness, nausea, lack of appetite, yellow skin or eyes, dark urine, pale stools, pain or sensitivity to touch on right side below ribs), or skin reactions with symptoms (flu-like symptoms, fever, muscle aches, conjunctivitis, blisters, mouth sores, swelling of face, tiredness) occur. Nevirapine should be discontinued immediately.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

niacin (**nye**-a-sin)
Edur-Acin, Nia-Bid, Niac, Niacels, Niacor, Niaspan, Nicobid, Nico-400, Nicolar, Nicotinex, nicotinic acid, ✱Novo-Niacin, Slo-Niacin, vitamin B

niacinamide (nye-a-**sin**-a-mide)
nicotinamide

Classification
Therapeutic: lipid-lowering agents, vitamins
Pharmacologic: water-soluble vitamins

Pregnancy Category C

Indications
Treatment and prevention of niacin deficiency (pellagra). Adjunctive therapy in certain hyperlipidemias (niacin only).

Action
Required as coenzymes (for lipid metabolism, glycogenolysis, and tissue respiration). Large doses decrease lipoprotein and triglyceride synthesis by inhibiting the release of free fatty acids from adipose tissue and decreasing hepatic lipoprotein synthesis (niacin only). Causes peripheral vasodilation in large doses (niacin only). **Therapeutic Effects:** Decreased blood lipids (niacin only). Supplementation in deficiency states.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Widely distributed following conversion to niacinamide. Enters breast milk.
Metabolism and Excretion: Amounts required for metabolic processes are converted to niacinamide. Large doses of niacin are excreted unchanged in the urine.
Half-life: 45 min.

TIME/ACTION PROFILE (effects on blood lipids)

ROUTE	ONSET	PEAK	DURATION
PO (cholesterol)	several days	unknown	unknown
PO (triglycerides)	several hr	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to niacin; Some products may contain tartrazine and should be avoided in patients with known hyper-

Copyright © 2008 by F.A. Davis

sensitivity; Alcohol intolerance (Nicotinex only).
Use Cautiously in: Liver disease; Arterial bleeding; History of peptic ulcer disease; Gout; Glaucoma; Diabetes mellitus.

Adverse Reactions/Side Effects

Adverse reactions and side effects refer to IV administration or doses used to treat hyperlipidemias.
CNS: nervousness, panic. **EENT:** blurred vision, loss of central vision, proptosis, toxic amblyopia. **CV:** orthostatic hypotension. **GI:** HEPATOTOXICITY (ER oral form only), GI upset, bloating, diarrhea, dry mouth, flatulence, heartburn, hunger pains, nausea, peptic ulceration. **Derm:** flushing of the face and neck, pruritus, burning, dry skin, hyperpigmentation, increased sebaceous gland activity, rashes, stinging or tingling of skin. **Metab:** glycosuria, hyperglycemia, hyperuricemia.

Interactions

Drug-Drug: ↑ risk of myopathy with concurrent use of **HMG-CoA reductase inhibitors**. Additive hypotension with **ganglionic blocking agents (guanadrel)**. Large doses may ↓ uricosuric effects of **probenecid** or **sulfinpyrazone**.

Route/Dosage

PO (Adults and Children): *Dietary supplement*—10–20 mg/day. *Dietary deficiency*—Up to 500 mg/day in divided doses. *Hyperlipidemias–Niacin only*—100–500 mg/day initially; increase slowly up to 1–2 g tid (up to 8 g/day).
PO (Children 7–10 yr): *Prevention of deficiency*—13 mg/day.
PO (Children 4–6 yr): *Prevention of deficiency*—12 mg/day.
PO (Children birth–3 yr): *Prevention of deficiency*—5–9 mg/day.

Availability

Niacin

Tablets: 25 mg^{OTC}, 50 mg^{OTC}, 100 mg^{OTC}, 125 mg^{OTC}, 250 mg^{OTC}, 400 mg^{OTC}, 500 mg$^{Rx, OTC}$. **Extended-release tablets:** 125 mg$^{Rx, OTC}$, 250 mg$^{Rx, OTC}$, 400 mg^{OTC}, 500 mg$^{Rx, OTC}$, 750 mg$^{Rx, OTC}$, 1000 mg^{OTC}. **Cost:** 500 mg $184.97/90, 750 mg $255.96/90, 1000 mg $331.97/90. **Extended-release capsules:** 125 mg$^{Rx, OTC}$, 250 mg$^{Rx, OTC}$, 300 mg$^{Rx, OTC}$, 400 mg$^{Rx, OTC}$, 500 mg$^{Rx, OTC}$. **Elixir:** 50 mg/5 ml in pints and gallons^{OTC}. ***In combination with:*** lovastatin (Advicor) See Appendix B.

Niacinamide

Tablets: 50 mg^{OTC}, 100 mg^{OTC}, 125 mg^{OTC}, 250 mg^{OTC}, 500 mg$^{Rx, OTC}$.

NURSING IMPLICATIONS

Assessment

- **Vitamin Deficiency:** Assess patient for signs of niacin deficiency (*pellagra*—dermatitis, stomatitis, glossitis, anemia, nausea and vomiting, confusion, memory loss, and delirium) prior to and periodically throughout therapy.
- **Hyperlipidemia:** Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Serum glucose and uric acid levels and hepatic function tests should be monitored periodically during prolonged high-dose therapy. Notify physician or other health care professional if AST, ALT, or LDH becomes elevated. May increase prothrombin times and decrease serum albumin.
- High-dose therapy may cause elevated serum glucose and uric acid levels.
- When niacin is used as a lipid-lowering agent, serum cholesterol and triglyceride levels should be monitored prior to and periodically throughout course of therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- **PO:** Administer with meals or milk to minimize GI irritation.
- Timed-release tablets and capsules should be swallowed whole, without crushing, breaking, or chewing. Use calibrated measuring device to ensure accurate dosage of solution.

Patient/Family Teaching

- Inform patient that cutaneous flushing and a sensation of warmth, especially in the face, neck, and ears; itching or tingling; and headache may occur within the first 2 hr after taking the drug. These effects are usually transient and subside with continued therapy. If flushing is distressing or persistent, aspirin 300 mg given 30 min before each dose or slow upward titration of dose may decrease flushing.
- Advise patient to change positions slowly to minimize orthostatic hypotension.

Copyright © 2008 by F.A. Davis

- Instruct patients taking long-term extended-release niacin to report signs of hepatotoxicity (darkening of urine, light gray–colored stool, loss of appetite, severe stomach pain, yellow eyes or skin) to health care professional.
- Emphasize the importance of follow-up examinations to evaluate progress.
- **Vitamin Deficiency:** Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Foods high in niacin include meats, eggs, milk, and dairy products; little is lost during ordinary cooking.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- **Hyperlipidemia:** Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.

Evaluation/Desired Outcomes

- Prevention and treatment of niacin deficiency.
- Decrease in serum cholesterol and triglyceride levels.

niCARdipine (nye-**kar**-di-peen)
Cardene, Cardene SR, Cardene IV

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications
Management of: Hypertension, Angina pectoris, Vasospastic (Prinzmetal's) angina. **Unlabeled uses:** Management of CHF.

Action
Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics
Absorption: Well absorbed following oral administration but extensively metabolized, resulting in decreased bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; ≤10% excreted unchanged by kidneys.
Half-life: 2–4 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	20 min	0.5–2 hr	8 hr
PO-ER	unknown	unknown	12 hr
IV	within min	45 min	50 hr†

†Following discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); BP <90 mm Hg; Advanced aortic stenosis.
Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Geri: Geriatric patients (dose reduction/slower IV infusion rates recommended for most agents; increased risk of hypotension); Severe renal impairment (dose reduction may be necessary); History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, jitteriness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea, shortness of breath. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** abnormal results in liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, pho-

Copyright © 2008 by F.A. Davis

tosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Cimetidine** and **propranolol** may ↓ metabolism and increase the risk of toxicity. May ↓ the metabolism of and ↑ risk of toxicity from **cyclosporine**, **prazosin**, **quinidine**, or **carbamazepine**.

Drug-Food: Grapefruit and **grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 20 mg 3 times daily, may increase q 3 days (range 20–40 mg 3 times daily); or 30 mg twice daily as sustained-release form (up to 60 mg twice daily).

IV (Adults): *To replace PO use*—0.5–2.2 mg/hr continuous infusion. *For acute hypertensive episodes*—5 mg/hr titrated as needed (up to 15 mg/hr).

Availability (generic available)

Capsules: 20 mg, 30 mg. **Sustained-release capsules:** 30 mg, 45 mg, 60 mg. **Injection:** 2.5 mg/ml in 10-ml amps.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse prior to therapy, during dosage titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

Implementation

- Do not confuse nicardipine with nifedipine or nimodipine. Do not confuse Cardene (nicardipine) with Cardura (doxazosin), codeine, or Cardizem (diltiazem).
- To transfer from IV nicardipine infusion to oral therapy with other antihypertensive, start oral therapy simultaneously with discontinuation of nicardipine infusion. If transferring to oral nicardipine therapy, administer first dose of a 3-times-a-day regimen 1 hr prior to discontinuation of infusion.
- Dosage adjustments of nicardipine should be made no more frequently than every 3 days.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew sustained-release capsules.

IV Administration

- **Continuous Infusion:** ***Diluent:*** Dilute each 25-mg ampule with 240 ml of D5W, D5/0.45% NaCl, D5/0.9% NaCl, 0.45% NaCl, or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 0.1 mg/ml. ***Rate:*** Titrate rate according to blood pressure response.
- **Y-Site Compatibility:** amikacin, aminophylline, aztreonam, calcium gluconate, caspofungin, cefazolin, ceftizoxime, chloramphenicol, cimetidine, clindamycin, daptomycin, diltiazem, dobutamine, dopamine, enalaprilat, epinephrine, ertapenem, erythromycin, famotidine, fenoldopam, fentanyl, gentamicin, hydrocortisone sodium succinate, hydromorphone, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, palonosetron, penicillin G potassium, potassium chloride,

Copyright © 2008 by F.A. Davis

potassium phosphate, quinupristin/dalfopristin, ranitidine, tacrolimus, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, voriconazole.
- **Y-Site Incompatibility:** amphotericin B liposome, ampicillin, ampicillin/sulbactam, cefepime, furosemide, lansoprazole, micafungin, pantoprazole.

Patient/Family Teaching
- Advise patient to take medication exactly as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and to use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath; or if persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes
- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

N

NICOTINE (nik-o-teen)

nicotine chewing gum
Nicorette, Thrive

nicotine inhaler
Nicotrol Inhaler

nicotine lozenge
Commit

nicotine nasal spray
Nicotrol NS

nicotine transdermal
Nicoderm CQ

Classification
Therapeutic:

Pregnancy Category D

Indications
Adjunct therapy (with behavior modification) in the management of nicotine withdrawal in patients desiring to give up cigarette smoking.

Action
Provides a source of nicotine during controlled withdrawal from cigarette smoking. **Therapeutic Effects:** Lessened sequelae of nicotine withdrawal (irritability, insomnia, somnolence, headache, and increased appetite).

Pharmacokinetics
Absorption: *Gum, lozenge*—Slowly absorbed from buccal mucosa during chewing/sucking.

Copyright © 2008 by F.A. Davis

Inhaler—50% of dose is systemically absorbed; most of nicotine released from inhaler is deposited in the mouth; absorption from buccal mucosa is slow. *Nasal spray*—53% absorbed from nasal mucosa. *Transdermal*—70% of nicotine released from the patch is absorbed through the skin.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver. Small amounts are metabolized by kidneys and lungs; 10–20% excreted unchanged by kidneys.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (nicotine blood levels)

ROUTE	ONSET	PEAK	DURATION
gum	rapid	15–30 min	unknown
inhaler	slow	within 15 min	unknown
lozenge	unknown	unknown	unknown
nasal spray	rapid	4–15 min	unknown
transdermal	rapid	2–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent history of MI (inhaler or nasal spray); Arrhythmias (inhaler or nasal spray); Severe or worsening angina (inhaler or nasal spray); Severe cardiovascular disease; Children; OB: Pregnancy or lactation.
Use Cautiously in: Cardiovascular disease including hypertension; Recent history of MI (gum, lozenge, patch); Arrhythmias (gum, lozenge, patch); Severe or worsening angina (gum, lozenge, patch); Diabetes mellitus; Pheochromocytoma; Peripheral vascular diseases; Hyperthyroidism; Diabetes; Continued smoking; Peptic ulcer disease; Hepatic disease; Bronchospastic lung disease (inhaler or nasal spray).

Adverse Reactions/Side Effects

CNS: headache, insomnia, abnormal dreams, dizziness, drowsiness, impaired concentration, nervousness, weakness. **EENT:** sinusitus; *gum*— pharyngitis; *nasal spray*— nasopharyngeal irritation, sneezing, watering eyes, change in smell, earache, epistaxis, eye irritation, hoarseness; *inhaler*— local mouth/throat irritation. **Resp:** *Nasal spray, inhaler*— cough, dyspnea. **CV:** tachycardia, chest pain, hypertension. **GI:** abdominal pain, abnormal taste, constipation, diarrhea, dry mouth, dyspepsia, hiccups, nausea, vomiting; *gum*— belching, increased appetite, increased salivation, oral injury, sore mouth. **Derm:** *transdermal*— burning at patch site, erythema, pruritus, cutaneous hypersensitivity, rash, sweating. **Endo:** dysmenorrhea. **MS:** arthralgia, back pain, myalgia; *gum*— jaw muscle ache. **Neuro:** paresthesia. **Misc:** allergy.

Interactions

Drug-Drug: Effects of **acetaminophen**, **caffeine**, **imipramine**, **insulin**, **oxazepam**, **pentazocine**, **propranolol**, or other **beta blockers**, **adrenergic antagonists** (**prazosin**, **labetalol**), and **theophylline** may be ↑ during smoking cessation because of ↓ metabolism; dosage ↓ at cessation may be necessary. Doses of adrenergic agonists (e.g. **isoproterenol**, **phenylephrine**) may need to be ↑ because of lower levels of circulating catecholamines at cessation of smoking. Concurrent treatment with **bupropion** may cause treatment-emergent hypertension.

Route/Dosage

Gum (Adults): If patient smokes <25 cigarettes/day start with 2-mg gum, if patient smokes ≥25 cigarettes/day start with 4-mg gum; Patients should chew one piece of gum every 1–2 hr for 6 wk, then one piece of gum every 2–4 hr for 2 wk, then one piece of gum every 4–8 hr for 2 wk, then discontinue. Should not exceed 24 pieces of gum/day.
Lozenge (Adults): If first cigarette is desired >30 min after awakening, start with 2-mg lozenge, if first cigarette is desired <30 min after awakening, start with 4-mg lozenge. Patients should use one lozenge every 1–2 hr for 6 wk, then one lozenge every 2–4 hr for 2 wk, then one lozenge every 4–8 hr for 2 wk, then discontinue. Should not exceed 20 lozenges/day or more than 5 lozenges in 6 hr.
Intranasal (Adults): One spray in each nostril 1–2 times/hr (up to 5 times/hr); may be ↑ up to maximum of 40 times/day (should not exceed 3 mo of therapy).
Inhaln (Adults): Patients are encouraged to use at least 6 cartridges/day for first 3–6 wk, with additional cartridges as necessary (up to 16/day) for 12 wk. Patients are self-titrated to level of nicotine they require (usual usage 6–16 cartridges/day) followed by gradual withdrawal over 6–12 wk (maximum duration of use = 6 mo).
Transdermal (Adults): *Patients smoking >10 cigarettes/day*—Begin with Step 1 (21 mg/day) for 6 wk, followed by Step 2 (14 mg/day) for 2 wk, and then Step 3 (7 mg/day) for 2 wk, then stop (total of 10 wk) (new patch

Copyright © 2008 by F.A. Davis

should be applied every 24 hr); *Patients smoking ≤10 cigarettes/day*—Begin with Step 2 (14 mg/day) for 6 wk, followed by Step 3 (7 mg/day) for 2 wk, then stop (total of 8 wk) (new patch should be applied every 24 hr).

Availability (generic available)

Chewing gum (mint, orange, and fruit chill flavors): 2 mg[OTC], 4 mg[OTC]. **Inhalation:** each system contains 168 cartridges, each containing 10 mg of nicotine (deliver 4 mg). **Lozenge:** 2 mg[OTC], 4 mg[OTC]. **Nasal spray:** 10 mg/ml (0.5 mg/spray) in 10-ml bottles (200 sprays). **Transdermal patch:** 7 mg/day[OTC], 14 mg/day[OTC], 21 mg/day[OTC].

NURSING IMPLICATIONS

Assessment

- Prior to therapy, assess smoking history (number of cigarettes smoked daily, smoking patterns, nicotine content of preferred brand, degree to which patient inhales smoke).
- Assess patient for symptoms of smoking withdrawal (irritability, drowsiness, fatigue, headache, nicotine craving) periodically during nicotine replacement therapy (NRT)
- Evaluate progress in smoking cessation periodically during therapy.
- ***Toxicity and Overdose:*** Monitor for nausea, vomiting, diarrhea, increased salivation, abdominal pain, headache, dizziness, auditory and visual disturbances, weakness, dyspnea, hypotension, and irregular pulse.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Implementation

- **Gum:** Protect gum from light; exposure to light causes gum to turn brown.
- **Lozenge:** Lozenge should be allowed to dissolve slowly in the mouth; it should not be chewed or swallowed.
- **Transdermal:** Patch can be worn for 16 or 24 hr; the patch can be removed before the patient goes to bed (especially if patient has vivid dreams or sleep distrubances) or can remain on while the patient sleeps (especially if patient craves cigarettes upon awakening).
- **Nasal Spray and Inhaler:** Regular use of the spray or inhaler during the first week of therapy may help patient adjust to irritant effects of the spray.

Patient/Family Teaching

- Explain to patient the necessity of immediate cessation of smoking upon initiation and throughout therapy.
- Encourage patient to participate in a smoking cessation program while using this product.
- Review the patient instruction sheet enclosed in the package.
- Instruct patient in proper method of disposal of unit. Emphasize need to keep out of the reach of children or pets.
- Nicotine in any form can be harmful to a pregnant woman and/or the fetus. Assist patient in determining risk/benefit of NRT and harm to the fetus versus the likelihood of stopping smoking without NRT.
- Emphasize the importance of regular visits to health care professional to monitor progress of smoking cessation.
- **Gum:** Explain purpose of nicotine gum to patient. The patient should chew 1 piece of gum whenever a craving for nicotine occurs or according to a fixed schedule (every 1–2 hr while awake) as directed. The gum should be chewed slowly until a tingling sensation is felt (about 15 chews). Then, patient should stop chewing and store the gum between the cheek and gums until the tingling sensation disappears (about 1 min). The process of stopping, then resuming chewing should be repeated for approximately 30 min until most of the tingle has disappeared. Rapid, vigorous chewing may result in side effects similar to those of smoking too many cigarettes (headache, dizziness, nausea, increased salivation, heartburn, and hiccups).
- Inform patient that the gum has a slight tobacco/pepper-like taste. Many patients initially find it unpleasant and slightly irritating to the mouth. This usually resolves after several days of therapy.
- Advise patient to carry gum at all times during therapy.
- Advise patient to avoid eating or drinking for 15 min before and during chewing of nicotine gum; these interfere with buccal absorption of nicotine.
- The gum usually can be chewed by denture wearers. Contact dentist if the gum adheres to bridgework.
- Inform patient that they should stop using the gum at the end of 12 wk; if they still feel the

Copyright © 2008 by F.A. Davis

need to use the gum after this time period, advise them to contact a health care professional.
- Instruct patient not to swallow gum.
- Dispose of the gum by wrapping in wrapper to prevent ingestion by children and animals. Call the poison control center, emergency department, or health care professional immediately if a child ingests the gum.
- Emphasize the need to discontinue the gum and to inform health care professional if pregnancy occurs.
- **Transdermal:** Instruct patient in application and use of patch. Apply patch at the same time each day. Keep patch in sealed pouch until ready to apply. Apply to clean, dry skin of upper arm or torso free of oil, hair, scars, cuts, burns, or irritation. Press patch firmly in place with palm for 10 sec, making sure there is good contact, especially around the edges. Keep patch in place during showering, bathing, or swimming; replace patches that have fallen off. Wash hands with soap and water after handling patches. Do not trim or cut patch. No more than 1 patch should be worn at a time. Alternate application sites. Dispose of used patches by folding adhesive sides together and replacing in protective pouch or aluminum foil; keep out of reach of children.
- Advise patient that redness, itching, and burning at application site usually subside within 1 hr. Instruct patient to notify health care professional and not apply new patch if signs of allergic reaction (urticaria, generalized rash, hives) or persistent local skin reactions (severe erythema, pruritus, edema) occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Nasal Spray:** Instruct patient in proper use of spray. Tilt head back slightly. Do not sniff, swallow, or inhale through nose as spray is being administered. Patients who have successfully stopped smoking should continue to use the same dose for up to 8 wk, after which the spray should be discontinued over the next 4–6 wk.
- Discontinue nasal spray by using ½ dose (1 spray at a time), using the spray less frequently, skipping a dose by not using every hour, or setting a planned stop date for use of the spray.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).
- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- Instruct patient to replace childproof cap after using and before disposal.
- **Inhalation:** Inhalation regimens should consist of frequent, continuous puffing for 20 minutes.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).
- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- **Lozenge:** Instruct patient to place lozenge in mouth and allow it to slowly dissolve (20–30 min). Minimize swallowing; advise patient not to chew or swallow lozenge. May cause a warm tingling sensation in mouth. Advise patient to occasionally move lozenge from side to side of mouth until completely dissolved. Instruct patient not to eat or drink 15 min before or while lozenge is in mouth. For best chances of quitting, use at least 9 lozenges/day during 1st 6 wks. Do not use more than 1 lozenge at a time or use continuously one after the another. Lozenge should not be used after 12 wks without consulting health care professional.

Evaluation/Desired Outcomes
- Smoking cessation.

NIFEdipine (nye-**fed**-i-peen)
Adalat, Adalat CC, ♣Adalat PA, ♣Adalat XL, Afeditab CR, ♣Apo-Nifed, Nifedical XL, ♣Novo-Nifedin, ♣Nu-Nifed, Procardia, Procardia XL

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications
Management of: Hypertension (extended-release only), Angina pectoris, Vasospastic

Copyright © 2008 by F.A. Davis

(Prinzmetal's) angina. **Unlabeled uses:** Prevention of migraine headache. Management of CHF or cardiomyopathy.

Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation, resulting in decreased blood pressure. Coronary vasodilation, resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but large amounts are rapidly metabolized (primarily by CYP3A4 enzyme system), resulting in decreased bioavailability (45–70%); bioavailability is increased (80%) with long-acting (CC, PA, XL) forms.
Distribution: Unknown.
Protein Binding: 92–98%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 2–5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	20 min	unknown	6–8 hr
PO–PA	unknown	4 hr	12 hr
PO–CC, PA, XL	unknown	6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Blood pressure <90 mm Hg; Coadministration with grapefruit juice.
Use Cautiously in: Severe hepatic impairment (↓ dose recommended); History of porphyria; Geri: Short-acting forms appear on Beers list due to increased risk of hypotension and constipation in geriatric patients (↓ dose recommended). Is also associated with increased incidence of falls; Severe renal impairment (↓ dose may be necessary); History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, jitteriness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea, shortness of breath. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** abnormal liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** flushing, dermatitis, erythema multiforme, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. May ↑ serum levels and risk of toxicity from **digoxin**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Cimetidine** and **propranolol** may ↓ metabolism and ↑ risk of toxicity. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **prazosin**, **quinidine**, or **carbamazepine**.
Drug-Food: Grapefruit and **grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 10–30 mg 3 times daily (not to exceed 180 mg/day), *or* 10–20 mg twice daily as PA form, *or* 30–90 mg once daily as sustained-release (CC, XL) form (not to exceed 90–120 mg/day).

Availability (generic available)

Capsules: 🍁5 mg, 10 mg, 20 mg. **Cost:** *Generic*—10 mg $62.99/90, 20 mg $104.97/90.
Tablets: 🍁10 mg. **Extended-release tablets, (Adalat CC, Afeditab CR, Nifedical XL, Procardia XL):** 🍁10 mg, 🍁20 mg, 30 mg, 60

Copyright © 2008 by F.A. Davis

mg, 90 mg. **Cost:** *Generic*—30 mg $94.00/90, 60 mg $164.99/90, 90 mg $174.99/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Geri: Assess fall risk and institute fall prevention strategies.
- Patients receiving digoxin concurrently with nifedipine should have routine tests of serum digoxin levels and be monitored for signs and symptoms of digoxin toxicity.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.
- Nifedipine may cause positive ANA and direct Coombs' test results.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew extended-release tablets. Empty tablets that appear in stool are not significant.
- Avoid administration with grapefruit juice.
- Sublingual use is not recommended due to serious adverse drug reactions.

Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Geri: Teach patients and family about risk for falls and how to reduce risk in the home.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or OTC medications and natural/herbal products, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and use SL nitroglycerin as needed for anginal attacks.
- Inform patient that anginal attacks may occur 30 min after administration because of reflex tachycardia. This is usually temporary and is not an indication for discontinuation.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress manage-

Copyright © 2008 by F.A. Davis

ment). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes
- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

nilutamide (nye-**loot**-a-mide)
Anandron, Nilandron

Classification
Therapeutic: antineoplastics
Pharmacologic: antiandrogens

Pregnancy Category C

Indications
Management of metastatic prostate cancer (with surgical castration).

Action
Blocks the effects of androgen (testosterone) at the cellular level. **Therapeutic Effects:** Decreased spread of prostate cancer.

Pharmacokinetics
Absorption: Rapidly and completely absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver; two metabolites have antiandrogenic activity; <2% excreted unchanged in urine.
Half-life: 41–49 hr.

TIME/ACTION PROFILE (antiandrogenic effects)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe hepatic impairment; Severe respiratory insufficiency.

Use Cautiously in: History of liver disease or alcoholism; History of respiratory problems; Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness. **EENT:** impaired adaptation to darkness, abnormal vision. **Resp:** interstitial pneumonitis. **CV:** hypertension. **GI:** HEPATOTOXICITY, constipation, hepatitis, increased liver enzymes, nausea. **Derm:** hot flashes, hair loss, sweating.

Interactions
Drug-Drug: May increase the effects of **warfarin**, **phenytoin**, and **theophylline**. May cause **alcohol** intolerance.

Route/Dosage
PO (Adults): 300 mg once daily for 30 days; then 150 mg once daily.

Availability
Tablets: 150 mg, 100 mg.

NURSING IMPLICATIONS

Assessment
- Patients should have a chest x-ray prior to initiation of therapy. Assess patient for symptoms of interstitial pneumonitis (dyspnea or worsening of pre-existing dyspnea). If symptoms occur, nilutamide should be discontinued until cause can be determined. Pneumonitis usually occurs during the first 3 mo of therapy and is almost always reversible when treatment is discontinued.
- ***Lab Test Considerations:*** Monitor hepatic function prior to and every 3 mo throughout therapy. If AST or ALT is elevated more than 2–3 times normal, treatment should be discontinued.
- May cause hyperglycemia; increased serum alkaline phosphatase, BUN, and creatinine; and leukopenia.

Potential Nursing Diagnoses
Risk for injury (Side Effects)

Implementation
- **PO:** May be taken without regard to food.

Patient/Family Teaching
- Instruct patient to take nilutamide exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.

Copyright © 2008 by F.A. Davis

- Caution patient that adaptation to darkness may be impaired and may cause difficulty driving at night or through tunnels. Wearing tinted glasses may minimize this effect.
- Advise patient to notify physician immediately if dark urine, fatigue, abdominal pain, yellow eyes or skin, or unexplained GI symptoms occur. Hepatotoxicity usually resolves when nilutamide is discontinued but may be progressive and fatal; requires immediate medical attention.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.

nimodipine (nye-**moe**-di-peen)
Nimotop

Classification
Therapeutic: subarachnoid hemorrhage therapy agents
Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications
Management of subarachnoid hemorrhage.

Action
Inhibits the transport of calcium into vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Potent peripheral vasodilator.
Therapeutic Effects: Prevention of vascular spasm after subarachnoid hemorrhage, resulting in decreased neurologic impairment.

Pharmacokinetics
Absorption: Well absorbed following oral administration but extensively metabolized, resulting in decreased bioavailability.
Distribution: Crosses the blood-brain barrier; remainder of distribution unknown.
Protein Binding: >95%.
Metabolism and Excretion: Mostly metabolized by the liver; ≤10% excreted unchanged by kidneys.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (vasodilation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); BP <90 mm Hg.
Use Cautiously in: Severe hepatic impairment (dose reduction recommended); Geri: Geriatric patients (dose reduction recommended; increased risk of hypotension); Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, bradycardia, chest pain, hypotension, palpitations, peripheral edema, syncope, tachycardia. **GI:** abnormal liver function studies, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

Interactions
Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF.
Drug-Natural Products: Grapefruit and **grapefruit juice** ↑ serum levels and effect.

Route/Dosage
PO (Adults): 60 mg q 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

Hepatic Impairment
PO (Adults): 30 mg q 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

Availability
Capsules: 30 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient's neurologic status (level of consciousness, movement) prior to and periodically following administration.

Copyright © 2008 by F.A. Davis

- Monitor blood pressure and pulse prior to therapy and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.
- May occasionally cause decreased platelet count.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- Do not confuse nimodipine with nicardipine or nifedipine.
- Begin administration within 96 hr of subarachnoid hemorrhage and continue every 4 hr for 21 consecutive days.
- **PO:** If patient is unable to swallow capsule, make a hole in both ends of the capsule with a sterile 18-gauge needle and extract the contents into a syringe. Empty contents into water or nasogastric tube and flush with 30 ml normal saline.

Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.

Evaluation/Desired Outcomes

- Improvement in neurologic deficits due to vasospasm following subarachnoid hemorrhage.

nisoldipine (nye-**sole**-di-peen)
Sular

Classification
Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers

Pregnancy Category C

N

Indications

Management of hypertension.

Action

Inhibits the transport of calcium into vascular smooth muscle cells, resulting in inhibition of vasoconstriction and dilation of arterioles.
Therapeutic Effects: Systemic vasodilation, resulting in decreased blood pressure.

Pharmacokinetics

Absorption: Well absorbed (87%) following oral administration but rapidly and extensively metabolized in the gut wall, resulting in 5% bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Highly metabolized CYP3A4 enzyme system.
Half-life: 7–12 hr.

TIME/ACTION PROFILE (antihypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with calcium channel blockers may occur; Concurrent phenytoin use.
Use Cautiously in: CHF/left ventricular dysfunction; Hepatic impairment (dose reduction

Copyright © 2008 by F.A. Davis

may be necessary); Geri: Geriatric patients (dose reduction may be necessary); Coronary artery disease (may precipitate angina); OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, dizziness. **EENT:** pharyngitis, sinusitis. **CV:** peripheral edema, chest pain, hypotension, palpitations. **GI:** nausea. **Derm:** rash. **Endo:** gynecomastia.

Interactions

Drug-Drug: Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Antihypertensive effects may be decreased by concurrent use of **NSAIDs**. **Phenytoin** or **other CYP3A4 inducers** decrease blood levels and effectiveness (avoid concurrent use).

Drug-Food: Grapefruit and **grapefruit juice** ↑ serum levels and effect. Blood levels are increased by concurrent ingestion of a **high-fat meal** and should be avoided.

Route/Dosage

PO (Adults): 20 mg/day as a single dose initially; may be increased by 10 mg/day q 7 days, up to 60 mg/day (usual range 20–40 mg/day).

Availability

Extended-release tablets: 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 10 mg $179.98/90, 20 mg $225.97/90, 30 mg $239.99/90, 40 mg $240.32/90.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse prior to therapy, during dosage titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **PO:** Avoid administration within 1 hr of high-fat meals or grapefruit products.
- Do not crush, break, or chew tablets.

Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.

Evaluation/Desired Outcomes

- Decrease in blood pressure.

nitrofurantoin

(nye-troe-fyoor-**an**-toyn)

Apo-Nitrofurantoin, Furadantin, Macrobid, Macrodantin

Classification

Therapeutic: anti-infectives

Pregnancy Category B

Indications

Prevention and treatment of urinary tract infections caused by susceptible organisms; not effective in systemic bacterial infections.

Action

Interferes with bacterial enzymes. **Therapeutic Effects:** Bactericidal or bacteriostatic action

Copyright © 2008 by F.A. Davis

against susceptible organisms. **Spectrum:** Many gram-negative and some gram-positive organisms, specifically: *Citrobacter*, *Corynebacterium*, *Enterobacter*, *Escherichia coli*, *Klebsiella*, *Neisseria*, *Salmonella*, *Shigella*, *Staphylococcus aureus*, *S. epidermidis*, *Enterococcus*.

Pharmacokinetics

Absorption: Readily absorbed after oral administration. Absorption is slower but more complete with macrocrystals (Macrodantin).
Distribution: Crosses placenta; enters breast milk.
Protein Binding: 40%.
Metabolism and Excretion: Partially metabolized by the liver; 30–50% excreted unchanged by the kidneys.
Half-life: 20 min (increased in renal impairment).

TIME/ACTION PROFILE (urine levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	30 min	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (suspension); Oliguria, anuria, or significant renal impairment (CCr <60 ml/min); G6PD deficiency; Infants <1 mo and pregnancy near term (increased risk of hemolytic anemia in newborn).
Use Cautiously in: Patients with diabetes or debilitated patients (neuropathy may be more common); Lactation, OB: Safety not established but has been used safely in pregnant women. May cause hemolysis in G6PD-deficient infants who are brestfed; Geri: Appears on Beers list. Geriatric patients may increase risk for renal, hepatic, and pulmonary reactions.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **EENT:** nystagmus. **Resp:** pneumonitis. **CV:** chest pain. **GI:** PSEUDOMEMBRANOUS COLITIS, anorexia, nausea, vomiting, abdominal pain, diarrhea, drug-induced hepatitis. **GU:** rust/brown discoloration of urine. **Derm:** photosensitivity. **Hemat:** blood dyscrasias, hemolytic anemia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Probenecid and **sulfinpyrazone** prevent high urinary concentrations; may ↓ effectiveness. **Antacids** may decrease absorption. ↑ risk of neurotoxicity with **neurotoxic drugs**. ↑ risk of hepatotoxicity with **hepatotoxic drugs**. ↑ risk of pneumonitis with **drugs having pulmonary toxicity**.

Route/Dosage

PO (Adults): *Treatment of active infection*—50–100 mg q 6–8 hr *or* 100 mg q 12 hr as extended-release product. *Chronic suppression*—50–100 mg single evening dose.
PO (Children >1 mo): *Treatment of active infection*—5–7 mg/kg/day divided q 6 hr; maximum dose: 400 mg/day. *Chronic suppression*—1–2 mg/kg/day as a single dose at bedtime; maximum dose: 100 mg/day (unlabeled).

Availability (generic available)

Tablets: 50 mg, 100 mg. **Oral suspension:** 25 mg/5 ml. **Capsules:** 25 mg, 50 mg, 100 mg. **Extended-release capsules:** 100 mg.

N

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of urinary tract infection (frequency, urgency, pain, and burning on urination; fever; cloudy or foul-smelling urine) before and periodically during therapy.
- Obtain specimens for culture and sensitivity before and during drug administration.
- Monitor intake and output ratios. Report significant discrepancies in totals.
- ***Lab Test Considerations:*** Monitor CBC routinely with patients on prolonged therapy.
- May cause ↑ serum glucose, bilirubin, alkaline phosphatase, BUN, and creatinine.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Administer with food or milk to minimize GI irritation, to delay and increase absorption, to increase peak concentration, and to prolong duration of therapeutic concentration in the urine.
- Do not crush tablets or open capsules.
- Administer liquid preparations with calibrated measuring device. Shake well before administration. Oral suspension may be mixed

Copyright © 2008 by F.A. Davis

with water, milk, fruit juices, or infant formula. Rinse mouth with water after administration of oral suspension to avoid staining teeth.

Patient/Family Teaching

- Instruct patient to take medication around the clock, as directed. Take missed doses as soon as remembered and space next dose 2–4 hr apart. Do not skip or double up on missed doses.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that medication may cause a rust-yellow to brown discoloration of urine, which is not significant.
- Advise patient to notify health care professional if fever, chills, cough, chest pain, dyspnea, skin rash, numbness or tingling of the fingers or toes, or intolerable GI upset occurs. Signs of superinfection (milky, foul-smelling urine; perineal irritation; dysuria) should also be reported.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to consult health care professional if no improvement is seen within a few days after initiation of therapy.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Therapy should be continued for a minimum of 7 days and for at least 3 days after the urine has become sterile.
- Decrease in the frequency of infections in chronic suppressive therapy.

nitroglycerin

(nye-tro-**gli**-ser-in)

extended-release capsules
Nitrocot, NitroglynE-R, Nitro-par, Nitro-Time

extended-release tablets
Nitrong

extended-release buccal tablets
Nitrogard, Nitrogard SR

intravenous
Nitro-Bid IV, Tridil

translingual spray
Nitrolingual

ointment
Nitro-Bid, Nitrol

sublingual
Nitrostat, NitroQuick

transdermal system
Deponit, Minitran, Nitrek, Nitro-disc, Nitro-Dur, Transderm-Nitro

Classification
Therapeutic: antianginals
Pharmacologic: nitrates

Pregnancy Category C

Indications

Acute (**translingual and SL**) and long-term prophylatic (**oral, buccal, transdermal**) management of angina pectoris. **PO:** Adjunct treatment of CHF. **IV:** Adjunct treatment of acute MI. Production of controlled hypotension during surgical procedures. Treatment of CHF associated with acute MI. **Unlabeled uses:** Management of chronic CHF.

Action

Increases coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. Produces vasodilation (venous greater than arterial). Decreases left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Reduces myocardial oxygen consumption. **Therapeutic Effects:** Relief or prevention of anginal attacks. Increased cardiac output. Reduction of blood pressure.

Pharmacokinetics

Absorption: Well absorbed after oral, buccal, and sublingual administration. Also absorbed through skin. Orally administered nitroglycerin is rapidly metabolized, leading to decreased bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Undergoes rapid and almost complete metabolism by the liver; also metabolized by enzymes in bloodstream.
Half-life: 1–4 min.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
SL	1–3 min	unknown	30–60 min
Buccal-ER	unknown	unknown	5 hr

Copyright © 2008 by F.A. Davis

PO-ER	40–60 min	unknown	8–12 hr
TD-Oint	20–60 min	unknown	4–8 hr
TD-Patch	40–60 min	unknown	8–24 hr
IV	immediate	unknown	several min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe anemia; Pericardial tamponade; Constrictive pericarditis; Alcohol intolerance (large IV doses only); Concurrent use of sildenafil.

Use Cautiously in: Head trauma or cerebral hemorrhage; Glaucoma; Hypertrophic cardiomyopathy; Severe liver impairment; Malabsorption or hypermotility (PO); Hypovolemia (IV); Normal or decreased pulmonary capillary wedge pressure (IV); Cardioversion (remove transdermal patch before procedure); OB: Pregnancy (may compromise maternal/fetal circulation); Pedi, Lactation: Children or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache, apprehension, restlessness, weakness. **EENT:** blurred vision. **CV:** hypotension, tachycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Derm:** contact dermatitis (transdermal or ointment). **Misc:** alcohol intoxication (large IV doses only), cross-tolerance, flushing, tolerance.

Interactions

Drug-Drug: Concurrent use of nitrates in any form with **sildenafil**, **tadalafil**, and **vardenafil** ↑ risk of serious and potentially fatal hypotension; concurrent use is contraindicated. Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, **haloperidol**, or **phenothiazines**. **Agents having anticholinergic properties (tricyclic antidepressants, antihistamines, phenothiazines)** may ↓ absorption of lingual, sublingual, or buccal nitroglycerin.

Route/Dosage

SL (Adults): 0.3–0.6 mg; may repeat q 5 min for 15 min for acute attack. Lingual Spray (Adults) 1–2 sprays; may be repeated q 5 min for 15 min. May also be used prophylactically 5–10 min before activities that may precipitate an acute attack.

Buccal (Adults): 1 mg q 5 hr; dosage and frequency may be increased as needed.

PO (Adults): *Extended-release capsules*—2.5–9 mg q 8–12 hr. *Extended-release tablets*—1.3–6.5 mg q 8–12 hr.

IV (Adults): 5 mcg/min; increase by 5 mcg/min q 3–5 min to 20 mcg/min, then increase by 10–20 mcg/min q 3–5 min (dosing determined by hemodynamic parameters).

Transdermal (Adults): *Ointment*—(1 in. = 15 mg) 1–2 in. q 8 hr (up to 5 in. q 4 hr). *Transdermal patch*—0.1–0.6 mg/hr, up to 0.8 mg/hr. Patch should be worn 12–14 hr/day.

Availability (generic available)

Extended-release tablets: 2.6 mg, 6.5 mg, 9 mg. **Extended-release capsules:** 2.5 mg, 6.5 mg, 9 mg. **Sublingual tablets:** 0.3 mg, 0.4 mg, 0.6 mg. **Cost:** *NitroQuick*—0.3 mg $6.82/100, 0.4 mg $6.82/100, 0.6 mg $6.82/100; *Nitrostat*—0.3 mg $9.09/100, 0.4 mg $9.09/100, 0.6 mg $9.09/100. **Translingual spray (Nitrolingual):** 400 mcg/spray in 14.5-g canister (200 doses), NitroMist 400 mcg/spray in 8.5-g canister (230 doses). **Extended-release buccal tablets:** 1 mg, 2 mg, 3 mg, ♣5 mg. **Transdermal systems:** 0.1 mg/hr, 0.2 mg/hr, 0.3 mg/hr, 0.4 mg/hr, 0.6 mg/hr, 0.8 mg/hr. **Transdermal ointment:** 2%. **Injection:** 5 mg/ml. **Injection solution:** 25 mg/250 ml, 50 mg/250 ml, 50 mg/500 ml, 100 mg/250 ml, 200 mg/500 ml.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor blood pressure and pulse before and after administration. Patients receiving IV nitroglycerin require continuous ECG and blood pressure monitoring. Additional hemodynamic parameters may be monitored.
- ***Lab Test Considerations:*** May cause ↑ urine catecholamine and urine vanillylmandelic acid concentrations.
- Excessive doses may cause ↑ methemoglobin concentrations.
- May cause falsely ↑ serum cholesterol levels.

Potential Nursing Diagnoses

Acute pain (Indications)
Ineffective tissue perfusion (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- **PO:** Administer dose 1 hr before or 2 hr after meals with a full glass of water for faster absorption. Sustained-release preparations should be swallowed whole; do not crush, break, or chew. **SL:** Tablet should be held under tongue until dissolved. Avoid eating, drinking, or smoking until tablet is dissolved. **Buccal:** Place tablet under upper lip or between cheek and gum. Onset of action may be increased by touching the tablet with the tongue or by drinking hot liquids.

IV Administration

- **IV:** Doses must be diluted and administered as an infusion. Standard infusion sets made of polyvinyl chloride (PVC) plastic may absorb up to 80% of the nitroglycerin in solution. Use glass bottles only and special tubing provided by manufacturer
- **Continuous Infusion:** ***Diluent:*** Vials must be diluted in D5W or 0.9% NaCl. Premixed infusions already diluted in D5W and are ready to be administered (no further dilution needed). Admixed solutions stable for 48 hr at room temperature or 7 days if refrigerated. Stability of premixed solutions based on manufacturer's expiration date. ***Concentration:*** Should not exceed 400 mcg/ml. ***Rate:*** See Route/Dosage section. Administer via infusion pump to ensure accurate rate. Titrate rate according to patient response.
- **Y-Site Compatibility:** amiodarone, amphotericin B cholesteryl sulfate complex, cisatracurium, diltiazem, dobutamine, dopamine, epinephrine, eptifibatide, esmolol, famotidine, fentanyl, fluconazole, furosemide, haloperidol, heparin, hydralazine, hydromorphone, insulin, labetalol, lidocaine, linezolid, lorazepam, midazolam, morphine, nesiritide, norepinephrine, nitroprusside, pancuronium, propofol, ranitidine, tacrolimus, theophylline, thiopental, tirofiban, vecuronium, warfarin.
- **Y-Site Incompatibility:** alteplase, diazepam, lansoprazole, levofloxacin, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer recommends that nitroglycerin not be admixed with other medications.
- **Topical:** Sites of topical application should be rotated to prevent skin irritation. Remove patch or ointment from previous site before application.
- Doses may be increased to the highest dose that does not cause symptomatic hypotension.
- Apply ointment by using dose-measuring application papers supplied with ointment. Squeeze ointment onto measuring scale printed on paper. Use paper to spread ointment onto nonhairy area of skin (chest, abdomen, thighs; avoid distal extremities) in a thin, even layer, covering a 2–3-in. area. Do not allow ointment to come in contact with hands. Do not massage or rub in ointment; this will increase absorption and interfere with sustained action. Apply occlusive dressing if ordered.
- Transdermal patches may be applied to any hairless site (avoid distal extremities or areas with cuts or calluses). Apply firm pressure over patch to ensure contact with skin, especially around edges. Apply a new dosage unit if the first one becomes loose or falls off. Units are waterproof and not affected by showering or bathing. Do not cut or trim system to adjust dosage. Do not alternate between brands of transdermal products; dosage may not be equivalent. Remove patches before cardioversion or defibrillation to prevent patient burns. Patch may be worn for 12–14 hr and removed for 10–12 hr at night to prevent development of tolerance.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, even if feeling better. Take missed doses as soon as remembered unless next dose is scheduled within 2 hr (6 hr with extended-release preparations). Do not double doses. Do not discontinue abruptly; gradual dosage reduction may be necessary to prevent rebound angina.
- Caution patient to change positions slowly to minimize orthostatic hypotension. First dose should be taken while in a sitting or reclining position, especially in geriatric patients.
- Advise patient to avoid concurrent use of alcohol with this medication. Patient should also consult health care professional before taking OTC medications while taking nitroglycerin.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe.

Copyright © 2008 by F.A. Davis

- Advise patient to notify health care professional if dry mouth or blurred vision occurs.
- **Acute Anginal Attacks:** Advise patient to sit down and use medication at first sign of attack. Relief usually occurs within 5 min. Dose may be repeated if pain is not relieved in 5–10 min. Call health care professional or go to nearest emergency room if anginal pain is not relieved by 3 tablets in 15 min.
- **SL:** Inform patient that tablets should be kept in original glass container or in specially made metal containers, with cotton removed to prevent absorption. Tablets lose potency in containers made of plastic or cardboard or when mixed with other capsules or tablets. Exposure to air, heat, and moisture also causes loss of potency. Instruct patient not to open bottle frequently, handle tablets, or keep bottle of tablets next to body (i.e., shirt pocket) or in automobile glove compartment. Advise patient that tablets should be replaced 6 mo after opening to maintain potency.
- **Lingual Spray:** Instruct patient to lift tongue and spray dose under tongue (*Nitrolingual, NitroMist*) or on tongue (*NitroMist*).

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance. During long-term therapy, tolerance may be minimized by intermittent administration in 12–14 hr or 10–12 hr off intervals.
- Controlled hypotension during surgical procedures.

nitroprusside

(nye-troe-**pruss**-ide)
Nitropress

Classification
Therapeutic: antihypertensives
Pharmacologic: vasodilators

Pregnancy Category C

Indications

Hypertensive crises. Controlled hypotension during anesthesia. Cardiac pump failure or cardiogenic shock (alone or with dopamine).

Action

Produces peripheral vasodilation by a direct action on venous and arteriolar smooth muscle.
Therapeutic Effects: Rapid lowering of blood pressure. Decreased cardiac preload and afterload.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Rapidly metabolized in RBCs and tissues to cyanide and subsequently by the liver to thiocyanate.
Half-life: 2 min.

TIME/ACTION PROFILE (hypotensive effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	rapid	1–10 min

N

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Decreased cerebral perfusion.
Use Cautiously in: Renal disease (↑ risk of thiocyanate accumulation); Hepatic disease (↑ risk of cyanide accumulation); Geriatric patients (↑ sensitivity); Hypothyroidism; Hyponatremia; Vitamin B deficiency; Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache, restlessness. **EENT:** blurred vision, tinnitus. **CV:** dyspnea, hypotension, palpitations. **GI:** abdominal pain, nausea, vomiting. **F and E:** acidosis. **Local:** phlebitis at IV site. **Misc:** CYANIDE TOXICITY, thiocyanate toxicity.

Interactions

Drug-Drug: ↑ hypotensive effect with **ganglionic blocking agents**, **general anesthetics**, and other **antihypertensives**. **Estrogens** and **sympathomimetics** may ↓ the response to nitroprusside.

Route/Dosage

IV (Adults and Children): 0.3 mcg/kg/min initially; may be increased as needed up to 10 mcg/kg/min (usual dose is 3 mcg/kg/min; not to exceed 10 min of therapy at 10 mcg/kg/min infusion rate).

Availability (generic available)

Injection: 25 mg/ml in 2-ml vials.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, heart rate, and ECG frequently throughout therapy; continuous monitoring is preferred. Consult physician for parameters. Monitor for rebound hypertension following discontinuation of nitroprusside.
- Pulmonary capillary wedge pressure (PCWP) may be monitored in patients with MI or CHF.
- ***Lab Test Considerations:*** May cause ↓ bicarbonate concentrations, P_{CO_2}, and pH.
- May cause ↑ lactate concentrations.
- May cause ↑ serum cyanide and thiocyanate concentrations.
- Monitor serum methemoglobin concentrations in patients receiving >10 mg/kg and exhibiting signs of impaired oxygen delivery despite adequate cardiac output and arterial P_{CO_2} (blood is chocolate brown without change on exposure to air). Treatment of methemoglobinemia is 1–2 mg/kg of methylene blue IV administered over several minutes.
- ***Toxicity and Overdose:*** If severe hypotension occurs, drug effects are quickly reversed, within 1–10 min, by decreasing rate or temporarily discontinuing infusion. May place patient in Trendelenburg position to maximize venous return: Monitor plasma thiocyanate levels daily in patients receiving prolonged infusions at a rate >3 mcg/kg/min or 1 mcg/kg/min in patients with anuria. Thiocyanate levels should not exceed 1 millimole/liter. Signs and symptoms of thiocyanate toxicity include tinnitus, toxic psychoses, hyperreflexia, confusion, weakness, seizures, and coma, Cyanide toxicity may manifest as lactic acidosis, hypoxemia, tachycardia, altered consciousness, seizures, and characteristic breath odor similar to almonds. Acute treatment of cyanide toxicity includes 4–6 mg/kg of *sodium nitrite* (as a 3% solution) over 2–4 min. This acts as a buffer for cyanide by converting 10% of hemoglobin to methemoglobin. If administration of sodium nitrite is delayed, inhalation of crushed ampule (vaporole, aspirole) of *amyl nitrite* for 15–30 sec of every minute should be started until sodium nitrite is running. Following completion of sodium nitrite infusion, administer *sodium thiosulfate* 150–200 mcg/kg (available as 25% and 50% solutions). This will convert cyanide to thiocyanate, which may then be eliminated. If required, entire regimen may be repeated in 2 hr at 50% of the initial doses.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- If infusion of 10 mcg/kg/min for 10 min does not produce adequate reduction in blood pressure, manufacturer recommends nitroprusside be discontinued.
- May be administered in left ventricular CHF concurrently with an inotropic agent (dopamine, dobutamine) when effective doses of nitroprusside restore pump function and cause excessive hypotension.

IV Administration

- **Continuous Infusion:** ***Diluent:*** Dilute 50 mg of nitroprusside in 250–1000 ml of D5W. Wrap infusion in aluminum foil to protect from light; administration-set tubing need not be covered. Amber plastic bags do not offer sufficient protection from light; wrap must be opaque. Freshly prepared solution has a slight brownish tint; discard if solution is dark brown, orange, blue, green, or dark red. Solution must be used within 24 hr of preparation. ***Concentration:*** 50–200 mcg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure accurate dosage rate.
- **Y-Site Compatibility:** amikacin, aminophylline, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nesiritide, nicardipine, nitroglycerin, norepinephrine, ondansetron, palonosetron, pancuronium, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, pi-

Copyright © 2008 by F.A. Davis

peracillin/tazobactam, potassium chloride, potassium phosphate, procainamide, propofol, propranolol, protamine, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** acyclovir, ampicillin, caspofungin, ceftazidime, diazepam, diphenhydramine, erythromycin, hydralazine, hydroxyzine, levofloxacin, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole, voriconazole.

Patient/Family Teaching

- Advise patient to report the onset of tinnitus, dyspnea, dizziness, headache, or blurred vision immediately.

Evaluation/Desired Outcomes

- Decrease in blood pressure without the appearance of side effects.
- Treatment of cardiac pump failure or cardiogenic shock.

nizatidine, See HISTAMINE H_2 ANTAGONISTS.

norethindrone, norethindrone/ethinyl acetate, See CONTRACEPTIVES, HORMONAL.

norfloxacin, See FLUOROQUINOLONES.

nortriptyline (nor-**trip**-ti-leen)

Aventyl, Pamelor

Classification

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Pregnancy Category D

Indications

Various forms of depression. **Unlabeled uses:** Management of chronic neurogenic pain.

Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed. Enters breast milk in small amounts; probably crosses the placenta.
Protein Binding: 92%.
Metabolism and Excretion: Extensively metabolized by the liver, much of it on its first pass. Some is converted to active compounds. Undergoes enterohepatic recirculation and secretion into gastric juices.
Half-life: 18–28 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	6 wk	unknown

N

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Alcohol intolerance (solution only).
Use Cautiously in: Pre-existing cardiovascular disease; History of seizures; Asthma; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children and adolescents; OB: Use only if clearly needed and maternal benefits outweigh risk to fetus; Lactation: May result in sedation in infant; discontinue drug or bottle-feed; Pedi: Safety not established; Geri: More susceptible to adverse reactions; dose reduction recommended). Pre-existing cardiovascular disease. Geriatric men with prostatic hyperplasia may be more susceptible to urinary retention.

Adverse Reactions/Side Effects

CNS: drowsiness, fatigue, lethargy, agitation, confusion, extrapyramidal reactions, hallucinations, headache, insomnia. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, nausea, paralytic ileus, unpleasant taste, weight gain. **GU:** urinary retention. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: May cause hypertension, hyperpyrexia, seizures, and death when used with **MAO inhibitors** (avoid concurrent use—dis-

Copyright © 2008 by F.A. Davis

continue 2 wk before starting nortriptyline). May prevent the therapeutic response to most **antihypertensives**. Hypertensive crisis may occur with **clonidine**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. Adrenergic effects may be ↑ with other **adrenergic agents**, including **vasoconstrictors** and **decongestants**. ↑ anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. **Cimetidine**, **fluoxetine**, or **hormonal contraceptives** ↑ blood levels and risk of toxicity. ↑ risk of agranulocytosis with **antithyroid agents**.

Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression. **St. John's wort** may ↓ serum concentrations and efficacy. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 25 mg 3–4 times daily, up to 150 mg/day.

PO (Geriatric Patients or adolescents): 30–50 mg/day in divided doses or as a single dose.

Availability (generic available)

Capsules: 10 mg, 25 mg, 50 mg, 75 mg. **Oral solution:** 10 mg/5 ml.

NURSING IMPLICATIONS

Assessment

- Monitor mental status (orientation, mood, behavior). Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout treatment
- Monitor blood pressure and pulse rate before and during initial therapy. Report significant decreases in blood pressure or a sudden increase in pulse rate
- Monitor baseline and periodic ECGs in geriatric patients or patients with heart disease. May cause prolonged PR and QT intervals and may flatten T waves
- For overweight/obese individuals, monitor FBS and cholesterol levels.
- **Pain:** Assess type, location, and severity of pain before and periodically during therapy. Use pain scale to monitor effectiveness of medication.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range is 50–150 mg/ml.
- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea: Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for CHF, antiarrhythmics, and anticonvulsants.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Chronic pain (Indications)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse nortriptyline with desipramine.
- Taper to avoid withdrawal effects. Reduce dose 50% for 3 days, then by 50% for 3 more days, then discontinue.
- **PO:** Administer medication with meals to minimize gastric irritation.
- May be given as a single dose at bedtime to minimize sedation during the day. Dose increases should be made at bedtime because of sedation.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.

Copyright © 2008 by F.A. Davis

- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be required during long-term therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. (This side effect is less pronounced with this medication than with other tricyclic antidepressants.).
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention occurs or if dry mouth or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain. Refer as appropriate for nutritional, weight, or medical management.
- May have teratogenic effects. Instruct patient to notify health care professional immediately if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams and participation in prescribed psychotherapy to improve coping skills.
- Refer to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in severity of chronic neurogenic pain. Patients may require 2–6 wk of therapy before full therapeutic effects of medication are seen.

nystatin (nye-**stat**-in)

Mycostatin, Nadostine, Nilstat, Nystex, PMS-Nystatin

Classification

Therapeutic: antifungals (topical/local)

Pregnancy Category B

For other nystatin dosage forms, see antifungals (topical) and antifungals (vaginal)

N

Indications

Lozenges, oral suspension: Local treatment of oropharyngeal candidiasis. Treatment of intestinal candidiasis.

Action

Binds to fungal cell membrane, allowing leakage of cellular contents. **Therapeutic Effects:** Fungistatic or fungicidal action. **Spectrum:** Active against most pathogenic *Candida* species, including *C. albicans*.

Pharmacokinetics

Absorption: Poorly absorbed; action is primarily local.
Distribution: Unknown.
Metabolism and Excretion: Excreted unchanged in the feces after oral administration.
Half-life: Unknown.

TIME/ACTION PROFILE (antifungal effects)

ROUTE	ONSET	PEAK	DURATION
Top	rapid	unknown	2 hr†

†Maintenance of saliva levels required to inhibit growth of Candida species after oral dissolution of 2 lozenges

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products may contain ethyl alcohol or benzyl alcohol—avoid use in patients who may be hypersensitive to or intolerant of these additives.
Use Cautiously in: Denture wearers (dentures require soaking in nystatin suspension); Pedi: Children <5 yr (lozenges, pastilles, troches).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

GI: diarrhea, nausea, stomach pain (large doses), vomiting. **Derm:** contact dermatitis, Stevens-Johnson syndrome.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults and Children): 400,000–600,000 units 4 times daily as oral suspension or 200,000–400,000 units 4–5 times daily as pastilles (lozenges).

PO (Infants): 200,000 units 4 times daily or 100,000 units to each side of the mouth 4 times daily.

PO (Neonates, Premature and Low Birth Weight): 100,000 units 4 times daily or 50,000 units to each side of the mouth 4 times a day.

Availability (generic available)

Oral suspension: 100,000 units/ml in 5-, 60-, and 480-ml containers. **Oral pastilles (lozenges, troches):** 200,000 units/troche. **Powder for oral suspension:** 1/8 tsp = 500,000 units in 50-, 150-, and 500-million, 1-, 2-, and 5-billion-unit containers. **Oral tablets:** 500,000 units.

NURSING IMPLICATIONS

Assessment

- Inspect oral mucous membranes before and frequently throughout therapy. Increased irritation of mucous membranes may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Indications)

Implementation

- **PO:** Suspension should be administered by placing 1/2 of dose in each side of mouth. Patient should hold suspension in mouth or swish throughout mouth for several minutes before swallowing, then gargle and swallow. Use calibrated measuring device for liquid doses. Shake well before administration. Pedi: For neonates and infants, paint suspension into recesses of the mouth.
- To prepare oral solution from powder, add 1/8 tsp (approximately 500,000 units) to 120 ml of water and stir well. Prepare immediately before use; contains no preservatives.
- Lozenges (pastilles) should be allowed to dissolve slowly and completely in mouth; do not chew or swallow whole. Nystatin vaginal tablets can be administered orally for treatment of oral candidiasis.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as remembered but not if almost time for next dose. Do not double doses. Therapy should be continued for at least 2 days after symptoms subside.
- Pedi: Instruct parents or caregivers of infants and children on correct dosage and administration. Remind them to use only the measuring devise dispensed with the product.
- Advise patient to report increased irritation of mucous membranes or lack of therapeutic response to health care professional.

Evaluation/Desired Outcomes

- Decrease in stomatitis.
- To prevent relapse after oral therapy, therapy should be continued for 48 hr after symptoms have disappeared and cultures are negative.
- Therapy for a period of 2 wk is usually sufficient, but more prolonged therapy may be necessary.

nystatin, See ANTIFUNGALS (TOPICAL), ANTIFUNGALS (VAGINAL).

Copyright © 2008 by F.A. Davis

octreotide (ok-tree-oh-tide)
Sandostatin, Sandostatin LAR

Classification
Therapeutic: antidiarrheals, hormones

Pregnancy Category B

Indications
Treatment of severe diarrhea and flushing episodes in patients with GI endocrine tumors, including metastatic carcinoid tumors and vasoactive intestinal peptide tumors (VIPomas).
Unlabeled uses: Relief of symptoms and suppressed tumor growth in patients with pituitary tumors associated with acromegaly. Management of diarrhea in AIDS patients or patients with fistulas.

Action
Suppresses secretion of serotonin and gastroenterohepatic peptides. Increases absorption of fluid and electrolytes from the GI tract and increases transit time. Decreases levels of serotonin metabolites. Also suppresses growth hormone, insulin, and glucagon. **Therapeutic Effects:** Control of severe flushing and diarrhea associated with GI endocrine tumors.

Pharmacokinetics
Absorption: Well absorbed following subcut administration and IM administration of depot form.
Distribution: Unknown.
Protein Binding: 65%.
Metabolism and Excretion: 32% excreted unchanged in urine.
Half-life: 1.5 hr.

TIME/ACTION PROFILE (control of symptoms)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV	unknown	unknown	up to 12 hr
IM (LAR)	unknown	2 wk	up to 4 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Gallbladder disease (↑ risk of stone formation); Renal impairment (dose reduction may be necessary); Hyperglycemia or hypoglycemia (changes in blood glucose may occur); Fat malabsorption (may be aggravated); OB: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, fatigue, headache, weakness. **EENT:** visual disturbances. **CV:** edema, orthostatic hypotension, palpitations. **GI:** abdominal pain, cholelithiasis, diarrhea, fat malabsorption, nausea, vomiting. **Derm:** flushing. **Endo:** hyperglycemia, hypoglycemia. **Local:** injection-site pain.

Interactions
Drug-Drug: May alter requirements for **insulin** or **oral hypoglycemic agents**. May ↓ blood levels of **cyclosporine**.

Route/Dosage

Carcinoid Tumors
Subcut, IV (Adults): *Sandostatin*—100–600 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 50–1500 mcg/day).
IM (Adults): *Sandostatin LAR*—20 mg q 4 wk for 2 mo; dose may be further adjusted.

VIPomas
Subcut, IV (Adults): *Sandostatin*—200–300 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 150–750 mcg/day).
IM (Adults): *Sandostatin LAR*—20 mg q 2 wk for 2 mo; dose may be further adjusted.

Suppression of Growth Hormone (Acromegaly)
Subcut, IV (Adults): *Sandostatin*—50–100 mcg 2–3 times daily.
IM (Adults): *Sandostatin LAR*—20 mg q 4 wk for 3 mo, then adjusted on the basis of growth hormone levels.

Antidiarrheal (AIDS Patients)
Subcut, IV (Adults): 100–1800 mcg/day (unlabeled).

Availability (generic available)
Injection: 0.05 mg/ml in 1-ml ampules, 0.1 mg/ml in 1-ml ampules, 0.2 mg/ml in 5-ml vials, 0.5 mg/ml in 1-ml ampules, 1 mg/ml in 5-ml vials. **Depot injection:** 10 mg, 20 mg, 30 mg.

NURSING IMPLICATIONS

Assessment
- Assess frequency and consistency of stools and bowel sounds throughout therapy.

Copyright © 2008 by F.A. Davis

- Monitor pulse and blood pressure prior to and periodically during therapy.
- Assess patient's fluid and electrolyte balance and skin turgor for dehydration.
- Monitor diabetic patients for signs of hypoglycemia. May require reduction in requirements for insulin and sulfonylureas and treatment with diazoxide.
- Assess for gallbladder disease; assess for pain and monitor ultrasound examinations of gallbladder and bile ducts prior to and periodically during prolonged therapy.
- ***Lab Test Considerations:*** Monitor 5-HIAA (urinary 5-hydroxyindoleacetic acid), plasma serotonin, and plasma substance P in patients with carcinoid; plasma vasoactive intestinal peptide (VIP) in patients with VIPoma; and free T_4 and serum glucose concentrations prior to and periodically during therapy in all patients taking octreotide.
- Monitor quantitative 72-hr fecal fat and serum carotene determinations periodically for possible drug-induced aggravations of fat malabsorption.
- May cause a slight ↑ in liver enzymes.
- May cause ↓ serum thyroxine (T_4) concentrations.

Potential Nursing Diagnoses

Diarrhea (Indications)

Implementation

- Do not use solution that is discolored or contains particulate matter. Ampules should be refrigerated but may be stored at room temperature for the days they will be used. Discard unused solution.
- **Subcut:** Administer the smallest volume needed to achieve required dose to prevent pain at injection site. Rotate injection sites; avoid multiple injections in same site within short periods of time. Preferred injection sites are the hip, thigh, or abdomen.
- Administer injections between meals and at bedtime to avoid GI side effects.
- Allow medication to reach room temperature prior to injection to minimize local reactions at injection site.
- **IM:** Mix IM solution by adding diluent included in kit. Administer immediately after mixing into the gluteal muscle. Avoid using deltoid site due to pain of injection.
- Patients with carcinoid tumors and VIPomas should continue to receive subcut dose for 2 wk following switch to IM depot form to maintain therapeutic level.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Rate:*** Administer over 3 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute in 50–200 ml of 0.9% NaCl or D5W. ***Concentration:*** 1.5–250 mcg/ml. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** acyclovir, ondansetron, tirofiban.
- **Y-Site Incompatibility:** micafungin.

Patient/Family Teaching

- May cause dizziness, drowsiness, or visual disturbances. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- **Home Care Issues:** Instruct patients administering octreotide at home on correct technique for injection, storage, and disposal of equipment.
- Instruct patient to administer octreotide exactly as directed. If a dose is missed, administer as soon as possible, then return to regular schedule. Do not double doses.

Evaluation/Desired Outcomes

- Decrease in severity of diarrhea and improvement of electrolyte imbalances in patients with carcinoid or VIP-secreting tumors.
- Relief of symptoms and suppressed tumor growth in patients with pituitary tumors associated with acromegaly.
- Management of diarrhea in patients with AIDS.

ofloxacin, See FLUOROQUINOLONES.

olanzapine (oh-lan-za-peen)

Zyprexa, Zyprexa Zydis

Classification

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: thienobenzodiazepines

Pregnancy Category C

Indications

Psychotic disorders: Acute manic episodes associated with bipolar disorder (may be used with lithium or valproate), long-term maintenance therapy of bipolar disorder, long-term treatment/maintenance of schizophrenia, agita-

Copyright © 2008 by F.A. Davis

tion due to schizophrenia or mania (IM). **Unlabeled uses:** Management of anorexia nervosa. Treatment of nausea and vomiting related to highly emetogenic chemotherapy.

Action

Antagonizes dopamine and serotonin type 2 in the CNS. Also has anticholinergic, antihistaminic, and anti–alpha$_1$-adrenergic effects. **Therapeutic Effects:** Decreased manifestations of psychoses.

Pharmacokinetics

Absorption: Well absorbed but rapidly metabolized by first-pass effect, resulting in 60% bioavailability. Conventional tablets and orally disintegrating tablets (Zydis) are bioequivalent. IM administration results in significantly higher blood levels (5 times that of oral).
Distribution: Extensively distributed.
Protein Binding: 93%.
Metabolism and Excretion: Highly metabolized (mostly by the hepatic P450 CYP 1A2 system); 7% excreted unchanged in urine.
Half-life: 21–54 hr.

TIME/ACTION PROFILE (antipsychotic effects)

ROUTE	ONSET	PEAK*	DURATION
PO	unknown	6 hr	unknown
IM	rapid	15–45 min	2–4 hr

*Blood levels

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Discontinue drug or bottle feed; **Orally disintegrating tablets only:** Phenylketonuria (orally disintegrating tablets contain aspartame).
Use Cautiously in: Patients with hepatic impairment; Patients at risk for aspiration; Cardiovascular or cerebrovascular disease; History of seizures; History of attempted suicide; Diabetes or risk factors for diabetes (may worsen glucose control); Prostatic hyperplasia; Angle-closure glaucoma; History of paralytic ileus; Dysphagia and aspiration have been associated with antipsychotic drug use; use with caution in patients at risk for aspiration; OB, Pedi: Safety not established; Geri: Geriatric patients (may require ↓ doses; inappropriate use for dementia is associated with ↑ mortality).

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, agitation, dizziness, headache, restlessness, sedation, weakness, dystonia, insomnia, mood changes, personality disorder, speech impairment, tardive dyskinesia. **EENT:** amblyopia, rhinitis, increased salivation, pharyngitis. **CV:** orthostatic hypotension (↑ with IM). **Resp:** cough, dyspnea. **CV:** orthostatic hypotension, tachycardia, chest pain. **GI:** constipation, dry mouth, abdominal pain, increased appetite, weight loss or gain, nausea, increased thirst. **GU:** decreased libido, urinary incontinence. **Derm:** photosensitivity. **Endo:** hyperglycemia, goiter. **Metab:** dyslipidema. **MS:** hypertonia, joint pain. **Neuro:** tremor. **Misc:** fever, flu-like syndrome.

Interactions

Drug-Drug: Effects may be ↓ by concurrent **carbamazepine**, **omeprazole**, or **rifampin**. ↑ hypotension may occur with **antihypertensives**. ↑ CNS depression may occur with concurrent use of **alcohol** or other **CNS depressants**. May antagonize the effects of **levodopa** or other **dopamine agonists**. **Nicotine** can decrease olanzapine levels.

Route/Dosage

PO (Adults—Most Patients): *Schizophrenia*—5–10 mg/day initially; may increase at weekly intervals by 5 mg/day (not to exceed 20 mg/day). *Bipolar mania*—10–15 mg/day initially; may increase every 24 hr by 5 mg/day (not to exceed 20 mg/day).
PO (Adults—Debilitated or Nonsmoking Female Patients ≥65 yr): Initiate therapy at 5 mg/day.
IM (Adults): *Acute agitation*—5–10 mg, may repeat in 2 hr, then 4 hr later.

Availability

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. **Cost:** 2.5 mg $556.93/90, 5 mg $645.82/90, 7.5 mg $805.91/90, 10 mg $1,007.96/90, 15 mg $1,475.96/90, 20 mg $1,860.77/90. **Orally disintegrating tablets (Zydis):** 5 mg, 10 mg, 15 mg, 20 mg. **Cost:** 5 mg $765.95/90, 10 mg $1,139.83/90, 15 mg $1,648.53/90, 20 mg $2,163.23/90. **Powder for injection:** 10 mg/vial. ***In combination with:*** fluoxetine (Symbyax; see Appendix B).

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during dose adjustment
- Assess weight and BMI initially and throughout therapy
- Assess fasting blood glucose and cholesterol levels initially and throughout therapy
- Observe patient carefully when administering medication to ensure that medication is taken and not hoarded or cheeked
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Report these symptoms if they occur, as reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive blinking of eyes). Report immediately; may be irreversible
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** Evaluate CBC, liver function tests, and ocular examinations periodically during therapy. May cause ↓ platelets. May cause ↑ bilirubin, AST, ALT, GGT, CPK, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired oral mucous membrane (Side Effects)
Sexual dysfunction (Side Effects)

Implementation

- Do not confuse Zyprexa (olanzapine) with Celexa (citalopram) or Zyrtec (cetrizine).
- **PO:** May be administered without regard to meals.
- For orally disintegrating tablets, peel back foil on blister, do not push tablet through foil. Using dry hands, remove from foil and place entire tablet in mouth. Tablet will disintegrate with or without liquid.
- **IM:** Reconstitute with 2.1 mL of sterile water for injection for a concentration of 5 mg/mL. Solution should be clear and yellow; do not administer solutions that are discolored or contain particulate matter. Inject slowly, deep into muscle. Do not administer IV or subcutaneously. Administer within 1 hr of reconstitution. Discard unused solution.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. May need to discontinue gradually.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol and to notify health care professional prior to taking other Rx, OTC, or herbal products concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Extremes of temperature (exercise, hot weather, hot baths or showers) should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to use saliva substitute, frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult dentist if dry mouth continues for >2 wk.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.

Copyright © 2008 by F.A. Davis

- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding or planning to breastfeed.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Decrease in excitable, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal; flat, blunted affect) of schizophrenia.

olmesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

olsalazine (ole-**sal**-a-zeen)
Dipentum

Classification
Therapeutic: gastrointestinal anti-inflammatories—therapeutic

Pregnancy Category C

Indications
Ulcerative colitis (when patients cannot tolerate sulfasalazine).

Action
Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of inflammatory bowel disease.

Pharmacokinetics
Absorption: Acts locally in colon, where 98–99% is converted to mesalamine (5-aminosalicylic acid).
Distribution: Action is primarily local and remains in the colon.
Metabolism and Excretion: 2% absorbed into systemic circulation is rapidly metabolized; mostly eliminated as mesalamine in the feces.
Half-life: 0.9 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr; 4–8 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity reactions to salicylates; Cross-sensitivity with furosemide, sulfonylurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; G6PD deficiency; Urinary tract or intestinal obstruction; Pedi: Children <2 yr (safe use not established); Porphyria.
Use Cautiously in: Severe hepatic or renal impairment; OB: Pregnancy; Geri: Geriatric patients (consider ↓ body mass, hepatic/renal/cardiac function, intercurrent illness and drug therapies; Renal impairment (↑ risk of renal tubular damage); Lactation: Lactation (safety not established).

Adverse Reactions/Side Effects
CNS: ataxia, confusion, dizziness, drowsiness, headache, mental depression, psychosis, restlessness. **GI:** diarrhea, abdominal pain, anorexia, exacerbation of colitis, drug-induced hepatitis, nausea, vomiting. **Derm:** itching, rash. **Hemat:** blood dyscrasias.

Interactions
Drug-Drug: ↑ risk of bleeding after neuraxial anesthesia with **low molecular weight heparins** and **heparinoids**; discontinue osalazine before initiation of therapy or monitor closely if discontinuation not possible. May ↓ metabolism, and ↑ effects/toxicity of **mercaptopurine** or **thioguanine** with and ↑ risk of myelosuppression (use lowest possible dose and monitor closely). ↑ risk of developing Reye's syndrome; avoid osalazine during 6 wks after **varicella vaccine**.

Route/Dosage
PO (Adults): 500 mg twice daily.

Availability
Capsules: 250 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without

Copyright © 2008 by F.A. Davis

difficulty, but therapy should be discontinued if rash or fever occur.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 ml daily to prevent crystalluria and stone formation.
- **Inflammatory Bowel Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and throughout therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy.
- Olsalazine may cause ↑ AST and ALT levels.
- ***Lab Test Considerations:*** Monitor CBC prior to and every 3–6 mo during prolonged therapy. Discontinue olsalazine if blood dyscrasias occur.

Potential Nursing Diagnoses
Acute pain (Indications)
Diarrhea (Indications)

Implementation
- **PO:** Administer with food in evenly divided doses every 12 hr.

Patient/Family Teaching
- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occurs.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.

Evaluation/Desired Outcomes
- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.
- Decrease in pain and inflammation, and increase in mobility in patients with rheumatoid arthritis.

omalizumab (o-ma-**liz**-u-mab)
Xolair

Classification
Therapeutic: antiasthmatics
Pharmacologic: monoclonal antibodies

Pregnancy Category B

Indications
Moderate to severe asthma not controlled by inhaled corticosteroids.

Action
Inhibits binding of IgE to receptors on mast cells and eosinophils; preventing the release of mediators of the allergic response. Also decreases amount of IgE receptors on basophils. **Therapeutic Effects:** Decreased incidence of exacerbations of asthma.

Pharmacokinetics
Absorption: 62% absorbed slowly from subcut sites.
Distribution: Enters breast milk.
Metabolism and Excretion: Degraded similarly to IgG via binding degradation, reticuloendothelial system and the liver.
Half-life: 26 days.

TIME/ACTION PROFILE (effects on IgE levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 1 hr	unknown	up to 1 yr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Acute bronchospasm.
Use Cautiously in: Chronic use of inhaled corticosteroids; Pregnancy, lactation or children <12 yr (safety not established, use in pregnancy only if clearly needed).

Adverse Reactions/Side Effects
Local: injection site reactions. **Misc:** allergic reactions including ANAPHYLAXIS, ↑ risk of malignancy.

Copyright © 2008 by F.A. Davis

Interactions
Drug-Drug: None noted.

Route/Dosage
Subcut (Adults and Children >12 yr): 150–375 mg every 2–4 wk (determined by pretreatment serum IgE level and body weight).

Availability
Sterile powder for subcut injection (requires reconstitution): 150 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess lung sounds and respiratory function prior to and periodically during therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Assess for allergic reactions (urticaria, tongue and/or throat edema) within 2 hr of first and subsequent injections. Observe patient following injection. Epinephrine, diphenhydramine, and corticosteroids should be available in case of anaphylaxis.
- Monitor for injection site reactions (bruising, redness, warmth, burning, stinging, itching, hives, pain, induration, mass, inflammation). Usually occur within 1 hr of injection, last <8 days, and decrease in frequency with subsequent dosing.
- ***Lab Test Considerations:*** Serum IgE levels will ↑ following administration and may persist for up to 1 year following discontinuation. Serum total IgE levels obtained <1 year following discontinuation may not reflect steady state free IgE levels and should not be used to reassess the dosing regimen.

Potential Nursing Diagnoses
Ineffective airway clearance

Implementation
- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.
- **Subcut:** To reconstitute, draw 1.4 ml of sterile water for injection into a 3-cc syringe with a 1-in 18-gauge needle. With the vial upright on a flat surface, inject the sterile water into vial. Keep vial upright and gently swirl for approximately 1 min to evenly wet powder. Do not shake. Lyophilized omalizumab takes 15–20 min to dissolve. Gently swirl vial for 5–10 seconds every 5 min to dissolve any remaining particles. Solution should be clear or slightly opalescent and may have small bubbles or foam around edge of vial. Do not use if particles are visible or if contents do not dissolve completely within 40 min. Invert vial for 15 seconds to allow solution to drain toward stopper. Solution may be somewhat viscous. In order to obtain full 1.2 ml dose, all of solution must be withdrawn from the vial using a new 3-cc syringe with an 18-gauge needle, before expelling any air or excess solution from syringe. Administer within 8 hr if refrigerated or within 4 hr if stored at room temperature. Discard unused solution.
- Replace the 18-gauge needle with a 25-gauge needle for subcut injection. Because solution is slightly viscous, injection may take 5–10 seconds to administer. Divide doses >150 mg into 2 injection sites.

Patient/Family Teaching
- Explain purpose of medication to patient. Inform patient that they may not see immediate results from omalizumab therapy.
- Instruct patient not to discontinue or reduce other asthma medications, especially inhaled corticosteroids, without consulting health care professional.

Evaluation/Desired Outcomes
- Decreased incidence of exacerbations of asthma.

omega-3-acid ethyl esters
(oh-**me**-ga three **as**-id **eth**-il **es**-ters)
Lovaza

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: fatty acids

Pregnancy Category C

Indications
Hypertriglyceridemia (triglycerides ≥500 mmg/dL) in adults; used with specific diet.

Action
Inhibits synthesis of triglycerides. **Therapeutic Effects:** Lowering of triglycerides.

Copyright © 2008 by F.A. Davis

Pharmacokinetics
Absorption: Well absorbed.
Distribution: Unknown.
Metabolism and Excretion: Incorporated into phospholipids.
Half-life: Unknown.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Allery/hypersensitivity to fish; OB: Use only if maternal benefit justifies fetal risk during pregnancy; use cautiously during lactation; Pedi: safety in children <18 yr not established.

Adverse Reactions/Side Effects
GI: altered taste, eructation. **Derm:** rash.

Interactions
Drug-Drug: Beta-blockers, **thiazide diuretics**, and **estrogens** may ↑ triglycerides and should be discontinued prior to therapy.

Route/Dosage
PO (Adults): 4 g/day; may be given as a single dose or 2 g twice daily.

Availability
Gelatin capsules (oil-filled): 1 g.

NURSING IMPLICATIONS

Assessment
- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum triglyceride levels prior to and periodically during therapy.
- Monitor serum ALT periodically during therapy. May cause ↑ serum ALT without concurrent ↑ in AST levels.
- Monitor serum LDL cholesterol levels periodically during therapy. May cause ↑ in serum LDL levels.

Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

Implementation
- An appropriate lipid-lowering diet should be followed before therapy and should continue during therapy.
- **PO:** May be taken as a single 4-g dose or as 2 g twice daily. May be administered with meals.

Patient/Family Teaching
- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, weight loss in overweight patients, and control of medical problems (such as diabetes mellitus and hypothyroidism) that may contribute to hypertriglyceridemia.
- Emphasize the importance of follow-up exams to determine effectiveness.

Evaluation/Desired Outcomes
- Lowering of serum triglyceride levels. Patients who do not have an adequate response after 2 mo of treatment should be withdrawn from therapy.

omeprazole (o-**mep**-ra-zole)
Losec, Prilosec, Prilosec[OTC], Zegerid

Classification
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Pregnancy Category C

Indications
GERD/maintenance of healing in erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Short-term treatment of active benign gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Reduction of risk of GI bleeding in critically ill patients. **OTC:** Heartburn occurring ≥twice/wk.

Action
Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration; immediate-release formulation

Copyright © 2008 by F.A. Davis

contains bicarbonate to prevent acid degradation.
Distribution: Good distribution into gastric parietal cells.
Protein Binding: 95%.
Metabolism and Excretion: Extensively metabolized by the liver.
Half-life: 0.5–1 hr (increased in liver disease to 3 hr).

TIME/ACTION PROFILE (antisecretory effects)

ROUTE	ONSET	PEAK	DURATION
PO-delayed release	within 1 hr	within 2 hr	72–96 hr
PO-immediate release	rapid	30 min	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Metabolic alkalosis and hypocalcemia (Zegerid only).
Use Cautiously in: Liver disease (dosage reduction may be necessary); Geri: Increased risk of hip fractures in patients using high-doses for >1 year; Bartter's syndrome, hypokalemia, and respiratory alkalosis (Zegerid only); Pregnancy, lactation, or children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, weakness. **CV:** chest pain. **GI:** abdominal pain, acid regurgitation, constipation, diarrhea, flatulence, nausea, vomiting. **Derm:** itching, rash. **Misc:** allergic reactions.

Interactions

Drug-Drug: Omeprazole is metabolized by the CYP450 enzyme system and may compete with other agents metabolized by this system. ↓ metabolism and may ↑ effects of Rx **antifungal agents**, **atazanavir**, **diazepam**, **digoxin**, **flurazepam**, **triazolam**, **cyclosporine**, **disulfiram**, **phenytoin**, **tacrolimus**, and **warfarin**. May interfere with absorption of drugs requiring acidic gastric pH, including esters of **ampicillin**, **iron salts**, **digoxin**, **cyanocobalamine**, and **ketoconazole**. Has been used safely with **antacids**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage

PO (Adults): *GERD/erosive esophagitis*—20 mg once daily. *Duodenal ulcers associated with* H. pylori—40 mg daily in the morning with clarithromycin for 2 wk, then 20 mg once daily for 2 wk *or* 20 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10 days (if ulcer is present at beginning of therapy, continue omeprazole 20 mg daily for 18 more days); has also been used with clarithromycin and metronidazole. *Gastric ulcer*—40 mg once daily for 4–6 wk. *Reduction of the risk of GI bleeding in critically ill patients*—40 mg initially, then another 40 mg 6–8 hr later, followed by 40 mg once daily for up to 14 days. *Gastric hypersecretory conditions*—60 mg once daily initially; may be increased up to 120 mg 3 times daily (doses >80 mg/day should be given in divided doses); *OTC*—20 mg once daily for up to 14 days.
PO (Children >2 yr and <20 kg): 10 mg once daily.
PO (Children >2 yr and ≥20 kg): 20 mg once daily.
PO (Children): *Alternative dosing* —1 mg/kg/day given once or divided twice daily (range of doses in the literature: 0.2—3.5 mg/kg/day); *Adjunctive therapy of duodenal ulcers associated with H. pylori*—15–30 kg: 10 mg BID; >30 kg: 20 mg BID.

Availability (generic available)

Delayed-release capsules: 10 mg, 20 mg[Rx, OTC], 40 mg. **Immediate-release powder for oral suspension (peach-mint):** 20-mg packet, 40-mg packet. ***In combination with:*** metronidazole and clarithromycin in a compliance package (Losec 1-2-3 M); with amoxicillin and clarithromycin in a compliance package (Losec 1-2-3A) (in Canada only; see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- May cause ↑ AST, ALT, alkaline phosphatase, and bilirubin.

Copyright © 2008 by F.A. Davis

- May cause serum gastrin concentrations to ↑ during first 1–2 wk of therapy. Levels return to normal after discontinuation of omeprazole.
- Monitor INR and prothrombin time in patients taking warfarin.

Potential Nursing Diagnoses
Acute pain (Indications)

Implementation
- Do not confuse Prilosec (omeprazole) with Prinivil (lisinopril).
- **PO:** Administer doses before meals, preferably in the morning. Capsules should be swallowed whole; do not crush or chew. Capsules may be opened and sprinkled on cool applesauce, entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use.
- *Powder for oral suspension:* Administer on empty stomach, as least 1 hr before a meal. For patients with nasogastric or enteral feeding, suspend feeding for 3 hr before and 1 hr after administration. Empty packet contents into a small cup containing 1–2 tablespoons of water. **Do not use other liquids or foods.** If administered through a nasogastric tube, suspend in 20 ml of water. Stir well and drink immediately. Refill cup with water and drink again.
- May be administered concurrently with antacids.

Patient/Family Teaching
- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products with omeprazole.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

Evaluation/Desired Outcomes
- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD. Therapy is continued for 4–8 wk after initial episode.

ondansetron (on-**dan**-se-tron)
Zofran

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Pregnancy Category B

Indications
Prevention of nausea and vomiting associated with chemotherapy or radiation therapy. **IM, IV:** Prevention and treatment of postoperative nausea and vomiting.

Action
Blocks the effects of serotonin at 5-HT_3–receptor sites (selective antagonist) located in vagal nerve terminals and the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following chemotherapy or surgery.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability; 50% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver; 5% excreted unchanged by the kidneys.
Half-life: 3.5–5.5 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	15–30 min	4 hr–8 hr
IM	rapid	40 min	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Orally disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria.
Use Cautiously in: Liver impairment (daily dose not to exceed 8 mg); Abdominal surgery (may mask ileus); OB, Pedi: Pregnancy, lactation, or children ≤3 yr (safety not established).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: headache, dizziness, drowsiness, fatigue, weakness. **GI:** constipation, diarrhea, abdominal pain, dry mouth, increased liver enzymes. **Neuro:** extrapyramidal reactions.

Interactions

Drug-Drug: May be affected by **drugs altering the activity of liver enzymes**.

Route/Dosage

PO (Adults and Children ≥12 yr): *Prevention of chemotherapy-induced nausea/vomiting*—8 mg 30 min prior to chemotherapy and repeated 8 hr later; 8 mg q 12 hr may be given for 1–2 days following chemotherapy. *Prevention of radiation-induced nausea/vomiting*—8 mg 1–2 hr prior to radiation; may be repeated q 8 hr, depending on type, location, and extent of radiation. *Prevention of postoperative nausea/vomiting*—16 mg 1 hr before induction of anesthesia.

PO (Children 4–11 yr): *Prevention of chemotherapy-induced nausea/vomiting*—4 mg 30 min prior to chemotherapy and repeated 4 and 8 hr later; 4 mg q 8 hr may be given for 1–2 days following chemotherapy.

IV (Adults): *Prevention of chemotherapy-induced nausea/vomiting*—0.15 mg/kg 15–30 min prior to chemotherapy, repeated 4 and 8 hr later, or 32-mg single dose 30 min prior to chemotherapy (lower doses have been used).

IM, IV (Adults): *Prevention of postoperative nausea/vomiting*—4 mg before induction of anesthesia or postoperatively.

IV (Children 4–18 yr): *Prevention of chemotherapy-induced nausea/vomiting*—0.15 mg/kg 15–30 min prior to chemotherapy, repeated 4 and 8 hr later.

IV (Children 2–12 yr and ≤40 kg): *Prevention of postoperative nausea/vomiting*—0.15 mg/kg.

IV (Children >40 kg): *Prevention of postoperative nausea/vomiting*—4 mg.

Hepatic Impairment

PO, IM, IV (Adults): Not to exceed 8 mg/day.

Availability (generic available)

Orally disintegrating tablets (contain aspartame) (strawberry flavor): 4 mg, 8 mg. **Cost:** *Generic*—4 mg $549.00/30. **Tablets:** 4 mg, 8 mg, 24 mg. **Cost:** *Generic*—4 mg $569.99/30, 8 mg $1,048.95/30. **Oral solution (strawberry flavor):** 4 mg/5 ml. **Solution for injection:** 2 mg/ml in 2- and 20-ml vials. **Premixed injection:** 32 mg/50 ml D5W.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess patient for extrapyramidal effects (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) periodically during therapy.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Diarrhea (Side Effects)
Constipation (Side Effects)

Implementation

- Do not confuse Zofran (ondansetron) with Zosyn (piperacillin/tazobactam).
- First dose is administered prior to emetogenic event.
- **PO:** For orally disintegrating tablets, do not attempt to push through foil backing; with dry hands, peel back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration of liquid is not necessary.

IV Administration

- **Direct IV:** Administer undiluted (2 mg/ml) immediately before induction of anesthesia or postoperatively if nausea and vomiting occur shortly after surgery. ***Rate:*** Administer over at least 30 sec and preferably over 2–5 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute doses for prevention of nausea and vomiting associated with chemotherapy in 50 ml of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl. Solution is clear and colorless. Stable for 7 days at room temperature following dilution. ***Concentration:*** 1 mg/ml. ***Rate:*** Administer each dose over 15 min.
- **Syringe Compatibility:** alfentanil, atropine, fentanyl, glycopyrrolate, meperidine, metoclopramide, midazolam, morphine, naloxone, neostigmine, propofol.

Copyright © 2008 by F.A. Davis

- **Syringe Incompatibility:** droperidol.
- **Y-Site Compatibility:** aldesleukin, amifostine, amikacin, azithromycin, aztreonam, bleomycin, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, floxuridine, fluconazole, fludarabine, gemcitabine, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, hydrocortisone sodium phosphate, hydromorphone, ifosfamide, imipenem/cilastatin, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitomycin, mitoxantrone, morphine, oxaliplatin, paclitaxel, pentostatin, piperacillin/tazobactam, potassium chloride, promethazine, prochlorperazine edisylate, ranitidine, remifentanil, sodium acetate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, topotecan, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, amsacrine, cefepime, cefoperazone, furosemide, ganciclovir, lansoprazole, lorazepam, methylprednisolone sodium succinate, pemetrexed, sargramostim, sodium bicarbonate.

Patient/Family Teaching

- Instruct patient to take ondansetron as directed.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy.
- Prevention of postoperative nausea and vomiting.
- Prevention of nausea and vomiting due to radiation therapy.

oprelvekin (o-prell-ve-kin)

Neumega

Classification

Therapeutic: colony-stimulating factors
Pharmacologic: interleukins, thrombopoetic growth factors

Pregnancy Category C

Indications

Prevention of severe thrombocytopenia and reduction of the need for platelet transfusions following myelosuppressive chemotherapy in patients with nonmyeloid malignancies at risk for thrombocytopenia.

Action

Stimulates production of megakaryocytes and platelets. **Therapeutic Effects:** Increased platelet count.

Pharmacokinetics

Absorption: >80% absorbed following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Appears to be mostly metabolized, with metabolites eliminated by kidneys.
Half-life: 6.9 hr.

TIME/ACTION PROFILE (increase in platelet count)

ROUTE	ONSET	PEAK	DURATION
Subcut	5–9 days	unknown	7–14 days†

†Counts continue to rise for 7 days following discontinuation and then return to baseline by 14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation.
Use Cautiously in: Any condition in which sodium and water retention would pose problems (CHF, renal disease); Pre-existing pericardial effusion or ascites (may be exacerbated); History of atrial arrhythmias (especially if receiving cardiac medications or previous doxorubicin therapy); Pre-existing papilledema or tumors of the CNS; OB, Pedi: Pregnancy or children (safety not established).

Adverse Reactions/Side Effects

These effects occurred in patients who had recently received myelosuppressive chemotherapy.
CNS: dizziness, headache, insomnia, nervousness, weakness. **EENT:** conjunctival hem-

Copyright © 2008 by F.A. Davis

orrhage, blurred vision, changes in visual acuity, blindness, papilledema, pharyngitis, rhinitis. **Resp:** cough, dyspnea, pleural effusions. **CV:** atrial fibrillation, edema, palpitations, syncope, tachycardia, vasodilation, ventricular arrhythmias. **GI:** anorexia, constipation, diarrhea, dyspepsia, mucositis, nausea, oral moniliasis, vomiting, abdominal pain. **Derm:** alopecia, ecchymoses, rash. **F and E:** sodium and water retention. **Local:** injection site reactions. **MS:** bone pain, myalgia. **Misc:** chills, fever, infection, pain.

Interactions
Drug-Drug: None significant.

Route/Dosage
Subcut (Adults): 50 mcg/kg once daily for 10–21 days.

Availability
Powder for injection: 5-mg vial.

NURSING IMPLICATIONS

Assessment
- Assess patient for signs of fluid retention (dyspnea on exertion, peripheral edema) during therapy. Fluid retention is a common side effect that usually resolves within several days following discontinuation of oprelvekin.
- ***Lab Test Considerations:*** Monitor platelet count prior to and periodically during therapy, especially at expected nadir. Therapy is continued until postnadir platelet count is ≥50,000 cells/ml.
- CBC should be monitored prior to and at regular intervals during therapy. Decrease in hemoglobin concentration, hematocrit, and RBC count may occur because of increased plasma volume (dilutional anemia); usually begins within 3–5 days of therapy and is reversible within a week of discontinuation of therapy.
- Monitor electrolyte concentrations in patients receiving chronic diuretic therapy. Hypokalemia may be fatal.
- May cause an ↑ in plasma fibrinogen.

Potential Nursing Diagnoses
Excess fluid volume (Side Effects)

Implementation
- Therapy should be started within 6–24 hr after completion of chemotherapy and continued for 10–21 days.
- Treatment should be discontinued at least 2 days prior to next planned chemotherapy cycle.
- **Subcut:** Reconstitute with 1 ml of sterile water for injection without preservatives for a concentration of 5 mg/ml. Direct diluent to sides of vial and swirl gently. Solution is clear and colorless. Do not administer solutions that are discolored or contain particulate matter. Do not shake or agitate vigorously. Do not freeze. Do not reuse vials. Administer within 3 hr of reconstitution as a single injection in abdomen, hip, thigh, or upper arm.

Patient/Family Teaching
- Instruct patient in proper technique for preparation and administration of medication. Provide a puncture-resistant container for disposal of needles.
- May cause transient blurred vision or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Inform patient of side effects and advise patient to notify health care professional if chest pain, shortness of breath, fatigue, blurred vision, or irregular heartbeat persists.

Evaluation/Desired Outcomes
- Increase in postnadir platelet count to ≥50,000 cells/ml.

orlistat (or-li-stat)
Xenical

Classification
Therapeutic: weight control agents
Pharmacologic: lipase inhibitors

Pregnancy Category B

Indications
Obesity management (weight loss and maintenance) when used in conjunction with a reduced-calorie diet in patients with an initial BMI ≥30 kg/m² or ≥27 kg/m² in the presence of additional risk factors (diabetes, hypertension, hyperlipidemia). Reduces the risk of weight regain after prior loss. May delay onset of type 2 diabetes in prediabetic patients.

Copyright © 2008 by F.A. Davis

Action
Decreases the absorption of dietary fat by reversibly inhibiting enzymes (lipases), which are necessary for the breakdown and subsequent absorption of fat. **Therapeutic Effects:** Weight loss and maintenance in obese patients. Delayed onset of type 2 diabetes.

Pharmacokinetics
Absorption: Minimal systemic absorption.
Distribution: Action is local, within the GI tract.
Protein Binding: Minimally absorbed drug is >99% bound to plasma proteins.
Metabolism and Excretion: Major route is fecal elimination of unabsorbed drug.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (effects on fecal fat)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	48–72 hr†

†Following discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Chronic malabsorption syndrome or cholestasis; OB: Pregnancy or lactation.
Use Cautiously in: Pedi: Children <16 (safety not established).

Adverse Reactions/Side Effects
With initial use; incidence decreases with prolonged use.
GI: fecal urgency, flatus with discharge, increased defecation, oily evacuation, oily spotting, fecal incontinence.

Interactions
Drug-Drug: Reduces the absorption of some **fat-soluble vitamins** and **beta-carotene**.

Route/Dosage
PO (Adults and adolescents ≥16 yr): 60–120 mg three times daily with each meal containing fat.

Availability
Capsules: 120 mg, 60 mg[OTC].

NURSING IMPLICATIONS

Assessment
- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

Potential Nursing Diagnoses
Disturbed body image (Indications)
Imbalanced nutrition: more than body requirements (Indications)

Implementation
- **PO:** Administer one capsule 3 times daily with or up to 1 hour after a meal. If a meal is missed or contains no fat, dose of orlistat can be omitted.
- A supplemental multivitamin containing vitamins D, E, K, and beta-carotene should be taken daily, at least 2 hr before or after orlistat dose.
- Psyllium 6 g with each dose or 12 g at bedtime may decrease GI side effects.

Patient/Family Teaching
- Instruct patient to take orlistat with meals as directed. If a meal is missed or contains no fat, orlistat dose can be omitted. Do not take more than recommended dose; does not improve benefit.
- Instruct patient to adhere to a reduced-calorie diet. Daily intake of fat should be distributed over three main meals. Meals should contain no more than 30% fat. Taking orlistat with a meal high in fat may increase the GI side effects.
- Advise patient that regular physical activity, approved by a health care professional, should be used in conjunction with orlistat and diet.
- Inform patient of common GI side effects (oily spotting, gas with discharge, urgent need to go to the bathroom, oily or fatty stools, an oily discharge, increased number of bowel movements, inability to control bowel movements). Oil in bowel movement may be clear or have orange or brown colorations. GI side effects usually occur in first weeks of treatment and are more increased following a meal high in fat. May lessen or disappear, or may continue for 6 mo or longer.
- Advise patient to notify health care professional prior to taking any Rx, OTC, or herbal product.
- Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes
- Slow, consistent weight loss when combined with a reduced-calorie diet.
- Delayed onset of type 2 diabetes.

Copyright © 2008 by F.A. Davis

orphenadrine

(or-**fenn**-a-dreen)
Antiflex, Banflex, Disipal, Flexoject, Flexon, Mio-Rel, Myolin, Myotrol, Norflex, Orfro, Orphenate

Classification
Therapeutic: skeletal muscle relaxants (centrally acting)
Pharmacologic: diphenhydramine analogues

Pregnancy Category C

Indications
Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions. Adjunct therapy of Parkinson's disease (Canadian labeling only).

Action
Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation, with decreased discomfort.

Pharmacokinetics
Absorption: Readily absorbed after oral and IM administration; IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 14 hr.

TIME/ACTION PROFILE (skeletal muscle effects)

ROUTE	ONSET	PEAK	DURATION
PO-ER	within 1 hr	6–8 hr	12 hr
IM	5 min	30 min	12 hr
IV	immediate	unknown	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Bladder neck obstruction, prostatic hyperplasia, glaucoma, myasthenia gravis, peptic ulcer disease, GI obstruction.
Use Cautiously in: Underlying cardiovascular disease; Impaired renal function; Geri: Appears on Beers list. Geriatric patients are more susceptible to sedation and anticholinergic effects; OB, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: CNS excitation, confusion, dizziness, drowsiness. **EENT:** blurred vision, dry eyes. **CV:** orthostatic hypotension, tachycardia. **GI:** constipation, dry mouth. **GU:** urinary retention.

Interactions
Drug-Drug: Concurrent use of other **anticholinergics** ↑ risk of anticholinergic side effects. ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, or **opioid analgesics**.
Drug-Natural Products: Kava kava, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Skeletal muscle relaxation
PO (Adults): 100 mg twice daily.
IV, IM (Adults): 60 mg q 12 hr.

Adjunctive therapy of Parkinson's disease
PO (Adults): 50 mg 3 times daily (lower doses if used with other agents).

Availability (generic available)
Tablets: 50 mg[OTC]. **Extended-release tablets:** 100 mg. **Injection:** 30 mg/ml.

NURSING IMPLICATIONS

Assessment
- Geri: Assess geriatric patients for anticholinergic adverse effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia) and sedation.
- **Skeletal Muscle Relaxant:** Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- **Parkinson's Disease:** Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) prior to and throughout therapy.
- ***Lab Test Considerations:*** Monitor CBC and renal and hepatic function tests periodically during prolonged therapy.

Potential Nursing Diagnoses
Acute pain (Indications)

Copyright © 2008 by F.A. Davis

Impaired physical mobility (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse Norflex (orphenadrine) with norfloxacin (Noroxin).
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Do not break, crush or chew extended-release tablets.

IV Administration

- **Direct IV:** May be administered undiluted. ***Concentration:*** 30 mg/ml.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity,
- Increased range of motion.
- Decrease in tremors and rigidity and an improvement in gait and balance.

oseltamivir (o-sel-**tam**-i-vir)
Tamiflu

Classification
Therapeutic: antivirals
Pharmacologic: neuramidase inhibitors

Pregnancy Category C

Indications

Uncomplicated acute illness due to influenza infection in adults and children >1 yr who have had symptoms for ≤2 days. Prevention of influenza in patients ≥1 yr.

Action

Inhibits the enzyme neuramidase, which may alter virus particle aggregation and release.
Therapeutic Effects: Reduced duration of flu-related symptoms.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract and converted by the liver to the active form, oseltamivir carboxylate. 75% reaches systemic circulation as the active drug.
Distribution: Unknown.
Metabolism and Excretion: Rapidly metabolized by the liver to oseltamivir carboxylate, the active drug. Oseltamivir is >99% excreted unchanged in urine.
Half-life: *Oseltamivir carboxylate*—6–10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pedi: Children <1 yr.
Use Cautiously in: OB, Lactation: Safety not established; use only if potential benefits outweigh possible risks.

Adverse Reactions/Side Effects

CNS: insomnia, vertigo, confusion, self-injurious behavior. **Resp:** bronchitis. **GI:** nausea, vomiting.

Interactions

Drug-Drug: None significant.

Route/Dosage

Treatment of Influenza

PO (Adults and Children >40kg): 75 mg twice daily for 5 days.
PO (Children 23–40 kg): 60 mg twice daily.
PO (Children 15–23 kg): 45 mg twice daily.
PO (Children ≤15 kg and ≥1 yr): 30 mg twice daily.

Renal Impairment

PO (Adults): *CCr <30 ml/min*—75 mg once daily for 5 days.

Influenza Prevention

PO (Adults and Children ≥13 yrs): 75 mg once daily for at least 10 days.
PO (Children >40 kg): 75 mg once daily for 10 days.
PO (Children 23–40 kg): 60 mg once daily for 10 days.

Copyright © 2008 by F.A. Davis

PO (Children 15–23 kg): 45 mg once daily for 10 days.
PO (Children ≤15 kg and ≥1 yr): 30 mg once daily.

Renal Impairment
PO (Adults and Children ≥13 yrs): *CCr 10–30 ml/min*—75 mg every other day *or* 30 mg every day.

Availability
Capsules: 30 mg, 45 mg, 75 mg. **Cost:** 75 mg $84.99/10. **Oral suspension (tutti-frutti flavor):** 12 mg/ml in 25-ml bottle.

NURSING IMPLICATIONS

Assessment
- Monitor influenza symptoms (sudden onset of fever, cough, headache, fatigue, muscular weakness, sore throat). Additional supportive treatment may be indicated to treat symptoms.

Potential Nursing Diagnoses
Risk for infection (Indications)

Implementation
- Treatment with oseltamivir should be started as soon as possible from the first sign of flu symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.
- To prepare oral solution, tap closed bottle to loosen powder. Add total amount of water for constitution and shake closed bottle for 15 seconds. Remove childproof cap and push bottle adaptor into neck of bottle. Close bottle with childproof top tightly, assuring proper seating of bottle adaptor and childproof status. Shake well before use. Use within 10 days of constitution. If oral suspension is not available, capsules can be opened and mixed with sweetened liquids, such as regular or sugar-free chocolate syrup.

Patient/Family Teaching
- Instruct patient to take oseltamivir as soon as influenza symptoms appear and to continue to take it as directed, for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless within 2 hr of next dose. Do not double doses.
- Caution patient that oseltamivir should not be shared with anyone, even if they have the same symptoms.
- Advise patient that oseltamivir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Advise patient to consult health care professional before taking other medications concurrently with oseltamivir.

Evaluation/Desired Outcomes
- Reduction of the duration of flu symptoms.

oxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

oxaliplatin (ox-a-li-pla-tin)
Eloxatin

Classification
Therapeutic: antineoplastics

Pregnancy Category D

Indications
Used in combination with 5–Fluorouracil and leucovorin in the treatment of advanced or metastatic colon or rectal cancer. **Unlabeled uses:** Treatment of ovarian cancer that has progressed despite treatment with other agents.

Action
Inhibits DNA replication and transcription by incorporating platinum into normal cross-linking (cell-cycle nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Extensive tissue distribution.
Protein Binding: >90% (platinum).
Metabolism and Excretion: Undergoes rapid and extensive nonenzymatic biotransformation; excreted mostly by the kidneys.
Half-life: 391 hours.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypersensitivity to other platinum compounds; Pregnancy or lactation.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Renal impairment; Geri: Geriatric patients (increased risk of adverse reactions); Pedi: Children (safety not established).

Adverse Reactions/Side Effects

Adverse reactions are noted for the combination of oxaliplatin, 5–FU and leucovorin. **CNS:** fatigue. **CV:** chest pain, edema, thromboembolism. **Resp:** PULMONARY FIBROSIS, coughing, dyspnea. **GI:** diarrhea, nausea, vomiting, abdominal pain, anorexia, gastroesophageal reflux, stomatitis. **F and E:** dehydration, hypokalemia. **Hemat:** leukopenia, NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Local:** injection site reactions. **MS:** back pain. **Neuro:** neurotoxicity. **Misc:** ANAPHYLAXIS/ANAPHYLACTOID REACTIONS, fever.

Interactions

Drug-Drug: Concurrent use of **nephrotoxic agents** may ↑ toxicity.

Route/Dosage

IV (Adults): *Day 1*—85 mg/m² with leucovorin 200 mg/m² at the same time over 2 hr, followed by 5-FU 400 mg/m² bolus over 2–4 min, then 5–FU 600 mg/m² as a 22-hr infusion. *Day 2*—leucovorin 200 mg/m² over 2 hr, followed by 5-FU 400 mg/m² bolus over 2–4 min, then 5-FU 600 mg/m² as a 22-hr infusion. Cycle is repeated every 2 wk. Dosage reduction/alteration may be required for neurotoxicity or other serious adverse effects.

Availability

Solution for injection: 5 mg/mL in 10-mL vials (50 mg), 5 mg/mL in 20-mL vials (100 mg).

NURSING IMPLICATIONS

Assessment

- Assess for peripheral sensory neuropathy. *Acute onset* occurs within hrs to 1–2 days of dosing, resolves within 14 days, and frequently recurs with further dosing (transient paresthesia, dysesthesia and hypothesia of hands, feet, perioral area, or throat). Symptoms may be precipitated or exacerbated by exposure to cold or cold objects. May also cause jaw spasm, abnormal tongue sensation, dysarthria, eye pain, and a feeling of chest pressure. *Persistent* (>14 days) causes paresthesias, dysethesias, and hypoesthesias, but may also include deficits in proprioception that may interfere with daily activities (walking, writing, swallowing). Persistent neuropathy may occur without prior acute neuropathy and may improve upon discontinuation of oxaliplatin.
- Assess for signs of pulmonary fibrosis (nonproductive cough, dyspnea, crackles, radiological; infiltrates). May be fatal. Discontinue oxaliplatin if pulmonary fibrosis occurs.
- Monitor for signs of anaphylaxis (rash, hives, swelling or lips or tongue, sudden cough). Epinephrine, corticosteroids, and antihistamines should be readily available.
- ***Lab Test Considerations:*** Monitor WBC with differential, hemoglobin, platelet count, and blood chemistries (ALT, AST, bilirubin, and creatinine) before each oxaliplatin cycle.

Potential Nursing Diagnoses

Nausea (Adverse Reactions)

Implementation

- Extravasation may result in local pain and inflammation that may be severe and lead to necrosis.
- Premedicate patient with antiemetics with or without dexamethasone. Prehydration is not required.

IV Administration

- **Intermittent Infusion:** Protect concentrated solution from light; do not freeze. ***Diluent:*** Must be further diluted with 250–500 ml of D5W. Do not use 0.9% NaCl or any other chloride-containing solution for final solution. Do not use aluminum needles or administration sets containing aluminum parts; aluminum may cause degradation of platinum compounds. May be stored in refrigerator for 24 hr or 6 hr at room temperature. Diluted solution is not light-sensitive. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 0.2–0.6 mg/ml. ***Rate:*** Administer oxaliplatin simultaneously with leucovorin in separate bags via Y-line over 120 min. Prolonging infusion time to 6 hr may decrease acute toxicities. Infusion times for fluorouracil and leucovorin do not need to change.
- **Y-Site Compatibility:** bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, chlorpromazine, cimetidine, cyclophosphamide, dexamethasone sodium phosphate, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, droperidol, enalaprilat, epirubicin, etoposide phosphate, famotidine, fentanyl, furosemide, gemcita-

Copyright © 2008 by F.A. Davis

bine, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, irinotecan, leucovorin, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, paclitaxel, palonosetron, potassium chloride, prochlorperazine, promethazine, ranitidine, theophylline, topotecan, verapamil, vincristine, vinorelbine.

- **Y-Site Incompatibility:** diazepam, alkaline solutions, chloride-containing solutions. Infusion line should be flushed with D5W prior to administration of other solutions or medications.

Patient/Family Teaching

- Inform patients and caregivers of potential for peripheral neuropathy and potentiation by exposure to cold or cold objects. Advise patient to avoid cold drinks, use of ice in drinks or as ice packs, and to cover exposed skin prior to exposure to cold temperature or cold objects. Caution patients to cover themselves with a blanket during infusion, do not breathe deeply when exposed to cold air, wear warm clothing, and cover mouth and nose with a scarf or pull-down ski cap to warm the air that goes to their lungs, do not take things from the freezer or refrigerator without wearing gloves, drink fluids warm or at room temperature, always drink through a straw, do not use ice chips for nausea, be aware that most metals (car doors, mailbox) are cold; wear gloves to touch, do not run air conditioning at high levels in house or car, if hands get cold wash them with warm water. Advise health care professional of how you did since last treatment before next infusion.
- Instruct patient to notify health care professional immediately if signs of low blood cell counts (fever, persistent diarrhea, infection) or if persistent vomiting, signs of dehydration, cough or breathing difficulty, thirst, dry mouth, dizziness, decreased urination or signs of allergic reactions occur.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancies.

oxaprozin (ox-a-proe-zin)

Daypro

Classification

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

Pregnancy Category B, C (first trimester), UK (second and third trimester)

Indications

Rheumatoid arthritis and osteoarthritis.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

Pharmacokinetics

Absorption: Well absorbed following oral administration (80%); 35% is rapidly converted to an active metabolite.
Distribution: Unknown.
Protein Binding: 99.9%.
Metabolism and Excretion: The active metabolite is metabolized by the liver to inactive compounds.
Half-life: 42–50 hr.

TIME/ACTION PROFILE (antirheumatic action)

ROUTE	ONSET	PEAK	DURATION
PO	within 7 days	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; Perioperative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe hepatic disease; Renal impairment (lower initial dose may be necessary); History of ulcer disease; Geri: Appears on Beers list. Geriatric patients are at ↑ risk of GI bleeding. May require dose adjustments due to age-related decrease in renal function); Pedi: Pregnancy, lactation, or children (safety not established; not recommended for use during the second half of pregnancy).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

CNS: agitation, anxiety, confusion, depression, dizziness, drowsiness, fatigue, headache, insomnia, malaise, weakness. **EENT:** abnormal vision, tinnitus. **Resp:** dyspnea, hypersensitivity pneumonitis. **CV:** edema, vasculitis. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, abnormal liver function tests, anorexia, cholestatic jaundice, constipation, dry mouth, duodenal ulcer, flatulence, gastritis, increased appetite, nausea, stomatitis, vomiting. **GU:** albuminuria, azotemia, interstitial nephritis. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, increased sweating, photosensitivity, pruritus, rash. **Hemat:** prolonged bleeding time. **Metab:** weight gain. **Neuro:** paresthesia, tremor. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIONEUROTIC EDEMA.

Interactions

Drug-Drug: ↑ adverse GI effects and toxicity with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensive** therapy. May ↑ hypoglycemic effects of **insulin** or **oral hypoglycemic agents**. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **thrombolytic agents**, **anticoagulants**, **ticlopidine**, **clopidogrel**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

PO (Adults): 1200 mg once daily; onset may be more rapid with an initial 1800-mg dose. Patients with low body weight, mild disease, or renal impairment may be started at 600 mg/day (not to exceed 1800 mg/day or 26 mg/kg/day). Daily doses >1200 mg should be given in 2–3 divided doses. Consideration should be given to decreasing dose to lowest effective amount.

Availability (generic available)

Tablets: 600 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause prolonged bleeding time, which may persist for up to 2 wk following discontinuation of therapy.
- Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy. Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Administer with food or antacids to decrease GI irritation.

Patient/Family Teaching

- Advise patient to take oxaprozin with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness and dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, and other OTC or herbal products without consulting health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery. Oxaprozin should be discontinued 2 wk prior to surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syn-

Copyright © 2008 by F.A. Davis

drome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Maximum effectiveness may require 2 wk or more of continuous therapy. Patients who do not respond to one NSAID may respond to another.

oxazepam (ox-az-e-pam)

Apo-Oxazepam, Novoxapam, Serax

Classification

Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications

Management of anxiety, anxiety associated with depression. Symptomatic treatment of alcohol withdrawal.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Decreased anxiety. Diminished symptoms of alcohol withdrawal.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Absorption is slower than with other benzodiazepines.
Distribution: Widely distributed. Crosses the blood-brain barrier. May cross the placenta and enter breast milk. Recommend to discontinue drug or bottle feed.
Metabolism and Excretion: Metabolized by the liver to inactive compounds.
Protein Binding: 97%.
Half-life: 5–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	45–90 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Pregnancy and lactation; Some products contain tartrazine and should be avoided in patients with known intolerance.
Use Cautiously in: Hepatic dysfunction (may be preferred over some benzodiazepines due to short half-life); History of suicide attempt or drug abuse; Debilitated patients (initial dosage reduction recommended); Severe chronic obstructive pulmonary disease; Myasthenia gravis; Geri: Elderly patients have increased sensitivity to benzodiazepines. Appears on Beers list and is associated with increased risk of falls (↓ dose required).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, confusion, hangover, headache, impaired memory, mental depression, paradoxical excitation, slurred speech. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** tachycardia. **GI:** constipation, diarrhea, drug-induced hepatitis, nausea, vomiting, weight gain (unusual). **GU:** urinary problems. **Derm:** rashes. **Hemat:** leukopenia. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and other **sedative/hypnotics** (including other **benzodiazepines**). May ↓ the therapeutic effectiveness of **levodopa**. **Hormonal contraceptives** or **phenytoin** may ↓ effectiveness. **Theophylline** may ↓ sedative effects of oxazepam.
Drug-Natural Products: Concomitant use of **kava kava, valerian, skullcap, chamomile,** or **hops** can increase CNS depression.

Route/Dosage

PO (Adults): *Antianxiety agent*—10–30 mg 3–4 times daily. *Sedative/hypnotic/management of alcohol withdrawal*—15–30 mg 3–4 times daily.
PO (Geriatric Patients): 5 mg 1–2 times daily initially or 10 mg 3 times daily; may be increased as needed.

Availability (generic available)

Capsules: 10 mg, 15 mg, 30 mg. **Tablets:** 10 mg, 15 mg, 30 mg.

= Canadian drug name.
* CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess patient for anxiety and orientation, mood and behavior.
- Assess level of sedation (ataxia, dizziness, slurred speech) periodically throughout therapy.
- Assess regularly for continued need for treatment.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- ***Lab Test Considerations:*** Monitor CBC and liver function tests periodically during prolonged therapy.
- May cause decreased thyroidal uptake of sodium iodide ^{123}I and ^{131}I.

Potential Nursing Diagnoses

Anxiety (Indications)
Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Medication should be tapered at the completion of therapy (taper by 0.5 mg q 3 days). Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).
- **PO:** Administer with food if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take oxazepam exactly as directed. Missed doses should be taken within 1 hr; if remembered later, omit and return to regular dosing schedule. Do not double or increase doses. If dose is less effective after a few weeks, notify health care professional.
- Inform patient that oxazepam is usually prescribed for short-term use. Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills.
- Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills.
- Teach other methods to decrease anxiety, such as increased exercise, support group, relaxation techniques.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and to consult health care professional prior to the use of OTC preparations that contain antihistamines or alcohol.
- Advise patient to inform health care professional if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to monitor effectiveness of medication.
- Geri: Instruct patient and family how to reduce falls risk at home.

Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Prevention or relief of acute agitation, tremor, and hallucinations during alcohol withdrawal.

oxcarbazepine

(ox-kar-**baz**-e-peen)
Trileptal

Classification
Therapeutic: anticonvulsants
Pharmacologic: carbamazepine analogues

Pregnancy Category C

Indications

Monotherapy or adjunctive therapy of partial seizures in adults and children 4 yrs and older with epilepsy. Adjunctive therapy in patients 2–16 yr with epilepsy. **Unlabeled uses:** Management of trigeminal neuralgia.

Action

Blocks sodium channels in neural membranes, stabilizing hyperexcitable states, inhibiting repetitive neuronal firing, and decreasing propagation of synaptic impulses. **Therapeutic Effects:** Decreased incidence of seizures.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration and rapidly converted to the active 10-hydroxy metabolite (MHD).
Distribution: Enters breast milk in significant amounts.
Metabolism and Excretion: Extensively converted to MHD, which is then primarily excreted by the kidneys.
Half-life: *Oxcarbazepine*—2 hr; *MHD*—9 hr.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO 12 hr	PO	rapid	4.5 hr†

†Steady-state levels of MHD are reached after 2–3 days during twice-daily dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity with carbamazepine may occur; OB: Lactation.

Use Cautiously in: Renal impairment (dose reduction recommended if CCr <30 ml/min); OB: Pregnancy (use only if potential benefit justifies the potential risk to the fetus); Pedi: Children <4 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness/vertigo, drowsiness/fatigue, headache, cognitive symptoms. **EENT:** abnormal vision, diplopia, nystagmus. **GI:** abdominal pain, dyspepsia, nausea, vomiting, thirst. **Derm:** acne, rash, urticaria. **F and E:** hyponatremia. **Neuro:** ataxia, gait disturbances, tremor. **Misc:** allergic reactions, hypersensitivity reactions including STEVENS-JOHNSON SYNDROME and MULTIORGAN REACTIONS, lymphadenopathy.

Interactions

Drug-Drug: Oxcarbazepine may inhibit the CYP 2C19 enzyme system drugs and would be expected to alter the effects of other drugs that are metabolized by this system. Oxcarbazepine and MHD induce the P450 3A4/5 enzyme systems and would be expected to alter the effects of other drugs that are metabolized by this system. This may result in decreased levels and effectiveness of **hormonal contraceptives**, **felodipine**, **isradipine**, **nicardipine**, **nifedipine**, and **nimodipine**. In addition, oxcarbazepine itself is metabolized by cytochrome P450 drugs system and other **drugs that alter the activity of this system**. ↑ CNS depression may occur with other CNS depressants, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and **opioids**. **Carbamazepine**, **phenobarbital**, **phenytoin**, **valproic acid** and **verapamil** ↓ levels. May ↑ serum levels and effects of **phenytoin** (dosage reduction of phenytoin may be required).

Route/Dosage

(Tablets and oral suspension can be interchanged at equal doses).

PO (Adults): *Adjunctive therapy*—300 mg twice daily, may be increased by up to 600 mg/day at weekly intervals up to 1200 mg/day (up to 2400 mg/day may be needed); *conversion to monotherapy*—300 mg twice daily; may be increased by 600 mg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be increased up to 2400 mg/day over a period of 2–4 wk; *initiation of monotherapy*—300 mg twice daily, increase by 300 mg/day every third day, up to 1200 mg/day. Maximum maintenance dose should be achieved over 2–4 wks.

PO (Children 2–16 yr): *Adjunctive therapy*—4–5 mg/kg twice daily (up to 600 mg/day), increased over 2 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg (range 6–51 mg/kg/day). In patients <20 kg, initial dose of 16–20 mg/kg/day may be used not to exceed 60 mg/kg/day; *conversion to monotherapy*—8–10 mg/kg/day given twice daily; may be increased by 10 mg/kg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be increased up to 600–900 mg/day in patient ≤20 kg, 900–1200 mg/day in patients 25–30 kg, 900–1500 mg/day in patients 35–40 kg. 1200–1500 mg/day in patients 45 kg, 1200–1800 mg/day in patients 50–55 kg, 1200–2100 mg/day in patients 60–65 kg, and 1500–2100 mg/day in patients 70 kg. Maximum maintenance dose should be achieved over 2–4 wks.

Renal Impairment

PO (Adults): *CCr<30 ml/min*—Initiate therapy at 300 mg/day and increase slowly to achieve desired response.

Availability (generic available)

Tablets: 150 mg, 300 mg, 600 mg. **Cost:** *Generic*—150 mg $53.79/100, 300 mg $375.97/180, 600 mg $742.97/180, 150 mg $96.21/100, 300 mg $175.70/100, 600 mg $322.94/100. **Oral suspension:** 60 mg/ml in 250-ml bottle. **Cost:** $155.23/250 ml.

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity.

Copyright © 2008 by F.A. Davis

Hyponatremia may increase frequency and severity of seizures.
- Monitor patient for CNS changes. May manifest as cognitive symptoms (psychomotor slowing, difficulty with concentration, speech or language problems), somnolence or fatigue, or coordination abnormalities (ataxia, gait disturbances).
- ***Lab Test Considerations:*** Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia. Usually occurs during the first 3 months of therapy. May require dose reduction, fluid restriction, or discontinuation of therapy. Sodium levels return to normal within a few days of discontinuation.

Potential Nursing Diagnoses
Risk for injury (Indications, Side Effects)

Implementation
- Implement seizure precautions as indicated.
- **PO:** Administer twice daily with or without food.
- Shake oral suspension well and prepare dose immediately after. Withdraw using oral dosing syringe supplied by manufacturer. May be mixed in a small glass of water just prior to administration or swallowed directly from syringe. Rinse syringe with warm water and allow to dry.

Patient/Family Teaching
- Instruct patient to take oxcarbazepine in equally spaced doses, as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than one dose is missed. Medication should be gradually discontinued to prevent seizures.
- May cause dizziness, drowsiness, or CNS changes. Advise patients to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes
- Absence or reduction of seizure activity.

oxiconazole, See ANTIFUNGALS (TOPICAL).

OXYBUTYNIN (ox-i-**byoo**-ti-nin)

oxybutynin (oral)
Ditropan, Ditropan XL

oxybutynin (transdermal)
Oxytrol

Classification
Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category B

Indications
Urinary symptoms that may be associated with neurogenic bladder including: Frequent urination, Urgency, Nocturia, Urge incontinence. Overactive bladder with symptoms of urge incontinence, urgency, and frequency.

Action
Inhibits the action of acetylcholine at postganglionic receptors. Has direct spasmolytic action on smooth muscle, including smooth muscle lining the GU tract, without affecting vascular smooth muscle. **Therapeutic Effects:** Increased bladder capacity. Delayed desire to void. Decreased urge incontinence, urinary urgency, and frequency and decreased number of urinary accidents associated with overactive bladder.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration, but undergoes extensive first-pass metabolism; XL tablets provide extended release. Transdermal absorption occurs by passive diffusion through intact skin and bypasses the first-pass effect.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system);

Copyright © 2008 by F.A. Davis

one metabolite is pharmacologically active; metabolites are renally excreted with negligible (<0.1%) excretion of unchanged drug.
Half-life: 7–8 hr.

TIME/ACTION PROFILE (urinary spasmolytic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	3–6 hr	6–10 hr (up to 24 hr with XL tablet)
Transdermal	within 24 hr	36 hr	3–4 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled angle-closure glaucoma; Intestinal obstruction or atony; Urinary retention.
Use Cautiously in: Hepatic/renal impairment; Bladder outflow obstruction; Ulcerative colitis; Benign prostatic hyperplasia; Cardiovascular disease; Reflux esophagitis or gastrointestinal osbstructive disorders; Myasthenia gravis; OB: Pregnancy and lactation (safety not established); Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects; Pedi: Pregnancy or children <5 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache. **EENT:** blurred vision. **CV:** tachycardia. **GI:** constipation, dry mouth, nausea, abdominal pain, diarrhea. **GU:** urinary retention. **Derm:** decreased sweating, *transdermal only:* application site reactions. **Metab:** hyperthermia.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **agents having anticholinergic properties**, including **amantadine**, **antidepressants**, **phenothiazines**, **disopyramide**, and **haloperidol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Ketoconazole**, **itraconazole**, **erythromycin**, and **clarithromycin** may ↑ effects.

Route/Dosage

PO (Adults): *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 5 mg 4 times daily) (may start with 2.5 mg 2–3 times daily in elderly). *Extended-release tablets*—5–10 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 30 mg/day.
PO (Children >5 yr): *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 15 mg/day). *Extended-release tablets (children ≥6 yr)*—5 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 20 mg/day.
Transdermal (Adults): One 3.9-mg system applied twice week-ly (every 3–4 days).

Availability (generic available)

Tablets: 5 mg. **Cost:** *Generic*—$29.97/180.
Extended-release tablets: 5 mg, 10 mg, 15 mg. **Cost:** *Generic*—5 mg $260.98/90, 10 mg $262.80/90, 15 mg $269.99/90. **Syrup:** 5 mg/5 ml. **Cost:** *Generic*—$35.95/480 ml. **Transdermal system:** 3.9-mg/day system. **Cost:** $106.50/8 patches.

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and intake and output ratios, and assess abdomen for bladder distention prior to and periodically during therapy. Catheterization may be used to assess postvoid residual. Cystometry, to diagnose type of bladder dysfunction, is usually performed prior to prescription of oxybutynin.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Acute pain (Indications)

Implementation

- Do not confuse Ditropan (oxybutynin) with diazepam.
- **PO:** May be administered on an empty stomach or with meals or milk to prevent gastric irritation.
- **Transdermal:** Apply patch on same two days each week (Sunday/Wednesday, Monday/Thursday) to hip, abdomen, or buttock in an area that is clean, dry, and without irritation. Patch should be worn continuously.

Patient/Family Teaching

- Instruct patient to take oxybutinin as directed. Take missed doses as soon as remembered unless almost time for next dose.
- May cause drowsiness or blurred vision. Advise patient to avoid driving and other activi-

Copyright © 2008 by F.A. Davis

ties requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if mouth dryness persists >2 wk.
- Inform patient that oxybutynin decreases the body's ability to perspire. Avoid strenuous activity in a warm environment because overheating may occur.
- Advise patient to notify health care professional if urinary retention occurs or if constipation persists. Discuss methods of preventing constipation, such as increasing dietary bulk, increasing fluid intake, and increasing mobility.
- Discuss need for continued medical follow-up. Periodic cystometry may be used to evaluate effectiveness. Ophthalmic exams should be performed periodically to detect glaucoma, especially in patients over 40 yr of age.
- **Transdermal:** Instruct patient on correct application and disposal of patch. Open pouch by tearing along arrows; apply immediately. Apply ½ patch to skin by removing ½ protective cover and applying firmly to skin. Apply second half by bending in half and rolling patch onto skin while removing protective liner. Press patch firmly in place.
- Remove slowly; fold in half, sticky sides together, and discard. Wash site with mild soap and water or a small amount of baby oil.

Evaluation/Desired Outcomes
- Relief of bladder spasm and associated symptoms (frequency, urgency, nocturia, and incontinence) in patients with a neurogenic or overactive bladder.

HIGH ALERT

oxycodone (ox-i-**koe**-done)
Endocodone, M-Oxy, Oxycontin, OxyFAST, OxyIR, Percolone, Roxicodone, Supeudol

oxycodone/acetaminophen†
Endocet, Magnacet, Oxycet, Percocet, Roxicet, Roxilox, Tylox

oxycodone/aspirin†
Endodan, Oxycodan, Percodan

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists, opioid agonists/nonopioid analgesic combinations

Schedule II

Pregnancy Category C (oxycodone alone)

†See also acetaminophen and salicylates monographs

Indications
Moderate to severe pain.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression.
Therapeutic Effects: Decreased pain.

Pharmacokinetics
Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	10–15 min	60–90 min	3–6 hr
PO-CR	10–15 min	3 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pregnancy or lactation (avoid chronic use); Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance or hypersensitivity.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geriatric or debilitated patients (initial dosage reduction recommended); Undiagnosed abdominal pain; Prostatic hyperplasia.

Adverse Reactions/Side Effects
CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical

Copyright © 2008 by F.A. Davis

dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions—decrease initial dose of oxycodone to 25% of usual dose). ↑ CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**, **buprenorphine**, or **pentazocine** may decrease analgesia.
Drug-Natural Products: Concomitant use of **kava kava, valerian,** or **chamomile** can ↑ CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy. Consider cumulative effects of additional acetaminophen/aspirin; if toxic levels are exceeded, change to pure oxycodone product.
PO (Adults ≥50 kg): 5–10 mg q 3–4 hr initially, as needed. Controlled-release tablets (Oxycontin) may be given q 12 hr after careful consideration as to dose, indication, and previous analgesic use/abuse history.
PO (Adults <50 kg or Children 6–12 years): 1.25 mg every 6 hr as needed or 0.2 mg/kg q 3–4 hr initially, as needed.
PO (Children >12): 2.5 mg every 6 hr as needed.
Rect (Adults): 10–40 mg 3–4 times daily initially, as needed.

Availability (generic available)

Oxycodone

Tablets (Percolone, Roxicodone): 5 mg, 15 mg, 30 mg. **Cost:** *Generic*—5 mg $24.99/30, 15 mg $26.99/30, 30 mg $36.99/30. **Immediate-release capsules (OxyIR):** 5 mg. **Cost:** *Generic*—$13.99/30. **Controlled-release tablets (Oxycontin):** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—10 mg $43.99/30, 20 mg $79.99/30, 40 mg $139.99/30, 80 mg $250.01/30. **Oral solution (Roxicodone) (burgundy cherry):** 5 mg/5 ml in 500-ml bottle. **Concentrated oral solution (Roxicodone Intensol, OxyFAST):** 20 mg/ml in 30-ml bottle with dropper. **Cost:** *Generic*—$33.99/30 ml. **Suppositories:** ✱10 mg, ✱20 mg.

Oxycodone/Acetaminophen

Tablets (Endocet, Oxycet, Percocet, Roxicet): 2.5 mg oxycodone with 325 mg acetaminophen, 2.5 mg oxycodone with 400 mg acetaminophen (Magnacet), 5 mg oxycodone with 325 mg acetaminophen, 5 mg oxycodone with 400 mg acetaminophen (Magnacet), 7.5 mg oxycodone with 325 mg acetaminophen (Percocet 7.5/325), 7.5 mg oxycodone with 400 mg acetaminophen (Magnacet), 7.5 mg oxycodone with 500 mg acetaminophen, 10 mg oxycodone with 325 mg acetaminophen, 10 mg oxycodone with 400 mg acetaminophen (Magnacet), 10 mg oxycodone with 650 mg acetaminophen. **Cost:** *Generic*—5/325 mg $16.99/30, 7.5/325 mg $47.99/30, 10/325 mg $60.99/30, 10/650 mg $49.99/30. **Capsules (Roxilox, Tylox):** 5 mg oxycodone with 500 mg acetaminophen. **Cost:** *Generic*—$23.99/30. **Caplets (Roxicet 5/500):** 5 mg oxycodone with 500 mg acetaminophen. **Oral solution (Roxicet) (mint):** 5 mg oxycodone with 325 mg acetaminophen/5 ml in 500-ml bottles. **Cost:** $43.43/500 ml.

Oxycodone/Aspirin

Tablets (Endodan, Percodan): 4.88 mg oxycodone with 325 mg aspirin).

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking controlled-release tablets may require additional short-acting opioid doses for breakthrough pain. Doses should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be

Copyright © 2008 by F.A. Davis

sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.

- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxycodone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnosis

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations. Do not confuse oxycodone with OxyContin. Do not confuse Percocet with Percodan.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses. Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Administer solution with properly calibrated measuring device.
- Controlled-release tablets should be swallowed whole; do not crush, break, or chew. Taking broken, chewed, or crushed controlled-release tablets leads to rapid release and absorption of a potentially fatal dose of oxycodone.
- **Controlled Release:** Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication. Caution patient not to increase the dose of controlled-release oxycodone without consulting health care professional.
- Caution patient that controlled-release oxycodone is a potential drug of abuse. Medication should be protected from theft and never given to anyone other than the individual for whom it was prescribed.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patients taking Oxycontin tablets that empty matrix tablets may appear in stool.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

Copyright © 2008 by F.A. Davis

HIGH ALERT

oxymorphone (ox-i-**mor**-fone)
Opana, Opana ER

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Pregnancy Category UK

Indications
Management of moderate to severe pain. Extended-release tablets should only be used in patients who require continuous 24-hr management of chronic pain. Supplement in balanced anesthesia.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression.
Therapeutic Effects: Decrease in pain.

Pharmacokinetics
Absorption: 10% absorbed following oral administration. Food and alcohol significantly ↑ absorption (38%). Well absorbed following IM, subcut, or rectal administration.
Distribution: Widely distributed; crosses placenta, enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; at least 2 metabolites are pharmacologically active, <1% excreted unchanged in urine.
Half-life: 2.6–4 hr.

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	4–6 hr
PO ER	unknown	unknown	12 hr
IM	10–15 min	30–90 min	3–6 hr
IV	5–10 min	15–30 min	3–6 hr
Subcut	10–20 min	unknown	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent alcohol; Moderate/severe hepatic impairment; Respiratory depression (unless monitoring and resuscitative equipment are readily available); Known/suspected paralytic ileus.
Use Cautiously in: Acute alcoholism or delirium tremens or other toxic psychoses; Mild hepatic impairment; Head injury/increased intracranial pressure (may obscure neurologic signs and further increase pressure); Volume depletion or drugs that may cause hypotension including diuretics and phenothiazines (may increase the risk of severe hypotension); Geri: Blood levels are ↑, dose accordingly; Circulatory shock (may increase the risk of severe hypotension); Adrenocortical insufficiency; Hypothyroidism; Prostatic hypertrophy or ureteral stricture; Severe pulmonary or renal impairment; Biliary tract disease or pancreatitis; OB: Use only in pregnancy if maternal benefit outweighs fetal risk; may enter breast milk and increase the risk of sedation/respiratory depression in infant.
Exercise Extreme Caution in: Conditions association with hypoxia, hypercapnea, decreased respiratory reserve (including asthma, COPD, cor pulmonale, morbid obesity, sleep apnea, myxedema, kyphoscoliosis, CNS depression, and coma).

Adverse Reactions/Side Effects
CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions—decrease initial dose of oxymorphone to 25% of usual dose). ↑ risk of CNS depression, hypotension and respiratory depression with **alcohol**, other **opioids** or **CNS depressants** including **sedatives**, **hypnotics**, **general anesthetics**, **phenothiazines**, **tranquilizers**, **skeletal muscle relaxants** or **sedating antihistamines**; may initiate therapy with 1/2 to 1/2 usual starting dose. **Drugs that may cause volume depletion or hypotension** including **diuretics** and **phenothiazines** may ↑ risk of severe hypotension. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**,

Copyright © 2008 by F.A. Davis

buprenorphine, or **pentazocine** ↓ analgesia.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy.
PO (Adults): *Opioid-naive patients*—10–20 mg every 4–6 hr, some patients may require initial dose of 5 mg, not to exceed 20 mg. Once optimal analgesia is obtained, chronic pain patients may be converted to an equivalent 24-hour dose given as extended release tablets every 12 hr.
Subcut, IM (Adults): 1–1.5 mg q 3–6 hr as needed. *Analgesia during labor*—0.5–1 mg.
IV (Adults): 0.5 mg q 3–6 hr as needed; increase as needed.

Availability

Tablets (Opana): 5 mg, 10 mg. **Extended-release tablets (Opana ER):** 5 mg, 10 mg, 20 mg, 40 mg. **Injection:** 1 mg/ml in 1-ml ampules, 1.5 mg/ml in 1-ml ampules and 10-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following IM and 15–30 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking controlled-release tablets should also be given supplemental short-acting opioid doses for breakthrough pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxymorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.

Copyright © 2008 by F.A. Davis

- **PO:** Administer at least 1 hr prior to or 2 hrs after eating.
- Controlled-release tablets should be swallowed whole; do not crush, break, or chew.
- **Controlled Release:** Patients should be titrated to mild to no pain with the regular use of no more than 2 doses of supplemental analgesia (rescue) per 24 hrs. Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.
- If patient is opioid-naive, start with 5 mg every 12 hrs, then titrate in increments of 5–10 mg every 12 hrs every 3–7 days to a level that provides adequate analgesia with minimal side effects.
- If converting from *Opana* to *Opana ER*, administer half the patient's total daily dose of *Opana* as *Opana ER* every 12 hrs.
- If converting from parenteral oxymorphone, administer 10 times the patient's total daily parenteral oxymorphone dose as *Opana ER* in two equally divided doses every 12 hrs.
- If converting from other opioids, 10 mg of oral oxymorphone is equianalgesic to hydrocodone 20 mg, oxycodone 20 mg, methadone 20 mg, and morphine 30 mg orally.

IV Administration

- **Direct IV:** Administer undiluted. ***Concentration:*** 1–1.5 mg/ml. ***Rate:*** Give over 2–3 min.
- **Syringe Compatibility:** glycopyrrolate, hydroxyzine, ranitidine.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take oxymorphone as directed and not to adjust dose without consulting health care professional. Take missed doses as soon as possible. If almost time for next dose, skip dose and return to regular schedule. Do not double doses unless advised by health care professional. Do not stop taking oxymorphone abruptly, may cause withdrawal symptoms. Discontinue gradually under supervision of health care professional. Caution patient to keep medication out of reach of children and pets.
- Caution patient not to share this medication; may cause harm or death and is against the law.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Caution patient not to take any new Rx, OTC, or herbal products without notifying health care professional.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- OB: Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

oxytocin (ox-i-toe-sin)
Pitocin, Syntocinon

Classification
Therapeutic: hormones
Pharmacologic: oxytocics

Pregnancy Category X (intranasal), UK (IV, IM)

Indications

IV: Induction of labor at term. Facilitation of uterine contractions at term. Facilitation of threatened abortion. Postpartum control of bleeding after expulsion of the placenta. **Intranasal:** Used to promote milk letdown in lactating women. **Unlabeled uses:** Evaluation of fetal competence (fetal stress test).

Action

Stimulates uterine smooth muscle, producing uterine contractions similar to those in spontaneous labor. Stimulates mammary gland smooth muscle, facilitating lactation. Has vasopressor and antidiuretic effects. **Therapeutic Effects:** Induction of labor (IV). Milk letdown (intranasal).

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Well absorbed from the nasal mucosa.
Distribution: Widely distributed in extracellular fluid. Small amounts reach fetal circulation.
Metabolism and Excretion: Rapidly metabolized by liver and kidneys.
Half-life: 3–9 min.

TIME/ACTION PROFILE (IV = uterine contractions; intranasal = milk letdown)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1 hr
IM	3–5 min	unknown	30–60 min
Intranasal	few min	unknown	20 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Anticipated nonvaginal delivery; Pregnancy (intranasal).
Use Cautiously in: First and second stages of labor.

Adverse Reactions/Side Effects

Maternal adverse reactions are noted for IV use only.
CNS: *maternal*— COMA, SEIZURES; *fetal*—INTRACRANIAL HEMORRHAGE. **Resp:** *fetal*—ASPHYXIA, hypoxia. **CV:** *maternal*—hypotension; *fetal*—arrhythmias. **F and E:** *maternal*—hypochloremia, hyponatremia, water intoxication. **Misc:** *maternal*— increased uterine motility, painful contractions, abruptio placentae, decreased uterine blood flow, hypersensitivity.

Interactions

Drug-Drug: Severe hypertension may occur if oxytocin follows administration of **vasopressors**. Concurrent use with **cyclopropane** anesthesia may result in excessive hypotension.

Route/Dosage

Induction/Stimulation of Labor

IV (Adults): 0.5–2 milliunits/min; increase by 1–2 milliunits/min q 15–60 min until pattern established (usually 5–6 milliunits/min; maximum 20 milliunits/min), then decrease dose.

Postpartum Hemorrhage

IV (Adults): 10 units infused at 20–40 milliunits/min.
IM (Adults): 10 units after delivery of placenta.

Incomplete/Inevitable Abortion

IV (Adults): 10 units at a rate of 20–40 milliunits/min.

Promotion of Milk Letdown

Intranasal (Adults): 1 spray in 1 or both nostrils 2–3 min before breastfeeding or pumping breasts.

Fetal Stress Test

IV (Adults): 0.5 milliunits/min; may be doubled q 20 min until 3 moderate contractions occur in one 10-min period (usually 5–6 milliunits/min) to a maximum of 20 milliunits/min with maternal/fetal monitoring.

Availability (generic available)

Solution for injection: 10 units/ml in 0.5- and 1-ml ampules, 1-ml prefilled syringes, 1- and 10-ml vials. **Nasal spray:** 40 units/ml in 2- and 5-ml containers.

NURSING IMPLICATIONS

Assessment

- Fetal maturity, presentation, and pelvic adequacy should be assessed prior to administration of oxytocin for induction of labor.
- Assess character, frequency, and duration of uterine contractions; resting uterine tone; and fetal heart rate frequently throughout administration. If contractions occur <2 min apart and are >50–65 mm Hg on monitor, if they last 60–90 sec or longer, or if a significant change in fetal heart rate develops, stop infusion and turn patient on her left side to prevent fetal anoxia. Notify health care professional immediately.
- Monitor maternal blood pressure and pulse frequently and fetal heart rate continuously throughout administration.
- This drug occasionally causes water intoxication. Monitor patient for signs and symptoms (drowsiness, listlessness, confusion, headache, anuria) and notify physician or other health care professional if they occur.
- ***Lab Test Considerations:*** Monitor maternal electrolytes. Water retention may result in hypochloremia or hyponatremia.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse Pitocin (oxytocin) with Pitressin (vasopressin).
- Do not administer oxytocin simultaneously by more than one route.

Copyright © 2008 by F.A. Davis

IV Administration

- **Continuous Infusion:** Rotate infusion container to ensure thorough mixing. Store solution in refrigerator, but do not freeze.
- Infuse via infusion pump for accurate dose. Oxytocin should be connected via Y-site injection to an IV of 0.9% NaCl for use during adverse reactions.
- Magnesium sulfate should be available if needed for relaxation of the myometrium.
- **Induction of Labor:** ***Diluent:*** Dilute 1 ml (10 units) in 1 L of compatible infusion fluid (0.9% NaCl, D5W, or LR). ***Concentration:*** 10 milliunits/ml. ***Rate:*** Begin infusion at 0.5–2 milliunits/min (0.05–0.2 ml); increase in increments of 1–2 milliunits/min at 15–30-min intervals until contractions simulate normal labor.
- **Postpartum Bleeding:** ***Diluent:*** For control of postpartum bleeding, dilute 1–4 ml (10–40 units) in 1 L of compatible infusion fluid. ***Concentration:*** 10–40 milliunits/ml. ***Rate:*** Begin infusion at a rate of 20–40 milliunits/min to control uterine atony. Adjust rate as indicated.
- **Incomplete or Inevitable Abortion:** ***Diluent:*** For incomplete or inevitable abortion, dilute 1 ml (10 units) in 500 ml of 0.9% NaCl or D5W. ***Concentration:*** 20 milliunits/ml. ***Rate:*** Infuse at a rate of 20–40 milliunits/min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, insulin, meperidine, morphine, potassium chloride, vitamin B complex with C, warfarin, zidovudine.
- **Solution Compatibility:** dextrose/Ringer's or lactated Ringer's combinations, dextrose/saline combinations, Ringer's or lactated Ringer's injection, D5W, D10W, 0.45% NaCl, 0.9% NaCl.
- **Intranasal:** Hold squeeze bottle upright while patient is in sitting position. Patient should clear nasal passages prior to administration.

Patient/Family Teaching

- Advise patient to expect contractions similar to menstrual cramps after administration has started.
- **Nasal Spray:** Advise patient to administer nasal spray 2–3 min prior to planned breastfeeding. Patient should notify health care professional if milk drips from non-nursed breast or if uterine cramps occur.

Evaluation/Desired Outcomes

- Onset of effective contractions.
- Increase in uterine tone.
- Effective letdown reflex.

paclitaxel (pak-li-tax-el)
Onxol, Taxol

paclitaxel protein-bound particles (albumin-bound)
Abraxane

Classification
Therapeutic: antineoplastics
Pharmacologic: taxoids

Pregnancy Category D

Indications

Paclitaxel: Advanced ovarian cancer (with cisplatin). Non-small cell lung cancer when potentially curative surgery and/or radiation therapy is not an option. Metastatic breast cancer unresponsive to other therapy. Node-positive breast cancer when administered sequentially to standard combination chemotherapy that includes doxorubicin. Treatment of AIDS-related Kaposi's sarcoma. **Paclitaxel (albumin-bound):** Metastatic breast cancer after treatment failure or relapse where therapy included an anthracycline.

Action

Interferes with the normal cellular microtubule function that is required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Cross the placenta.
Protein Binding: 89–98%.
Metabolism and Excretion: Highly metabolized by the liver, <10% excreted unchanged in urine.
Half-life: *Paclitaxel*—13–52 hr; *Paclitaxel protein-bound particles (albumin-bound)* 27 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	11 days	3 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to paclitaxel or to castor oil (non-protein-bound vehicle contains polyoxyethylated castor oil); Known alcohol intolerance; OB: Pregnancy or lactation; ANC ≤1500/mm³ in patients with ovarian, lung, or breast cancer; ANC ≤1000/mm³ in patients with AIDS-related Kaposi's sarcoma.
Use Cautiously in: Severe hepatic impairment; Geri: ↑ risk of neuropathy, myelosuppression, and cardiovascular events; OB: Childbearing potential; Active infection; Decreased bone marrow reserve; Pedi: Children (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: ECG changes, hypotension, hypotension, bradycardia. **GI:** abnormal liver function tests, diarrhea, mucositis, nausea, vomiting. **Derm:** alopecia. **Hemat:** anemia, neutropenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Resp:** cough, dyspnea. **Local:** injection site reactions. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS.

Interactions

Drug-Drug: Ketoconazole, verapamil, quinidine, cyclosporine, diazepam, dexamethasone, teniposide, etoposide, or vincristine may ↓ metabolism and ↑ risk of serious toxicity; concurrent use should be undertaken with caution. ↑ risk of myelosuppression with other **antineoplastics** or **radiation therapy**. Myelosuppression ↑ when given after **cisplatin**. May ↑ levels and toxicity of **doxorubicin**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage

Many other regimens are used.

PACLITAXEL

Ovarian Cancer

IV (Adults): *Previously untreated patients*—175 mg/m² over 3 hr every 3 wk, or 135 mg/m² over 24 hr every 3 wk, followed by cisplatin; *Previously treated patients*—135 mg/m² or 175 mg/m² over 3 hr every 3 wk.

Breast Cancer

IV (Adults): *Adjuvant treatment of node-positive breast cancer*—175 mg/m² over 3 hr every 3 wk for 4 courses administered sequentially to doxorubicin-containing combination chemotherapy; *Failure of initial therapy for metastatic disease or relapse within 6 mo of adjuvant therapy*—175 mg/m² over 3 hr every 3 wk.

Copyright © 2008 by F.A. Davis

Non-Small Cell Lung Cancer

IV (Adults): 135 mg/m² over 24 hr every 3 wk, followed by cisplatin.

AIDS-Related Kaposi's Sarcoma

IV (Adults): 135 mg/m² over 3 hr every 3 wk or 100 mg/m² over 3 hr every 2 wk (dose reduction/adjustment may be necessary in patients with advanced HIV infection).

PACLITAXEL PROTEIN-BOUND PARTICLES (albumin-bound)

IV (Adults): 260 mg/m² over 30 min every 3 wk.

Availability

Paclitaxel

Solution for injection: 6 mg/ml in 5-ml, 16.7-ml, 25-ml, and 50-ml vials.

Paclitaxel protein-bound particles (albumin-bound)

Powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently, especially during first hr of the infusion.
- Monitor cardiovascular status especially during first 3 hr of infusion. Hypotension and bradycardia are common but usually do not require treatment. Continuous ECG monitoring is recommended only for patients with serious underlying conduction abnormalities.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension. Granulocyte-colony stimulating factor (G-CSF) may be used if necessary.
- Assess for development of peripheral neuropathy. If severe symptoms occur, subsequent dose should be reduced by 20%.
- Monitor intake and output, appetite, and nutritional intake. Paclitaxel causes nausea and vomiting in 50% of patients. Prophylactic antiemetics may be used. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess patient for arthralgia and myalgia, which usually begin 2–3 days after therapy and resolve within 5 days. Pain is usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- **Paclitaxel:** Monitor for hypersensitivity reactions continuously during the first 30 min and frequently thereafter. These occur frequently (19%), usually during the first 10 min of paclitaxel infusion, after the first or second dose. Pretreatment is recommended for **all** patients and should include dexamethasone 20 mg PO (10 mg for patients with advanced HIV disease) 12 and 6 hours prior to paclitaxel, diphenhydramine 50 mg IV 30–60 min prior to paclitaxel, and cimetidine 300 mg or ranitidine 50 mg IV 30–60 min prior to paclitaxel. Most common manifestations are dyspnea, flushing, tachycardia, rash, hypotension, and chest pain. If these occur, stop infusion and notify physician. Treatment may include bronchodilators, epinephrine, antihistamines, and corticosteroids. Keep these agents and resuscitative equipment close by in the event of an anaphylactic reaction. Other manifestations of hypersensitivity reactions include flushing and rash.
- No premedication for hypersensitivty is required for paclitaxel protein-bound (albumin-bound).
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically during therapy. The nadir of leukopenia occurs in 11 days, with recovery by days 15–21. Notify physician if the leukocyte count is <1500/mm³ (1000/mm³ in AIDS-related Kaposi's sarcoma) or if the platelet count is <100,000/mm³. Subsequent doses are usually held until leukocyte count is >1500/mm³ (1000/mm³ in AIDS-related Kaposi's sarcoma) and platelet count is >100,000/mm³.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) prior to and periodically during therapy to detect hepatotoxicity.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

Implementation

- Do not confuse Taxol (paclitaxel) with Taxotere (docetaxel). Do not confuse paclitaxel with Paxil (paroxetine).

Paclitaxel

IV Administration

- **Continuous Infusion:** Paclitaxel must be diluted prior to injection. ***Diluent:*** Dilute

Copyright © 2008 by F.A. Davis

contents of 5-ml (30-mg) vials with the following diluents: 0.9% NaCl, D5W, D5/0.9% NaCl, or dextrose in Ringer's solution. ***Concentration:*** 0.3–1.2 mg/ml. Although haziness in the solution is normal, inspect for particulate matter or discoloration before use. Use an in-line filter of not >0.22-micron pore size. Solutions are stable for 27 hr at room temperature and lighting. Do not use PVC containers or administration sets. ***Rate:*** Dose for *breast cancer or AIDS-related Kaposi's sarcoma* is administered over 3 hr. Dose for *ovarian cancer* is administered as a 24-hr infusion.

- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, ampicillin/sulbactam, bleomycin, butorphanol, calcium chloride, carboplatin, cefepime, ceftazidime, ceftriaxone, cimetidine, cisplatin, cladribine, cyclophosphamide, cytarabine, dacarbazine, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, droperidol, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, lansoprazole, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, morphine, nalbuphine, ondansetron, oxaliplatin, palonosetron, pemetrexed, pentostatin, potassium chloride, prochlorperazine edisylate, propofol, ranitidine, sodium bicarbonate, thiotepa, topotecan, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate, chlorpromazine, doxorubicin liposome, methylprednisolone sodium succinate, mitoxantrone.

Paclitaxel Protein-Bound Particles (Albumin-Bound)

IV Administration

- **Intermittent Infusion:** Reconstitute by slowly adding 20 mL to each vial over at least 1 min for a concentration of 5 mg/mL. Direct solution to inside wall of vial to prevent foaming. Allow vial to sit for at least 5 min to ensure proper wetting of cake/powder. Gently swirl or invert vial for at least 2 min until powder is completely dissolved; avoid foaming. If foaming or clumping occurs, allow vial to stand for 15 min until foaming dissolves. Solution should be milky and homogenous without visible particles. If particles or settling are visible, gently invert vial to resuspend. Inject appropriate amount into sterile PVC IV bag. Do not use an in-line filter during administration. Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution should be administered immediately but is stable for 8 hr if refrigerated. Discard unused portion. ***Rate:*** Administer over no more than 30 min. Monitor infusion site closely for infiltration.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or to take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis usually resolves in 5–7 days.
- Discuss with patient the possibility of hair loss. Complete hair loss usually occurs between days 14 and 21 and is reversible after discontinuation of therapy. Explore coping strategies.
- Advise patient to use a nonhormonal method of contraception. Advise male patients not to father a child while receiving paclitaxel.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

P

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes
- Decrease in size or spread of malignancy.

palifermin (pa-liff-er-min)
Kepivance

Classification
Therapeutic: cytoprotective agents
Pharmacologic: keratinocyte growth factors (rDNA)

Pregnancy Category C

Indications
To decrease incidence/duration of severe oral mucositis associated with myelotoxic therapy requiring stem cell support for hematologic malignancies.

Action
Enhances proliferation of epithelial cells. **Therapeutic Effects:** Decreased incidence/duration of mucositis.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Distributes into extravascular space.
Metabolism and Excretion: Unknown.
Half-life: 4.5 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of dose	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to palifermin or other *E. coli*–derived proteins.
Use Cautiously in: OB: Pregnancy (use only if maternal benefit outweighs fetal risk); Pedi: Children, lactation (safety not established).

Adverse Reactions/Side Effects
Derm: skin toxicity. **GI:** oral toxicity. **Metab:** ↑ amylase, ↑ lipase. **MS:** arthralgia. **Neuro:** dysesthesia.

Interactions
Drug-Drug: Binds to and inactivates **heparin** (flush tubing between use). Administration within 24 hr after **myelotoxic therapy (chemotherapy/radiation)** ↑ severity and duration of mucositis.

Route/Dosage
IV (Adults): 60 mcg/kg/day for 3 days before and 3 days after myelotoxic therapy.

Availability
Powder for injection: 6.25 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess level of oral mucositis prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum lipase and amylase; usually reversible.
- May cause proteinuria.

Potential Nursing Diagnoses
Acute pain (Indications)
Impaired oral mucous membrane (Indications)

Implementation
- Do not administer palifermin within 24 hrs before, during infusion, or 24 hr after infusion of myelotoxic chemotherapy.
- Administer doses for 3 consecutive days before (third dose 24–48 hrs prior to chemotherapy) and 3 consecutive days after myelotoxic chemotherapy (fourth dose on same days as hematopoietic stem cells infusion and at least 4 days after most recent palifermin administration) for a total of 6 doses.

IV Administration
- **Direct IV:** ***Diluent:*** Reconstitute palifermin powder by slowly injecting 1.2 mL of sterile water for injection aseptically. ***Concentration:*** 5 mg/mL. Swirl gently; do not shake or vigorously agitate. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes less than 3 minutes. Administer immediately after reconstitution or refrigerate and administer within 24 hrs. Do not freeze. Allow to reach room temperature for up to 1 hr. Protect from light. Discard palifermin after expiration date or if left at room temperature for more than 1 hr. ***Rate:*** Administer via bolus injection. Do not use a filter.
- **Y-Site Incompatibility:** heparin. If heparin solution is used to maintain IV line, flush with 0.9% NaCl prior to and after use of palifermin.

Patient/Family Teaching
- Inform patient of evidence of tumor growth and stimulation in cell culture and animal models.
- Advise patient to notify health care professional if rash, erythema, edema, pruritus, oral/perioral dysesthesia, tongue discolora-

Copyright © 2008 by F.A. Davis

tion, tongue thickening, alteration of taste occur.

Evaluation/Desired Outcomes

- Decrease in incidence and duration of oral mucositis in patients receiving myelotoxic therapy requiring hematopoietic stem cell support.

paliperidone (pa-li-**per**-i-done)
Invega

Classification
Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

Pregnancy Category C

Indications
Schizophrenia.

Action
May act by antagonizing dopamine and serotonin in the CNS. Paliperidone is the active metabolite of risperidone. **Therapeutic Effects:** Decreased manifestations of schizophrenia.

Pharmacokinetics
Absorption: 28% absorbed following oral administration; food increases absorption.
Distribution: Unknown.
Metabolism and Excretion: 59% excreted unchanged in urine; 32% excreted in urine as metabolites.
Half-life: 23 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	24 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to paliperidone or risperidone; Concurrent use of drugs known to cause QTc prolongation (including quinidine, procainamide, sotalol, amiodarone, chlorpromazine, thioridazine, moxofloxacin); History of congenital QTc prolongation or other cardiac arrhythmias; Bradycardia, hypokalemia, hypomagnesemia (increased risk of QTc prolongation); Pre-existing severe GI narrowing (due to nature of tablet formulation); Lactation: Discontinue drug or bottle feed.

Use Cautiously in: Patients with Parkinson's Disease or Dementia with Lewy Bodies (increased sensitivity to effects of antipsychotics); History of suicide attempt; Patients at risk for aspiration pneumonia; History of seizures; Conditions which may increase body temperature (strenuous exercise, exposure to extreme heat, concurrent anticholinergics or risk of dehydration); Decreased GI transit time (may increase blood levels); May mask symptoms of some drug overdoses, intestinal obstruction, Reye's Syndrome or brain tumor (due to antiemetic effect); Diabetes mellitus; Severe hepatic impairment; Renal impairment (dose reduction recommended if CCr <80 ml/min); OB: Safe use not established; use only if maternal benefit outweighs fetal risk; Pedi: Safety not established; Geri: Increased risk of death when used to treat dementia-related psychoses; consider age-related decrease in renal function.

Adverse Reactions/Side Effects
CNS: NEUROLEPTIC MALIGNANT SYNDROME, drowsiness, headache, anxiety, confusion, dizziness, extrapyramidal disorders (dose related), fatigue, Parkinsonism (dose related), syncope, tardive dyskinesia, weakness. **EENT:** blurred vision. **Resp:** dyspnea, cough. **CV:** palpitations, tachycardia (dose related), bradycardia, orthostatic hypotension, ↑ QTc interval. **GI:** abdominal pain, dry mouth, dyspepsia, nausea, swollen tongue. **Endo:** hyperglycemia. **MS:** back pain, dystonia (dose related). **Neuro:** akithisia, dyskinesia, tremor (dose related). **Misc:** fever.

Interactions
Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **sedative/hypnotics**, or **opioid analgesics**. May antagonize the effects of **levodopa** or other **dopamine agonists**. ↑ risk of orthostatic hypotension with **antihypertensives**, **nitrates**, or other **agents that lower blood pressure**.

Route/Dosage
PO (Adults): 6 mg/day; may be titrated as needed (range 3–12 mg/day)

Renal Impairment
PO (Adults): *CCr 50–80 ml/min*—dose should not exceed 6 mg/day; *CCr 10–<50 ml/min*—dose should not exceed 3 mg/day.

Copyright © 2008 by F.A. Davis

Availability

Extended-release tablets: 3 mg, 6 mg, 9 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue paliperidone and notify physician or other health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** Monitor fasting blood glucose and cholesterol levels before and periodically during therapy.
- May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Risk for other-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)
Impaired oral mucous membrane (Side Effects)
Risk for constipation (Side Effects)
Imbalanced nutrition: risk for more than body requirements (Side Effects)
Disturbed sensory perception: (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

Implementation

- **PO:** Administer once daily in the morning without regard to food. Tablets should be swallowed whole; do not crush, break or chew.
- May administer Brief Psychiatric Rating Scale (BPRS) to evaluate treatment response to medication.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and Rx, OTC, or herbal products without consulting health care professional.
- Advise patient to seek nutritional, weight, or medical management as needed for weight gain or cholesterol elevation.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breastfeeding or planning to breastfeed.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, or tremors occur.
- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.
- Refer to local support group.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes
- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.

palonosetron
(pa-lone-**o**-se-tron)
Aloxi

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Pregnancy Category B

Indications
Prevention of acute and delayed nausea and vomiting caused by initial or repeat courses of moderate or highly emetogenic chemotherapy.

Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zones in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: 50% metabolized; 40% excreted unchanged in urine.
Half-life: 40 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	within 30 min	unknown	7 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; cross sensitivity with other 5-HT_3 antagonists may occur; Lactation.
Use Cautiously in: Hereditary or acquired QTc prolongation, hypokalemia, hypomagnesemia, concurrent diuretic or antiarrhythmic therapy or history of high cumulative anthracycline therapy (may ↑ risk of arrhythmias); OB, Pedi: Pregnancy or children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache. **GI:** constipation, diarrhea,.

Interactions
Drug-Drug: Concurrent **diuretic** or **antiarrhythmic** therapy or history of high cumulative **anthracycline** therapy may ↑ risk of arrhythmias.

Route/Dosage
IV (Adults): 0.25 mg 30 min before start of chemotherapy.

Availability
Solution for IV injection: 0.25mg/5-ml vials.

NURSING IMPLICATIONS

Assessment
- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)
Diarrhea (Side Effects)
Constipation (Side Effects)

Implementation
- First dose is administered prior to emetogenic event.
- Repeated dose within a 7 day period is not recommended.

IV Administration
- **Direct IV:** Administer dose undiluted 30 min prior to chemotherapy. Flush line prior to and after administration with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 0.05 mg/ml. ***Rate:*** Administer over 30 seconds.
- **Syringe Compatibility:** dexamethasone sodium phosphate.
- **Y-Site Compatibility:** carboplatin, cisplatin, docetaxel, irinotecan, lorazepam, midazolam, oxaliplatin, paclitaxel, topotecan.

Patient/Family Teaching
- Inform patient of purpose of medication.
- Advise patient to notify health care professional if nausea or vomiting occur.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy.

pamidronate

(pa-**mid**-roe-nate)
Aredia

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates, hypocalcemics

Pregnancy Category D

Indications

Moderate to severe hypercalcemia associated with malignancy. Osteolytic bone lesions associated with multiple myeloma or breast cancer. Moderate to severe Paget's disease.

Action

Inhibits resorption of bone. **Therapeutic Effects:** Decreased serum calcium. Decreased skeletal destruction in multiple myeloma or breast cancer. Decreased skeletal complications in Paget's disease.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly absorbed by bone. Reaches high concentrations in bone, liver, spleen, teeth, and tracheal cartilage. Approximately 50% of a dose is retained by bone and then slowly released.
Metabolism and Excretion: 50% is excreted unchanged in the urine.
Half-life: Elimination half-life from plasma is biphasic—1st phase 1.6 hr, 2nd phase 27.2 hr. Elimination half-life from bone is 300 days.

TIME/ACTION PROFILE (effect on serum calcium)

ROUTE	ONSET	PEAK	DURATION
IV	24 hr	7 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pamidronate, other biphosphonates, or mannitol.
Use Cautiously in: Underlying cardiovascular disease, especially CHF (initiate saline hydration cautiously); Concurrent dental surgery; Renal impairment (dosage reduction recommended); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** conjunctivitis, blurred vision, eye pain/inflammation, rhinitis. **Resp:** rales. **CV:** arrhythmias, hypertension, syncope, tachycardia. **GI:** nausea, abdominal pain, anorexia, constipation, vomiting. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hypophosphatemia, fluid overload. **Hemat:** leukopenia, anemia. **Local:** phlebitis at injection site. **Metab:** hypothyroidism. **MS:** muscle stiffness, bone pain, osteonecrosis of the jaw. **Misc:** fever, generalized pain.

Interactions

Drug-Drug: Hypokalemia and hypomagnesemia may ↑ risk of **digoxin** toxicity. **Calcium** and **vitamin D** will antagonize the beneficial effects of pamidronate.

Route/Dosage

Single doses should not exceed 90 mg.

Hypercalcemia of Malignancy

IV (Adults): *Moderate hypercalcemia*—30–90 mg; may be repeated after 7 days.

Osteolytic Lesions from Multiple Myeloma

IV (Adults): 90 mg monthly.

Osteolytic Lesions from Metastatic Breast Cancer

IV (Adults): 90 mg q 3–4 wk.

Paget's Disease

IV (Adults): 90–180 mg/treatment; may be given as 30 mg daily for 3 days up to 30 mg/wk for 6 wk. Single doses of 60–90 mg may also be effective.

Availability (generic available)

Injection: 30 mg/vial, 60 mg/vial, 90 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor intake/output ratios and blood pressure frequently during therapy. Assess for signs of fluid overload (edema, rales/crackles).
- Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, and cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, and Chvostek's or Trousseau's sign). Protect

Copyright © 2008 by F.A. Davis

symptomatic patients by elevating and padding side rails; keep bed in low position.
- Monitor IV site for phlebitis (pain, redness, swelling). Symptomatic treatment should be used if this occurs.
- Assess for bone pain. Treatment with nonopioid or opioid analgesics may be necessary.
- ***Lab Test Considerations:*** Monitor serum electrolytes (including calcium, phosphate, potassium, and magnesium), hemoglobin, and creatinine closely. Monitor CBC and platelet count during the first 2 wk of therapy.

Potential Nursing Diagnoses
Acute pain (Indications, Side Effects)
Risk for injury (Indications)

Implementation
- Initiate a vigorous saline hydration, maintaining a urine output of 2000 ml/24 hr, concurrently with pamidronate therapy. Patients should be adequately hydrated, but avoid overhydration. Use caution in patients with underlying cardiovascular disease, especially CHF. Do not use diuretics prior to treatment of hypovolemia.
- Patients with severe hypercalcemia should be started at the 90-mg dose.
- **IV:** Reconstitute by adding 10 ml of sterile water for injection to each vial for a concentration of 30 mg/10 ml, 60 mg/ml, or 90 mg/ml. Allow drug to dissolve before withdrawing. Solution is stable for 24 hr if refrigerated.
- **Hypercalcemia:** Dilute further in 1000 ml of 0.45% NaCl, 0.9% NaCl, or D5W. Solution is stable for 24 hr at room temperature. ***Rate:*** Administer 60-mg infusion over at least 4 hr and 90-mg infusion over 24 hr.
- **Multiple Myeloma:** Dilute reconstituted solution in 500 ml of 0.45% NaCl, 0.9% NaCl, or D5W. ***Rate:*** Administer over 4 hr.
- **Paget's Disease:** Dilute reconstituted solution in 500 ml of 0.45% NaCl, 0.9% NaCl, or D5W. ***Rate:*** Administer over 4 hr.
- **Additive Incompatibility:** Calcium-containing solutions, such as Ringer's solution.

Patient/Family Teaching
- Advise patient to report signs of hypercalcemic relapse (bone pain, anorexia, nausea, vomiting, thirst, lethargy) or eye problems (pain, inflammation, blurred vision, conjunctivitis) to health care professional promptly.
- Advise patient to notify nurse of pain at the infusion site.
- Encourage patient to comply with dietary recommendations. Diet should contain adequate amounts of calcium and vitamin D.
- Advise patient to notify health care professional if bone pain is severe or persistent.
- Caution patients to avoid dental surgery during treatment; recovery may be prolonged.
- Emphasize the need for keeping follow-up exams to monitor progress, even after medication is discontinued, to detect relapse.

Evaluation/Desired Outcomes
- Lowered serum calcium levels.
- Decreased pain from lytic lesions.

pancrelipase (pan-kre-**li**-pase)
Cotazym, ✤Cotazym-65 B, Cotazym E.C.S. 8, Cotazym E.C.S. 20, Cotazym-S, Creon 10, Creon 25, Enzymase-16, Ilozyme, Ku-Zyme HP, Lipram-PN16, Lipram-CR20, Lipram-UL12, Lipram-PN10, Lipram-UL18, Lipram,-UL20, Pancoate, Pancrease, Pancrease MT 4, Pancrease MT 10, Pancrease MT 16, Pancrease MT 20, Pancrebarb MS-8, Protilase, Ultrase MT 12, Ultrase MT 20, Viokase, Zymase

Classification
Therapeutic: digestive agents
Pharmacologic: pancreatic enzymes

Pregnancy Category C

Indications
Pancreatic insufficiency associated with: Chronic pancreatitis, Pancreatectomy, Cystic fibrosis, GI bypass surgery, Ductal obstruction secondary to tumor.

Action
Contains lipolytic, amylolytic, and proteolytic activity. **Therapeutic Effects:** Increased digestion of fats, carbohydrates, and proteins in the GI tract.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (digestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hog proteins.
Use Cautiously in: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

EENT: nasal stuffiness. **Resp:** dyspnea, shortness of breath, wheezing. **GI:** abdominal pain (high doses only), diarrhea, nausea, stomach cramps, oral irritation. **GU:** hematuria. **Derm:** hives, rash. **Metab:** hyperuricemia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Antacids **calcium carbonate** or **magnesium hydroxide** may ↓ effectiveness of pancrelipase. May ↓ the absorption of concurrently administered **iron supplements**.
Drug-Food: Alkaline foods destroy coating on enteric-coated products.

Route/Dosage

PO (Adults): 1–3 capsule(s) before or with meals; dosage may be increased as needed (up to 8 capsules may be needed), *or* 1–2 delayed-release capsule(s), *or* 0.7 g powder.
PO (Children): 1–3 capsule(s) before or with meals; dosage may be increased as needed, *or* 1–2 delayed-release capsule(s), *or* 0.7 g powder.

Availability (generic available)

Capsules: 8000 units lipase/30,000 units protease and amylase. **Delayed-release capsules:** 4000 units lipase/12,000 units protease and amylase, 4000 units lipase/25,000 units protease/20,000 units amylase, 5000 units lipase/20,000 units protease and amylase, ♣8000 units lipase/30,000 units protease and amylase, 10,000 units lipase/30,000 units protease and amylase, 12,000 units lipase/24,000 units protease and amylase, 12,000 units lipase/39,000 units protease and amylase, 16,000 units lipase/48,000 units protease and amylase, ♣20,000 units lipase/55,000 units protease and amylase, 20,000 units lipase/65,000 units protease and amylase, 24,000 units lipase/78,000 units protease and amylase. **Powder:** 16,800 units lipase/70,000 units protease and amylase.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status (height, weight, skin-fold thickness, arm muscle circumference, and lab values) prior to and periodically throughout therapy.
- Monitor stools for high fat content (steatorrhea). Stools will be foul-smelling and frothy.
- Assess patient for allergy to pork; sensitivity to pancrelipase may exist.
- ***Lab Test Considerations:*** May cause elevated serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **PO:** Administer immediately before or with meals and snacks.
- Capsules may be opened and sprinkled on foods. Capsules filled with enteric-coated beads should not be chewed (sprinkle on soft foods that can be swallowed without chewing, such as applesauce or Jell-O).
- Pancrelipase is destroyed by acid. Concurrent sodium bicarbonate or aluminum-containing antacids may be used with nonenteric-coated preparations to neutralize gastric pH. Enteric-coated beads are designed to withstand the acid pH of the stomach. These medications should not be chewed or mixed with alkaline foods prior to ingestion or coating will be destroyed.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional (generally high-calorie, high-protein, low-fat). Dosage should be adjusted for fat content of diet. Usually 300 mg of pancrelipase is necessary to digest every 17 g of dietary fat. If a dose is missed, it should be omitted.
- Instruct patient not to chew tablets and to swallow them quickly with plenty of liquid to prevent mouth and throat irritation. Patient should be sitting upright to enhance swallowing. Eating immediately after taking medication helps further ensure that the medication is swallowed and does not remain in contact with mouth and esophagus for a prolonged period. Patient should avoid sniffing powdered contents of capsules, as sensitization of nose and throat may occur (nasal stuffiness or respiratory distress).

Copyright © 2008 by F.A. Davis

- Instruct patient to notify health care professional if joint pain, swelling of legs, gastric distress, or rash occurs.

Evaluation/Desired Outcomes

- Improved nutritional status in patients with pancreatic insufficiency.
- Normalization of stools in patients with steatorrhea.

HIGH ALERT

pancuronium

(pan-cure-**oh**-nee-yum)
Pavulon

Classification
Therapeutic: neuromuscular blocking agents—nondepolarizing

Pregnancy Category C

Indications

Induction of skeletal muscle paralysis and facilitation of intubation after induction of anesthesia in surgical procedures. Facilitation of compliance during mechanical ventilation.

Action

Prevents neuromuscular transmission by blocking the effect of acetylcholine at the myoneural junction. Has no analgesic or anxiolytic properties. **Therapeutic Effects:** Skeletal muscle paralysis.

Pharmacokinetics

Absorption: Following IV administration, absorption is essentially complete.
Distribution: Rapidly distributes into extracellular fluid; small amounts cross the placenta.
Metabolism and Excretion: Excreted mostly unchanged by the kidneys; small amounts are eliminated in bile.
Half-life: 2 hr.

TIME/ACTION PROFILE (neuromuscular blockade)

ROUTE	ONSET	PEAK	DURATION
IV	30–45 sec	3–4.5 min	40–60 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bromides; Products containing benzyl alcohol should be avoided in neonates.

Use Cautiously in: Patients with underlying cardiovascular disease (increased risk of arrhythmias); Dehydration or electrolyte abnormalities (should be corrected); Situations in which histamine release would be problematic; Fractures or muscle spasm; Geriatric patients or patients with impaired renal function (decreased elimination); Hyperthermia (increased duration/intensity of paralysis); Patients with significant hepatic impairment (altered response); Shock; Extensive burns (may be more resistant to effects of cisatracurium); Low plasma pseudocholinesterase levels (may be seen in association with anemia, dehydration, cholinesterase inhibitors/insecticides, severe liver disease, pregnancy, or hereditary predisposition); Obese patients; Neonates (contains benzyl alcohol which can cause potentially fatal gasping syndrome); Pregnancy or lactation (safety not established for some agents; most agents have been used safely in pregnant women undergoing cesarean section).
Exercise Extreme Caution in: Patients with neuromuscular diseases such as myasthenia gravis (small test dose may be used to assess response).

Adverse Reactions/Side Effects

Resp: bronchospasm. **CV:** hypertension, tachycardia. **GI:** excessive salivation. **Derm:** rash. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Intensity and duration of paralysis may be prolonged by pretreatment with **succinylcholine**, **general anesthesia** (inhalation), **aminoglycosides**, **vancomycin**, **tetracyclines**, **polymyxin B**, **colistin**, **cyclosporine**, **calcium channel blockers**, **clindamycin**, **lidocaine**, and other **local anesthetics**, **lithium**, **quinidine**, **procainamide**, **beta blockers**, **potassium-losing diuretics**, or **magnesium**. **Inhalation anesthetics** including **enflurane**, **isoflurane**, **halothane**, **desflurane**, **sevoflurane** may enhance effects. Higher infusion rates may be required and duration of action may be shortened in patients receiving long-term **carbamazepine**, **steroids (chronic)**, **azathioprine** or **phenytoin**.

Route/Dosage

IV (Adults and Children >12 yrs): 0.15 mg/kg initially; incremental doses of 0.15 mg/kg may be given q 20–60 min as needed to main-

Copyright © 2008 by F.A. Davis

tain paralysis or as a continuous infusion of 0.02–0.04 mg/kg/hr or 0.4–0.6 mcg/kg/min.
IV (Children >1 yr): 0.15 mg/kg q 30–60 min as needed or as a continuous infusion of 0.03–0.1 mg/kg/hr or 0.5–1.7 mcg/kg/min.
IV (Neonates and Infants): 0.1 mg/kg q 30–60 min as needed or as a continuous infusion of 0.02–0.04 mg/kg/hr or 0.4–0.6 mcg/kg/min.

Availability

Injection: 1 mg/ml in 10-ml vials, 2 mg/ml in 2- and 5-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status continuously throughout therapy with neuromuscular blocking agents. These medications should be used only to facilitate intubation or in patients already intubated.
- Neuromuscular response should be monitored with a peripheral nerve stimulator intraoperatively. Paralysis is initially selective and usually occurs sequentially in the following muscles: levator muscles of eyelids, muscles of mastication, limb muscles, abdominal muscles, muscles of the glottis, intercostal muscles, and the diaphragm. Recovery of muscle function usually occurs in reverse order.
- Monitor ECG, heart rate, and blood pressure throughout administration.
- Observe the patient for residual muscle weakness and respiratory distress during the recovery period.
- Monitor infusion site frequently. If signs of tissue irritation or extravasation occur, discontinue and restart in another vein.
- ***Toxicity and Overdose:*** If overdose occurs, use peripheral nerve stimulator to determine the degree of neuromuscular blockade. Maintain airway patency and ventilation until recovery of normal respirations occurs: Administration of anticholinesterase agents (neostigmine, pyridostigmine) may be used to antagonize the action of neuromuscular blocking agents once the patient has demonstrated some spontaneous recovery from neuromuscular block. Atropine is usually administered prior to or concurrently with anticholinesterase agents to counteract the muscarinic effects. Administration of fluids and vasopressors may be necessary to treat severe hypotension or shock.

Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)
Impaired verbal communication (Side Effects)
Fear (Side Effects)

Implementation

- ***High Alert:*** Unintended administration of a neuromuscular blocking agent instead of administration of the intended medication or administration of a neuromuscular blocking agent in the absence of ventilatory support has resulted in serious harm or death. Confusing similarities in packaging and insufficiently controlled access to these medications are often implicated in these medication errors. Store these products in a separate, locked container.
- Dose is titrated to patient response.
- Neuromuscular blocking agents have *no* effect on consciousness or pain threshold. Adequate anesthesia/analgesia should *always* be used when neuromuscular blocking agents are used as an adjunct to surgical procedures or when painful procedures are performed. Benzodiazepines and/or analgesics should be administered concurrently when prolonged neuromuscular blocker therapy is used for ventilator patients, because patient is awake and able to feel all sensations.
- If eyes remain open throughout prolonged administration, protect corneas with artificial tears.
- Store pancuronium in refrigerator. To prevent absorption by plastic, pancuronium should not be stored in plastic syringes. May be administered in plastic syringes.
- Most neuromuscular blocking agents are incompatible with barbiturates and sodium bicarbonate. Do not admix.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 1 mg/ml (10-ml vial); 2-mg/ml (2-ml or 5-ml vial). ***Rate:*** Administer over 1–2 min.
- **Intermittent Infusion:** ***Diluent:*** Add 100 mg of pancuroniuum to 250 ml of D5W, 0.9% NaCl, D5/0.9% NaCl, or LR. ***Concentration:*** 0.4 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** aminophylline, cefazolin, cefuroxime, cimetidine, daptomycin, diltiazem, dobutamine, dopamine, epinephrine, ertapenem, esmolol, etomidate, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium

Copyright © 2008 by F.A. Davis

succinate, hydromorphone, isoproterenol, levofloxacin, linezolid, lorazepam, midazolam, morphine, nitroglycerin, nitroprusside, palonosetron, piperacillin/tazobactam, quinupristin/dalfopristin, ranitidine, trimethoprim/sulfamethoxazole, tacrolimus, tirofiban, vancomycin, voriconazole.

- **Y-Site Incompatibility:** caspofungin, diazepam, pantoprazole, thiopental.

Patient/Family Teaching

- Explain all procedures to patient receiving neuromuscular blocker therapy without general anesthesia, because consciousness is not affected by neuromuscular blocking agents alone.
- Reassure patient that communication abilities will return as the medication wears off.

Evaluation/Desired Outcomes

- Adequate suppression of the twitch response when tested with peripheral nerve stimulation and subsequent muscle paralysis.
- Improved compliance during mechanical ventilation.

panitumumab

(pan-i-**tu**-mu-mab)
Vectibix

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Treatment of metastatic colorectal cancer that expresses EGFR (epidermal growth factor receptor) and has failed conventional treatments.

Action

Binds to EGFR resulting in inactivation of kinases that regulate proliferation and transformation. **Therapeutic Effects:** Decreased progression of colorectal cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Monoclonal antibodies cross the placenta and enter breast milk.
Metabolism and Excretion: Unknown.
Half-life: 7.5 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Concurrent leucovorin; OB: Pregnancy or lactation.
Use Cautiously in: Pedi: Safe use in children not established.

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** OCULAR TOXICITY, eyelash growth. **Resp:** PULMONARY FIBROSIS, cough. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, stomatitis. **Derm:** DERMATOLOGIC TOXICITY, paromychia, photosensitivity. **F and E:** edema, hypocalcemia, hypomagnesemia. **Misc:** INFUSION REACTIONS.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 6 mg/kg as a 60-min infusion every 14 days; decreased infusion rates and dose modifications are recommended for infusion reactions and other serious toxicities.

Availability

Solution for IV administration (requires dilution): 20 mg/mL in 5-ml vials (100 mg/vial).

NURSING IMPLICATIONS

Assessment

- Assess for dermatologic toxicity (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, paronychia, dry skin, skin fissures). If severe, may lead to infection (sepsis, septic death, abscesses requiring incision and drainage). With severe reactions, withhold panitumumab and monitor for inflammatory or infectious sequelae.
- Monitor for severe infusion reactions (anaphylactic reaction, bronchospasm, fever, chills, hypotension). If severe reaction occurs, stop panitumumab; may require permanent discontinuation.
- Assess for pulmonary fibrosis (cough, wheezing, exertional dyspnea, interstitial lung disease, pneumonitis, lung infiltrates). Perma-

Copyright © 2008 by F.A. Davis

nently discontinue panitumumab if these signs occur.
- Monitor for diarrhea during therapy.
- ***Lab Test Considerations:*** Monitor electrolyte levels periodically during and for 8 wks after completion of therapy. May cause hypomagnesemia and hypocalcemia.

Potential Nursing Diagnoses
Risk for impaired skin integrity (Adverse Reactions)
Impaired gas exchange (Adverse Reactions)

Implementation
- **Intermittent Infusion:** Withdraw necessary amount of panitumumab. Dilute to a volume of 100 mL with 0.9% NaCl; dilute doses >1000 mg with 150 mL for a concentration of 10 mg/mL. Mix by inverting gently; do not shake. Administer via infusion pump using a low-protein binding 0.2 mcg or 0.22 mcg in-line filter. Solution is colorless and may contain a small amount of visible translucent to white, amorphous, proteinaceous particles. Do not administer solutions that are discolored or contain particulate matter. Store in refrigerator; do not freeze. Use diluted solution within 6 hr of preparation if stored at room temperature or within 24 hr if refrigerated. ***Rate:*** Administer over 60 min every 14 days. Administer doses >1000 mg over 90 min.
- If mild to moderate infusion reaction (Grade 1 or 2) occurs decrease infusion rate by 50% If severe reaction (Grade 3 or 4) occurs, immediately and permanently discontinue panitumumab.
- If severe dermatologic toxicities (Grade 3 or higher) or those considered intolerable occur, withhold panitumumab. If toxicity does not improve to ≤grade 2 within 1 month, discontinue permanently. If toxicity improves to ≤grade 2 and patient improves symptomatically after withholding no more than 2 doses, resume therapy at 50% dose. If toxicities recur, permanently discontinue panitumumab. If toxicities do not recur, increase subsequent doses in 25% increments of the original dose until recommended dose of 6 mg/kg is reached.
- **Y-Site Incompatibility:** Flush line before and after administration with 0.9% NaCl. Do not mix with other medications or solutions.

Patient/Family Teaching
- May cause photosensitivity. Caution patient to wear sunscreen and hats and to limit sun exposure.
- Advise patient that panitumumab may cause fertility impairment and may have teratogenic effects. Caution women of childbearing years to use contraception during and for at least 6 months after the last dose and not to breast feed during and for at least 2 months after the last dose of panitumumab.
- Inform patient of potential for dermatologic toxicity, infusion reactions, pulmonary fibrosis and impairment of fertility. Advise patient to notify health care professional if skin or ocular changes or dyspnea occur. Advise patient that periodic electrolyte monitoring is required.

Evaluation/Desired Outcomes
- Decreased progression of colorectal cancer.

pantoprazole
(pan-**toe**-pra-zole)
Pantoloc, Protonix, Protonix I.V

Classification
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications
Erosive esophagitis associated with GERD. Decrease relapse rates of daytime and nighttime heartburn symptoms on patients with GERD. Pathologic gastric hypersecretory conditions. **Unlabeled uses:** Adjunctive treatment of duodenal ulcers associated with *Helicobacter pylori*.

Action
Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics
Absorption: Tablet is enteric-coated; absorption occurs only after tablet leaves the stomach.
Distribution: Unknown.
Protein Binding: 98%.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Mostly metabolized by the liver via the cytochrome P450 (CYP) system; inactive metabolites are excreted in urine (71%) and feces (18%).
Half-life: 1 hr.

TIME/ACTION PROFILE (effect on acid secretion)

ROUTE	ONSET†	PEAK	DURATION†
PO	2.5 hr	unknown	1 wk
IV	15–30 min	2 hr	unknown

†Onset = 51% inhibition; duration = return to normal following discontinuation

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Should be used during pregnancy only if clearly needed; Lactation: Discontinue breastfeeding due to potential for serious adverse reactions in infants.
Use Cautiously in: Pedi: Safety not established.

Adverse Reactions/Side Effects
CNS: headache. **GI:** abdominal pain, diarrhea, eructation, flatulence. **Endo:** hyperglycemia.

Interactions
Drug-Drug: May alter the bioavailability and effects of **drugs for which absorption is pH dependent**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage
PO (Adults): *GERD*—40 mg once daily; *Gastric hypersecretory conditions*—40 mg twice daily, up to 120 mg twice daily.
PO (Children): 0.5–1 mg/kg/day.
IV (Adults): *GERD*—40 mg once daily for 7–10 days. *Gastric hypersecretory conditions*—80 mg q 12 hr (up to 240 mg/day).

Availability
Delayed-release tablets: 20 mg, 40 mg.
Cost: 20 mg $353.61/90, 40 mg $351.97/90.
Powder for injection: 40 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, and bilirubin.

Potential Nursing Diagnoses
Acute pain (Indications)

Implementation
- Patients receiving pantoprazole IV should be converted to PO dosing as soon as possible.
- **PO:** May be administered with or without food. Do not break, crush, or chew tablets.
- Antacids may be used concurrently.

IV Administration
- **IV:** ***Diluent:*** Reconstitute each vial with 10 mL of 0.9% NaCl. Reconstituted solution is stable for 6 hr at room temperature
- **Direct IV:** ***Concentration:*** Administer the 4 mg/mL solution undiluted. ***Rate:*** Administer over at least 2 min.
- **Intermittent Infusion:** Dilute further with D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.4–0.8 mg/ml. Diluted solution is stable for 24 hr at room temperature. ***Rate:*** Administer over 15 min at a rate of <3 mg/min.
- **Y-Site Compatibility:** ampicillin, cefazolin, ceftriaxone, dopamine, furosemide, epinephrine, insulin, morphine, nitroglycerin, potassium chloride, vasopressin.
- **Y-Site Incompatibility:** dobutamine, esmolol, mannitol, midazolam, multivitamins, solutions containing zinc.

Patient/Family Teaching
- Instruct patient to take medication as directed for the full course of therapy, even if feeling better.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly.

Evaluation/Desired Outcomes
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk.

paricalcitol, See VITAMIN D COMPOUNDS.

paroxetine hydrochloride
(par-**ox**-e-teen)
Paxil, Paxil CR

Copyright © 2008 by F.A. Davis

paroxetine mesylate
Pexeva

Classification
Therapeutic: antianxiety agents, antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category D

Indications
Paxil, Paxil CR, Pexeva. Major depressive disorder, panic disorder. Paxil, Pexeva. Obsessive compulsive disorder (OCD), generalized anxiety disorder (GAD). Paxil, Paxil CRSocial anxiety disorder. Paxil. Post-traumatic stress disorder (PTSD). Paxil CRPremenstrual dysphoric disorder (PMDD).

Action
Inhibits neuronal reuptake of serotonin in the CNS, thus potentiating the activity of serotonin; has little effect on norepinephrine or dopamine. **Therapeutic Effects:** Antidepressant action. Decreased frequency of panic attacks, OCD, or anxiety. Improvement in manifestations of post-traumatic stress disorder. Decreased dysphoria prior to menses.

Pharmacokinetics
Absorption: Completely absorbed following oral administration. Controlled-release tablets are enteric-coated and control medication release over 4–5 hr.
Distribution: Widely distributed throughout body fluids and tissues, including the CNS; cross the placenta and enter breast milk.
Protein Binding: 95%.
Metabolism and Excretion: Highly metabolized by the liver (partly by P450 2D6 enzyme system); 2% excreted unchanged in urine.
Half-life: 21 hr.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor, thioridazine, or pimozide therapy.
Use Cautiously in: Risk of suicide (may ↑ risk of suicide attempt/ ideation especially during early treatment or dose adjustment); History of seizures; History of bipolar disorder; OB: Use during the first trimester may be associated with an increased risk of cardiac malformations—consider fetal risk/maternal benefit; use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Lactation: Safety not established; discontinue drug or bottle feed; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment may be greater in children and adolescents (safety in children/adolescents not established); Geri: Severe renal hepatic impairment; geriatric or debilitated patients (daily dose should not exceed 40 mg); History of mania/risk of suicide.

Adverse Reactions/Side Effects
CNS: anxiety, dizziness, drowsiness, headache, insomnia, weakness, agitation, amnesia, confusion, emotional lability, hangover, impaired concentration, malaise, mental depression, suicidal behavior, syncope. **EENT:** blurred vision, rhinitis. **Resp:** cough, pharyngitis, respiratory disorders, yawning. **CV:** chest pain, edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, decreased appetite, dyspepsia, flatulence, increased appetite, taste disturbances, vomiting. **GU:** ejaculatory disturbance, decreased libido, genital disorders, urinary disorders, urinary frequency. **Derm:** sweating, photosensitivity, pruritus, rash. **Metab:** weight gain, weight loss. **MS:** back pain, myalgia, myopathy. **Neuro:** paresthesia, tremor. **Misc:** chills, fever.

Interactions
Drug-Drug: Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitor** therapy. MAO inhibitors should be stopped at least 14 days prior to paroxetine therapy. Paroxetine should be stopped at least 14 days prior to MAO inhibitor therapy. May ↓ metabolism and ↑ effects of certain **drugs that are metabolized by the liver**, including other **antidepressants**, **phenothiazines**, **class IC antiarrhythmics**, **risperidone**, **atomoxetine**, **theophylline**, **procyclidine**, and **quinidine**. Concurrent use should be undertaken with caution. Concurrent use with **pimozide** or **thioridazine** may ↑ risk of QT inter-

Copyright © 2008 by F.A. Davis

val prolongation and torsades de pointes. Concurrent use is contraindicated. **Cimetidine** ↑ blood levels. **Phenobarbital** and **phenytoin** may ↓ effectiveness. Concurrent use with **alcohol** is not recommended. May ↓ the effectiveness of **digoxin**. May ↑ risk of bleeding with **warfarin**, **aspirin**, or **NSAIDs**. Concurrent use with **5-HT$_1$ agonists** (**frovatriptan**, **naratriptan**, **rizatriptan**, **sumatriptan**, **zolmitriptan**), **linezolid**, **lithium**, or **tramadol** may result in increased serotonin levels and lead to serotonin syndrome.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort**, **SAMe**, and **tryptophan**.

Route/Dosage

Depression

PO (Adults): 20 mg as a single dose in the morning; may be ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day). *Controlled-release tablets*—25 mg once daily initially. May ↑ at weekly intervals by 12.5 mg (not to exceed 62.5 mg/day).

PO (Geriatric Patients or Debilitated Patients): 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

Obsessive-Compulsive Disorder

PO (Adults): 20 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day).

Panic Disorder

PO (Adults): 10 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day). *Controlled-release tablets*—12.5 mg/day initially; ↑ by 12.5 mg/day at weekly intervals (not to exceed 75 mg/day).

Social Anxiety Disorder

PO (Adults): 20 mg/day. *Controlled-release tablets*—12.5 mg/day initially; may ↑ by 12.5 mg/day weekly intervals (not to exceed 37.5 mg/day).

Generalized Anxiety Disorder

PO (Adults): 20 mg once daily initially; ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Post-traumatic Stress Disorder

PO (Adults): 20 mg/day initially; may be ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Premenstrual Dysphoric Disorder

PO (Adults): *Controlled-release tablets*—12.5 mg once daily throughout menstrual cycle or during luteal phase of menstrual cycle only; may be ↑ to 25 mg/day after one week.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

Renal Impairment

PO (Adults): *Severe renal impairment*—10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may be slowly ↑ increased (not to exceed 50 mg/day).

P

Availability (generic available)

Paroxetine hydrochloride tablets: 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—10 mg $89.96/90, 20 mg $28.99/90, 30 mg $101.97/90, 40 mg $110.96/90. **Paroxetine hydrochloride controlled-release tablets:** 12.5 mg, 25 mg, 37.5 mg. **Cost:** 12.5 mg $297.99/90, 25 mg $303.95/90, 37.5 mg $317.99/90. **Paroxetine hydrochloride oral suspension (orange flavor):** 10 mg/5 ml. **Cost:** $166.90/250 ml. **Paroxetine mesylate tablets:** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 20 mg $352.95/90, 30 mg $256.21/90, 40 mg $383.97/90.

NURSING IMPLICATIONS

Assessment

- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- **Depression:** Monitor mental status (orientation, mood, behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.

Copyright © 2008 by F.A. Davis

- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **Social Anxiety Disorder:** Assess frequency and severity of episodes of anxiety.
- **Post-traumatic Stress Disorder:** Assess manifestations of post-traumatic stress disorder periodically during therapy.
- **Premenstrual Dysphoria:** Assess symptoms of premenstrual distress prior to and during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Report leukopenia or anemia.

Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Implementation

- Do not confuse paroxetine (Paxil) with paclitaxel (Taxol).
- Paroxetine mesylate (Pexeva) cannot be substituted with paroxetine (Paxil or Paxil CR) or generic paroxetine.
- Periodically reassess dose and continued need for therapy.
- **PO:** Administer as a single dose in the morning. May administer with food to minimize GI irritation.
- Tablets should be swallowed whole. Do not crush, break, or chew.
- Taper to avoid potential withdrawal reactions.

Patient/Family Teaching

- Instruct patient to take paroxetine as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses. Caution patient to consult health care professional before discontinuing paroxetine. Daily doses should be decreased slowly. Abrupt withdrawal may cause dizziness, sensory disturbances, agitation, anxiety, nausea, and sweating.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol or other CNS-depressant drugs during therapy and to consult with health care professional before taking other medications or herbal products with paroxetine.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists for more than 2 wk.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if she is breastfeeding.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.
- Refer patient to local support group.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in frequency and severity of episodes of anxiety.
- Improvement in manifestations of post-traumatic stress disorder.
- Decreased dysphoria prior to menses.

pegaspargase

(peg-ass-**par**-jase)
Oncaspar, PEG-L-asparaginase

Classification
Therapeutic: antineoplastics
Pharmacologic: enzymes

Pregnancy Category C

Indications

Treatment (usually with other agents) of acute lymphoblastic leukemia (ALL) in patients who have had a previous hypersensitivity reaction to native asparaginase.

Action

Consists of L-asparaginase bound to polyethylene glycol (PEG). This compound depletes asparagine, which leukemic cells cannot synthesize. Normal cells are able to produce their own asparagine and are less susceptible to the effects

Copyright © 2008 by F.A. Davis

of asparaginase. Binding to PEG renders asparaginase less antigenic and therefore less likely to induce hypersensitivity reactions. **Therapeutic Effects:** Death of leukemic cells.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolized by serum proteases and in the reticuloendothelial system.
Half-life: 5.7 days (less in patients with previous hypersensitivity to native L-asparaginase).

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	14 days

Contraindications/Precautions

Contraindicated in: Pancreatitis or history of pancreatitis; History of previous hemorrhagic reaction to asparaginase therapy; Previous hypersensitivity reactions to pegaspargase.
Use Cautiously in: History of previous hypersensitivity reactions to other drugs; Patients with childbearing potential; OB: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, headache, malaise. **GI:** PANCREATITIS, abdominal pain, abnormal liver function tests, anorexia, diarrhea, lip edema, nausea, vomiting. **Derm:** jaundice. **Endo:** hyperglycemia. **F and E:** peripheral edema. **Hemat:** decreased fibrinogen, disseminated intravascular coagulation, hemolytic anemia, increased thromboplastin, leukopenia, pancytopenia, thrombocytopenia. **Local:** injection site hypersensitivity, injection site pain, thrombosis. **MS:** arthralgia, myalgia, pain in extremities. **Neuro:** paresthesia. **Misc:** chills, hypersensitivity reactions, night sweats.

Interactions

Drug-Drug: May alter response to **anticoagulants** or **antiplatelet agents**. May alter the response to other **drugs that are metabolized by the liver**.

Route/Dosage

IM, IV (Adults up to 21 yr, and Children with Body Surface Area ≥0.6 m²): 2500 IU/m² q 14 days (usually in combination with other agents).
IM, IV (Children with Body Surface Area <0.6 m²): 82.5 IU/kg q 14 days (usually in combination with other agents).

Availability

Injection: 750 IU/ml.

NURSING IMPLICATIONS

Assessment

- Assess patient for previous hypersensitivity reactions to native L-asparaginase. Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm). Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration.
- Monitor for development of bone marrow depression. Assess for fever, sore throat, and signs of infection. Monitor platelet count throughout therapy. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid giving IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor patient frequently for signs of pancreatitis (nausea, vomiting, abdominal pain).
- Assess nausea, vomiting, and appetite. Weigh patient weekly. Prophylactic antiemetics may be used prior to administration.
- ***Lab Test Considerations:*** Monitor CBC prior to and periodically throughout therapy. May alter coagulation studies. Fibrinogen may be decreased; PT and partial thromboplastin time (PTT) may be ↑.
- Monitor serum amylase frequently to detect pancreatitis.
- Monitor blood glucose; may cause hyperglycemia.
- May cause elevated BUN and serum creatinine.
- Hepatotoxicity may be manifested by increased AST, ALT, or bilirubin. Liver function tests usually return to normal after therapy.
- May cause ↓ serum calcium.
- May cause elevated serum and urine uric acid and hyponatremia.

P

Copyright © 2008 by F.A. Davis

Potential Nursing Diagnoses
Risk for infection (Adverse Reactions)

Implementation
- Do not confuse pegaspargase with asparaginase.
- IM is the preferred route because of a lower incidence of adverse reactions.
- Solutions should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- **IM:** Limit single injection volume to 2 ml. If volume of injection is >2 ml, use multiple injection sites.

IV Administration
- **Intermittent Infusion:** ***Diluent:*** Dilute each dose in 100 ml of 0.9% NaCl or D5W. Do not shake or agitate. Do not use if solution is cloudy or has formed a precipitate
- Use only 1 dose per vial; do not re-enter the vial. Discard unused portions.
- Keep refrigerated but do not freeze. Freezing destroys activity but does not change the appearance of pegaspargase. ***Rate:*** Administer over 1–2 hr via Y-site through an infusion that is already running.
- **Additive Incompatibility:** Information unavailable. Do not admix with other medications or solutions.

Patient/Family Teaching
- Inform patient of the possibility of hypersensitivity reactions, including anaphylaxis.
- Advise patient that concurrent use of other medications may increase the risk of bleeding and the toxicity of pegaspargase. Consult health care professional before taking any other medications, including OTC drugs.
- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush, electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medications containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter child's immunization schedule.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Improvement of hematologic status in patients with leukemia.

pegfilgrastim
(peg-fil-**gra**-stim)
Neulasta

Classification
Therapeutic: colony-stimulating factors

Pregnancy Category C

Indications
To decrease the incidence of infection (febrile neutropenia) in patients with nonmyeloid malignancies receiving myelosuppressive antineoplastics associated with a high risk of febrile neutropenia.

Action
Filgrastim is a glycoprotein that binds to and stimulates neutrophils to divide and differentiate. Also activates mature neutrophils. Binding to a polyethylene glycol molecule prolongs its effects. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy.

Pharmacokinetics
Absorption: Well absorbed following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 15–80 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
subcut	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*-derived proteins.
Use Cautiously in: Patients with sickle cell disease (increased risk of sickle cell crisis); Concurrent use of lithium; Malignancy with myeloid characteristics; Pregnancy, lactation, or children (safety not established; 6 mg fixed dose should not be used in infants, children, and smaller adolescents weighing <45 kg; use in pregnancy only if potential benefits to mother justifies potential risk to the fetus).

Copyright © 2008 by F.A. Davis

Adverse Reactions/Side Effects

Resp: ADULT RESPIRATORY DISTRESS SYNDROME (ARDS). **GI:** SPLENIC RUPTURE. **Hemat:** SICKLE CELL CRISIS, leukocytosis. **MS:** medullary bone pain. **Misc:** allergic reaction including ANAPHYLAXIS.

Interactions

Drug-Drug: Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils; avoid use for 24 hr before and 24 hr following chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

Subcut (Adults): 6 mg per chemotherapy cycle.

Availability

Solution for subcut injection: 6 mg/0.6 ml in prefilled syringes.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require opioid analgesics.
- Assess patient periodically for signs of ARDS (fever, lung infiltration, respiratory distress). If ARDS occurs, treat condition and discontinue pegfilgrastim and/or withold until symptoms resolve.
- ***Lab Test Considerations:*** Obtain CBC and platelet count before chemotherapy. Monitor hematocrit and platelet count regularly.
- May cause elevated LDH, alkaline phosphatase, and uric acid.

Potential Nursing Diagnoses

Risk for infection (Indications)
Acute pain (Side Effects)

Implementation

- Pegfilgrastim should not be administered between 14 and 24 days after administration of cytotoxic chemotherapy.
- Keep patients with sickle cell disease receiving pegfilgrastim well hydrated and monitor for sickle cell crisis.
- **Subcut:** Administer subcut once per chemotherapy cycle. Do not administer solutions that are discolored or contain particulate matter. Do not shake. Store refrigerated; may be allowed to reach room temperature for a maximum of 48 hr, but protect from light.
- Supplied in prefilled syringes. Following administration, activate UltraSafe Needle Guard to prevent needle sticks by placing hands behind needle, grasping guard with one hand, and sliding guard forward until needle is completely covered and guard clicks into place. If audible click is not heard, guard may not be completely activated. Dispose of by placing entire prefilled syringe with guard activated into puncture-proof container.

Patient/Family Teaching

- Advise patient to notify health care professional immediately if signs of allergic reaction (shortness of breath, hives, rash, pruritus, laryngeal edema) or signs of splenic rupture (left upper abdominal or shoulder tip pain) occur.
- Emphasize the importance of compliance with therapy and regular monitoring of blood counts.
- **Home Care Issues:** Instruct patient on correct disposal technique for home administration. Caution patient not to reuse needle, syringe, or drug product. Provide patient with a puncture-proof container for disposal of prefilled syringe.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow–depressing antineoplastics.

peginterferon alpha-2b/2a, See INTERFERONS, ALFA.

pemetrexed (pe-me-trex-ed)
Alimta

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites, folate antagonists

Pregnancy Category D

Indications

Malignant pleural mesothelioma (with cisplatin) when tumor is unresectable or patient is not a candidate for surgery. Local advanced or met-

Copyright © 2008 by F.A. Davis

astatic non-small cell lung cancer in previously treated patients.

Action

Disrupts folate dependent metabolic processes involved in thymidine and purine synthesis. Converted intracellularly to polyglutamate form which increases duration of action. **Therapeutic Effects:** Decreases growth and spread of mesothelioma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Minimal metabolism; 70–90% excreted unchanged in urine.
Half-life: 3.5 hr (normal renal function).

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	8–15 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; CCr <45 ml/min; OB: Pregnancy, lactation.
Use Cautiously in: Concurrent use of NSAIDs (avoid those with short half-lives); CCr 45–80 ml/min; Third space fluid accumulation (ascites, pleural effusions); consider drainage prior to therapy; Hepatic impairment (dosage alteration recommended); Pedi: Children (safety not established).

Adverse Reactions/Side Effects

Resp: pharyngitis. **CV:** chest pain. **GI:** constipation, nausea, stomatitis, vomiting, anorexia, diarrhea, esophagitis, mouth pain. **Derm:** desquamation, rash. **Hemat:** anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy. **Misc:** fever, infection.

Interactions

Drug-Drug: NSAIDs, especially those with short half-lives, ↑ blood levels and risk of toxicity; avoid for 2 days before, day of and 2 days after treatment. **Probenecid** ↑ blood levels. Concurrent use of **nephrotoxic agents** ↑ risk of nephrotoxicity.

Route/Dosage

IV (Adults): *Mesothelioma*—500 mg/m^2 on day 1 of each 21 day cycle (with cisplatin); concurrent hydration, folic acid, vitamin B_{12}, pretreatment with dexamethasone required. Dose adjustments for hematologic, non-hematologic toxicities and neurotoxicity recommended. *Non–small cell lung cancer* 500 mg/m^2 on day 1 of each 21 day cycle (pretreatment with corticosteroids, folic acid and vitamin B_{12} recommended). Dose adjustments for hematologic, non-hematologic toxicities and neurotoxicity recommended.

Availability

Lyophilized powder for IV infusion: 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for rash during therapy. Pretreatment with dexamethasone 4 mg orally twice daily the day before, the day of, and the day after administration reduces incidence and severity or reaction.
- Monitor for hematologic and GI (mucositis, diarrhea) toxicities. If any Grade 3 or 4 toxicities, except mucositis or diarrhea, requiring hospitalization occur, decrease doses of pemetrexed and cisplatin by 75%. If Grade 3 or 4 mucositis occurs decrease pemetrexed dose by 50% and cisplatin by 100% of previous dose.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess for neurotoxicity during therapy. If Grade 0–1 neurotoxicity occurs, decrease pemetrexed and cisplatin doses by 100% of previous dose. If Grade 2 neurotoxicity occurs, decrease pemetrexed dose by 100% and cisplatin dose by 50% of previous dose. If Grade 3 or 4 neurotoxicity occurs, discontinue therapy.
- ***Lab Test Considerations:*** Monitor CBC and platelet counts for nadir and recovery, before each dose and on days 8 and 15 of each cycle and chemistry for renal and liver functions periodically. May cause neutropenia, thrombocytopenia, leukopenia, and anemia. A new cycle should not be started unless the ANC is at least 1500 cells/mm^3, platelet count is at least 100,000 cells/mm^3, and creatinine clearance is at least 45 mL/min. If nadir of ANC is less than 500/mm^3 and nadir of

Copyright © 2008 by F.A. Davis

platelets are at least 50,000/mm^3 decrease doses of pemetrexed and cisplatin by 75%. If nadir of platelets is less than 50,000/mm^3 regardless of ANC nadir decrease pemetrexed and cisplatin doses by 50%.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Pemetrexed should be administered under supervision of a physician experienced in the use of chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- To reduce toxicity, at least 5 mg of folic acid must be taken daily for 7 days preceding first dose of pemetrexed and should continue during and for 21 days after last dose. Patients must also receive an injection of vitamin B_{12} 1000 mcg during the week preceding first dose of permetrexed and every 3 cycles thereafter. Subsequent doses of vitamin B_{12} may be given on same day as pemetrexed.

IV Administration

- **Intermittent Infusion:** Calculate number of pemetrexed 500-mg vials needed; vials contain excess to facilitate delivery. ***Diluent:*** Reconstitute 500 mg with 20 mL of preservative–free 0.9% NaCl for a solution containing 25 mg/mL. Swirl gently until powder is completely dissolved. Solution is clear and colorless to yellow or green-yellow. Do not administer if discolored or containing particulate matter. Dilute further to 100 mL with preservative–free 0.9% NaCl. Solution is stable at room temperature or if refrigerated for up to 24 hr. ***Rate:*** Administer over 10 min.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, ampicillin, amipicillin/sulbactam, aztreonam, bumetanide, buprenorphine, butorphanol, carboplatin, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, dexrazoxane, diphenhydramine, docetaxel, dopamine, enalaprilat, famotidine, fluconazole, fluorouracil, ganciclovir, granisetron, haloperidol, heparin, hydromoorphone, ifosfamide, leucovorin, lorazepam, mannitol, meperidine, mesna, methylprednisolone sodium succinate, metoclopramide, morphine, paclitaxel, potassium chloride, promethazine, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, zidoudine.
- **Y-Site Incompatibility:** amphotericin B, cefazolin, cefotaxime, cefoxitin, ceftazidime, chlorpromazine, ciprofloxacin, dobutamine, doxorubicin, doxycycline, droperidol, gemcitabine, gentamicin, irinotecan, metronidazole, mitoxantrone, nalbuphine, ondansetron, prochlorperazine, tobramycin, topotecan.
- **Additive Incompatibility:** Solutions containing calcium, including Lactated Ringer's and Ringer's solution.

Patient/Family Teaching

- Emphasize the importance of taking prophylactic folic acid and vitamin B_{12} to reduce treatment-related hematologic and GI toxicity.
- OB: Advise patient to avoid becoming pregnant during therapy. If pregnancy is planned or suspected notify health care professional promptly.

Evaluation/Desired Outcomes

- Decreased growth and spread of mesothelioma or non-small cell lung cancer.

penciclovir

(pen-**sye**-kloe-veer)
Denavir

Classification
Therapeutic: antivirals (topical)

Pregnancy Category B

Indications

Recurrent herpes labialis (cold sores).

Action

Inhibits viral DNA synthesis and replication.
Therapeutic Effects: Death of herpes virus. Decreased lesion duration and pain. Active against herpes viruses.

Pharmacokinetics

Absorption: Not absorbed following topical use.
Distribution: Unknown.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Converted intracellularly to active triphosphate form; excreted in urine.
Half-life: 2–2.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
topical	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to penciclovir or other components of the formulation.
Use Cautiously in: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: headache. **Local:** application site reactions.

Interactions
Drug-Drug: None significant.

Route/Dosage
PO (Adults): Apply 1% cream q 2 hr for 4 days while awake.

Availability
Cream: 1% in 2-g tubes.

NURSING IMPLICATIONS

Assessment
- Assess lesions prior to and daily during therapy.

Potential Nursing Diagnoses
Risk for impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation
- Do not confuse Denavir (penciclovir) with indinivir.
- Begin treatment as early as possible, during prodrome or when lesions appear.
- **Topical:** Apply to lesions every 2 hr for 4 days while awake.
- Apply to lips and face only; avoid application to mucous membranes or near the eyes.

Patient/Family Teaching
- Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible but not just before next dose is due; do not double doses. Penciclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.

Evaluation/Desired Outcomes
- More rapid healing of lesions and relief of pain in herpes labialis.

PENICILLINS (pen-i-**sill**-ins)

penicillin G
Pfizerpen

penicillin V
Apo-Pen VK, Crystapen, Novo-Pen-VK, Nu-Pen-VK, Penicilline V

procaine penicillin G
Wycillin

benzathine penicillin G
Bicillin L-A, Permapen

Classification
Therapeutic: anti-infectives
Pharmacologic: penicillins

Pregnancy Category B

Indications
Treatment of a wide variety of infections including: Pneumococcal pneumonia, Streptococcal pharyngitis, Syphilis, Gonorrhea strains. Treatment of enterococcal infections (requires the addition of an aminoglycoside). Prevention of rheumatic fever. Should not be used as a single agent to treat anthrax. **Unlabeled uses:** Treatment of Lyme disease. Prevention of recurrent *Streptococcal pneumoniae* septicemia in children with sickle-cell disease.

Action
Bind to bacterial cell wall, resulting in cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Most gram-positive organisms, including many streptococci (*Streptococcus pneumoniae*, group A beta-hemolytic streptococci), staphylococci (non–penicillinase-producing strains) and *Bacillus anthracis*. Some gram-negative organisms, such as *Neisseria meningitidis* and *Neisseria gonorrhoeae* (only penicillin susceptible strains). Some anaerobic bacteria and spirochetes including *Borellia burgdorferi*.

Copyright © 2008 by F.A. Davis

Pharmacokinetics

Absorption: Variably absorbed from the GI tract. *Penicillin V*—resists acid degradation in the GI tract. *Procaine and benzathine penicillin*—IM absorption is delayed and prolonged and results in sustained therapeutic blood levels.

Distribution: Widely distributed, although CNS penetration is poor in the presence of uninflamed meninges. Cross the placenta and enter breast milk.

Metabolism and Excretion: Minimally metabolized by the liver, excreted mainly unchanged by the kidneys.

Half-life: 30–60 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
penicillin V PO	rapid	0.5–1 hr	4–6 hr
penicillin G IM	rapid	0.25–0.5 hr	4–6 hr
benzathine penicillin IM	delayed	12–24 hr	3 wk
procaine penicillin IM	delayed	1–4 hr	12 hr
penicillin G IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to penicillins (cross-sensitivity may exist with cephalosporins and other beta-lactams); Hypersensitivity to procaine or benzathine (procaine and benzathine preparations only); Some products may contain tartrazine and should be avoided in patients with known hypersensitivity.

Use Cautiously in: Geri: Geriatric patients (consider decreased body mass, age-related decrease in renal/hepatic/cardiac function, intercurrent diseases and drug therapy); Severe renal insufficiency (dose reduction recommended); OB: Pregnancy (although safety not established, has been used safely); Lactation (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES. **GI:** diarrhea, epigastric distress, nausea, vomiting, pseudomembranous colitis. **GU:** interstitial nephritis. **Derm:** rashes, urticaria. **Hemat:** eosinophilia, hemolytic anemia, leukopenia. **Local:** pain at IM site, phlebitis AT IV SITE. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Penicillin may ↓ effectiveness of oral contraceptive agents. **Probenecid** ↓ renal excretion and ↑ blood levels of penicillin (therapy may be combined for this purpose). **Neomycin** may ↓ absorption of penicillin V. ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage

Penicillin G (aqueous)

IM, IV (Adults): *Most infections*—1–5 million units q 4–6 hr.

IM, IV (Children): 8333–16,667 units/kg q 4 hr; 12,550–25,000 units/kg q 6 hr; up to 250,000 units/kg/day in divided doses, some infections may require up to 300,000 units/kg/day.

IV (Infants >7 days): 25,000 units/kg q 8 hr; *meningitis*—50,000–75,000 units/kg q 6 hr.

IV (Infants <7 days): 25,000 units/kg q 12 hr; *Streptococcus B meningitis*—100,000–150,000 units/kg/day in divided doses.

Penicillin V

PO (Adults and Children ≥12 yr): *Most infections*—125–500 mg q 6–8 hr. *Rheumatic fever prevention*—125–250 mg q 12 hr.

PO (Children <12 yr): *Lyme disease*—12.5 mg/kg q 6 hr (unlabeled); prevention of *Streptococcus pneumoniae* sepsis in children with sickle cell disease—125 mg twice daily.

Benzathine Penicillin G

IM (Adults): *Streptococcal infections/erysipeloid*—1.2 million units single dose. *Primary, secondary, and early latent syphilis*—2.4 million units single dose. *Tertiary and late latent syphilis (not neurosyphilis)*—2.4 million units once weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 3–4 wk.

IM (Children >27 kg): *Streptococcal infections/erysipeloid*—900,000–1.2 million units (single dose). *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.

IM (Children <27 kg): *Streptococcal infections/erysipeloid*—300,000–600,000 units

P

Copyright © 2008 by F.A. Davis

single dose. *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.

Procaine Penicillin G

IM (Adults): *Moderate or severe infections*—600,000–1.2 million units/day as a single dose or in 2 divided doses. *Neurosyphilis*—2.4 million units/day with 500 mg probenecid PO 4 times daily for 10–14 days.
IM (Children): *Congenital syphilis*—50,000 units/kg/day for 10–14 days.

Availability

Penicillin G Potassium

Powder for injection: 5 million units/vial, 20 million units/vial. **Premixed (frozen) solution for injection:** 1 million units/50 ml, 2 million units/50 ml, 3 million units/50 ml.

Penicillin G Sodium

Powder for injection: 5 million units/vial.

Penicillin V Potassium

Tablets: 250 mg, 500 mg. **Oral solution:** 125 mg/5 ml, 250 mg/5 ml.

Procaine Penicillin G

Suspension for IM injection: 600,000 units/ml in 1-ml and 2-ml prefilled syringes.

Benzathine Penicillin G

Suspension for IM injection: 600,000 units/ml in 1-, 2-, and 4-ml prefilled syringes.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause positive direct Coombs' test results.
- Hyperkalemia may develop after large doses of penicillin G potassium.
- Monitor serum sodium concentrations in patient with hypertension or CHF. Hypernatremia may develop after large doses of penicillin sodium.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.
- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse penicillin with penicillamine. Do not confuse penicillin G aqueous (potassium or sodium salt) with penicillin G procaine.
- **PO:** Administer around the clock. Penicillin V may be administered without regard for meals.
- Use calibrated measuring device for liquid preparations. Solution is stable for 14 days if refrigerated.
- **IM:** Reconstitute according to manufacturer's directions with sterile water for injection, D5W, or 0.9% NaCl.
- **IM:** Shake medication well before injection. Inject penicillin deep into a well-developed muscle mass at a slow, consistent rate to prevent blockage of the needle. Massage well. Accidental injury near or into a nerve can result in severe pain and dysfunction.
- Penicillin G potassium or sodium may be diluted with lidocaine (without epinephrine) 1% or 2% to minimize pain from IM injection.
- Never give penicillin G benzathine or penicillin G procaine suspensions IV. May cause embolism or toxic reactions.

IV Administration

- **IV:** Change IV sites every 48 hr to prevent phlebitis
- Administer slowly and observe patient closely for signs of hypersensitivity.
- **Intermittent Infusion:** ***Diluent:*** Doses of 3 million units or less should be diluted in at least 50 ml of D5W or 0.9% NaCl; doses of more than 3 million units should be diluted with 100 ml. ***Concentration:*** 100,000–

Copyright © 2008 by F.A. Davis

500,000 units/ml (50,000 units/ml in neonates). ***Rate:*** Infuse over 1–2 hr in adults or 15–30 min in children.
- **Continuous Infusion:** Doses of 10 million units or more may be diluted in 1 or 2 L. ***Rate:*** Infuse over 24 hr.

Penicillin G Potassium

- **Y-Site Compatibility:** acyclovir, amiodarone, cyclophosphamide, diltiazem, enalaprilat, esmolol, fluconazole, foscarnet, heparin, hydromorphone, labetalol, magnesium sulfate, meperidine, morphine, nicardipine, perphenazine, potassium chloride, tacrolimus, theophylline, verapamil, vitamin B complex with C.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

Penicillin G Sodium

- **Y-Site Compatibility:** levofloxacin.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling better. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.
- Advise patient taking oral contraceptives to use an additional nonhormonal method of contraception during therapy with penicillin and until next menstrual period.
- Patient with an allergy to penicillin should be instructed to always carry an identification card with this information.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

PENICILLINS, PENICILLINASE RESISTANT

cloxacillin (klox-a-**sill**-in)
Apo-Cloxi, Cloxapen, Novo-Cloxin, Nu-Cloxi

dicloxacillin (dye-klox-a-**sill**-in)

nafcillin (naf-**sill**-in)

oxacillin (ox-a-**sill**-in)
Bactocill

Classification
Therapeutic: anti-infectives
Pharmacologic: penicillinase–resistant penicillins

Pregnancy Category B

P

Indications

Treatment of the following infections due to penicillinase-producing staphylococci: Respiratory tract infections, Sinusitis, Skin and skin structure infections. **Dicloxacillin:** Osteomyelitis. **Nafcillin, oxacillin:** Are also used to treat: Bone and joint infections, Urinary tract infections, Endocarditis, Septicemia, Meningitis.

Action

Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci but less so than penicillin. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus*, *Staphylococcus epidermidis*. Not active against methicillin-resistant staphylococci.

Pharmacokinetics

Absorption: *Cloxacillin*—Moderately absorbed (50%) following oral administration. *Dicloxacillin*—Rapidly but incompletely (35–76%) absorbed from the GI tract. *Nafcillin and*

Copyright © 2008 by F.A. Davis

oxacillin—Completely absorbed following IV administration; well absorbed from IM sites.
Distribution: Widely distributed; penetration into CSF is minimal, but sufficient in the presence of inflamed meninges; cross the placenta and enter breast milk.
Metabolism and Excretion: *Cloxacillin*—Some metabolism by the liver (9–22%) and some renal excretion of unchanged drug (30–45%). *Dicloxacillin*—Some metabolism by the liver (6–10%) and some renal excretion of unchanged drug (60%); small amounts eliminated in the feces via the bile. *Nafcillin, oxacillin*—Partially metabolized by the liver (nafcillin 60%, oxacillin 49%), partially excreted unchanged by the kidneys.
Half-life: *Cloxacillin and dicloxacillin*—0.5–1.1 hr (↑ in severe hepatic and renal dysfunction); *nafcillin*—Neonates: 1–5 hr; Children 1 month–14 yr: 0.75–1.9 hr; Adults: 0.5–1.5 hr (↑ in renal impairment); *oxacillin*—Neonates: 1.6 hr; Children up to 2 yr: 0.9–1.8 hr; Adults: 0.3–0.8 hr (↑ in severe hepatic impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
cloxacillin PO	30 min	30–120 min	6 hr
dicloxacillin PO	30 min	30–120 min	6 hr
nafcillin IM	30 min	60–120 min	4–6 hr
nafcillin IV	rapid	end of infusion	4–6 hr
oxacillin IM	rapid	30 min	4–6 hr
oxacillin IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity with cephalosporins may exist).
Use Cautiously in: Severe renal or hepatic impairment; OB: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, drug-induced hepatitis. **GU:** interstitial nephritis. **Derm:** rashes, urticaria. **Hemat:** eosinophilia, leukopenia. **Local:** pain at IM sites, phlebitis at IV sites. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels (treatment may be combined for this purpose). May ↓ effectiveness of **oral contraceptive agents**. May ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage

Cloxacillin

PO (Adults): 250–500 mg q 6 hr.
PO (Children >1 mo): 12.5–25 mg/kg q 6 hr up to a maximum of 4 g/day.

Dicloxacillin

PO (Adults and Children ≥40 kg): 125–250 mg q 6 hr (up to 2 g/day).
PO (Children <40 kg): 6.25–12.5 mg/kg q 6 hr; (up to 12.25 mg/kg q 6 hr has been used for osteomyelitis), maximum: 2 g/day.

Nafcillin

IM (Adults): 500-mg q 4–6 hr.
IM, IV (Children and Infants): 50–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.
IM, IV (Neonates 0–4 weeks, <1200 g): 25 mg/kg q 12 hr.
IM, IV (Neonates 1.2–2 kg):—25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.
IM, IV (Neonates >2 kg):—25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.
IV (Adults): 500–2000 mg q 4–6 hr.

Oxacillin

IM, IV (Adults and Children ≥40 kg): 250–2000 mg q 4–6 hr (up to 12 g/day).
IM, IV (Children <40 kg): 100–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.
IM, IV (Neonates <1200 g):—25 mg/kg q 12 hr.
IM, IV (Neonates ≥2 kg):—25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.
IM, IV (Neonates 1.2–2 kg):—25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.

Availability

Cloxacillin

Capsules: 250 mg, 500 mg. **Oral solution:** 125 mg/5 ml. **Powder for injection:** ✱500-mg vial, ✱1-g vial, ✱2-g vial.

Dicloxacillin

Capsules: 250 mg, 500 mg. **Oral suspension:** 62.5 mg/5 ml.

Copyright © 2008 by F.A. Davis

Nafcillin

Powder for injection: 500-mg vial, 1-g vial, 2-g vial, 10-g vial.

Oxacillin

Powder for injection: 250-mg vial, 500-mg vial, 1-g vial, 2-g vial, 4-g vial, 10-g vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Assess vein for signs of irritation and phlebitis. Change IV site every 48 hr to prevent phlebitis.
- ***Lab Test Considerations:*** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.

Nafcillin

IV Administration

- **IV, IM:** To reconstitute, add 3.4 ml to each 1-g vial or 6.8 ml to each 2-g vial, for a concentration of 250 mg/ml. Stable for 2–7 days if refrigerated.
- **Direct IV:** ***Diluent:*** Dilute reconstituted solution with 15–30 ml of sterile water, 0.45% NaCl, or 0.9% NaCl for injection. ***Concentration:*** 100 mg/ml. ***Rate:*** Administer over 5–10 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute with sterile water for injection, 0.9% NaCl, D5W, D10W, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature, 96 hr if refrigerated. ***Concentration:*** 2–40 mg/ml. ***Rate:*** Infuse over at least 30–60 min to avoid vein irritation.
- **Y-Site Compatibility:** acyclovir, atropine, cyclophosphamide, diazepam, enalaprilat, esmolol, famotidine, fentanyl, fluconazole, foscarnet, heparin, hydromorphone, magnesium sulfate, morphine, nicardipine, perphenazine, propofol, theophylline, zidovudine.
- **Y-Site Incompatibility:** droperidol, insulin, labetalol, midazolam, nalbuphine, pentazocine, verapamil. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Oxacillin

IV Administration

- **IV, IM:** To reconstitute for IM or IV use, add 1.4 ml of sterile water for injection to each 250-mg vial, 2.7 ml to each 500-mg vial, 5.7 ml to each 1-g vial, 11.5 ml to each 2-g vial, and 23 ml to each 4-g vial, for a concentration of 250 mg/1.5 ml. Stable for 3 days at room temperature or 7 days if refrigerated.
- **Direct IV:** ***Diluent:*** Further dilute each reconstituted 250-mg or 500-mg vial with 5 ml of sterile water or 0.9% NaCl for injection, 10 ml for each 1-g vial, 20 ml for each 2-g vial, and 40 ml for each 4-g vial. ***Concentration:*** 100 mg/ml. ***Rate:*** Administer slowly over 10 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. ***Concentration:*** 0.5–40 mg/ml. ***Rate:*** May be infused for up to 6 hr.

Copyright © 2008 by F.A. Davis

- **Y-Site Compatibility:** acyclovir, cyclophosphamide, diltiazem, doxapram, famotidine, fluconazole, foscarnet, heparin, hydrocortisone sodium succinate, hydromorphone, labetalol, levofloxacin, magnesium sulfate, meperidine, methotrexate, milrinone, morphine, perphenazine, potassium chloride, tacrolimus, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** sodium bicarbonate, verapamil. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

pentamidine (pen-**tam**-i-deen)

NebuPent, Pentam 300, ♣Pentacarinat, ♣Pneumopent

Classification

Therapeutic: antiprotozoals

Pregnancy Category C

Indications

IV: Treatment of *Pneumocystis carinii* pneumonia (PCP). **Inhaln:** Prevention of PCP in AIDS or HIV-positive patients who have had PCP or who have a peripheral CD4 lymphocyte count of ≤200/mm^3. **Unlabeled uses: Inhaln:** Treatment of PCP.

Action

Appears to disrupt DNA or RNA synthesis in protozoa. Also has a direct toxic effect on pancreatic islet cells. **Therapeutic Effects:** Death of susceptible protozoa.

Pharmacokinetics

Absorption: Minimal systemic absorption occurs following inhalation.
Distribution: Widely and extensively distributed but does not cross the blood-brain barrier. Concentrates in liver, kidneys, lungs, and spleen, with prolonged storage in some tissues.
Metabolism and Excretion: 1–30% excreted unchanged by the kidneys. Remainder of metabolic fate unknown.
Half-life: 6.4–9.4 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr
Inhaln	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: History of previous anaphylactic reaction to pentamidine.
Use Cautiously in: Hypotension; Hypertension; Hypoglycemia; Hyperglycemia; Hypocalcemia; Leukopenia; Thrombocytopenia; Anemia; Renal impairment (dose reduction required); Diabetes mellitus; Liver impairment; Cardiovascular disease; Bone marrow depression, previous antineoplastic therapy, or radiation therapy; OB: Pregnancy or lactation (safety not established during pregnancy; breastfeeding not recommended).

Adverse Reactions/Side Effects

For parenteral form, unless otherwise indicated.
CNS: anxiety, headache, confusion, dizziness, hallucinations. **EENT:** *inhalation*— burning in throat. **Resp:** *inhalation*— bronchospasm, cough. **CV:** ARRHYTHMIAS, HYPOTENSION. **GI:** PANCREATITIS, abdominal pain, anorexia, drug-induced hepatitis, nausea, unpleasant metallic taste, vomiting. **GU:** nephrotoxicity. **Derm:** pallor, rash. **Endo:** HYPOGLYCEMIA, hyperglycemia. **F and E:** hyperkalemia, hypocalcemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local: IV:**—phlebitis, pruritus, urticaria at IV site. **IM:**—sterile abscesses at IM sites. **Misc:** allergic reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME, chills, fever.

Copyright © 2008 by F.A. Davis

Interactions

Interactions listed for parenteral administration **Drug-Drug:** Concurrent use with **erythromycin** IV may ↑ risk of potentially fatal arrhythmias. Additive nephrotoxicity with other **nephrotoxic agents**, including **aminoglycosides**, **amphotericin B**, and **vancomycin**. Additive bone marrow depression with **antineoplastics** or previous **radiation therapy**. ↑ risk of pancreatitis with **didanosine**. ↑ risk of nephrotoxicity, hypocalcemia, and hypomagnesemia with **foscarnet**.

Route/Dosage

IV (Adults and Children): 4 mg/kg once daily for 14–21 days (longer treatment may be required in AIDS patients; some patients may respond to 3 mg/kg/day).
Inhaln (Adults): *NebuPent, Pentacarinat*—300 mg q 4 wk, using a Respirgard II jet nebulizer (150 mg q 2 wk has also been used). *Pneumopent*—60 mg q 24–72 hr for 5 doses over a 2-wk period, then q 2 wk using a Fisoneb ultrasonic nebulizer.
Inhaln (Children >5 yr): *NebuPent, Pentacarinat*—300 mg q 4 wk, using a Respirgard II jet nebulizer (for patients who cannot tolerate trimethoprim/sulfamethoxazole; unlabeled).

Availability (generic available)

Injection: 300 mg/vial. **Solution for aerosol use (NebuPent, Pentacarinat):** 300 mg/vial. **Solution for aerosol use (Pneumopent):** ✱60 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, sputum, WBC) and monitor respiratory status (rate, character, lung sounds, dyspnea, sputum) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **IV, IM:** Monitor blood pressure frequently during and following IM or IV administration of pentamidine. Patient should be lying down during administration. Sudden, severe hypotension may occur following a single dose. Resuscitation equipment should be immediately available.
- Assess patient for signs of hypoglycemia (anxiety; chills; diaphoresis; cold, pale skin; headache; increased hunger; nausea; nervousness; shakiness) and hyperglycemia (drowsiness; flushed, dry skin; fruit-like breath odor; increased thirst; increased urination; loss of appetite), which may occur up to several months after therapy is discontinued.
- Pulse and ECG should be monitored prior to and periodically during course of therapy. Fatalities due to cardiac arrhythmias, tachycardia, and cardiotoxicity have been reported.
- **Inhaln:** A tuberculin skin test, chest x-ray, and sputum culture should be performed prior to administration to rule out tuberculosis.
- ***Lab Test Considerations:*** *IM, IV*—Monitor blood glucose concentrations prior to, daily during, and for several months following therapy. Severe hypoglycemia and permanent diabetes mellitus have occurred.
- Monitor BUN and serum creatinine prior to and daily during therapy to monitor for nephrotoxicity. Concentrations may be ↑.
- Monitor CBC and platelet count prior to and every 3 days during therapy. Pentamidine may cause leukopenia, anemia, and thrombocytopenia.
- May cause ↑ serum bilirubin, alkaline phosphatase, AST, and ALT concentrations. Monitor liver function tests prior to and every 3 days during therapy.
- Monitor serum calcium and magnesium concentrations prior to and every 3 days during therapy; may cause hypocalcemia and hypomagnesemia.
- May cause ↑ serum potassium concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- Pentamidine must be given on a regular schedule for the full course of therapy. Administer missed doses as soon as remembered. If almost time for the next dose, skip the missed dose and return to the regular schedule. Do not double doses.
- **IM:** Dilute 300 mg of pentamidine with 3 ml of sterile water for injection for a concentration of 100 mg/ml. IM administration should be used only for patients with adequate muscle mass and given deep IM via Z-track technique. May cause sterile abscesses.

Copyright © 2008 by F.A. Davis

IV Administration

- **Intermittent Infusion:** ***Diluent:*** To reconstitute, add 3–5 ml of sterile water for injection or D5W to each 300-mg vial for a concentration of 100, 75, or 60 mg/ml, respectively. Withdraw dose and dilute further in 50–250 ml of D5W. Solution is stable for 48 hr at room temperature. Discard unused portions. ***Concentration:*** Not to exceed 6 mg/ml for administration. ***Rate:*** Administer slowly over 1–2 hr.
- **Y-Site Compatibility:** diltiazem, zidovudine.
- **Y-Site Incompatibility:** aldesleukin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, fluconazole, foscarnet, lansoprazole, linezolid. **Inhaln:** If using inhalation bronchodilator, administer bronchodilator 5–10 min prior to pentamidine administration.
- Administer in a well-ventilated area.
- Administration with patient in supine or recumbent position appears to provide a more uniform distribution of pentamidine.
- *NebuPent* or *Pentacarinat:* Dilute 300 or 600 mg (for prophylaxis or treatment, respectively) in 6 ml of sterile water for injection. Place reconstituted solution into Respirgard II nebulizer. Do not dilute with 0.9% NaCl or admix with other medications, as solution will form a precipitate. Do not use Respirgard II nebulizer for other medications.
- Administer inhalation dose through nebulizer until chamber is empty, approximately 30–45 min.
- *Pneumopent:* Remove rubber stopper and set upside down on a clean surface for use later. Add 3–5 ml of sterile water for inhalation or preservative-free water for injection to vial and replace rubber stopper. Do not use tap water or 0.9% NaCl. Powder should dissolve immediately; if not, shake gently to mix. Solution should be clear and colorless; do not use if cloudy. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. Place entire reconstituted contents into Fisoneb ultrasonic nebulizer.
- Administer with the flow rate of the nebulizer at the midflow mark over approximately 15 min until the chamber is empty.

Patient/Family Teaching

- Inform patient of the importance of completing the full course of pentamidine therapy, even if feeling better.
- **IV:** Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding of gums; unusual bruising; petechiae; or blood in stool, urine, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should not be given IM injections or rectal thermometers. Patient should be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, as these may precipitate gastric bleeding.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- **Inhaln:** Advise patient that an unpleasant metallic taste may occur with pentamidine administration but is not significant.
- Inform patients who continue to smoke that bronchospasm and coughing during therapy are more likely.

Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of PCP in HIV-positive patients.

HIGH ALERT

pentazocine (pen-**taz**-oh-seen)
Talwin, Talwin NX

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

Schedule IV

Pregnancy Category C

Indications

Moderate to severe pain. Also used for: Analgesia during labor; Sedation prior to surgery; Supplemention in balanced anesthesia.

Action

Binds to opiate receptors in the CNS. Alters perception of and response to painful stimuli, while producing generalized CNS depression. Has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decrease in moderate to severe pain.

Pharmacokinetics

Absorption: Well absorbed following oral, IM, and subcut administration. Small amount (0.5

Copyright © 2008 by F.A. Davis

mg) of naloxone in tablets included to prevent parenteral abuse.
Distribution: Widely distributed. Crosses the placenta.
Metabolism and Excretion: Mostly metabolized by the liver. Small amounts excreted unchanged by the kidneys.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	60–90 min	3 hr
IM, subcut	15–20 min	30–60 min	2–3 hr
IV	2–3 min	15–30 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients who are physically dependent on opioids (may precipitate withdrawal).
Use Cautiously in: Head trauma; History of drug abuse; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients or patients with severe liver impairment (dose reduction recommended); Geri: Appears on Beers list and is associated with increase risk of falls. Geriatric patients are more susceptible to adverse CNS effects; dose reduction recommended; Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; OB: Pregnancy (has been used during labor but may cause respiratory depression in the newborn); Lactation or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, euphoria, hallucinations, headache, sedation, confusion, dysphoria, floating feeling, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** clammy feeling, sweating. **Local:** severe tissue damage at subcut sites. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions—decrease initial dose of pentazocine to 25% of usual dose). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioid analgesic agonists**. May ↓ analgesic effects of other **opioids**.
Drug-Natural Products: Concomitant use of **kava kava, valerian, or chamomile can ↑ CNS depression.**

Route/Dosage

PO (Adults): 50–100 mg q 3–4 hr (not to exceed 600 mg/day).
Subcut, IV, IM (Adults): 30 mg q 3–4 hr (not to exceed 30 mg/dose IV or 60 mg/dose IM or subcut; not to exceed 360 mg/day subcut, IV, or IM). *Obstetrical use*—20 mg IV or 30 mg IM when contractions become regular, may repeat q 2–3 hr for 2–3 doses.

Availability

Tablets: 50 mg (with 0.5 mg naloxone), ✱50 mg. **Injection:** 30 mg/ml. ***In combination with:*** acetaminophen (Talacen) or aspirin (Talwin compound). See Appendix B.

P

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, or IM and 15–30 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 100 mg should be converted to an opioid agonist. Pentazocine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix J) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Pentazocine produces respiratory de-

Copyright © 2008 by F.A. Davis

pression, but this does not markedly increase with increased doses.
- Assess prior analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving pentazocine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Geri: Assess falls risk and implement prevention strategies. Assess for adverse CNS effects.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Disturbed sensory perception (visual, auditory) (Side Effects)

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and may permit lower opioid doses.
- **PO:** Talwin NX contains 0.5 mg of naloxone, which has no pharmacologic activity when administered orally. If the product is abused by injection, naloxone antagonizes pentazocine. Parenteral use of oral pentazocine may lead to severe, potentially fatal reactions (pulmonary emboli, vascular occlusion, ulceration and abscess, and withdrawal symptoms in opioid-dependent individuals).
- **IM, Subcut:** Administer IM injections deep into well-developed muscle. Rotate sites of injections. Subcut route may cause tissue damage with repeated injections.

IV Administration

- **Direct IV:** ***Diluent:*** Manufacturer recommends diluting each 5 mg with at least 1 ml of sterile water for injection. ***Concentration:*** 5 mg/ml. ***Rate:*** Administer slowly, each 5 mg over at least 1 min.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, hydroxyzine, metoclopramide, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** glycopyrrolate, heparin, pentobarbital.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.
- **Y-Site Incompatibility:** nafcillin.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness, dizziness, or hallucinations, particularly in geriatric patients. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known. Institute fall prevention strategies and teach patient or family how to prevent falls at home.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

pentoxifylline (pen-tox-if-i-lin)
Trental

Classification
Therapeutic: blood viscosity reducing agents

Pregnancy Category C

Indications
Management of symptomatic peripheral vascular disease (intermittent claudication).

Action
Increases the flexibility of RBCs by increasing levels of cyclic adenosine monophosphate (cAMP). Decreases blood viscosity by inhibiting platelet aggregation and decreasing fibrinogen.
Therapeutic Effects: Increased blood flow.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Bound to RBC membrane. Enters breast milk.
Metabolism and Excretion: Metabolized by RBCs and the liver.
Half-life: 25–50 min.

TIME/ACTION PROFILE (improvement in blood flow)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	8 wk	8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Intolerance to other xanthine derivatives (caffeine and theophylline).
Use Cautiously in: Coronary artery or cerebrovascular disease; Renal disease (lower doses may be used); Geriatric patients (increased risk of adverse reactions); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: agitation, dizziness, drowsiness, headache, insomnia, nervousness. **EENT:** blurred vision. **Resp:** dyspnea. **CV:** angina, arrhythmias, edema, flushing, hypotension. **GI:** abdominal discomfort, belching, bloating, diarrhea, dyspepsia, flatus, nausea, vomiting. **Neuro:** tremor.

Interactions
Drug-Drug: Additive hypotension may occur with **antihypertensives** and **nitrates**. May increase the risk of bleeding with **warfarin**, **heparin**, **aspirin**, **NSAIDs**, **cefoperazone**, **cefotetan**, **valproic acid**, **clopidogrel**, **ticlopidine**, **eptifibatide**, **tirofiban**, or **thrombolytic agents**. May increase the risk of **theophylline** toxicity. **Smoking** may decrease the beneficial effects of pentoxifylline.
Drug-Natural Products: Increased bleeding risk with **anise**, **arnica**, **asafoetida**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Dosage
PO (Adults): 400 mg 3 times daily; if GI or CNS side effects occur, decrease dose to 400 mg twice daily.

Availability (generic available)
Controlled-release tablets: 400 mg. **Extended-release tablets:** 400 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient for intermittent claudication prior to and periodically throughout therapy.
- Monitor blood pressure periodically in patients on concurrent antihypertensive therapy.

Potential Nursing Diagnoses
Acute pain (Indications)
Activity intolerance (Indications)

Implementation
- **PO:** Administer with meals to minimize GI irritation. Tablets should be swallowed whole; do not crush, break, or chew.
- If GI and CNS side effects occur, decrease dose to twice daily. Discontinue if side effects persist.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed. If a dose is missed, it should be taken as soon as remembered unless almost time for next dose. Consult health care professional before discontinuing medication,

Copyright © 2008 by F.A. Davis

because several weeks of therapy may be required before effects are seen.
- May cause dizziness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid smoking, because nicotine constricts blood vessels.
- Instruct patient to notify health care professional if nausea, vomiting, GI upset, drowsiness, dizziness, or headache persists.

Evaluation/Desired Outcomes
- Relief from cramping in calf muscles, buttocks, thighs, and feet during exercise.
- Improvement in walking endurance. Therapeutic effects may be seen in 2–4 wk, but therapy should be continued for ≥8 wk.

perindopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

permethrin (per-meth-rin)
Acticin, Elimite, Nix

Classification
Therapeutic: pediculocides

Pregnancy Category B

Indications
1% lotion: Eradication of *Pediculus humanus capitis* (head lice and their eggs): Prevention of infestation of head lice during epidemics. **5% cream:** Eradication of *Sarcoptes scabiei* (scabies).

Action
Causes repolarization and paralysis in lice by disrupting sodium transport in normal nerve cells. **Therapeutic Effects:** Death of parasites.

Pharmacokinetics
Absorption: Small amounts (<2%) systemically absorbed. Remains on hair for 10 days.
Distribution: Unknown.
Metabolism and Excretion: Rapidly inactivated by enzymes.
Half-life: Unknown.

TIME/ACTION PROFILE (pediculocidal action)

ROUTE	ONSET	PEAK	DURATION
topical	10 min	unknown	14 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity to permethrin, pyrethrins (insecticides or veterinary pesticides), chrysanthemums, or isopropyl alcohol.
Use Cautiously in: Pregnancy or lactation; Children <2 yr (1% lotion); Children <2 mo (5% cream).

Adverse Reactions/Side Effects
Derm: burning, itching, rash, redness, stinging, swelling. **Neuro:** numbness, tingling.

Interactions
Drug-Drug: No significant interactions.

Route/Dosage
Head Lice (Treatment and Prevention)
Topical (Adults and Children >2 yr): 1% lotion applied to the hair, left on for 10 min, then rinsed, for 1 application.

Scabies
Topical (Adults and Children): Massage 5% cream into all skin surfaces. Leave on for 8–14 hr, then wash off.
Topical (Infants >2 mo): Massage 5% cream into hairline, scalp, neck, temple, and forehead. Leave on for 8–14 hr, then wash off.

Availability (generic available)
Liquid cream rinse (lotion): 1% in 60-ml containers[OTC]. **Cream:** 5% in 60-g tube.

NURSING IMPLICATIONS

Assessment
- **Head Lice:** Assess scalp for presence of lice and their ova (nits) prior to and 1 wk after application of permethrin.
- **Scabies:** Assess skin for scabies prior to and following therapy.

Potential Nursing Diagnoses
Impaired home maintenance (Indications)
Bathing/hygiene self-care deficit (Indications)

Implementation
- **Topical:** For topical application only.

Patient/Family Teaching
- Instruct patient to notify health care professional if scalp itching, numbness, redness, or rash occurs.

Copyright © 2008 by F.A. Davis

- Instruct patient to avoid getting Elimite cream in eyes. If this occurs, eyes should be flushed thoroughly with water. Health care professional should be contacted if eye irritation persists.
- Advise patient that others residing in the home should also be checked for lice.
- Instruct patient on methods of preventing reinfestation. All clothes, including outdoor apparel and household linens, should be machine-washed using very hot water and dried for at least 20 min in a hot dryer. Dry-clean nonwashable clothes. Brushes and combs should be soaked in hot (130°F), soapy water for 5–10 min. Remind patient that brushes and combs should not be shared. Wigs and hairpieces should be shampooed. Rugs and upholstered furniture should be vacuumed. Toys should be washed in hot, soapy water. Items that cannot be washed should be sealed in a plastic bag for 2 wk.
- If patient is a child, instruct parents to notify school nurse or day care center so that classmates and playmates can be checked.
- **Head Lice:** Instruct patient to wash hair with regular shampoo, rinse, and towel dry. Each container holds enough medication for one treatment. Shake the container well. Thoroughly wet scalp and hair with the lotion. The patient should use as much of the solution as needed to coat entire head of hair, then discard remainder of solution. Allow lotion to remain on hair for 10 min, then thoroughly rinse hair and towel dry with a clean towel. Comb hair with a fine-toothed comb to remove dead lice and eggs (not necessary but may be desired for cosmetic effects). Products are available for removal of nits (Rid Lice Egg Loosener Gel® Step 2). Schools usually require children to be nit-free prior to returning to school.
- Explain to patient that permethrin will protect from reinfestation for 2 wk. These effects continue even when the patient resumes regular shampooing.
- **Scabies:** Instruct patient to massage thoroughly into the skin from head to soles of feet. Treat infants on the hairline, neck, scalp, temple, and forehead. Remove the cream by washing after 8–14 hr. Usually 30 g (½ tube) is sufficient for adults. One application is curative.

Evaluation/Desired Outcomes

- The absence of lice and eggs 1 wk after therapy. A second application is indicated if lice are detected at this time.
- Prevention of infestation of head lice during epidemics.
- Eradication of scabies following one application.
- If resistance to permethrin develops, malathion may be used.

phenazopyridine

(fen-az-oh-**peer**-i-deen)
Azo-Standard, Baridium, Geridium, Phenazo, Prodium, Pyridiate, Pyridium, Pyridium Plus, Urodine, Urogesic, UTI Relief

Classification
Therapeutic: nonopioid analgesics
Pharmacologic: urinary tract analgesics

Pregnancy Category B

P

Indications

Provides relief from the following urinary tract symptoms, which may occur in association with infection or following urologic procedures: Pain, Itching, Burning, Urgency, Frequency.

Action

Acts locally on the urinary tract mucosa to produce analgesic or local anesthetic effects. Has no antimicrobial activity. **Therapeutic Effects:** Diminished urinary tract discomfort.

Pharmacokinetics

Absorption: Appears to be well absorbed following oral administration.
Distribution: Unknown. Small amounts cross the placenta.
Metabolism and Excretion: Rapidly excreted unchanged in the urine.
Half-life: Unknown.

TIME/ACTION PROFILE (urinary analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	5–6 hr	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Glomerulonephritis; Severe hepatitis, uremia, or renal failure; Renal insufficiency; G6PD deficiency.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Hepatitis; Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: headache, vertigo. **GI:** hepatotoxicity, nausea. **GU:** bright-orange urine, renal failure. **Derm:** rash. **Hemat:** hemolytic anemia, methemoglobinemia.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 200 mg 3 times daily for 2 days.
PO (Children): 4 mg/kg 3 times daily for 2 days.

Availability (generic available)

Tablets: 95 mg[OTC], 100 mg, ♣100 mg[OTC], ♣200 mg[OTC], 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for urgency, frequency, and pain on urination prior to and throughout therapy.
- ***Lab Test Considerations:*** Renal function should be monitored periodically during course of therapy.
- Interferes with urine tests based on color reactions (glucose, ketones, bilirubin, steroids, protein).

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired urinary elimination (Indications)

Implementation

- Medication should be discontinued after pain or discomfort is relieved (usually 2 days for treatment of urinary tract infection). Concurrent antibiotic therapy should continue for full prescribed duration.
- **PO:** Administer medication with or following meals to decrease GI irritation. Do not crush, break, or chew tablet.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Advise patient that while phenazopyridine administration is stopped once pain or discomfort is relieved, concurrent antibiotic therapy must be continued for full duration of therapy. Do not save unused portion of phenazopyridine without consulting health care professional.
- Inform patient that drug causes reddish-orange discoloration of urine that may stain clothing or bedding. Sanitary napkin may be worn to avoid clothing stains. May also cause staining of soft contact lenses.
- Instruct patient to notify health care professional if rash, skin discoloration, or unusual tiredness occurs.

Evaluation/Desired Outcomes

- Decrease in pain and burning on urination.

phenelzine, See MONOAMINE OXIDASE (MAO) INHIBITORS.

phenobarbital

(fee-noe-**bar**-bi-tal)
♣Ancalixir, Luminal, Solfoton

Classification
Therapeutic: anticonvulsants, sedative/hypnotics
Pharmacologic: barbiturates

Schedule IV

Pregnancy Category D

Indications

Anticonvulsant in tonic-clonic (grand mal), partial, and febrile seizures in children. Preoperative sedative and in other situations in which sedation may be required. Hypnotic (short-term). **Unlabeled uses:** Prevention/treatment of hyperbilirubinemia in neonates.

Action

Produces all levels of CNS depression. Depresses the sensory cortex, decreases motor activity, and alters cerebellar function. Inhibits transmission in the nervous system and raises the seizure threshold. Capable of inducing (speeding up) enzymes in the liver that metabolize drugs, bilirubin, and other compounds. **Therapeutic Effects:** Anticonvulsant activity. Sedation.

Pharmacokinetics

Absorption: Absorption is slow but relatively complete (70–90%).
Distribution: Unknown.
Metabolism and Excretion: 75% metabolized by the liver, 25% excreted unchanged by the kidneys.

Copyright © 2008 by F.A. Davis

Half-life: Neonates: 1.8–8.3 days; Infants: 0.8–5.5 days; Children: 1.5–3 days; Adults: 2–6 days.

TIME/ACTION PROFILE (sedation†)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	>6 hr
IM, subcut	10–30 min	unknown	4–6 hr
IV	5 min	30 min	4–6 hr

†Full anticonvulsant effects occur after 2–3 wk of chronic dosing unless a loading dose has been used

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Comatose patients or those with pre-existing CNS depression; Severe respiratory disease with dyspnea or obstruction; Uncontrolled severe pain; Known alcohol intolerance (elixir only); Lactation: Discontinue drug or bottle feed.

Use Cautiously in: Hepatic dysfunction; Severe renal impairment; History of suicide attempt or drug abuse; Hypnotic use should be short-term. Chronic use may lead to dependence; OB: Chronic use during pregnancy results in drug dependency in the infant; may result in coagulation defects and fetal malformation; acute use at term may result in respiratory depression in the newborn; Geri: Initial dose reduction recommended; Hypnotic use should be short-term. Chronic use may lead to dependence.

Adverse Reactions/Side Effects

CNS: hangover, delirium, depression, drowsiness, excitation, lethargy, vertigo. **Resp:** respiratory depression; *IV*— LARYNGOSPASM, bronchospasm. **CV:** *IV*— hypotension. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** photosensitivity, rashes, urticaria. **Local:** phlebitis at IV site. **MS:** arthralgia, myalgia, neuralgia. **Misc:** hypersensitivity reactions including ANGIOEDEMA and SERUM SICKNESS, physical dependence, psychological dependence.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics**. May induce hepatic enzymes that metabolize other drugs, ↓ their effectiveness, including **hormonal contraceptives**, **warfarin**, **chloramphenicol**, **cyclosporine**, **dacarbazine**, **corticosteroids**, **tricyclic antidepressants**, **felodipine**, **clonazepam**, **carbamazepine**, **verapamil**, **theophylline**, **metronidazole**, and **quinidine**. May ↑ risk of hepatic toxicity of **acetaminophen**. **MAO inhibitors**, **valproic acid**, or **divalproex** may ↓ metabolism of phenobarbital, ↑ sedation. **Rifampin** may ↑ metabolism of and ↓ effects of phenobarbital. May ↑ risk of hematologic toxicity with **cyclophosphamide**.

Drug-Natural Products: Concomitant use of **kava kava, valerian, chamomile,** or **hops** can ↑ CNS depression. **St. John's wort** may ↓ effects.

Route/Dosage

Status Epilepticus

IV (Adults and Children >1 month): 15–18 mg/kg in a single or divided dose, maximum loading dose 20 mg/kg.

IV (Neonates): 15–20 mg/kg in a single or divided dose.

Maintenance Anticonvulsant

IV, PO (Adults and Children >12 yrs): 1–3 mg/kg/day as a single dose or 2 divided doses.

IV, PO (Children 5–12 yr): 4–6 mg/kg/day in 1–2 divided doses.

IV, PO (Children 1–5 yr): 6–8 mg/kg/day in 1–2 divided doses.

IV, PO (Infants): 5–6 mg/kg/day in 1–2 divided doses.

IV, PO (Neonates): 3–4 mg/kg/day once daily, may need to increase up to 5 mg/kg/day by 2nd week of therapy.

Sedation

PO, IM (Adults): 30–120 mg/day in 2–3 divided doses. *Preoperative sedation*—100–200 mg IM 1–1.5 hours before the procedure.

PO (Children): 2 mg/kg 3 times daily. *Preoperative sedation*—1–3 mg/kg PO/IM/IV 1–1.5 hours before the procedure.

Hypnotic

PO, Subcut, IV, IM (Adults): 100–320 mg at bedtime.

IV, IM, Subcut (Children): 3–5 mg/kg at bedtime.

Hyperbilirubinemia

PO (Adults): 90–180 mg/day in 2–3 divided doses.

Copyright © 2008 by F.A. Davis

PO (Children <12 yr): 3–8 mg/kg/day in 2–3 divided doses, doses up to 12 mg/kg/day have been used.

Availability (generic available)

Tablets: 8 mg, 15 mg, 30 mg, 60 mg, 100 mg. **Capsules:** 15 mg. **Elixir:** 20 mg/5 ml. **Injection:** 30 mg/ml in 1-ml prefilled syringes, 60 mg/ml in 1-ml prefilled syringes, 65 mg/ml in 1-ml vials, 130 mg/ml in 1-ml prefilled syringes, 1-ml vials, and 1-ml ampules. ***In combination with:*** phenytoin. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory status, pulse, and blood pressure frequently in patients receiving phenobarbital IV. Equipment for resuscitation and artificial ventilation should be readily available. Respiratory depression is dose-dependent.
- Prolonged therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if depressed, suicidal, or with a history of addiction.
- Geri: Elderly patients may react to phenobarbital with marked excitement, depression, and confusion. Monitor for these adverse reactions.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Sedation:** Assess level of consciousness and anxiety when used as a preoperative sedative.
- Assess postoperative patients for pain with a pain scale. Phenobarbital may increase sensitivity to painful stimuli.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have hepatic and renal function and CBC evaluated periodically.
- Monitor serum folate concentrations periodically during therapy because of increased folate requirements of patients on long-term anticonvulsant therapy with phenobarbital.
- May cause ↓ serum bilirubin concentrations in neonates, in patients with congenital nonhemolytic unconjugated hyperbilirubinemia, and in epileptics.
- ***Toxicity and Overdose:*** Serum phenobarbital levels may be monitored when used as an anticonvulsant. Therapeutic blood levels are 10–40 mcg/ml. Symptoms of toxicity include confusion, drowsiness, dyspnea, slurred speech, and staggering.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)
Acute confusion (Side Effects)

Implementation

- Do not confuse phenobarbital with pentobarbital.
- Supervise ambulation and transfer of patients following administration. Two side rails should be raised and call bell within reach at all times. Keep bed in low position. Institute seizure and fall precautions.
- When changing from phenobarbital to another anticonvulsant, gradually decrease phenobarbital dose while concurrently increasing dose of replacement medication to maintain anticonvulsant effects.
- **PO:** Tablets may be crushed and mixed with food or fluids (do not administer dry) for patients with difficulty swallowing. Oral solution may be taken undiluted or mixed with water, milk, or fruit juice. Use calibrated measuring device for accurate measurement of liquid doses.
- **IM:** Injections should be given deep into the gluteal muscle to minimize tissue irritation. Do not inject >5 ml into any one site, because of tissue irritation.

IV Administration

- **IV:** Doses may require 15–30 min to reach peak concentrations in the brain. Administer minimal dose and wait for effectiveness before administering 2nd dose to prevent cumulative barbiturate-induced depression.
- **Direct IV:** ***Diluent:*** Reconstitute sterile powder for IV dose with a minimum of 3 ml of sterile water for injection. Dilute further with 10 ml of sterile water. Do not use solution that is not absolutely clear within 5 min after reconstitution or that contains a precipitate. Discard powder or solution that has been exposed to air for longer than 30 min.
- Solution is highly alkaline; avoid extravasation, which may cause tissue damage and necrosis. If extravasation occurs, injection of 5% procaine solution into affected area and application of moist heat may be ordered. ***Concentration:*** 130 mg/ml (undiluted). ***Rate:*** Do not inject IV faster than 1 mg/kg/min with a maximum of 30 mg over 1 min in infants and children and 60 mg over 1 min in adults. Titrate slowly for desired response. Rapid administration may result in respiratory depression.
- **Y-Site Compatibility:** doxapram, enalaprilat, fentanyl, fosphenytoin, levofloxacin, line-

Copyright © 2008 by F.A. Davis

zolid, meropenem, methadone, morphine, propofol, sufentanil.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole.

Patient/Family Teaching
- Advise patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose; do not double doses.
- Advise patients on prolonged therapy not to discontinue medication without consulting health care professional. Abrupt withdrawal may precipitate seizures or status epilepticus.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise female patients using oral contraceptives to use an additional nonhormonal contraceptive during therapy and until next menstrual period. Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Advise patient to notify health care professional if fever, sore throat, mouth sores, unusual bleeding or bruising, nosebleeds, or petechiae occur.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).
- Pedi: Advise parents or caregivers that child may experience irritability, hyperactivity and/or sleep disturbances, which may diminish in a few days to a few weeks or may persist until drug is stopped. An alternative medication can be considered. Instruct parents to monitor for skin rash occurring 7–20 days after treatment begins and to contact a health care provider if rash occurs. Teach family about symptoms of toxicity (staggering, drowsiness, slurred speech).

Evaluation/Desired Outcomes
- Decrease or cessation of seizure activity without excessive sedation. Several weeks may be required to achieve maximum anticonvulsant effects.
- Preoperative sedation.
- Improvement in sleep patterns.
- Decrease in serum bilirubin levels.

phentolamine
(fen-**tole**-a-meen)
Regitine, ♣Rogitine

Classification
Therapeutic: agents for pheochromocytoma
Pharmacologic: alpha-adrenergic blockers

Pregnancy Category C

Indications
IV: Control of blood pressure during surgical removal of a pheochromocytoma. **IV, Infiltration:** Prevention and treatment of dermal necrosis and sloughing following extravasation of norepinephrine, phenylephrine, or dopamine. **Unlabeled uses: IM, IV:** Treatment of hypertension associated with pheochromocytoma or adrenergic (sympathetic) excess, such as administration of phenylephrine, tyramine-containing foods in patients on MAO inhibitor therapy, or clonidine withdrawal.

Action
Produces incomplete and short-lived blockade of alpha-adrenergic receptors located primarily in smooth muscle and exocrine glands. Induces hypotension by direct relaxation of vascular smooth muscle and by alpha blockade. **Therapeutic Effects:** Reduction of blood pressure in situations in which hypertension is due to adrenergic (sympathetic) excess. When infiltrated locally, reverses vasoconstriction caused by norepinephrine or dopamine.

Pharmacokinetics
Absorption: Well absorbed following IM administration.
Distribution: Unknown.
Metabolism and Excretion: 10% excreted unchanged by kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (alpha-adrenergic blockade)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	20 min	30–45 min
IV	immediate	2 min	15–30 min

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Coronary or cerebral arteriosclerosis; Renal impairment.

Use Cautiously in: Peptic ulcer disease; Geri: Geriatric patients (more susceptible to hypotensive effects; dose reduction recommended); OB, Geri: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

With parenteral use. **CNS:** CEREBROVASCULAR SPASM, dizziness, weakness. **EENT:** nasal stuffiness. **CV:** HYPOTENSION, MI, angina, arrhythmias, tachycardia. **GI:** abdominal pain, diarrhea, nausea, vomiting, aggravation of peptic ulcer. **Derm:** flushing.

Interactions

Drug-Drug: Antagonizes the effects of **alpha-adrenergic stimulants**. May ↓ pressor response to **ephedrine** or **phenylephrine**. Severe hypotension may occur with concurrent use of **epinephrine** or **methoxamine**. Use with **guanadrel** may result in exaggerated hypotension and bradycardia. ↓ peripheral vasoconstriction from high doses of **dopamine**.

Route/Dosage

Hypertension Associated with Pheochromocytoma—Before/During Surgery

IV (Adults): 5 mg given 1–2 hr preop, repeated as necessary. May be infused at a rate of 0.5–1 mg/min during surgery.

IV, IM (Children): 1 mg or 0.1 mg/kg (3 mg/m^2) given 1–2 hr preop, repeated IV as necessary during surgery.

Prevention of Dermal Necrosis during Infusion of Norepinephrine, Phenylephrine, or Dopamine

IV (Adults): Add 10 mg phentolamine to every 1000 ml of fluid containing norepinephrine.

Treatment of Dermal Necrosis Following Extravasation of Norepinephrine, Phenylephrine, or Dopamine

Infiltrate **(Adults):** 5–10 mg.

Infiltrate **(Children):** 0.1–0.2 mg/kg (up to 10 mg).

Availability (generic available)

Powder for injection: 5 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and ECG every 2 min until stable during IV administration. If hypotensive crisis occurs, epinephrine is contraindicated and may cause paradoxic further decrease in blood pressure; norepinephrine may be used.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Indications)

Implementation

- Patient should remain supine throughout parenteral administration.

IV Administration

- **IV:** ***Diluent:*** Reconstitute each 5 mg with 1 ml of sterile water for injection or 0.9% NaCl. Discard unused solution. ***Concentration:*** 5 mg/ml. ***Rate:*** Inject each 5 mg over 1 min.
- **Continuous Infusion:** Dilute 5–10 mg in 500 ml of D5W. ***Rate:*** Titrate infusion rate according to patient response.
- May also add 10 mg to every 1000 ml of fluid containing norepinephrine for prevention of dermal necrosis and sloughing. Does not affect pressor effect of norepinephrine.
- **Syringe Compatibility:** papaverine.
- **Y-Site Compatibility:** amiodarone.
- **Additive Compatibility:** dobutamine, norepinephrine.
- **Infiltration:** Dilute 5–10 mg of phentolamine in 10 ml of 0.9% NaCl. For children, use 0.1–0.2 mg/kg up to a maximum of 10 mg. Infiltrate site of extravasation promptly. Must be given within 12 hr of extravasation to be effective.

Patient/Family Teaching

- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if chest pain occurs during IV infusion.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Prevention of dermal necrosis and sloughing in extravasation of norepinephrine, dopamine, and phenylephrine.

phenytoin (**fen**-i-toyn)
Dilantin, Phenytek

Classification

Therapeutic: antiarrhythmics (group IB), anticonvulsants
Pharmacologic: hydantoins

Pregnancy Category D

Copyright © 2008 by F.A. Davis

Indications

Treatment/prevention of tonic-clonic (grand mal) seizures and complex partial seizures. **Unlabeled uses:** As an antiarrhythmic, particularly for ventricular arrhythmias associated with digoxin toxicity, prolonged QT interval, and surgical repair of congenital heart diseases in children. Management of neuropathic pain, including trigeminal neuralgia.

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Antiarrhythmic properties as a result of shortening the action potential and decreasing automaticity. **Therapeutic Effects:** Diminished seizure activity. Termination of ventricular arrhythmias.

Pharmacokinetics

Absorption: Absorbed slowly from the GI tract. Bioavailability differs among products; the Dilantin and Phenytek preparations are considered to be "extended" products. Other products are considered to be prompt release.
Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.
Protein Binding: Adults 90–95%; decreased protein binding in neonates (up to 20% free fraction available), infants (up to 15% free), and patients with hyperbilirubinemia, hypoalbuminemia, severe renal dysfunction or uremia.
Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted in the urine.
Half-life: 22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–24 hr (1 wk)*	1.5–3 hr	6–12 hr
PO-ER	2–24 hr (1 wk)	4–12 hr	12–36 hr
IV	0.5–1 hr (1 wk)	rapid	12–24 hr

*() = time required for onset of action without a loading dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to propylene glycol (phenytoin injection only); Alcohol intolerance (phenytoin injection and liquid only); Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree heart block, or Stokes-Adams syndrome (phenytoin injection only).
Use Cautiously in: Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); Patients with severe cardiac or respiratory disease (use of IV phenytoin may result in an ↑ risk of serious adverse reactions); OB: Safety not established; may result in fetal hydantoin syndrome if used chronically or hemorrhage in the newborn if used at term; Lactation: Safety not established; Pedi: Suspension contains sodium benzoate, a metabolite of benzyl alcohol that can cause potentially fatal gasping syndrome in neonates; Geri: Use of IV phenytoin may result in an ↑ risk of serious adverse reactions.

Adverse Reactions/Side Effects

Most listed are for chronic use of phenytoin.
CNS: ataxia, agitation, confusion, dizziness, drowsiness, dysarthria, dyskinesia, extrapyramidal syndrome, headache, insomnia, weakness. **EENT:** diplopia, nystagmus. **CV:** hypotension (↑ with IV phenytoin), tachycardia. **GI:** gingival hyperplasia, nausea, constipation, drug-induced hepatitis, vomiting. **Derm:** hypertrichosis, rash, exfoliative dermatitis, pruritus. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, megaloblastic anemia, thrombocytopenia. **MS:** osteomalacia. **Misc:** allergic reactions including STEVENS-JOHNSON SYNDROME, fever, lymphadenopathy.

Interactions

Drug-Drug: Disulfiram, acute ingestion of **alcohol**, **amiodarone**, **ethosuximide**, **isoniazid**, **chloramphenicol**, **sulfonamides**, **fluoxetine**, **gabapentin**, **H2 antagonists**, **benzodiazepines**, **omeprazole**, **ketoconazole**, **fluconazole**, **estrogens**, **succinamides**, **halothane**, **methylphenidate**, **phenothiazines**, **salicylates**, **ticlopidine**, **tolbutamide**, **topiramate**, **trazodone**, **felbamate**, and **cimetidine** may ↑ phenytoin blood levels. **Barbiturates**, **carbamazepine**, **reserpine**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may

Copyright © 2008 by F.A. Davis

↓ the effects of **amiodarone**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **corticosteroids**, **disopyramide**, **warfarin**, **felbamate**, **doxycycline**, **lamotrigine**, **oral contraceptives**, **paroxetine**, **propafenone**, **rifampin**, **ritonavir**, **quinidine**, **tacrolimus**, **theophylline**, **topiramate**, **tricyclic antidepressants**, **zonisamide**, **methadone**, **cyclosporine**, and **estrogens**. IV phenytoin and **dopamine** may cause additive hypotension. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Antacids** may ↓ absorption of orally administered phenytoin. ↑ systemic clearance of antileukemic drugs **teniposide** and **methotrexate** which has been associated with a worse event free survival, phenytoin use is not recommended in children undergoing chemotherapy for acute lymphocytic leukemia. **Calcium** and **sucralfate** ↓ phenytoin absorption. **Drug-Food:** Phenytoin may ↓ absorption of **folic acid**. Concurrent administration of **enteral tube feedings** may ↓ phenytoin absorption.

Route/Dosage

IM administration is not recommended due to erratic absorption and pain on injection.

Anticonvulsant

PO (Adults): Loading dose of 15–20 mg/kg as extended capsules in 3 divided doses given every 2–4 hr; maintenance dose 5–6 mg/kg/day given in 1–3 divided doses; usual dosing range = 200–1200 mg/day.
PO (Children 10–16 yr): 6–7 mg/kg/day in 2–3 divided doses.
PO (Children 7–9 yr): 7–8 mg/kg/day in 2–3 divided doses.
PO (Children 4–6 yr): 7.5–9 mg/kg/day in 2–3 divided doses.
PO (Children 0.5–3 yr): 8–10 mg/kg/day in 2–3 divided doses.
PO (Neonates up to 6 months): 5–8 mg/kg/day in 2 divided doses, may require q 8 hr dosing.
IV (Adults): *Status epilepticus loading dose*—15–20 mg/kg. Rate not to exceed 25–50 mg/min. *Maintenance dose*—same as PO dosing above.
IV (Children): *Status epilepticus loading dose*—15–20 mg/kg at 1–3 mg/kg/min. *Maintenance dose*—same as PO dosing above.

Antiarrhythmic

IV (Adults): 50–100 mg q 10–15 min until arrhythmia is abolished, or a total of 15 mg/kg has been given, or toxicity occurs.
PO (Adults): Loading dose: 250 mg QID for 1 day, then 250 mg BID for 2 days, then maintenance at 300–400 mg/day in divided doses 1–4 times/day.
IV (Children): 1.25 mg/kg q 5 min, may repeat up to total loading dose of 15 mg/kg. *Maintenance dose*—5–10 mg/kg/day in 2–3 divided doses IV or PO.

Availability (generic available)

Chewable tablets: 50 mg[Rx]. **Cost:** $41.99/90. **Oral suspension:** 125 mg/5 ml[Rx]. **Cost:** *Generic*—$28.99/237 ml. **Extended-release capsules:** 30 mg[Rx], 100 mg[Rx], 200 mg[Rx], 300 mg[Rx]. **Cost:** *Dilantin*—30 mg $34.99/90; *Phenytek*—200 mg $65.97/90, 300 mg $95.27/90; *Generic*—100 mg $23.18/90. **Injection:** 50 mg/ml[Rx].

NURSING IMPLICATIONS

Assessment

- Assess oral hygiene. Vigorous cleaning beginning within 10 days of initiation of phenytoin therapy may help control gingival hyperplasia.
- Assess patient for phenytoin hypersensitivity syndrome (fever, skin rash, lymphadenopathy). Rash usually occurs within the first 2 wk of therapy. Hypersensitivity syndrome usually occurs at 3–8 wk but may occur up to 12 wk after initiation of therapy. May lead to renal failure, rhabdomyolysis, or hepatic necrosis; may be fatal.
- **Seizures:** Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically throughout therapy.
- Monitor blood pressure, ECG, and respiratory function continuously during administration of IV phenytoin and throughout period when peak serum phenytoin levels occur (15–30 min after administration).
- **Arrhythmias:** Monitor ECG continuously during treatment of arrhythmias.
- ***Lab Test Considerations:*** Monitor CBC, serum calcium, albumin, and hepatic function tests prior to and monthly for the first several months, then periodically throughout therapy.
- May cause ↑ serum alkaline phosphatase, GGT, and glucose levels.

Copyright © 2008 by F.A. Davis

- Monitor serum folate concentrations periodically during prolonged therapy.
- ***Toxicity and Overdose:*** Monitor serum phenytoin levels routinely. Therapeutic blood levels are 10–20 mcg/ml (8–15 mcg/ml in neonates) in patients with normal serum albumin and renal function. In patients with altered protein binding (neonates, patients with renal failure, hypoalbuminemia, acute trauma), free phenytoin serum concentrations should be monitored. Therapeutic serum free phenytoin levels are 1–2 mcg/ml: Progressive signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

Potential Nursing Diagnoses

Risk for injury (Indications)
Impaired oral mucous membrane (Side Effects)

Implementation

- Implement seizure precautions.
- When transferring from phenytoin to another anticonvulsant, dosage adjustments are made gradually over several weeks.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- **PO:** Administer with or immediately after meals to minimize GI irritation. Shake liquid preparations well before pouring. Use a calibrated measuring device for accurate dose. Chewable tablets must be crushed or chewed well before swallowing. Capsules may be opened and mixed with food or fluids for patients with difficulty swallowing. To prevent direct contact of alkaline drug with mucosa, have patient swallow a liquid first, follow with mixture of medication, then follow with a full glass of water or milk or with food.
- If patient is receiving enteral tube feedings, 2 hr should elapse between feeding and phenytoin administration. If phenytoin is administered via nasogastric tube, flush tube with 2–4 oz water before and after administration.
- Do not interchange chewable phenytoin tablets with phenytoin sodium capsules, because they are not bioequivalent.
- Capsules labeled "extended" may be used for once-a-day dose (Dilantin Kapseals only); those labeled "prompt" may result in toxic serum levels if used for once-a-day dose.

IV Administration

- **IV:** Slight yellow color will not alter solution potency. If refrigerated, may form precipitate, which dissolves after warming to room temperature. Discard solution that is not clear
- To prevent precipitation and minimize local venous irritation, follow infusion with 0.9% NaCl through the same needle or catheter. Avoid extravasation; phenytoin is caustic to tissues.
- **Direct IV:** Administer undiluted. ***Rate:*** Administer at a rate not to exceed 50 mg over 1 min in adults or 1–3 mg/kg/min in neonates. Rapid administration may result in severe hypotension, cardiovascular collapse, or CNS depression.
- **Intermittent Infusion:** Administer by mixing with no more than 50 ml of 0.9% NaCl in a concentration of 1–10 mg/ml. Administer immediately following admixture. Use tubing with a 0.45- to 0.22-micron in-line filter. ***Rate:*** Complete infusion within 1 hr at a rate not to exceed 50 mg/min. In patients who may develop hypotension, patients with cardiovascular disease, or geriatric patients maximum rate of 25 mg/min [may be as low as 5–10 mg/min]. Monitor cardiac function and blood pressure throughout infusion.
- **Y-Site Compatibility:** esmolol, famotidine, fluconazole, foscarnet, tacrolimus.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, cefepime, ceftazidime, ciprofloxacin, diltiazem, enalaprilat, fenoldopam, fentanyl, heparin, hydrocortisone sodium succinate, hydromorphone, lansoprazole, linezolid, methadone, morphine, potassium chloride, propofol, sufentanil, theophylline, vitamin B complex with C.
- **Additive Incompatibility:** Do not admix with other solutions or medications, especially dextrose, because precipitation will occur.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. If a dose is missed from a once-a-day schedule, take as soon as possible and return to regular dosing schedule. If taking several doses a day, take missed dose as soon as possible within 4 hr of next scheduled dose; do not double doses.

Copyright © 2008 by F.A. Davis

Consult health care professional if doses are missed for 2 consecutive days. Abrupt withdrawal may lead to status epilepticus.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid taking alcohol, OTC medications, or herbal medications concurrently with phenytoin without consulting health care professional.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia. Institution of oral hygiene program within 10 days of initiation of phenytoin therapy may minimize growth rate and severity of gingival enlargement. Patients under 23 yr of age and those taking doses >500 mg/day are at increased risk for gingival hyperplasia.
- Advise patient that brands of phenytoin may not be equivalent. Check with health care professional if brand or dosage form is changed.
- Advise diabetic patients to monitor blood glucose carefully and to notify health care professional of significant changes.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient not to take phenytoin within 2–3 hr of antacids.
- Advise female patients to use an additional nonhormonal method of contraception during therapy. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional if skin rash, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, bleeding or tender gums, yellow skin or eyes, joint pain, fever, sore throat, unusual bleeding or bruising, or persistent headache occurs.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes
- Decrease or cessation of seizures without excessive sedation.
- Suppression of arrhythmias.
- Relief of pain due to neuralgia.

phosphate/biphosphate
(**foss**-fate/bye-**foss**-fate)
Fleet Enema, Fleet Phospho-Soda, Visicol

Classification
Therapeutic: laxatives (saline)

Pregnancy Category C (Visicol)

Indications
Preparation of the bowel prior to surgery or radiologic studies. Intermittent treatment of chronic constipation. **Visicol:** Cleansing of the bowel as a preparation for colonoscopy in adults 18 years of age or older.

Action
Osmotically active in the lumen of the GI tract. Produces laxative effect by causing water retention and stimulation of peristalsis. Stimulates motility and inhibits fluid and electrolyte absorption from the small intestine. **Therapeutic Effects:** Relief of constipation. Emptying of the bowel.

Pharmacokinetics
Absorption: 1–20% of rectally administered sodium and phosphate may be absorbed; some absorption follows oral administration.
Distribution: Unknown.
Metabolism and Excretion: Excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–3 hr	unknown	unknown
rect	2–5 min	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen; Severe renal or cardiovascular disease; Intestinal obstruction; Pregnancy (at term); *Visicol*—CHF, ascites, unstable angina, acute colitis, toxic megacolon, or hypomotility syndrome.

Copyright © 2008 by F.A. Davis

Use Cautiously in: Excessive or chronic use (may lead to dependence); Renal or cardiovascular disease, dehydration or concurrent use of diuretics or other drugs known to alter electrolytes (correct abnormalities prior to administration); Pregnancy (may cause sodium retention and edema); *Visicol tablets*—use cautiously within 3 mos of MI, cardiac surgery, in patients with acute exacerbations of inflammatory bowel disease.

Adverse Reactions/Side Effects

CNS: *Visicol*— dizziness, headache. **CV:** ARRHYTHMIAS. **GI:** cramping, nausea, colonic aphtous ulcerations; *Visicol*— abdominal bloating, abdominal pain, vomiting. **F and E:** hyperphosphatemia, hypocalcemia, hypokalemia, sodium retention.

Interactions

Drug-Drug: *Visicol*—Concurrently administered oral medications may not be absorbed due to rapid peristalsis and diarrhea.

Route/Dosage

Each Fleet Enema contains 4.4 g sodium/118 ml. Each 20 ml of Fleet Phospho-Soda oral solution contains 96.4 mEq sodium.

PO (Adults): 20–30 ml Phospho-Soda; *Visicol*—evening before colonoscopy: 3 tablets every 15 min (with at least 8 oz of water), last dose will be 2 tablets (total of 20 tablets), on morning of colonoscopy starting 3–5 hr before procedure, 3 tablets every 15 min (with at least 8 oz of clear liquids), last dose will be 2 tablets (total of 20 tablets); should not be repeated in less than 7 days.

PO (Children): 5–15 ml Phospho-Soda.

Rect (Adults and Children >12 yr): 118 ml Fleet Enema.

Rect (Children >2 yr): ½ of the adult dose.

Availability (generic available)

Oral solution: 18 g sodium phosphate and 48 g sodium biphosphate/100 ml in 45-, 90-, and 237-ml containers[OTC]. **Enema:** 7 g sodium phosphate and 19 g sodium biphosphate/118 ml in 67.5- and 133-ml containers[OTC]. **Tablets (Visicol):** 2 g (40 tablets/bottle).

NURSING IMPLICATIONS

Assessment

- Assess patient for fever, abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- May rarely cause arrhythmias. Monitor patients with underlying cardiovascular disease, renal disease, bowel perforation, misuse or overdose.
- ***Lab Test Considerations:*** May cause increased serum sodium and phosphorus levels, decreased serum calcium and potassium levels, and acidosis. Electrolyte changes are transient, self-limiting, do not require treatment and are not usually associated with adverse clinical events.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Do not administer at bedtime or late in the day.
- **PO:** Administer on an empty stomach for more rapid results. Mix dose in at least ½ glass cold water. May be followed by carbonated beverage or fruit juice to improve flavor.
- See Route and Dose section for dosing of Visicol. Undigested Visicol tablets may appear in the stool or be visualized during colonoscopy.
- **Rect:** Position patient on left side with knee slightly flexed. Insert prelubricated tip about 2 in. into rectum, aiming toward the umbilicus. Gently squeeze bottle until empty. Discontinue if resistance is met, because perforation may occur if contents are forced into rectum.

Patient/Family Teaching

- Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Caution patient on sodium restriction that this product has a high sodium content.
- Advise patient not to take oral form of this medication within 2 hr of other medications.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid intake, and mobility. Normal bowel habits may vary from 3 times/day to 3 times/wk.
- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbal-

Copyright © 2008 by F.A. Davis

ance (muscle cramps or pain, weakness, dizziness, and so forth) occur.

Evaluation/Desired Outcomes

- Soft, formed bowel movement.
- Evacuation of the bowel.

phytonadione

(fye-toe-na-**dye**-one)
AquaMEPHYTON, Mephyton, vitamin K

Classification
Therapeutic: antidotes, vitamins
Pharmacologic: fat-soluble vitamins

Pregnancy Category UK

Indications

Prevention and treatment of hypoprothrombinemia, which may be associated with: Excessive doses of oral anticoagulants, Salicylates, Certain anti-infective agents, Nutritional deficiencies, Prolonged total parenteral nutrition. Prevention of hemorrhagic disease of the newborn.

Action

Required for hepatic synthesis of blood coagulation factors II (prothrombin), VII, IX, and X.
Therapeutic Effects: Prevention of bleeding due to hypoprothrombinemia.

Pharmacokinetics

Absorption: Well absorbed following oral, IM, or subcut administration. Oral absorption requires presence of bile salts. Some vitamin K is produced by bacteria in the GI tract.
Distribution: Crosses the placenta; does not enter breast milk.
Metabolism and Excretion: Rapidly metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK†	DURATION‡
PO	6–12 hr	unknown	unknown
IM, subcut	1–2 hr	3–6 hr	12–14 hr
IV	1–2 hr	3–6 hr	12 hr

†Control of hemorrhage
‡Normal PT achieved

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity or intolerance to benzyl alcohol (injection only).
Use Cautiously in: Impaired liver function.
Exercise Extreme Caution in: Severe life-threatening reactions have occurred following IV administration, use other routes unless risk is justified.

Adverse Reactions/Side Effects

GI: gastric upset, unusual taste. **Derm:** flushing, rash, urticaria. **Hemat:** hemolytic anemia. **Local:** erythema, pain at injection site, swelling. **Misc:** allergic reactions, hyperbilirubinemia (large doses in very premature infants), kernicterus.

Interactions

Drug-Drug: Large doses will counteract the effect of **warfarin**. Large doses of **salicylates** or broad-spectrum **anti-infectives** may increase vitamin K requirements. **Bile acid sequestrants**, **mineral oil**, and **sucralfate** may decrease vitamin K absorption from the GI tract.

Route/Dosage

IV use of phytonadione should be reserved for emergencies, subcutaneous route is preferred.

Treatment of Hypoprothrombinemia due to Vitamin K Deficiency

Subcut, IM, IV (Adults): 10 mg.
PO (Adults): 2.5–25 mg/day.
Subcut, IM, IV (Children >1 month): 1–2-mg single dose.
PO (Children >1 month): 2.5–5 mg/day.

Prevention of Hypoprothrombinemia during Total Parenteral Nutrition

IM, IV (Adults): 5–10 mg once weekly.
IM, IV (Children): 2–5 mg once weekly.

Oral Anticoagulant Overdose

Subcut, IV (Adults): 2.5–10 mg/dose (rarely up to 25–50 mg has been used); may repeat 12–48 hr after with oral route.
Subcut, IV (Children >1 month): 0.5–5 mg.

Prevention of Hemorrhagic Disease of Newborn

IM (Neonates): 0.5–1 mg, within 1 hr of birth, may repeat in 6–8 hrs if needed. May be repeated in 2–3 wk if mother received previous anticonvulsant/anticoagulant/anti-infective/antitubercular therapy. 1–5 mg may be given IM to mother 12–24 hr before delivery.

Treatment of Hemorrhagic Disease of Newborn

IM, Subcut (Neonates): 1–2 mg/day.

Copyright © 2008 by F.A. Davis

Availability

Tablets: 5 mg. **Injection:** 2 mg/ml in 0.5-ml ampules, 10 mg/ml in 1-ml ampules.

NURSING IMPLICATIONS

Assessment

- Monitor for frank and occult bleeding (guaiac stools, Hematest urine, and emesis). Monitor pulse and blood pressure frequently; notify physician immediately if symptoms of internal bleeding or hypovolemic shock develop. Inform all personnel of patient's bleeding tendency to prevent further trauma. Apply pressure to all venipuncture sites for at least 5 min; avoid unnecessary IM injections.
- Pedi: Monitor for side effects and adverse reactions. Children may be especially sensitive to the effects and side effects of vitamin K. Neonates, especially premature neonates, may be more sensitive than older children.
- ***Lab Test Considerations:*** Monitor prothrombin time (PT) prior to and throughout vitamin K therapy to determine response to and need for further therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- The parenteral route is preferred for phytonadione therapy but, because of severe, potentially fatal hypersensitivity reactions, IV vitamin K is not recommended.
- Administration of whole blood or plasma may also be required in severe bleeding because of the delayed onset of this medication.
- Phytonadione is an antidote for warfarin overdose but does not counteract the anticoagulant activity of heparin.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in 0.9% NaCl, D5W, or D5/0.9% NaCl. ***Rate:*** Administer over 30–60 min. Rate should not exceed 1 mg/min.
- **Y-Site Compatibility:** amikacin, aminophylline, atropine, aztreonam, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, dexamethasone sodium phosphate, digoxin, diphenhydramine, dopamine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, heparin, hydrocortisone sodium succinate, hydroxyzine, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, meperidine, metoclopramide, metoprolol, metronidazole, midazolam, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, penicillin G potassium, piperacillin, potassium chloride, procainamide, prochlorperazine, propranolol, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, tobramycin, tolazoline, vancomycin, vasopressin, verapamil, vitamin B with C.
- **Y-Site Incompatibility:** diazepam, dobutamine, magnesium sulfate, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take this medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Notify health care professional of missed doses.
- Cooking does not destroy substantial amounts of vitamin K. Patient should not drastically alter diet while taking vitamin K. See Appendix L for foods high in vitamin K.
- Caution patient to avoid IM injections and activities leading to injury. Use a soft toothbrush, do not floss, and shave with an electric razor until coagulation defect is corrected.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow).
- Patients receiving vitamin K therapy should be cautioned not to take OTC medications without advice of health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.

Evaluation/Desired Outcomes

- Prevention of spontaneous bleeding or cessation of bleeding in patients with hypopro-

Copyright © 2008 by F.A. Davis

thrombinemia secondary to impaired intestinal absorption or oral anticoagulant, salicylate, or anti-infective therapy.
- Prevention of hemorrhagic disease in the newborn.

pilocarpine (oral)†

(pye-loe-**kar**-peen)
Salagen

Classification
Therapeutic: none assigned
Pharmacologic: cholinergics

Pregnancy Category C

†For ophthalmic use of pilocarpine, see Appendix C

Indications
Management of xerostomia, which may occur as a consequence of radiation therapy for cancer of the head and neck. Treatment of dry mouth in patients with Sjögren's syndrome.

Action
Stimulates cholinergic receptors, resulting in primarily muscarinic action, including stimulation of exocrine glands. Other effects include: Increased sweating, gastric secretions, Increased bronchial secretions, Increased tone and motility of the urinary tract, gallbladder, and biliary duct smooth muscle. **Therapeutic Effects:** Increased salivary gland secretion.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Inactivated at neuronal synapses and in plasma. Some unchanged pilocarpine and metabolites are excreted in urine.
Half-life: *After 5-mg dose for 2 days*—0.8 hr; *after 10-mg dose for 2 days*—1.3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	20 min	1 hr	3–5 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Uncontrolled asthma; Angle-closure glaucoma; Iritis.
Use Cautiously in: History of pulmonary disease (asthma, bronchitis, or chronic obstructive pulmonary disease); Biliary tract disease or cholelithiasis; Cardiovascular disease; Retinal disease; Nephrolithiasis; History of psychiatric or cognitive disorders; OB: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache, weakness. **EENT:** amblyopia, epistaxis, rhinitis. **CV:** edema, hypertension, tachycardia. **GI:** nausea, vomiting, dyspepsia, dysphagia. **GU:** urinary frequency. **Derm:** flushing, sweating. **Neuro:** tremors. **Misc:** chills, voice change.

Interactions
Drug-Drug: Concurrent use of **anticholinergics** will ↓ the effectiveness of pilocarpine. Concurrent use of **bethanechol** or **ophthalmic cholinergics** may result in ↑ cholinergic effects. Concurrent use with **beta blockers** may ↑ the risk of adverse cardiovascular reactions (conduction disturbances).

Route/Dosage

Head and Neck Cancer Patients
PO (Adults): 5 mg three times daily initially, then titrated to need/response, usual range 15–30 mg/day (no single should exceed 10 mg).

Patients with Sjögren's Syndrome
PO (Adults): 5 mg four times daily.

Availability
Tablets: 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment
- Assess oral mucosa for dryness and ulceration periodically during therapy.

Potential Nursing Diagnoses
Impaired oral mucous membrane (Indications)

Implementation
- **PO:** Use lowest dose that is tolerated and effective for maintenance.

Patient/Family Teaching
- Instruct patient to take medication as directed.
- Caution patient that pilocarpine may cause visual changes, especially at night; avoid driving or other activities requiring alertness until effects of medication are known.
- Advise patient to drink adequate daily fluids (1500–2000 ml/day), especially if sweating occurs. Less than adequate fluid intake may lead to dehydration.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Increased salivary gland secretion in patients with xerostomia.
- Decrease in dry mouth in patients with Sjögren's syndrome. Full effects in cancer patients may not be seen for up to 12 weeks or 6 weeks in patients with Sjögren's syndrome.

pimecrolimus

(pi-me-**cro**-li-mus)
Elidel

Classification
Therapeutic: immunosuppressants (topical)

Indications

Short-term and intermittent long-term management of mild to moderate atopic dermatitis unresponsive to or in patients intolerant of conventional treatment.

Action

Inhibits T-cell and mast cell activation by interfering with production of inflammatory cytokines. **Therapeutic Effects:** Decreased severity of atopic dermatatis.

Pharmacokinetics

Absorption: Minimally absorbed through intact skin.
Distribution: Local distribution after topical administration.
Metabolism and Excretion: Systemic metabolism and excretion is negligible with local application.
Half-life: Not applicable.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
topical	within 6 days	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be applied to areas of active cutaneous viral infections (increased risk of dissemination); Concurrent use of occlusive dressings; Netherton's syndrome (increased absorption of pimecrolimus); Lactation: Discontinue breastfeeding.

Use Cautiously in: Possible risk of cancer. Do not use as first-line therapy; Clinical infection at treatment site (infection should be treated/cleared prior to use); Skin papillomas (warts); allow treatment/resolution prior to use; Natural/artificial sunlight (minimize exposure); OB: Use only if clearly needed; Pedi: Use only if other treatments have failed; safety not established in children <2 yr.

Adverse Reactions/Side Effects

Local: burning. **Misc:** increased risk of lymphoma/skin cancer.

Interactions

Drug-Drug: None significant as systemic absorption is negligible.

Route/Dosage

Topical (Adults and Children ≥2 yr): Apply thin film twice daily; rub in gently and completely.

Availability

Cream: 1% in 30-g, 60-g, and 100-g tubes.
Cost: $75.99/30 g, $141.58/60 g, $220.98/100 g.

NURSING IMPLICATIONS

Assessment

- Assess skin lesions prior to and periodically during therapy. Discontinue therapy after signs and symptoms of atopic dermatitis have resolved. Resume treatment at the first signs and symptoms of recurrence.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Implementation

- **Topical:** Apply a thin layer to affected area twice daily and rub in gently and completely. May be used on all skin areas including head, neck, and intertriginous areas. Do not use with occlusive dressings.

Patient/Family Teaching

- Instruct patient on correct technique for application. Apply only as directed to external areas. Wash hands following application, unless hands are areas of application.
- Caution patient to avoid exposure to natural or artificial sunlight, including tanning beds, while using cream.
- Advise patient that pimecrolimus may cause skin burning. This occurs most commonly

Copyright © 2008 by F.A. Davis

during first few days of application, is of mild to moderate severity, and improves within 5 days or as atopic dermatitis resolves.
- Advise patient to notify health care provider if no improvement is seen following 6 wk of treatment or at any time if condition worsens.

Evaluation/Desired Outcomes
- Resolution of signs and symptoms of atopic dermatitis.

pioglitazone (pi-o-glit-a-zone)
Actos

Classification
Therapeutic: antidiabetics (oral)
Pharmacologic: thiazolidinediones

Pregnancy Category C

Indications
Management of type 2 diabetes mellitus; may also be used with a sulfonylurea, metformin, or insulin when the combination of diet, exercise, and metformin does not achieve glycemic control.

Action
Improves sensitivity to insulin by acting as an agonist at receptor sites involved in insulin responsiveness and subsequent glucose production and utilization. Requires insulin for activity.
Therapeutic Effects: Decreased insulin resistance, resulting in glycemic control without hypoglycemia.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: >99% bound to plasma proteins. Active metabolites are also highly (>99 %) bound.
Metabolism and Excretion: Extensively metabolized by the liver; at least two metabolites have pharmacologic activity. Minimal renal excretion of unchanged drug.
Half-life: *Pioglitazone*—3–7 hr; *total pioglitazone (pioglitazone plus metabolites)*—16–24 hr.

TIME/ACTION PROFILE (effects on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Diabetic ketoacidosis; Clinical evidence of active liver disease or increased ALT (>2.5 times upper limit of normal); OB: Pregnancy or lactation (not recommended for use during pregnancy or lactation; insulin should be used); Pedi: Children <18 yr or type 1 diabetes (requires insulin for activity).
Use Cautiously in: Edema; CHF (avoid use in moderate to severe CHF); Hepatic impairment; Women (may increase distal upper and lower limb fractures); Women with childbearing potential (may restore ovulation and risk of pregnancy).

Adverse Reactions/Side Effects
CV: edema. **GI:** hepatitis, ↑ liver enzymes. **Hemat:** anemia. **Misc:** fractures (arm, hand, foot) in female patients.

Interactions
Drug-Drug: May ↓ efficacy of **hormonal contraceptives**. Pioglitazone is metabolized by the **CYP450 3A4** enzyme system. Concurrent use of drugs that alter the activity of this system may result in drug-drug interactions. **Ketoconazole** may ↑ effects of pioglitazone. Concurrent use with **insulin** may ↑ risk of CHF (consider predisposing factors).
Drug-Natural Products: Glucosamine may worsen blood glucose control. Chromium, and coenzyme Q-10 may produce ↑ hypoglycemic effects.

Route/Dosage
PO (Adults): 15–30 mg once daily, may be increased to 45 mg/day if needed. Doses greater than 30 mg have not been evaluated in combination with insulin and other antidiabetics.

Availability
Tablets: 15 mg, 30 mg, 45 mg. **Cost:** 15 mg $329.97/90, 30 mg $505.97/90, 45 mg $549.97/90. ***In combination with:*** Metformin (Actoplus Met), glimepride (Duetact); see Appendix B.

NURSING IMPLICATIONS

Assessment
- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reac-

Copyright © 2008 by F.A. Davis

tions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).

- ***Lab Test Considerations:*** Monitor serum glucose and Hb A_{1c} periodically during therapy to evaluate effectiveness.
- Monitor CBC with differential periodically during therapy. May cause ↓ in hemoglobin and hematocrit, usually during the first 4–12 wk of therapy; then levels stabilize.
- Monitor serum ALT levels before starting therapy and periodically thereafter or if jaundice or symptoms of hepatic dysfunction occur. Pioglitazone should not be started in patients with active liver disease or ALT levels >2.5 times the upper limit of normal. Patients with mild ALT ↑ should have more frequent monitoring. If ALT ↑ to >3 times the upper limit of normal, recheck ALT promptly. Discontinue pioglitazone if ALT remains >3 times normal.
- May cause transient ↑ in CPK levels.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered with or without meals.

Patient/Family Teaching

- Instruct patient to take medication as directed. If dose for 1 day is missed, do not double dose the next day.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional immediately if signs of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, jaundice) or CHF (edema, shortness of breath, rapid weight gain) occur.
- Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients that higher doses of oral contraceptives or a form of contraception other than oral contraceptives may be required and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels.

piperacillin/tazobactam

(pi-**per**-a-sill-in/tay-zoe-**bak**-tam)
Zosyn

Classification
Therapeutic: anti-infectives
Pharmacologic: extended spectrum penicillins

Pregnancy Category B

Indications

Appendicitis and peritonitis. Skin and skin structure infections. Gynecologic infections. Community-acquired and nosocomial pneumonia caused by piperacillin-resistant, beta-lactamase–producing bacteria.

Action

Piperacillin binds to bacterial cell wall membrane, causing cell death. Spectrum is extended compared with other penicillins. Tazobactam inhibits beta-lactamase, an enzyme that can destroy penicillins. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Active

Copyright © 2008 by F.A. Davis

against piperacillin-resistant, beta-lactamase–producing: *Bacteroides fragilis*, *E. coli*, *Acinetobacter baumanii*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Haemophilus influenzae*.

Pharmacokinetics

Absorption: Piperacillin is well absorbed (80%) from IM sites.
Distribution: Widely distributed. Enter CSF well only when meninges are inflamed. Cross the placenta and enter breast milk in low concentrations.
Metabolism and Excretion: Piperacillin (68%) and tazobactam (80%) are mostly excreted unchanged by the kidneys.
Half-life: 0.7–1.2 hr.

TIME/ACTION PROFILE (piperacillin blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins, beta-lactams, cephalosporins, or tazobactam (cross-sensitivity may occur).
Use Cautiously in: Renal impairment (dosage reduction or increased interval recommended if CCr <40 ml/min); Sodium restriction; Pedi: Children (safety and efficacy not established); OB: Pregnancy and lactation (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES (higher doses), confusion, dizziness, headache, insomnia, lethargy. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, constipation, drug-induced hepatitis, nausea, vomiting. **GU:** interstitial nephritis. **Derm:** rashes (↑ in cystic fibrosis patients), urticaria. **Hemat:** bleeding, leukopenia, neutropenia, thrombocytopenia. **Local:** pain, phlebitis at IV site. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS and SERUM SICKNESS, fever (↑ in cystic fibrosis patients), superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels. May alter excretion of **lithium**. **Potassium-losing diuretics**, **corticosteroids**, or **amphotericin B** may ↑ risk of hypokalemia. ↑ risk of hepatotoxicity with other **hepatotoxic agents**. May ↓ half-life of **aminoglycosides** in patients with renal impairment. May ↑ levels and risk of toxicity from **methotrexate**.

Route/Dosage

Contains 2.79 mEq (64 mg) sodium/g of piperacillin; dose below expressed as combined piperacillin/tazobactam content.
IV (Adults): *Most infections*—3.375 g q 6 hr. *Nosocomial pneumonia*—4,5 g q 6 hr.

Renal Impairment

IV (Adults): *CCr 20–40 ml/min*—2.25 g q 6 hr (3.375 g q 6 hr for nosocomial pneumonia); *CCr <20 ml/min*—2.25 g q 8 hr (2.25 g q 6 hr for nosocomial pneumonia); *Hemodialysis*—2.25 g q 12 h (2.25 g q 8 hr for nosocomial pneumonia).

Availability

Powder for injection: 2-g piperacillin/0.25-g tazobactam vials and 50-g ml premixed frozen containers, 3-g piperacillin/0.375-g tazobactam vials and 50-ml premixed frozen containers, 4-g piperacillin/0.5-g tazobactam vials and 50-ml premixed frozen containers, 36-g piperacillin/4.5-g tazobactam bulk vials.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** Evaluate renal and hepatic function, CBC, serum potassium, and bleeding times prior to and routinely during therapy.
- May cause positive direct Coombs' test result.
- May cause ↑ BUN, creatinine, AST, ALT, serum bilirubin, alkaline phosphatase, and LDH.

Copyright © 2008 by F.A. Davis

- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause prolonged prothrombin and partial thromboplastin time.
- May cause ↓ hemoglobin and hematocrit and thrombocytopenia, eosinophilia, leukopenia, and neutropenia. It also may cause proteinuria; hematuria; pyuria; hyperglycemia; ↓ total protein or albumin; and abnormalities in sodium, potassium, and calcium levels.

Potential Nursing Diagnosis

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not confuse Zosyn (piperacillin/tazobactam) with Zofran (ondansetron).

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 1 g of piperacillin with at least 5 ml of 0.9% NaCl, sterile water for injection, or D5W. Dilute further in 50–100 ml of 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. Reconstituted vials stable for 24 hr at room temperature or 48 hr if refrigerated. Infusion stable for 24 hr at room temperature or 7 days if refrigerated. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** amikacin, aminophylline, anidulafungin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, calcium chloride, calcium gluconate, cefepime, chloramphenicol, cimetidine, clindamycin, cyclosporine, cytarabine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diazepam, digoxin, diphenhydramine, docetaxel, dopamine, enalaprilat, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, isoproterenol, ketorolac, lansoprazole, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, pantoprazole, phenylephrine, potassium chloride, procainamide, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, thiotepa, trimethoprim/sulfamethoxazole, tigecycline, tirofiban, vasopressin, vinblastine, vincristine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B, amphotericin b cholesteryl sulfate complex, azithromycin, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin, diltiazem, dobutamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, drotrecogin, famotidine, ganciclovir, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, insulin, labetalol, levofloxacin, midazolam, mitomycin, mitoxantrone, nalbuphine, phenytoin, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, thiotepa, tobramycin, vecuronium, verapamil.

Patient/Family Teaching

- Advise patient to report signs of superinfection (black furry overgrowth on tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

piroxicam (peer-**ox**-i-kam)

Apo-Piroxicam, Feldene, Novo-Pirocam, Nu-Pirox, PMS-Piroxicam

Classification

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

Pregnancy Category C

Copyright © 2008 by F.A. Davis

Indications

Management of inflammatory disorders, including: Rheumatoid arthritis, Osteoarthritis. **Unlabeled uses:** Management of dysmenorrhea.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Unknown. Enters breast milk in small amounts.
Metabolism and Excretion: Mostly metabolized by the liver. Minimal amounts excreted unchanged by the kidneys.
Half-life: 50 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic effect)	1 hr	unknown	48–72 hr
PO (anti-inflammatory effect)	7–12 days	2–3 wk†	unknown

†May take up to 12 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; OB: Lactation; Peri-operative pain from coronary artery bypass graft (CABG) surgery.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe hepatic disease; History of ulcer disease; Geri: Appears on Beers list. Geriatric patients are at increased risk for GI bleeding, edema, renal failure; Renal impairment (dosage reduction recommended); OB, Pedi: Pregnancy or children (safety not established; avoid use during 2nd half of pregnancy).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, dizziness. **EENT:** blurred vision, tinnitus. **CV:** edema. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, discomfort, dyspepsia, nausea, vomiting, anorexia, constipation, diarrhea, flatulence. **GU:** renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rashes. **Hemat:** blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use with **aspirin** ↓ piroxicam blood levels and may ↓ effectiveness. ↑ risk of bleeding with **anticoagulants**, **cefoperazone**, **cefotetan**, **heparin**, **ticlopidine**, **clopidogrel**, **eptifibatide**, **tirofiban**, **thrombolytic agents**, **valproic acid**. ↑ adverse GI side effects with **aspirin**, **corticosteroids**, and other **NSAIDs**. **Probenecid** ↑ blood levels and may increase toxicity. May ↓ response to **antihypertensives** or **diuretics**. May ↑ serum levels and risk of toxicity from **lithium**. May ↑ risk of hypoglycemia from **insulin** or **oral hypoglycemic agents**. ↑ risk of adverse renal effects with **gold compounds**, **cyclosporine**, or chronic use of **acetaminophen**. May ↑ risk of hematologic toxicity from **antineoplastics** or **radiation therapy**.
Drug-Natural Products: Increased anticoagulant effect and bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

PO (Adults): *Anti-inflammatory*—10–20 mg/day; may be given as single dose or 2 divided doses. *Antidysmenorrheal*—40 mg initially, then 20 mg/day.
PO (Geriatric Patients): 10 mg/day initially.

Availability (generic available)

Capsules: 10 mg, 20 mg. **Suppositories:** ✱10 mg, ✱20 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Bleeding time may be prolonged for up to 2 wk following discontinuation of therapy.
- May cause ↓ hemoglobin, hematocrit, leukocyte, and platelet counts.
- Monitor liver function tests periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN, serum creatinine, and electrolytes periodically during therapy. May cause ↑ BUN, serum creatinine, and electrolyte

Copyright © 2008 by F.A. Davis

concentrations and ↓ urine electrolyte concentrations.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects, especially in geriatric patients. Use lowest effective dose for shortest period of time.
- **PO:** Administer after meals or with food or an antacid containing aluminum or magnesium to minimize gastric irritation.
- Administer as soon as possible after the onset of menses. Prophylactic use has not been proved effective.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC or herbal products without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reaction (rare).
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require up to 12 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.

polyethylene glycol

(po-lee-**eth**-e-leen **glye**-kole)
MiraLax

Classification
Therapeutic: laxatives
Pharmacologic: osmotics

Pregnancy Category C

Indications

Treatment of occasional constipation.

Action

Polyethylene glycol (PEG) in solution acts as an osmotic agent, drawing water into the lumen of the GI tract. **Therapeutic Effects:** Evacuation of the GI tract without water or electrolyte imbalance.

Pharmacokinetics

Absorption: Nonabsorbable.
Distribution: Unknown.
Metabolism and Excretion: Excreted in fecal contents.
Half-life: Unknown.

TIME/ACTION PROFILE (bowel movement)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 days	unknown

Contraindications/Precautions

Contraindicated in: GI obstruction; Gastric retention; Toxic colitis; Megacolon.
Use Cautiously in: Abdominal pain of uncertain cause, particularly if accompanied by fever; Pregnancy or children (safety not established).

Adverse Reactions/Side Effects

GI: abdominal bloating, cramping, flatulence, nausea.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 17 g (heaping tablespoon) in 8 oz of water; may be used for up to 2 wk.

Availability (generic available)

Powder: 14-oz, 16-oz, 24-oz, and 26-oz containers, 17-g packets.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)
Diarrhea (Side Effects)

Implementation

- **PO:** Dissolve powder in 8 oz of water prior to administration.

Patient/Family Teaching

- Inform patient that 2–4 days may be required to produce a bowel movement. PEG should not be used for more than 2 wk. Prolonged, frequent, or excessive use may result in electrolyte imbalance and laxative dependence.
- Advise patient to notify health care professional if unusual cramps, bloating, or diarrhea occurs.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.

polyethylene glycol/electrolyte

(po-lee-**eth**-e-leen **glye**-kole/e-**lek**-troe-lite)
Colovage, Colyte, GoLYTELY, ✱Klean-Prep, NuLytely, OCL, Peglyte, TriLyte

Classification
Therapeutic: laxatives
Pharmacologic: osmotics

Pregnancy Category C

Indications

Bowel cleansing in preparation for GI examination. **Unlabeled uses:** Treatment of acute iron overdose in children.

Action

Polyethylene glycol (PEG) in solution acts as an osmotic agent, drawing water into the lumen of the GI tract. **Therapeutic Effects:** Evacuation of the GI tract without water or electrolyte imbalance.

Pharmacokinetics

Absorption: Ions in the solution are nonabsorbable.
Distribution: Unknown.
Metabolism and Excretion: Solution is excreted in fecal contents.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	4 hr

Contraindications/Precautions

Contraindicated in: GI obstruction; Gastric retention; Toxic colitis; Megacolon.
Use Cautiously in: Patients with absent or diminished gag reflex; Unconscious or semicomatose states, in which administration is via NG tube; History of ulcerative colitis (increased risk of hypoglycemia, dehydration, and hypokalemia); Barium enema using double-contrast technique (may not allow proper barium coating of mucosa); Abdominal pain of uncertain cause, particularly if accompanied by fever; Geri: May be more sensitive to effects; Pedi: Children (safety not established; children <2 yr more prone to hypoglycemia, dehydration, and hypokalemia).

Adverse Reactions/Side Effects

GI: abdominal fullness, diarrhea, bloating, cramps, nausea, vomiting. **Misc:** allergic reactions (rare).

Interactions

Drug-Drug: Interferes with the absorption of **orally administered medications** by decreasing transit time (do not administer within 1 hr of start of therapy).

Route/Dosage

PO (Adults): 240 ml q 10 min (up to 4 L) until fecal discharge appears clear and has no solid material; may be given through NG tube at 20–30 ml/min (up to 4 L).
PO (Children ≥6 mo): 25 ml/kg/hr until fecal discharge is clear and has no solid material; may also be given through a NG tube (unlabeled).

Availability

Oral solution: OCL—1500-ml 3-pack. **Powder for oral solution (regular, pineapple, citrus berry, lemon lime, cherry flavor):** CoLyte—powder in bottles for reconstitution, GoLYTLEY—powder in packets and disposable jugs for reconstitution, NuLytely—powder in disposable jugs for reconstitution.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- Monitor semiconscious or unconscious patients closely for regurgitation when administering via NG tube.

Potential Nursing Diagnoses

Diarrhea (Side Effects)

Implementation

- Do not add extra flavorings or additional ingredients to solution prior to administration.
- Patient should fast for 3–4 hr prior to administration and should never have solid food within 2 hr of administration.
- Patient should be allowed only clear liquids after administration.
- May be administered on the morning of the examination as long as time is allotted to drink solution (3 hr) and evacuate bowel (1 additional hr). For barium enema, administer solution early evening (6 PM) prior to exam to allow proper mucosal coating by barium.
- **PO:** Solution may be reconstituted with tap water. Shake vigorously until powder is dissolved.
- May be administered via NG tube at a rate of 20–30 ml/min.

Patient/Family Teaching

- Instruct patient to drink 240 ml every 10 min until 4 L have been consumed or fecal discharge is clear and free of solid matter. Rapidly drinking each 240 ml is preferred over drinking small amounts continuously.

Evaluation/Desired Outcomes

- Diarrhea, which cleanses the bowel within 4 hr. The first bowel movement usually occurs within 1 hr of administration.

posaconazole

(po-sa-**kon**-a-zole)
Noxafil

Classification
Therapeutic: antifungals
Pharmacologic: triazoles

Pregnancy Category C

Indications

Prevention of invasive Aspergillus and Candida infections in severely immunocompromised patients. Treatment of orpharyngeal candidiasis (including candidiasis unresponsive to itraconazole or fluconazole).

Action

Blocks ergosterol synthesis, a major component of fungal cell wall. **Therapeutic Effects:** Fungistatic/fungicidal action against susceptible fungi.

Pharmacokinetics

Absorption: Well absorbed following oral administration; absorption is optimized by food.
Distribution: Extensive extravascular distribution and penetration into body tissues.
Protein Binding: >98%.
Metabolism and Excretion: Some metabolism via UDP glucuronidation; 66% eliminated unchanged in feces, 13% in urine (mostly as metabolites).
Half-life: 35 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–5 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of pimozide or quinidine (↑ risk of serious arrhythmias); Concurrent use of ergot alkaloids (↑ risk of ergotism).
Use Cautiously in: History of/predisposition to QTc prolongation including congenital QTc prolongation, concurrent medications which prolong QTc, high cumulative anthracycline history or electrolyte abnormalities (hypokalemia, hypomagnesemia); correct pre-existing abnormalities prior to administration; Hypersensitivity to other azole antifungals; Hepatic impairment; Severe diarrhea, vomiting, or renal impairment (monitor for breakthrough fungal infections); OB: Use only in pregnancy or lactation if maternal benefit outweighs risk to child;

Copyright © 2008 by F.A. Davis

Pedi: Safe use in children <13 yr not established.

Adverse Reactions/Side Effects

GI: HEPATOCELLULAR DAMAGE, diarrhea, nausea, vomiting. **Endo:** adrenal insufficiency. **Metab:** ALLERGIC RECTIONS.

Interactions

Drug-Drug: Posaconazole inhibits the CYP3A4 enzyme systems and should be expected to interact with other drugs affected by this system. **Rifabutin**, **phenytoin**, **cimetidine** ↓ levels and may ↓ antifungal effectiveness; avoid concurrent use. ↑ **cyclosporine**, **sirolimus**, and **tacrolimus** levels and risk of toxicity, decrease dose initially and monitor levels frequently. ↑ **rifabutin** levels; avoid concurrent use of **phenytoin**, and **midazolam**; monitor for excess clinical effect and dose accordingly. ↑ levels and risk of toxicity from **ergot alkaloids**, including **ergotamine** and **dihydroergotamine**; concurrent administration is contraindicated. ↑ levels and risk of neurotoxicity of **vinca alkaloids**, including **vincristine** and **vinblastine**; consider dose adjustment. ↑ levels and risk of toxicity of **HMG CoA reductase inhibitors (statins)**; consider ↓ statin dose. May ↑ levels and risk of adverse cardiovascular reactions to **calcium channel blockers**; consider dosage reduction.

Route/Dosage

PO (Adults): 200 mg three times daily.

Availability

Oral suspension (cherry): 40 mg/ml in 105-ml bottles.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of fungal infection.
- ***Lab Test Considerations:*** Monitor liver function tests prior to and periodically during therapy. May cause ↑ ALT, ↑ AST, ↑ alkaline phosphatase and ↑ total bilirubin levels; generally reversible on discontinuation. Discontinue posaconazole if clinical signs and symptoms of liver disease develop.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Shake suspension well before use. Administer 200 mg (5-mL dose) with a full meal or liquid nutritional supplement to enhance absorption. Rinse spoon for administration with water after each use. Alternative therapy or close monitoring for breakthrough fungal infections should be considered for patients unable to eat a full meal or tolerate a nutritional supplement.

Patient/Family Teaching

- Advise patient to notify health care professional if severe diarrhea or vomiting occur; may decrease posaconazole blood levels and allow breakthrough fungal infections.
- Instruct patient to consult health care professional prior to taking Rx, OTC, or herbal products during posaconazole therapy.
- Advise patient to notify health care professional of pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy is based on recovery from neutropenia or immunosuppression.

potassium and sodium phosphates

(po-**tas**-e-um/**soe**-dee-yum **foss**-fates)

K-Phos M.F, K-Phos Neutral, K-Phos No. 2, Neutra-Phos, Uro-KP Neutral

Classification

Therapeutic: antiurolithics, mineral and electrolyte replacements/supplements

Pregnancy Category C

Indications

Treatment and prevention of phosphate depletion in patients who are unable to ingest adequate dietary phosphate. Adjunct therapy of urinary tract infections with methenamine hippurate or mandelate. Prevention of calcium urinary stones. Phosphate salts of potassium may be used in hypokalemic patients with metabolic acidosis or coexisting phosphorus deficiency.

Action

Phosphate is present in bone and is involved in energy transfer and carbohydrate metabolism. Serves as a buffer for the excretion of hydrogen ions by the kidneys. Dibasic potassium phosphate is converted in renal tubule to monobasic

Copyright © 2008 by F.A. Davis

salt, resulting in urinary acidification, which is required for methenamine hippurate or mandelate to be active as urinary anti-infectives. Acidification of urine increases solubility of calcium, decreasing calcium stone formation. **Therapeutic Effects:** Replacement of phosphorus in deficiency states. Urinary acidification. Increased efficacy of methenamine. Decreased formation of calcium urinary tract stones.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Vitamin D promotes GI absorption of phosphates.
Distribution: Phosphates enter extracellular fluids and are then actively transported to sites of action.
Metabolism and Excretion: Excreted mainly (>90%) by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia (potassium salts); Hyperphosphatemia; Hypocalcemia; Severe renal impairment; Untreated Addison's disease (potassium salts).
Use Cautiously in: Hyperparathyroidism; Cardiac disease; Hypernatremia (sodium phosphate only); Hypertension (sodium phosphate only); Renal impairment.

Adverse Reactions/Side Effects

Related to hyperphosphatemia, unless otherwise indicated.
CNS: confusion, dizziness, headache, weakness. **CV:** ARRHYTHMIAS, CARDIAC ARREST, bradycardia, ECG changes (absent P waves, widening of the QRS complex with biphasic curve, peaked T waves), edema. **GI:** diarrhea, abdominal pain, nausea, vomiting. **F and E:** hyperkalemia, hypernatremia, hyperphosphatemia, hypocalcemia, hypomagnesemia. **MS:** *hypocalcemia*, *hyperkalemia*—muscle cramps. **Neuro:** flaccid paralysis, heaviness of legs, paresthesias, tremors.

Interactions

Drug-Drug: Concurrent use of **potassium-sparing**, **diuretics**, **ACE inhibitors**, or **angiotensin II receptor blockers** with potassium phosphates may result in hyperkalemia. Concurrent use of **corticosteroids** with sodium phosphate may result in hypernatremia. Concurrent administration of **calcium-**, **magnesium-**, or **aluminum-containing compounds** ↓ absorption of phosphates by formation of insoluble complexes. **Vitamin D** enhances the absorption of phosphates.
Drug-Food: Oxalates (in spinach and rhubarb) and **phytates** (in bran and whole grains) may ↓ absorption of phosphates by binding them in the GI tract.

Route/Dosage

Phosphorous Supplementation

PO (Adults and Children >4 yr): 250–500 mg (8–16 mmol) phosphorus (1–2 packets) 4 times daily.
PO (Children <4 yr): 250 mg (8 mmol) phosphorus (1 packet) 4 times daily.

Urinary Acidification

PO (Adults): 2 tablets 4 times/day.

Maintenance Phosphorus

PO (Adults): 50–150 mmol/day in divided doses.
PO (Children): 2–3 mmol/kg/day in divided doses.

Availability

Potassium and Sodium Phosphates

Tablets (K-Phos MF): elemental phosphorus 125.6 mg (4 mmol), sodium 67 mg (2.9 mEq), and potassium 44.5 mg (1.1 mEq). **Tablets (K-Phos Neutral):** elemental phosphorus 250 mg (8 mmol), sodium 298 mg (13 mEq), and potassium 45 mg (1.1 mEq). **Tablets (K-Phos No.2):** elemental phosphorus 250 mg (8 mmol), sodium 134 mg (5.8 mEq), and potassium 88 mg (2.3 mEq). **Tablets (Uro-KP Neutral):** elemental phosphorus 258 mg, sodium 262.4 mg (10.8 mEq), and potassium 49.4 mg (1.3 mEq). **Powder for oral solution (Neutra-Phos):** elemental phosphorus 250 mg (8 mmol), sodium 164 mg (7.1 mEq), and potassium 278 mg (7.1 mEq)/packet.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of hypokalemia (weakness, fatigue, arrhythmias,

Copyright © 2008 by F.A. Davis

presence of U waves on ECG, polyuria, polydipsia) and hypophosphatemia (anorexia, weakness, decreased reflexes, bone pain, confusion, blood dyscrasias) throughout therapy.
- Monitor intake and output ratios and daily weight. Report significant discrepancies.
- ***Lab Test Considerations:*** Monitor serum phosphate, potassium, sodium, and calcium levels prior to and periodically throughout therapy. Increased phosphate may cause hypocalcemia.
- Monitor renal function studies prior to and periodically throughout therapy.
- Monitor urinary pH in patients receiving potassium and sodium phosphate as a urinary acidifier.

Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)

Implementation
- **PO:** Tablets should be dissolved in a full glass of water. Allow mixture to stand for 2–5 min to ensure it is fully dissolved. Solutions prepared by pharmacy should not be further diluted.
- Medication should be administered after meals to minimize gastric irritation and laxative effect.
- Do not administer simultaneously with antacids containing aluminum, magnesium, or calcium.

Patient/Family Teaching
- Explain to the patient the purpose of the medication and the need to take as directed. Take missed doses as soon as remembered unless within 1 or 2 hr of the next dose. Explain that the tablets should not be swallowed whole. Tablets should be dissolved in water.
- Instruct patients in low-sodium diet (see Appendix L).
- Advise patient of the importance of maintaining a high fluid intake (drinking at least one 8-oz glass of water each hr) to prevent kidney stones.
- Instruct the patient to promptly report diarrhea, weakness, fatigue, muscle cramps, unexplained weight gain, swelling of lower extremities, shortness of breath, unusual thirst, or tremors.

Evaluation/Desired Outcomes
- Prevention and correction of serum phosphate and potassium deficiencies.
- Maintenance of acid urine.
- Decreased urine calcium, which prevents formation of renal calculi.

potassium iodide, See IODINE, IODIDE.

trikates (potassium acetate/potassium bicarbonate/potassium citrate)

Tri-K

Classification

Therapeutic: mineral and electrolyte replacements/supplements

Pregnancy Category C

Indications

PO, IV: Treatment/prevention of potassium depletion. **IV:** Arrhythmias due to digoxin toxicity.

Action

Maintain acid-base balance, isotonicity, and electrophysiologic balance of the cell. Activator in many enzymatic reactions; essential to transmission of nerve impulses; contraction of cardiac, skeletal, and smooth muscle; gastric secretion; renal function; tissue synthesis; and carbohydrate metabolism. **Therapeutic Effects:** Replacement. Prevention of deficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Enters extracellular fluid; then actively transported into cells.
Metabolism and Excretion: Excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (increase in serum potassium levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	unknown
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia; Severe renal impairment; Untreated Addison's disease; Severe tissue trauma; Hyperkalemic familial periodic paralysis; Some products may contain tartrazine (FDC yellow dye #5) or alcohol; avoid using in patients with known hypersensitivity or intolerance; Potassium acetate injection contains aluminum, which may become toxic with prolonged use to high risk groups (renal impairment, premature neonates).

Use Cautiously in: Cardiac disease; Renal impairment; Diabetes mellitus (liquids may contain sugar); Hypomagnesemia (may make correction of hypokalemia more difficult); GI hypomotility including dysphagia or esophageal compression from left atrial enlargement (tablets, capsules); Patients receiving potassium-sparing drugs.

Adverse Reactions/Side Effects

CNS: confusion, restlessness, weakness. **CV:** ARRHYTHMIAS, ECG changes. **GI:** abdominal pain, diarrhea, flatulence, nausea, vomiting; *tablets, capsules only*—GI ulceration, stenotic lesions. **Local:** irritation at IV site. **Neuro:** paralysis, paresthesia.

Interactions

Drug-Drug: Use with **potassium-sparing diuretics** or **ACE inhibitors** or **angiotensin II receptor antagonists** may lead to hyperkalemia. **Anticholinergics** may ↑ GI mucosal lesions in patients taking wax-matrix potassium chloride preparations.

P

Route/Dosage

Expressed as mEq of potassium. Potassium acetate contains 10.2 mEq/g; potassium bicarbonate contains 10 mEq potassium/g; potassium chloride contains 13.4 mEq potassium/g; potassium gluconate contains 4.3 mEq/g.

Normal Daily Requirements

PO, IV (Adults): 40–80 mEq/day.
PO, IV (Children): 2–3 mEq/kg/day.
PO, IV (Neonates): 2–6 mEq/kg/day.

Prevention of Hypokalemia During Diuretic Therapy

PO (Adults): 20–40 mEq/day in 1–2 divided doses; single dose should not exceed 20 mEq.
PO (Neonates, Infants and Children): 1–2 mEq/kg/day in 1–2 divided doses.

Treatment of Hypokalemia

PO (Adults): 40–100 mEq/day in divided doses.
PO (Neonates, Infants and Children): 2–5 mEq/kg/day in divided doses.
IV (Adults): *Serum potassium >2.5 mEq/L*—Up to 20 mEq/day as an infusion (not to exceed 10 mEq/hr) or a concentration of 40 mEq/L via peripheral line (up to 100 mEq/L have been used via central line [unlabeled]). *Serum potassium <2 mEq/L with symptoms*—Up to 40

Copyright © 2008 by F.A. Davis

mEq/day as an infusion (rate should generally not exceed 20 mEq/hr).
IV (Neonates, Infants and Children): 0.5–1 mEq/kg/dose (maximum 30 mEq/dose) as an infusion to infuse at 0.3–0.5 mEq/kg/hr (maximum infusion rate 1 mEq/kg/hr).

Availability

Potassium Acetate
Concentrate for injection (contains aluminum): 2 mEq/ml in 20-, 50-, and 100-ml vials, 4 mEq/ml in 50-ml vials.

Potassium Bicarbonate
Tablets for effervescent oral solution: 25 mEq.

Potassium Bicarbonate/Potassium Chloride
Packets for effervescent oral solution: 20 mEq/2.8-g packet. **Tablets for effervescent oral solution:** ♣12 mEq, 20 mEq, 25 mEq, 50 mEq.

Potassium Bicarbonate/Potassium Citrate
Tablets for effervescent oral solution: 25 mEq, 50 mEq. **Cost:** 25 mEq $122.98/90, 50 mEq $213.97/90.

Potassium Chloride
Extended-release tablets: 8 mEq, 10 mEq, 20 mEq. **Cost:** *Generic*—10 mEq $22.49/90, 20 mEq $32.97/90. **Extended-release capsules:** 8 mEq, 10 mEq. **Cost:** *Generic*—10 mEq $24.74/90. **Oral solution:** 20 mEq/15 ml, 40 mEq/15 ml. **Cost:** *Generic*—20 mEq/15 ml $8.99/473 ml, 40 mEq/15 ml $19.97/480 ml. **Powder/packets for oral solution:** 20-mEq/1.5-g packet, 25-mEq/1.8-g packet. **Packets for oral suspension:** 20-mEq/1.5-g packet. **Concentrate for injection:** 0.1 mEq/ml in 10-mEq ampules and vials, 0.2 mEq/ml in 10- and 20-mEq ampules and vials, 0.3 mEq/ml in 30-mEq ampules and vials, 0.4 mEq/ml in 20- and 40-mEq ampules and vials, 1.5 mEq/ml, 2 mEq/ml, 3 mEq/ml. **Solution for IV infusion:** 10 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-ml containers, 20 mEq/L in dextrose/saline/LRs in 250-, 500-, and 100-ml containers, 30 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-ml containers, 40 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-ml containers.

Potassium Chloride/Potassium Bicarbonate/Potassium Citrate
Tablets for effervescent oral solution: 20 mEq.

Potassium Gluconate
Tablets: 2 mEq, 5 mEq. **Elixir:** 20 mEq/15 ml.

Potassium Gluconate/Potassium Chloride
Oral solution: 20 mEq/15 ml. **Powder for oral solution:** 20 mEq/5-g packet.

Potassium Gluconate/Potassium Citrate
Oral solution: 20 mEq/15 ml.

Trikates (Potassium Acetate/Potassium Bicarbonate/Potassium Citrate)
Oral solution: 15 mEq/5 ml.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia) and hyperkalemia (see Toxicity and Overdose).
- Monitor pulse, blood pressure, and ECG periodically during IV therapy.
- ***Lab Test Considerations:*** Monitor serum potassium before and periodically during therapy. Monitor renal function, serum bicarbonate, and pH. Determine serum magnesium level if patient has refractory hypokalemia; hypomagnesemia should be corrected to facilitate effectiveness of potassium replacement. Monitor serum chloride because hypochloremia may occur if replacing potassium without concurrent chloride.
- ***Toxicity and Overdose:*** Symptoms of toxicity are those of hyperkalemia (slow, irregular heartbeat; fatigue; muscle weakness; paresthesia; confusion; dyspnea; peaked T waves; depressed ST segments; prolonged QT segments; widened QRS complexes; loss of P waves; and cardiac arrhythmias): Treatment includes discontinuation of potassium, administration of sodium bicarbonate to correct acidosis, dextrose and insulin to facilitate passage of potassium into cells, calcium salts to reverse ECG effects (in patients who are not receiving digoxin), sodium polystyrene used as an exchange resin, and/or dialysis for patient with impaired renal function.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- ***High Alert:*** Medication errors involving too rapid infusion or bolus IV administration of potassium chloride have resulted in fatalities. See IV administration guidelines below.

Copyright © 2008 by F.A. Davis

- Do not confuse K-Dur with Imdur (isosorbide mononitrate). Do not confuse Micro-K with micronase (glyburide).
- For most purposes, potassium chloride should be used, except for renal tubular acidoses (hyperchloremic acidosis), in which other salts are more appropriate (potassium bicarbonate, potassium citrate, or potassium gluconate).
- If hypokalemia is secondary to diuretic therapy, consideration should be given to decreasing the dose of diuretic, unless there is a history of significant arrhythmias or concurrent digitalis glycoside therapy.
- **PO:** Administer with or after meals to decrease GI irritation.
- Use of tablets and capsules should be reserved for patients who cannot tolerate liquid preparations.
- Dissolve effervescent tablets in 3–8 oz of cold water. Ensure that effervescent tablet is fully dissolved. Powders and solutions should be diluted in 3–8 oz of cold water or juice (do not use tomato juice if patient is on sodium restriction). Instruct patient to drink slowly over 5–10 min.
- Tablets and capsules should be taken with a meal and full glass of water. Do not chew or crush enteric-coated or extended-release tablets or capsules. Micro-K ExtenCaps capsules can be opened and sprinkled on soft food (pudding, applesauce) and swallowed immediately with a glass of cool water or juice.
- **IV:** Assess for extravasation; severe pain and tissue necrosis may occur.

High Alert: Never administer potassium IV push or bolus.

Potassium Acetate

- **Continuous Infusion:** ***High Alert:*** Do not administer undiluted. Each single dose *must* be diluted and thoroughly mixed in 100–1000 ml of dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or LR combinations. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line). ***Rate: High Alert:*** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children on general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children).
- **Y-Site Compatibility:** ciprofloxacin.

Potassium Chloride

- **Continuous Infusion:** ***High Alert:*** Do not administer concentrations of ≥1.5 mEq/ml undiluted; fatalities have occurred. Concentrated products have black caps on vials or black stripes above constriction on ampules and are labeled with a warning about dilution requirement. Each single dose must be diluted and thoroughly mixed in 100–1000 ml of IV solution. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line).
- Concentrations of 0.1 and 0.4 mEq/ml are intended for administration via calibrated infusion device and do not require dilution. ***Rate: High Alert:*** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children in general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children). Use an infusion pump.
- **Solution Compatibility:** May be diluted in dextrose, saline, Ringer's solution, LR, dextrose/saline, dextrose/Ringer's solution, and dextrose/LR combinations. Commercially available premixed with many of the above IV solutions.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, aminophylline, amiodarone, ampicillin, atropine, aztreonam, betamethasone, bivalirudin, calcium gluconate, chlordiazepoxide, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, cyanocobalamin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, droperidol, drotrecogin, edrophonium, enalaprilat, epinephrine, ertapenem, esmolol, conjugated estrogens, ethacrynate sodium, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, furosemide, gemcitabine, granisetron, heparin, hydralazine, idarubicin, inamrinone, indomethacin, insulin, isoproterenol, kanamycin, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, menadiol, meperidine, meropenem, methoxamine, methylergono-

Copyright © 2008 by F.A. Davis

vine, midazolam, milrinone, morphine, neostigmine, nicardipine, nitroprusside, norepinephrine, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, pantoprazole, pemetrexed, penicillin G potassium, pentazocine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, quinupristin/dalfopristin, remifentanil, sargramostim, scopolamine, sodium bicarbonate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, vinorelbine, warfarin, zidovudine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, azithromycin, diazepam, ergotamine tartrate, lansoprazole, phenytoin.
- **Additive Compatibility:** calcium gluconate, cimetidine, dobutamine, dopamine, furosemide, heparin, hydrocortisone, hydromorphone, lidocaine, ranitidine, sodium bicarbonate, vitamin B complex with C.

Patient/Family Teaching

- Explain to patient purpose of the medication and the need to take as directed, especially when concurrent digoxin or diuretics are taken. Take missed doses as soon as remembered within 2 hr; if not, return to regular dose schedule. Do not double dose.
- Emphasize correct method of administration. GI irritation or ulceration may result from chewing enteric-coated tablets or insufficient dilution of liquid or powder forms.
- Some extended-release tablets are contained in a wax matrix that may be expelled in the stool. This occurrence is not significant.
- Instruct patient to avoid salt substitutes or low-salt milk or food unless approved by health care professional. Patient should be advised to read all labels to prevent excess potassium intake.
- Advise patient regarding sources of dietary potassium (see Appendix L). Encourage compliance with recommended diet.
- Instruct patient to report dark, tarry, or bloody stools; weakness; unusual fatigue; or tingling of extremities. Notify health care professional if nausea, vomiting, diarrhea, or stomach discomfort persists. Dosage may require adjustment.
- Emphasize the importance of regular follow-up exams to monitor serum levels and progress.

Evaluation/Desired Outcomes

- Prevention and correction of serum potassium depletion.
- Cessation of arrhythmias caused by digoxin toxicity.

pramipexole (pra-mi-**pex**-ole)
Mirapex

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications

Management of idiopathic Parkinson's disease. Restless leg syndrome.

Action

Stimulates dopamine receptors in the striatum of the brain. **Therapeutic Effects:** Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics

Absorption: >90% absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: 90% excreted unchanged in urine.
Half-life: 8 hr (increased in geriatric patients and patients with renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Geri: Geriatric patients (increased risk of hallucinations); Renal impairment (increased dosing interval recommended if CCr <60 ml/min); OB, Pedi, Geri: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: SLEEP ATTACKS, amnesia, dizziness, drowsiness, hallucinations, weakness, abnormal dreams, confusion, dyskinesia, extrapyramidal syndrome, headache, insomnia. **CV:** postural hypotension. **GI:** constipation, dry mouth, dyspepsia, nausea, tooth disease. **GU:** urinary frequency. **MS:** leg cramps. **Neuro:** hypertonia, unsteadiness/falling.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: Concurrent **levodopa** increases the risk of hallucinations and dyskinesia. Effectiveness may be increased by **cimetidine**. Effectiveness may be decreased by **dopamine antagonists**, including **butyrophenones**, **metoclopramide**, **phenothiazines**, or **thioxanthenes**.

Route/Dosage

PO (Adults): *Parkinson's disease*—0.125 mg 3 times daily initially; may be increased q 5–7 days (range 1.5–4.5 mg/day in 3 divided doses). *Restless Leg Syndrome*—0.125 mg once daily 1–3 hrs before bedtime. May be increased at 4–7 day intervals to 0.25 mg, then up to 0.5 mg.

Renal Impairment

PO (Adults): *Parkinson's disease—CCr 35–59 ml/min*—0.125 mg twice daily initially, may be increased q 5–7 days up to 1.5 mg twice daily; *CCr 15–34 ml/min*—0.125 mg once daily initially, may be increased q 5–7 days up to 1.5 mg once daily. *Restless Leg Syndrome*—0.125 mg once daily 1–3 hrs before bedtime. May be increased at 14 day intervals to 0.25 mg, then up to 0.5 mg.

Availability

Tablets: 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg. **Cost:** 0.125 mg $517.05/270, 0.25 mg $491.97/270, 0.5 mg $605.96/270, 1 mg $574.97/270, 1.5 mg $605.96/270.

NURSING IMPLICATIONS

Assessment

- Assess patient for confusion or hallucinations. Notify physician or other health care professional if these occur.
- Monitor ECG and blood pressure frequently during dosage adjustment and periodically throughout therapy.
- Assess patient for drowsiness and sleep attacks. Drowsiness is a common side effect of pramipexole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum pramipexole levels (see Interactions). May require discontinuation of therapy.
- **Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxia) before and throughout therapy.
- **Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- **PO:** An attempt to reduce the dose of levodopa/carbidopa may be made cautiously during pramipexole therapy.
- Administer with meals to minimize nausea; usually resolves with continued therapy.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as remembered if it is not almost time for next dose. Do not double doses. Consult health care professional before reducing dose or discontinuing medication.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to change position slowly to minimize orthostatic hypotension. May occur more frequently during initial therapy.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if currently breastfeeding or planning to breastfeed.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

HIGH ALERT

pramlintide (**pram**-lin-tide)
Symlin

Classification
Therapeutic: antidiabetics
Pharmacologic: hormones

Pregnancy Category C

Copyright © 2008 by F.A. Davis

Indications
Used with mealtime insulin in the management of diabetics whose blood sugar cannot be controlled by optimal insulin therapy; can be used with other agents (sulfonylureas, metformin).

Action
Acts as a synthetic analogue of amylin, an endogenous pancreatic hormone that helps to control postprandial hyperglycemia; effects include slowed gastric emptying, suppression of glucagon secretion and regulation of food intake.
Therapeutic Effects: Improved control of postprandial hyperglycemia.

Pharmacokinetics
Absorption: 30–40% absorbed following subcutaneous administration.
Distribution: Does not appear to significantly cross the placenta.
Metabolism and Excretion: metabolized by the kidneys; major metabolite has pharmacologic properties similar to the parent compound.
Half-life: 48 min.

TIME/ACTION PROFILE (effect on blood sugar)*

ROUTE	ONSET	PEAK	DURATION
subcut	rapid	20 min	3 hr

*Blood level

Contraindications/Precautions
Contraindicated in: Hypersensitivty; Inability to identify hypoglycemia; Gastroparesis or need for medications to stimulate gastric motility; Poor compliance with current insulin regimen or self-monitoring; HbA1c >9%; Recurring severe hypoglycemia within the last 6 mo, requiring treatment; Pedi: Children.
Use Cautiously in: OB: Pregnancy/lactation (use only if maternal benefit outweighs potential risks to fetus/newborn).

Adverse Reactions/Side Effects
Noted for concurrent use with insulin.
CNS: dizziness, fatigue, headache. **Resp:** cough. **GI:** nausea, abdominal pain, anorexia, vomiting. **Endo:** HYPOGLYCEMIA. **Derm:** local allergy. **MS:** arthralgia. **Misc:** systemic allergic reactions.

Interactions
Drug-Drug: ↑ likelihood of hypoglycemia with short-acting **insulin**; reduce dose of short-acting pre-meal insulin by 50%. Avoid concurrent use with other agents that ↓ GI motility, including **atropine** and other **anticholinergics**. Avoid concurrent use with other agents that ↓ GI absorption of nutrients, including **α-glucosidase inhibitors** including **acarbose** and **miglitol**. May delay oral absorption of concurrently administered drugs; if prompt absorption is desired, administer 1 hr before or 2 hr after pramlintide.

Route/Dosage

Insulin-using Type 2 Diabetes
Subcut (Adults): 60 mcg, immediately prior to major meals initially, if no significant nausea occurs, dose may be increased to 120 mcg.

Type 1 Diabetes
Subcut (Adults): 15 mcg, immediately prior to major meals initially, if no significant nausea occurs, dose may be increased by 15 mcg every 3 days up to 60 mcg.

Availability
Injection: 0.6 mg/ml in 5-mL vials.

NURSING IMPLICATIONS

Assessment
- Assess hemoglobin A1c, recent blood glucose monitoring data, history of insulin-induced hypoglycemia, current insulin regimen, and body weight prior to initiation of therapy.
- Assess for signs and symptoms of hypoglycemia (hunger, headache, sweating, tremor, irritability, difficulty concentrating, loss of consciousness, coma, seizure), occurs within 3 hr of injection. Pramlintide alone does not cause hypoglycemia, may increase risk when administered with insulin.
- ***Lab Test Considerations:*** Monitor blood glucose frequently, including pre- and post-meals and at bedtime.

Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

Implementation
- ***High Alert:*** Dose errors are a potential problem with administration of pramlintide. Pramlintide is available in a concentration of 0.6 mg/ml, dosing is in mcg, and insulin syringe for administration is in units. Carefully review dosing and conversion table prior to administration.
- Administer pramlintide and insulin as separate injections; do not mix.

Copyright © 2008 by F.A. Davis

- Adjust insulin doses to optimize glycemic control once target dose of pramlintide is achieved and nausea has subsided.
- **Subcut:** Administer immediately prior to major meals ≥250 kcal or containing ≥30 g of carbohydrate. Reduce preprandial rapid-acting, short-acting, and fixed-mix insulin doses by 50%. Use a U-100 syringe (preferably a 0.3 ml size) for optimal accuracy. Administer into abdomen or thigh, rotating injection sites. Do not administer solutions that are cloudy. Store unopened vials in refrigerator. Opened vials may be refrigerated or kept at room temperature for up to 28 days.

Patient/Family Teaching

- Instruct patient in proper use of pramlintide (injection technique, timing of doses, storage, and disposal of equipment). Make sure patient understands dosing and preparation of correct dose. Emphasize importance of adherence to meal planning, physical activity, recognition and management of hypoglycemia and hyperglycemia, and assessment of diabetes complications. Advise patient to read the Medication Guide before use and with each refill for new information.
- Review with patient how to handle illness or stress, inadequate or omitted insulin dose, inadvertent administration of increased dose of insulin or pramlintide, inadequate food intake or missed meals. If a dose is missed, wait until the next meal and take usual dose; do not give an additional injection.
- Instruct patient to contact health care professional at least once a week until target dose of pramlintide is achieved, pramlintide is well-tolerated, and blood glucose concentrations are stable.
- May cause difficulty concentrating. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that signs of local allergy (redness, swelling, itching at site of injection) usually resolve within a few days to a few weeks; may be related to pramlintide, irritants in skin cleansing agent or improper injection technique.
- Advise patient to contact health care professional if recurrent nausea or hypoglycemia occur; may lead to increased risk of severe hypoglycemia. Discontinue pramlintide therapy if recurrent unexplained hypoglycemia requiring medical assistance, persistent clinically significant nausea, or noncompliance with self-monitoring of blood glucose concentrations, insulin dose adjustments, or scheduled health care professional contacts or recommended clinic visits occur.
- Advise patient to contact health care professional before taking other Rx, OTC, vitamins, or herbal products with pramlintide and to avoid concurrent alcohol use.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Reduction in postprandial glucose concentrations.

pravastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

P

prazosin (pra-zoe-sin)
Minipress

Classification
Therapeutic: antihypertensives
Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category C

Indications

Mild to moderate hypertension. **Unlabeled uses:** Management of urinary outflow obstruction in patients with benign prostatic hyperplasia.

Action

Dilates both arteries and veins by blocking postsynaptic $alpha_1$-adrenergic receptors. Decreases contractions in smooth muscle of prostatic capsule. **Therapeutic Effects:** Lowering of blood pressure. Decreased cardiac preload and afterload. Decreased symptoms of prostatic hyperplasia (urinary urgency, urinary hesitancy, nocturia).

Pharmacokinetics

Absorption: 60% absorbed following oral administration.
Distribution: Widely distributed.

Copyright © 2008 by F.A. Davis

Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver. Minimal (5–10%) renal excretion of unchanged drug.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (antihypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–4 hr†	10 hr

†Following single dose; maximal antihypertensive effects occur after 3–4 wk of chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal insufficiency (increased sensitivity to effects; dosage reduction may be required); Pregnancy, lactation, or children (safety not established); Angina pectoris; When adding diuretics (reduce dose of prazosin).

Adverse Reactions/Side Effects

CNS: dizziness, headache, weakness, drowsiness, mental depression, syncope. **EENT:** blurred vision. **CV:** first-dose orthostatic hypotension, palpitations, angina, edema. **GI:** abdominal cramps, diarrhea, dry mouth, nausea, vomiting. **GU:** erectile dysfunction, priapism.

Interactions

Drug-Drug: Additive hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. Antihypertensive effects may be decreased by **NSAIDs**.

Route/Dosage

Hypertension

PO (Adults): 1 mg 2–3 times daily (give first dose at bedtime) for initial 3 days of therapy, then increase gradually to maintenance dose of 6–15 mg/day in 2–3 divided doses (not to exceed 20–40 mg/day).
PO (Children): 50–400 mcg (0.05–0.4 mg)/kg/day in 2–3 divided doses (not to exceed 7 mg/dose or 15 mg/day).

Benign Prostatic Hyperplasia

PO (Adults): 1–5 mg twice daily.

Availability (generic available)

Capsules: 1 mg, 2 mg, 5 mg. **Cost:** *Generic*—1 mg $35.96/180, 2 mg $43.00/180, 5 mg $93.98/180. **Tablets:** 1 mg, 2 mg, 5 mg.
In combination with: polythiazide (Minizide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios and daily weight and assess for edema daily, especially at beginning of therapy. Report significant weight gain or edema.
- **Hypertension:** Monitor blood pressure and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- Monitor frequency of prescription refills to determine compliance.
- **Benign Prostatic Hyperplasia:** Assess patient for urinary symptoms (retention, dribbling, hesitancy, urgency) periodically during therapy.
- ***Lab Test Considerations:*** May cause elevated serum sodium levels.
- May cause increased vanillylmandelic acid (VMA) concentrations; false-positive results may occur in screening tests for pheochromocytoma.

Potential Nursing Diagnoses

Risk for injury (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Following initial dose, patient may develop first-dose orthostatic hypotensive reaction, which most frequently occurs 30–90 min after initial dose and may be manifested by dizziness, weakness, and syncope. Observe patient closely during this period, and take precautions to prevent injury. The first dose may be given at bedtime to minimize this reaction.
- Commonly administered concurrently with a thiazide diuretic or a beta blockers for treatment of hypertension.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. If a dose is missed, take as soon as remembered unless almost time for next dose. Do not double doses.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, stress management).
- Instruct patient and family on proper technique for blood pressure monitoring. Advise

Copyright © 2008 by F.A. Davis

them to check blood pressure at least weekly and to report significant changes.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any OTC medications, especially cough, cold, or allergy remedies.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.

Evaluation/Desired Outcomes
- Decrease in blood pressure without appearance of side effects.
- Decrease in symptoms of prostatic hyperplasia.

prednicarbate, See CORTICOSTEROIDS (TOPICAL/LOCAL).

prednisoLONE, See CORTICOSTEROIDS (SYSTEMIC).

predniSONE, See CORTICOSTEROIDS (SYSTEMIC).

pregabalin (pre-**gab**-a-lin)
Lyrica

Classification
Therapeutic: analgesics, anticonvulsants
Pharmacologic: gamma aminobutyric acid (GABA) analogues, nonopioid analgesics

Schedule V

Pregnancy Category C

Indications
Pain due to: diabetic peripheral neuropathy, postherpetic neuralgia, fibromyalgia. Adjunctive therapy of partial-onset seizures in adults.

Action
Binds to calcium channels in CNS tissues which regulate neurotransmitter release. Does not bind to opioid receptors. **Therapeutic Effects:** Decreased neuropathic or post-herpetic pain. Decreased partial-onset seizures.

Pharmacokinetics
Absorption: Well absorbed (90%) following oral administration.
Distribution: Probably crosses the blood-brain barrier.
Metabolism and Excretion: Minimally metabolized, 90% excreted unchanged in urine.
Half-life: 6 hr.

TIME/ACTION PROFILE (decreased post–herpetic pain)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 wk	unknown

Contraindications/Precautions
Contraindicated in: Myopathy (known/suspected); OB: Lactation.
Use Cautiously in: Renal impairment (dose alteration recommended for CCr <60 ml/min); Geri: Elderly patients (consider age-related decrease in renal function; CHF; History of drug dependence/drug-seeking behavior; Pedi: Children (safety not established); OB: Use only if maternal benefit outweighs fetal risk; may also have ↑ risk of male-mediated teratogenicity).

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, impaired attention/concentration/thinking. **CV:** edema. **EENT:** blurred vision. **GI:** dry mouth, abdominal pain, constipation, ↑ appetite, vomiting. **Hemat:** ↓ platelet count. **Metab:** weight gain. **Misc:** allergic reactions, fever.

Interactions
Drug-Drug: Concurrent use with **thiazolidinediones (pioglitazone, rosiglitazone)** may ↑ risk of fluid retention. ↑ risk of CNS depression with other **CNS depressants** including **opioids**, **alcohol**, **benzodiazepines**, or other **sedatives/hypnotics**.

Route/Dosage
PO (Adults): *Diabetic neuropathic pain*—50 mg three times daily, increased over 7 days up to 100 mg three times daily; *Partial onset seizures*—150 mg/day initially in 2–3 divided doses, may be gradually increased to 600 mg/day; *Post-herpetic neuralgia*—75 mg twice daily or 50 mg three times daily initially, may be increased over 7 days to 300 mg/day in 2–3 di-

Copyright © 2008 by F.A. Davis

vided doses, after 2–4 wk may be increased to 600 mg/day in 2–3 divided doses; Fibromyalgia-75 mg twice daily initially, may be increased to 150 mg twice daily within 1 wk based on efficacy and tolerability. May be increased to 225 twice daily.

Renal Impairment

PO (Adults): *CCr 30–60 ml/min*— 75–300 mg/day in 2–3 divided doses; *CCr 15–30 ml/min*—25–150 mg/day in 1–2 divided doses; *CCr <15 ml/min*—25–75 mg/day as a single daily dose.

Availability

Capsules: 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg. **Cost:** 25 mg $335.95/180, 50 mg $335.95/180, 75 mg $335.95/180, 100 mg $335.95/180, 150 mg $335.95/180, 200 mg $343.94/180, 225 mg $337.01/180, 300 mg $351.92/180.

NURSING IMPLICATIONS

Assessment

- **Diabetic Peripheral Neuropathy, Postherpetic Neuralgia, and Fibromylagia:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- ***Lab Test Considerations:*** May cause ↑ creatine kinase levels.
- May cause ↓ platelet count.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Pregabalin should be discontinued gradually over at least 1 wk. Abrupt discontinuation may cause insomnia, nausea, headache, and diarrhea when used for pain and may cause increase in seizure frequency when treating seizures.
- **PO:** May be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not discontinue abruptly; may cause insomnia, nausea, headache, or diarrhea or increase in frequency of seizures. Advise patient to read the *Patient Information Leaflet* prior to taking pregabalin.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Advise patient to notify health care professional if changes in vision occur. Seizure patients should not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to promptly report unexplained muscle pain, tenderness, or weakness, especially if accompanied by malaise or fever. Discontinue therapy if myopathy is diagnosed or suspected or if markedly elevated creatine kinase levels occur.
- Inform patient that pregabalin may cause edema and weight gain.
- Caution patient to avoid alcohol or other CNS depressants with pregabalin.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she intends to breastfeed or is breastfeeding an infant. Inform male patients who plan to father a child of the potential risk of male-mediated teratogenicity.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in intensity of chronic pain.
- Decrease in the frequency or cessation of seizures.

probenecid (proe-**ben**-e-sid)

Benuryl, Probalan

Classification

Therapeutic: antigout agents, uricosurics

Pregnancy Category B

Indications

Prevention of recurrences of gouty arthritis. Treatment of hyperuricemia secondary to thiazide therapy. Used to increase and prolong serum levels of penicillin and related anti-infectives.

Action

Inhibits renal tubular reabsorption of uric acid, thus promoting its renal excretion. **Therapeutic Effects:** Reduction of serum uric acid levels.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Copyright © 2008 by F.A. Davis

Distribution: Crosses the placenta.
Protein Binding: 75–95%.
Metabolism and Excretion: Mostly metabolized by the liver; 10% excreted unchanged in the urine.
Half-life: 4–17 hr.

TIME/ACTION PROFILE (effects on serum uric acid levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–4 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Chronic high-dose salicylate therapy; Children <2 yr.
Use Cautiously in: Peptic ulcer; Blood dyscrasias; Uric acid kidney stones; Renal impairment (dosage reduction recommended; may not be effective if CCr ≤30 ml/min); Pregnancy or lactation (has been used safely during pregnancy; safety during lactation not established).

Adverse Reactions/Side Effects

CNS: headache, dizziness. **GI:** nausea, vomiting, abdominal pain, diarrhea, drug-induced hepatitis, sore gums. **GU:** uric acid stones, urinary frequency. **Derm:** flushing, rashes. **Hemat:** APLASTIC ANEMIA, anemia.

Interactions

Drug-Drug: Increases blood levels of **acyclovir**, **allopurinol**, **barbiturates**, **benzodiazepines**, **cephalosporins**, **clofibrate**, **dapsone**, **dyphylline**, **methotrexate**, **NSAIDs**, **pantothenic acid**, **penicillamine**, **penicillins**, **rifampin**, **sulfonamides**, **sulfonylurea oral hypoglycemic agents**, or **zidovudine**. Large doses of **salicylates** may decrease uricosuric activity.

Route/Dosage

PO (Adults and Children >50 kg): *Hyperuricemia*—250 mg bid for 1 wk; increase to 500 mg twice daily, then may increase by 500 mg/day every 4 wk (not to exceed 3 g/day). *Augmentation of penicillin/cephalosporins*—500 mg 4 times daily. *Single-dose therapy of gonorrhea*—1 g with amoxicillin or penicillin.
PO (Children 2–14 yr and ≤50 kg): 25 mg/kg (700 mg/m^2) initially; then 10 mg/kg (300 mg/m^2) 4 times daily.

Availability

Tablets: 0.5 g.

NURSING IMPLICATIONS

Assessment

- **Gout:** Assess involved joints for pain, mobility, and edema throughout course of therapy.
- Monitor intake and output ratios. Fluids should be encouraged to prevent urate stone formation (2000–3000 ml/day). Alkalinization of the urine with sodium bicarbonate, potassium citrate, or acetazolamide may also be used for this purpose.
- ***Lab Test Considerations:*** CBC, serum uric acid levels, and renal function should be monitored routinely during long-term therapy.
- Serum and urine uric acid determinations may be measured periodically when probenecid is used to treat hyperuricemia.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Probenecid therapy is not used to treat gouty arthritis but, rather, to prevent it. If acute attacks occur during therapy, probenecid is usually continued at full dose along with colchicine or NSAIDs.
- **PO:** Administer with food or antacid to minimize gastric irritation.
- Gradual dosage reduction should be attempted if uric acid levels remain stable following 6 mo of therapy.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, not to discontinue without consulting health care professional. Irregular dosage schedules may cause elevation of uric acid levels and precipitate an acute gout attack.
- Explain purpose of the medication to patients taking probenecid with penicillin.
- Advise patient to follow recommendations of health care professional regarding weight loss, diet, and alcohol consumption.
- Caution patient not to take aspirin or other salicylates, because they decrease the effects of probenecid.
- Instruct patient to report nausea, vomiting, loss of appetite, abdominal pain, unusual bleeding

Copyright © 2008 by F.A. Davis

or bruising, sore throat, fatigue, malaise, or yellowing of the skin or eyes promptly.

Evaluation/Desired Outcomes

- Decrease in pain and swelling in affected joints and subsequent decrease in frequency of gout attacks. May require several months of continuous therapy for maximum effects.
- Decrease in serum uric acid levels.
- Prolonged serum levels of penicillins and other related antibiotics.

procainamide

(proe-**kane**-ah-mide)
Pronestyl

Classification
Therapeutic: antiarrhythmics (class IA)

Pregnancy Category C

Indications

Treatment of a wide variety of ventricular and atrial arrhythmias, including: Atrial premature contractions, Premature ventricular contractions, Ventricular tachycardia, Paroxysmal atrial tachycardia. Maintenance of normal sinus rhythm after conversion from atrial fibrillation or flutter.

Action

Decreases myocardial excitability. Slows conduction velocity. May depress myocardial contractility. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics

Absorption: Well absorbed (75–90%) following IM administration. Sustained-release oral preparation is more slowly absorbed.
Distribution: Rapidly and widely distributed.
Metabolism and Excretion: Converted by the liver to *N*-acetylprocainamide (NAPA), an active antiarrhythmic compound. Remainder (40–70%) excreted unchanged by the kidneys.
Half-life: 2.5–4.7 hr (NAPA—7 hr); prolonged in renal impairment.

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	25–60 min	3–4 hr
IM	10–30 min	15–60 min	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; AV block; Myasthenia gravis; Hypersensitivity to tartrazine (FDC yellow dye #5; present in some oral products).
Use Cautiously in: MI or cardiac glycoside toxicity; CHF, renal or hepatic insufficiency, geriatric patients (dose reduction or increased dosing intervals recommended); Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES, confusion, dizziness. **CV:** ASYSTOLE, HEART BLOCK, VENTRICULAR ARRHYTHMIAS, hypotension. **GI:** diarrhea, anorexia, bitter taste, nausea, vomiting. **Derm:** rashes. **Hemat:** AGRANULOCYTOSIS, eosinophilia, leukopenia, thrombocytopenia. **Misc:** chills, drug-induced systemic lupus syndrome, fever.

Interactions

Drug-Drug: May have additive or antagonistic effects with other **antiarrhythmics**. Additive neurologic toxicity (confusion, seizures) with **lidocaine**. **Antihypertensives** and **nitrates** may potentiate hypotensive effect. Potentiates **neuromuscular blocking agents**. May partially antagonize the therapeutic effects of **anticholinesterase agents** in myasthenia gravis. ↑ risk of arrhythmias with **pimozide**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, and **phenothiazines**. Effects of procainamide may be ↑ by **cimetidine**, **quinidine**, or **trimethoprim**.

Route/Dosage

IM (Adults): 50 mg/kg/day in divided doses q 3–6 hr.
IV (Adults): 100 mg q 5 min until arrhythmia is abolished or 1000 mg have been given; wait at least 10 min until further dosing *or* loading infusion of 500–600 mg over 30–60 min followed by maintenance infusion of 1–4 mg/min.

Availability

Injection: 100 mg/ml in 10-ml vials, 500 mg/ml in 2-ml vials.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and blood pressure continuously throughout IV administration. Parameters should be monitored periodically during oral administration. IV administration is usually discontinued if any of the following occur: arrhythmia is resolved, QRS complex widens by 50%, PR interval is prolonged,

Copyright © 2008 by F.A. Davis

blood pressure drops >15 mm Hg, or toxic side effects develop. Patient should remain supine throughout IV administration to minimize hypotension.

- ***Lab Test Considerations:*** Monitor CBC every 2 wk during the first 3 mo of therapy. May cause ↓ leukocyte, neutrophil, and platelet counts. Therapy may be discontinued if leukopenia occurs. Blood counts usually return to normal within 1 mo of discontinuation of therapy.
- Monitor ANA periodically during prolonged therapy or if symptoms of lupus-like reaction occur. Therapy is discontinued if a steady increase in ANA titer occurs.
- May cause ↑ AST, ALT, alkaline phosphatase, LDH, bilirubin, and a positive Coombs' test result.
- ***Toxicity and Overdose:*** Serum procainamide and *N*-acetylprocainamide levels may be monitored periodically during dosage adjustment. Therapeutic blood level of procainamide is 4–8 mcg/ml: Toxicity may occur with procainamide blood levels of 8–16 mcg/ml or greater, Signs of toxicity include confusion, dizziness, drowsiness, decreased urination, nausea, vomiting, and tachyarrhythmias.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **IM:** Used only when oral and IV routes are not feasible.

IV Administration

- **Direct IV:** (only to be used for life-threatening arrhythmias) ***Diluent:*** Dilute each 100 mg of procainamide with 10 ml of 0.9% NaCl. ***Rate:*** Administer at a rate not to exceed 25 mg/min. Rapid administration may cause ventricular fibrillation or asystole.
- **Intermittent Infusion:** (preferred route of administration). ***Diluent:*** Add 2 g of procainamide to 250 ml of 0.9% NaCl. ***Concentration:*** 8 mg/ml. ***Rate:*** Administer initial infusion over 30–60 min. Administer maintenance infusion at rate of 1–4 mg/min to maintain control of arrhythmia.
- **Y-Site Compatibility:** amikacin, aminophylline, amiodarone, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cimetidine, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** acyclovir, ceftizoxime, chloramphenicol, diazepam, ganciclovir, hydralazine, lansoprazole, metronidazole, milrinone, phenytoin trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if signs of drug-induced lupus syndrome (fever, chills, joint pain or swelling, pain with breathing, skin rash), leukopenia (sore throat, mouth, or gums), or thrombocytopenia (unusual bleeding or bruising) occur. Medication may be discontinued if these occur.
- Caution patient not to take OTC medications with procainamide without consulting health care professional.

P

Copyright © 2008 by F.A. Davis

- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Resolution of cardiac arrhythmias without detrimental side effects.

procaine penicillin G, See PENICILLINS.

procarbazine

(proe-**kar**-ba-zeen)
Matulane, Natulan

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications

Treatment of Hodgkin's disease (with other treatment modalities). **Unlabeled uses:** Other lymphomas. Brain and lung tumors. Multiple myeloma. Malignant melanoma. Polycythemia vera.

Action

Appears to inhibit DNA, RNA, and protein synthesis (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Widely distributed; crosses the blood-brain barrier.
Metabolism and Excretion: Metabolized by the liver; <5% excreted unchanged by the kidneys; some respiratory elimination as methane and carbon dioxide.
Half-life: 1 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	14 days	2–8 wk	28 days or more (up to 6 wk)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy or lactation; Alcoholism; Severe renal or liver impairment; Pheochromocytoma; CHF.
Use Cautiously in: Patients with childbearing potential; Infections; Decreased bone marrow reserve; Other chronic debilitating illnesses; Headaches; Psychiatric illness; Liver impairment; Cardiovascular disease.

Adverse Reactions/Side Effects

CNS: SEIZURES, confusion, dizziness, drowsiness, hallucinations, headache, mania, mental depression, nightmares, psychosis, syncope, tremor. **EENT:** nystagmus, photophobia, retinal hemorrhage. **Resp:** cough, pleural effusions. **CV:** edema, hypotension, tachycardia. **GI:** nausea, vomiting, anorexia, diarrhea, dry mouth, dysphagia, hepatic dysfunction, stomatitis. **GU:** gonadal suppression. **Derm:** alopecia, photosensitivity, pruritus, rashes. **Endo:** gynecomastia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy, paresthesia. **Misc:** ascites, secondary malignancy.

Interactions

Drug-Drug: Concurrent use with **sympathomimetics** including **methylphenidate** may produce life-threatening hypertension (avoid concurrent use during and for 14 days following procarbazine). Deep coma and death may result from concurrent use of **opioid analgesics**; avoid **meperidine**. Use small incremental doses of other agents and titrate to effect. ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. Seizures and hyperpyrexia may occur with concurrent use of **MAO inhibitors**, **tricyclic antidepressants**, **SSRI antidepressants** (should not be used within 5 wk of **fluoxetine**), or **carbamazepine**. May ↓ serum **digoxin** levels. Concurrent use with **levodopa** may result in flushing and hypertension. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, **phenothiazines**, and **sedative/hypnotics**. Disulfiram-like reaction

Copyright © 2008 by F.A. Davis

may occur with **alcohol**. **Cigarette smoking** may ↑ the risk of secondary lung cancer. **Drug-Food:** Ingestion of foods high in **tyramine** content (see Appendix L) may result in hypertension. Ingestion of foods high in **caffeine** content may result in arrhythmias.

Route/Dosage

PO (Adults): 2–4 mg/kg/day as a single dose or in divided doses for 1 wk, then 4–6 mg/kg/day until response is obtained; then maintenance dose of 1–2 mg/kg/day. Dosage should be rounded off to the nearest 50 mg.
PO (Children): 50 mg/m²/day for 7 days, then 100 mg/m²/day, maintenance dose of 50 mg/m²/day.

Availability

Capsules: 50 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiratory rate periodically during therapy. Report significant changes to health care professional.
- Assess nutritional status (appetite, intake and output ratios, weight, frequency and amount of emesis). Anorexia and weight loss can be decreased by feeding light, frequent meals. Nausea and vomiting can be minimized by administering an antiemetic at least 1 hr prior to receiving medication. Phenothiazine antiemetics should be avoided.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Concurrent ingestion of tyramine-rich foods and many medications may result in life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, severe headache, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.
- Procarbazine should be discontinued until side effects clear and then resumed at a lower dose if leukopenia, thrombocytopenia, hypersensitivity reaction, stomatitis (first small ulceration or persistent soreness), diarrhea, hemorrhage, or bleeding tendencies occur.
- ***Lab Test Considerations:*** Monitor hemoglobin, hematocrit, WBC, differential, reticulocytes, and platelet count prior to and every 3–4 days during therapy. Notify physician if WBC <4000/mm³ or platelet count <100,000/mm³. Therapy should be discontinued and resumed at a lower dose when counts improve. The nadir of leukopenia and thrombocytopenia occurs in approximately 2–8 wk, and recovery usually occurs in about 6 wk. Anemia also may occur.
- Assess hepatic and renal function prior to therapy. Monitor urinalysis, AST, ALT, alkaline phosphatase, and BUN at least weekly during therapy.
- Closely monitor serum glucose in diabetic patients. Oral hypoglycemics or insulin dosage may need to be reduced, because hypoglycemic effects are enhanced.
- Bone marrow aspiration studies are recommended prior to initiation of therapy and at time of maximum hematologic response to ensure adequate bone marrow reserve.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- **PO:** Administer with food or fluids if GI irritation occurs. Confer with pharmacist regarding opening of capsules if patient has difficulty swallowing.

Patient/Family Teaching

- Emphasize the need to take medication as directed. Take missed doses as soon as remembered within a few hours but not if several hours have passed or if almost time for next dose. Health care professional should be consulted if vomiting occurs shortly after a dose is taken.
- Instruct patient to notify health care professional promptly if signs of infection (fever, sore throat, chills, cough, thickened bronchial secretions, hoarseness, pain in lower back or side, difficult or painful urination); bleeding gums; bruising; petechiae; or blood in stool, urine, or emesis occurs. Caution patient to avoid crowds and persons with known

Copyright © 2008 by F.A. Davis

infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should not receive IM injections or rectal temperatures. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Caution patient to avoid alcohol, caffeinated beverages, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix L for foods included) during therapy and for at least 2 wk after therapy has been discontinued, because they may precipitate a hypertensive crisis.
- Advise patient that an additional interaction of alcohol with procarbazine is a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional and to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient that this medication may have teratogenic effects. Contraception should be practiced during therapy and for at least 4 mo after therapy is concluded.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery. This therapy usually should be withdrawn at least 2 wk prior to surgery.
- Instruct patient to inform health care professional if muscle or joint pain, nausea, vomiting, sweating, tiredness, weakness, constipation, headache, difficulty swallowing, or loss of appetite becomes pronounced.
- Advise patient to carry identification describing medication regimen at all times.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size and spread of malignant tissue in Hodgkin's disease.

prochlorperazine
(proe-klor-**pair**-a-zeen)
Compazine, Stemetil, Ultrazine

Classification
Therapeutic: antiemetics, antipsychotics
Pharmacologic: phenothiazines

Pregnancy Category C

Indications
Management of nausea and vomiting. Treatment of psychoses. Treatment of anxiety.

Action
Alters the effects of dopamine in the CNS. Possesses significant anticholinergic and alpha-adrenergic blocking activity. Depresses the chemoreceptor trigger zone (CTZ) in the CNS.
Therapeutic Effects: Diminished nausea and vomiting. Diminished signs and symptoms of psychoses or anxiety.

Pharmacokinetics
Absorption: Absorption from tablet is variable; may be better with oral liquid formulations. Well absorbed after IM administration.
Distribution: Widely distributed, high concentrations in the CNS. Crosses the placenta and probably enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Highly metabolized by the liver and GI mucosa. Converted to some compounds with antipsychotic activity.
Half-life: Unknown.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–40 min	unknown	3–4 hr
PO-ER	30–40 min	unknown	10–12 hr
rect	60 min	unknown	3–4 hr
IM	10–20 min	10–30 min	3–4 hr
IV	rapid (min)	10–30 min	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity with other phenothiazines may exist; Angle-closure glaucoma; Bone marrow depression; Severe liver or cardiovascular disease; Hypersensitivity to bisulfites or benzyl alcohol

Copyright © 2008 by F.A. Davis

(some parenteral products); Pedi: Children <2 yr or 9.1 kg.
Use Cautiously in: Geri: Geriatric or debilitated patients (dose reduction recommended); Diabetes mellitus; Respiratory disease; Prostatic hypertrophy; CNS tumors; Epilepsy; Intestinal obstruction; Geri: Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, extrapyramidal reactions, sedation, tardive dyskinesia. **EENT:** blurred vision, dry eyes, lens opacities. **CV:** ECG changes, hypotension, tachycardia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus. **GU:** pink or reddish-brown discoloration of urine, urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia. **Metab:** hyperthermia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Additive hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, **sedative/hypnotics**, or **general anesthetics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, some **antidepressants**, **atropine**, **haloperidol**, and other **phenothiazines**. **Lithium** ↑ risk of extrapyramidal reactions. May mask early signs of **lithium** toxicity. ↑ risk of agranulocytosis with **antithyroid agents**. ↓ beneficial effects of **levodopa**. **Antacids** may ↓ absorption.
Drug-Natural Products: Concomitant use of **kava kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

Pediatric dose should not exceed 10 mg on the 1st day and then should not exceed 20 mg/day in children 2–5 yr or 25 mg/day in children 6–12 yr.

Antiemetic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily; may also be given as 15–30 mg once daily *or* 10 mg twice daily as ER capsules (up to 40 mg/day).
PO (Children 18–39 kg): 2.5 mg 3 times daily *or* 5 mg twice daily (not to exceed 15 mg/day).
PO (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).
PO (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).
IM (Adults and Children ≥12 yr): 5–10 mg q 3–4 hr as needed. *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg; usually only 1 dose is required.
IV (Adults and Children ≥12 yr): 2.5–10 mg (not to exceed 40 mg/day). *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.
Rect (Adults): 25 mg twice daily.
Rect (Children 18–39 kg): 2.5 mg 3 times daily or 5 mg twice daily (not to exceed 15 mg/day).
Rect (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).
Rect (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).

Antipsychotic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily; may be increased q 2–3 days (up to 150 mg/day).
PO (Children 2–12 yr): 2.5 mg 2–3 times daily.
IM (Adults): 10–20 mg q 2–4 hr for up to 4 doses, then 10–20 mg q 4–6 hr (up to 200 mg/day).
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg (not to exceed 10 mg/dose).
IV (Adults and Children ≥12 yr): 2.5–10 mg (up to 40 mg/day).
Rect (Adults): 10 mg 3–4 times daily; may be increased by 5–10 mg q 2–3 days as needed.

Antianxiety

PO (Adults and Children ≥12 yr): 5 mg 3–4 times daily (not to exceed 20 mg/day or longer than 12 wk); may also be given as 15 mg once daily or 10 mg twice daily as ER capsules.
IM (Adults and Children ≥12 yr): 5–10 mg q 3–4 hr as needed (up to 40 mg/day).
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg.

P

Copyright © 2008 by F.A. Davis

IV (Adults): 2.5–10 mg (up to 40 mg/day).

Availability (generic available)

Tablets: 5 mg, 10 mg, 25 mg. **Syrup (fruit flavor):** 5 mg/5 ml (edisylate), ✱5 mg/5 ml (mesylate). **Extended-release capsules:** 10 mg, 15 mg, 30 mg. **Injection:** 5 mg/ml (edisylate), ✱5 mg/ml (mesylate). **Suppositories:** 2.5 mg, 5 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure (sitting, standing, lying down), ECG, pulse, and respiratory rate before and frequently during the period of dosage adjustment. May cause Q-wave and T-wave changes in ECG.
- Assess patient for level of sedation after administration
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Report these symptoms; reduction in dosage or discontinuation may be necessary. Trihexyphenidyl or diphenhydramine may be used to control these symptoms
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify physician or other health care professional immediately if these symptoms occur.
- **Antiemetic:** Assess patient for nausea and vomiting before and 30–60 min after administration.
- **Antipsychotic:** Monitor patient's mental status (orientation to reality and behavior) before and periodically throughout therapy.
- Observe patient carefully when administering oral medication to ensure that medication is actually taken and not hoarded
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status before and periodically during therapy.
- ***Lab Test Considerations:*** CBC and liver function tests should be evaluated periodically throughout course of therapy. May cause blood dyscrasias, especially between wks 4 and 10 of therapy. Hepatotoxicity is more likely to occur between wks 2 and 4 of therapy. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy.
- May cause false-positive or false-negative pregnancy test results and false-positive urine bilirubin test results.
- May cause increased serum prolactin levels.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)
Disturbed thought process (Indications)

Implementation

- Do not confuse prochlorperazine with chlorpromazine.
- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr after myelography; they lower seizure threshold.
- **PO:** Do not crush or chew extended-release capsules. Administer with food, milk, or a full glass of water to minimize gastric irritation.
- Dilute syrup in citrus or chocolate-flavored drinks.
- Do not open, crush, or chew extended-release capsules.
- **IM:** Do not inject subcut. Inject slowly, deep into well-developed muscle. Keep patient recumbent for at least 30 min after injection to minimize hypotensive effects. Slight yellow color will not alter potency. Do not administer solution that is markedly discolored or that contains a precipitate.

IV Administration

- **Direct IV:** ***Concentration:*** Dilute to a concentration of 1 mg/ml. ***Rate:*** Administer at a rate of 1 mg/min; not to exceed 5 mg/min.
- **Intermittent Infusion:** ***Diluent:*** Dilute 20 mg in up to 1 L dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or lactated Ringer's combinations

Copyright © 2008 by F.A. Davis

- **Continuous Infusion:** Has been used as infusion with 20 mg/L of compatible solution.
- **Syringe Incompatibility:** Manufacturer does not recommend mixing prochlorperazine with other medications in syringe.
- **Y-Site Compatibility:** amsarcine, calcium gluconate, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, doxorubicin, doxorubicin liposome, fluconazole, granisetron, heparin, hydrocortisone sodium succinate, linezolid, melphalan, methotrexate, ondansetron, oxaliplatin, paclitaxel, potassium chloride, propofol, remifentanil, sargramostim, sufentanil, teniposide, thiotepa, topotecan, vinorelbine, vitamin B complex with C.
- **Y-Site Incompatibility:** aldesleukin, allopurinol, amifostine, amphotericin B cholesteryl, amifostine, aztreonam, bivalirudin, cefepime, etoposide phosphate, fenoldopam, filgrastim, fludarabine, foscarnet, gemcitabine, lansoprazole, pemetrexed, piperacillin/tazobactam.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. If a dose is missed, it should be taken as soon as remembered unless almost time for next dose. If more than 2 doses are scheduled each day, missed dose should be taken within about 1 hr of the ordered time. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient not to take prochlorperazine within 2 hr of antacids or antidiarrheal medication.
- Advise patient that increasing bulk and fluids in the diet and exercise may help minimize the constipating effects of this medication.
- Inform patient that this medication may turn urine pink to reddish-brown.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, skin rashes, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools are noted.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects. Periodic ocular exams are indicated. Encourage continued participation in psychotherapy as ordered by health care professional.

Evaluation/Desired Outcomes

- Relief of nausea and vomiting.
- Decrease in excitable, paranoic, or withdrawn behavior when used as an antipsychotic.
- Decrease in feelings of anxiety.

progesterone

(proe-**jess**-te-rone)
Crinone, Endometrin, Prochieve, Prometrium

Classification
Therapeutic: hormones
Pharmacologic: progestins

Pregnancy Category D

Indications

Secondary amenorrhea and abnormal uterine bleeding due to hormonal imbalance. **Prometrium:** Prevention of cell overgrowth in the

Copyright © 2008 by F.A. Davis

uterine lining in postmenopausal women who have not had a hysterectomy (with estrogen). Part of assisted reproductive technology (ART) in the management of infertility (4% and 8% vaginal gel). **Endometrin:** Support of embryo implantation and early pregnancy. **Unlabeled uses:** Corpus luteum dysfunction.

Action

Produces: Secretory changes in the endometrium, Increase in basal body temperature, Histologic changes in vaginal epithelium, Relaxation of uterine smooth muscle, Mammary alveolar tissue growth, Pituitary inhibition, Withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Restoration of hormonal balance with control of uterine bleeding. Successful outcome in assisted reproduction.

Pharmacokinetics

Absorption: Micronization increases oral and vaginal absorption.
Distribution: Enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Metabolized by the liver; 50–60% eliminated by kidneys; 10% eliminated in feces.
Half-life: Several minutes.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown
vaginal	unknown	34.8–55 hr	unknown
IM	unknown	19.6–28 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens or sesame oil (IM suspension only); Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria; Missed abortion; OB: Pregnancy (except corpus luteum dysfunction).
Use Cautiously in: History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression.

Adverse Reactions/Side Effects

CNS: depression. **EENT:** retinal thrombosis. **CV:** PULMONARY EMBOLISM, THROMBOEMBOLISM, thrombophlebitis. **GI:** gingival bleeding, hepatitis. **GU:** cervical erosions. **Derm:** chloasma, melasma, rashes. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, spotting. **F and E:** edema. **Local:** irritation or pain at IM injection site. **Misc:** allergic reactions including ANAPHYLAXIS and ANGIOEDEMA, weight gain, weight loss.

Interactions

Drug-Drug: May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea and amenorrhea.

Route/Dosage

PO (Adults): *Secondary amenorrhea*—400 mg once daily in the evening for 10 days; *prevention of postmenopausal estrogen-induced endometrial hyperplasia*—200 mg once daily at bedtime for 14 days on days 8–21 of a 28-day cycle or on days 12–25 of a 30-day cycle; if patient currently receives ≥1.25 mg/day of estrogen, then a daily of dose of 300 mg of progesterone as 100 mg 2 hr after breakfast and 200 mg at bedtime is used; further adjustments may be required.
Vag (Adults): *Secondary amenorrhea*—45 mg (1 applicatorful of 4% gel) once every other day for up to 6 doses, may be increased to 90 mg (1 applicatorful of 8% gel) once every other day for up to 6 doses; *Corpus luteum insufficiency or assisted reproduction technology*—For luteal phase support: 90 mg (1 applicatorful of 8% gel) once daily; for *in vitro* fertilization: 90 mg (1 applicatorful of 8% gel) once daily beginning within 24 hr of embryo transfer and continued through day 30 post-transfer (if pregnancy occurs, treatment may be continued for up to 10–12 wk); *partial or complete ovarian failure*—90 mg (1 applicatorful of 8% gel) twice daily while undergoing donor oocyte transfer (if pregnancy occurs, treatment may be continued for up to 10–12 wk).—*Support of embryo implantation and early pregnancy*—100 mg insert 2 or 3 times daily for up to 10 wks.
IM (Adults): *Secondary amenorrhea*—100–150 mg (single dose) or 5–10 mg daily for 6–8 days given 8–10 days before expected menstrual period. *Dysfunctional uterine bleeding*—5–10 mg daily for 6 days. *Corpus luteum insufficiency*—12.5 mg/day at onset of ovulation for 2 wk; may continue until 11th wk of gestation (unlabeled).

Availability (generic available)

Micronized capsules (Prometrium): 100 mg, 200 mg. **Cost:** 100 mg $48.99/30, 200 mg $85.99/30. **Bioadhesive vaginal gel (Crinone, Prochieve):** 4%, 8%. **Vaginal tablets (Endometrin):** 100 mg. **Injection:** 50 mg/ml in 10-ml vials.

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Blood pressure be monitored periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Amenorrhea:** Assess patient's usual menstrual history. Administration of drug usually begins 8–10 days before anticipated menstruation. Withdrawal bleeding usually occurs 48–72 hr after course of therapy. Therapy should be discontinued if menses occur during injection series.
- **Dysfunctional Bleeding:** Monitor pattern and amount of vaginal bleeding (pad count). Bleeding should end by sixth day of therapy. Therapy should be discontinued if menses occur during injection series.
- ***Lab Test Considerations:*** Monitor hepatic function before and periodically during therapy.
- May cause ↑ plasma amino acid and alkaline phosphatase levels.
- May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum concentrations of LDL and ↓ concentrations of HDL.
- High doses may ↑ sodium and chloride excretion.
- May alter thyroid function test results.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- **IM:** Shake vial before preparing IM dose. Administer deep IM. Rotate sites.
- **Vag:** Vaginal gel and insert are administered with disposable applicator provided by manufacturer.
- If dose increase is required from 4% gel to 8% gel, doubling the volume of the 4% gel will not accomplish dose increase; changing to 8% gel is required.

Patient/Family Teaching

- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Instruct patient to notify health care professional if change in vaginal bleeding pattern or spotting occurs.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; and Pap smears.
- **Vag:** Instruct patient not use vaginal gel concurrently with other vaginal agents. If these agents must be used concurrently, administer at least 6 hr before or after vaginal gel.

Evaluation/Desired Outcomes

- Development of normal cyclic menses.
- Successful outcome in assisted reproduction.

P

promethazine

(proe-**meth**-a-zeen)
Antinaus, Histanil, Pentazine, Phenadoz, Phenergan, Promacot, Promet, Prorex

Classification
Therapeutic: antiemetics, antihistamines, sedative/hypnotics
Pharmacologic: phenothiazines

Pregnancy Category C

Indications

Treatment of various allergic conditions and motion sickness. Preoperative sedation. Treatment and prevention of nausea and vomiting. Adjunct to anesthesia and analgesia.

Action

Blocks the effects of histamine. Has inhibitory effect on the chemoreceptor trigger zone in the medulla, resulting in antiemetic properties. Alters the effects of dopamine in the CNS. Possesses significant anticholinergic activity. Produces CNS depression by indirectly decreased

Copyright © 2008 by F.A. Davis

stimulation of the CNS reticular system. **Therapeutic Effects:** Relief of symptoms of histamine excess usually seen in allergic conditions. Diminished nausea or vomiting. Sedation.

Pharmacokinetics

Absorption: Well absorbed after oral (88%) and IM administration; rectal administration may be less reliable.
Distribution: Widely distributed; crosses the blood-brain barrier and the placenta.
Protein Binding: 65–90%.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 9–16 hr.

TIME/ACTION PROFILE (noted as antihistaminic effects; sedative effects last 2–8 hr)

ROUTE	ONSET	PEAK	DURATION
PO, IM	20 min	unknown	4–12 hr
rectal	20 min	unknown	4–12 hr
IV	3–5 min	unknown	4–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Comatose patients; Prostatic hypertrophy; Bladder neck obstruction; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance; Angle-closure glaucoma; Pedi: May cause fatal respiratory depression in children <2 yr.
Use Cautiously in: IV administration, may cause severe injury to tissue; Hypertension; Cardiovascular disease; Impaired liver function; Prostatic hypertrophy; Glaucoma; Asthma; Sleep apnea; Epilepsy; Underlying bone marrow depression; Pedi: For children >2 yr, use lowest effective dose, avoid concurrent respiratory depressants; OB: Has been used safely during labor; avoid chronic use during pregnancy; Lactation: Safety not established; may cause drowsiness in infant. Geri: Appears on Beers list. Geriatric patients are sensitive to anticholinergic effects and have increased risk for side effects.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, confusion, disorientation, sedation, dizziness, extrapyramidal reactions, fatigue, insomnia, nervousness. **EENT:** blurred vision, diplopia, tinnitus. **CV:** bradycardia, hypertension, hypotension, tachycardia. **GI:** constipation, drug-induced hepatitis, dry mouth. **Derm:** photosensitivity, severe tissue necrosis upon infiltration at IV site, rashes. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, other **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics**. Neuroleptic malignant syndrome can occur when used concurrently with **antipsychotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including other **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, other **phenothiazines**, **quinidine**, and **disopyramide**. May precipitate seizures when used with **drugs that lower seizure threshold**. Concurrent use with **MAO inhibitors** may result in ↑ sedation and anticholinergic side effects.

Route/Dosage

Antihistamine

PO (Adults): 6.25–12.5 mg 3 times/day and 25 mg at bedtime.
PO (Children ≥2 yr): 0.1 mg/kg/dose (not to exceed 12.5 mg) q 6 hr during the day and 0.5 mg/kg/dose (not to exceed 25 mg) at bedtime.
IM, IV, Rect (Adults): 25 mg; may repeat in 2 hr.
Rect (Children ≥2 yr): 0.125 mg/kg q 4–6 hr *or* 0.5 mg/kg at bedtime.

Antivertigo (Motion Sickness)

PO (Adults): 25 mg 30–60 min before departure; may be repeated in 8–12 hr.
PO, Rect (Children ≥2 yr): 0.5 mg/kg (not to exceed 25 mg) 30–60 min before departure; may be given q 12 hr as needed.

Sedation

PO, Rect, IM, IV (Adults): 25–50 mg; may repeat q 4–6 hr if needed.
PO, Rect, IM (Children >2 yr): 0.5–1 mg/kg (not to exceed 50 mg) q 6 hr as needed.

Sedation during Labor

IM, IV (Adults): 50 mg in early labor; when labor is established, additional doses of 25–75 mg may be given 1–2 times at 4-hr intervals (24-hr dose should not exceed 100 mg).

Antiemetic

PO, Rect, IM, IV (Adults): 12.5–25 mg q 4 hr as needed; initial PO dose should be 25 mg.
PO, Rect, IM, IV (Children ≥2 yr): 0.25–1 mg/kg (not to exceed 25 mg) q 4–6 hr.

Availability (generic available)

Tablets: 10 mg[OTC], 12.5 mg, 12.5 mg[OTC], 25 mg, 25 mg[OTC], 50 mg, 50 mg[OTC]. **Syrup**

Copyright © 2008 by F.A. Davis

(cherry flavor): 3.25 mg/120 ml, 6.25 mg/5 ml, 10 mg/5 ml[OTC], 25 mg/5 ml. **Injection:** 25 mg/ml in 1-ml ampules and 1- and 10-ml vials, 50 mg/ml in 1-ml ampules and 10-ml vials. **Suppositories:** 2.5 mg, 5 mg, 12.5 mg, 25 mg. ***In combination with:*** codeine, dextromethorphan, phenylephrine, and/or pseudoephedrine in a variety of cough and cold preparations. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure, pulse, and respiratory rate frequently in patients receiving IV doses.
- Assess patient for level of sedation after administration. Risk of sedation and respiratory depression are increased when administered concurrently with other drugs that cause CNS depression
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Notify physician or other health care professional if these symptoms occur.
- Geri: Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- **Allergy:** Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout course of therapy.
- **Antiemetic:** Assess patient for nausea and vomiting before and after administration.
- **IV:** If administered IV, assess for burning and pain at IV site; may cause severe tissue injury. Avoid IV administration, if possible. If pain occurs, discontinue administration immediately.
- ***Lab Test Considerations:*** May cause false-positive or false-negative pregnancy test results.
- CBC should be evaluated periodically during chronic therapy; blood dyscrasias may occur.
- May cause increased serum glucose.
- May cause false-negative results in skin tests using allergen extracts. Promethazine should be discontinued 72 hr before the test.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)
Risk for injury (Side Effects)

Implementation

- When administering promethazine concurrently with opioid analgesics, supervise ambulation closely to prevent injury from increased sedation.
- **PO:** Administer with food, water, or milk to minimize GI irritation. Tablets may be crushed and mixed with food or fluids for patients with difficulty swallowing.
- **IM:** Administer deep into well-developed muscle. Subcut or inadvertent intra-arterial administration may cause severe tissue necrosis.

IV Administration

- **Direct IV:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** Doses should not exceed a concentration of 25 mg/ml. Administer through a large-bore vein through a running IV line into the most distal port. Slight yellow color does not alter potency. Do not use if precipitate is present. ***Rate:*** Administer each 25 mg slowly, over at least 10–15 min. Rapid administration may produce a transient fall in blood pressure.
- **Solution Compatibility:** dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, lactated Ringer's combinations.
- **Syringe Compatibility:** atropine, butorphanol, cimetidine, droperidol, fentanyl, glycopyrrolate, hydromorphone, meperidine, metoclopramide, midazolam, pentazocine, ranitidine, scopolamine.
- **Syringe Incompatibility:** heparin, ketorolac, pentobarbital, thiopental.
- **Y-Site Compatibility:** amifostine, amsacrine, aztreonam, bivalirudin, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, etoposide, fenoldopam, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, linezolid, melphalan, ondansetron, oxaliplatin, pemetrexed, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** aldesleukin, allopurinol, amphotericin B cholesteryl, cefepime, cefotetan, doxorubicin liposome, fos-

Copyright © 2008 by F.A. Davis

carnet, lansoprazole, methotrexate, piperacillin/tazobactam.

Patient/Family Teaching

- Review dose schedule with patient. If medication is ordered regularly and a dose is missed, take as soon as remembered unless time for next dose Pedi: Caution caregivers to use only the measuring device accompanying the liquid medication and not to use household measuring devices.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if dry mouth persists >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Geri: Geriatric patients are at increased risk.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- Instruct patient to notify health care professional if sore throat, fever, jaundice, or uncontrolled movements are noted.
- Geri: Teach patient and family about anticholinergic effects and to contact a health care professional if such effects persist.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 30 min and preferably 1–2 hr before exposure to conditions that may cause motion sickness.

Evaluation/Desired Outcomes

- Relief from allergic symptoms.
- Prevention of motion sickness.
- Sedation.
- Relief from nausea and vomiting.

propafenone

(proe-**paff**-e-nown)
Rythmol

Classification
Therapeutic: antiarrhythmics (class IC)

Pregnancy Category C

Indications

Treatment of life-threatening ventricular arrhythmias, including ventricular tachycardia. Prolongs the time to recurrence of symptomatic paroxysmal atrial arrhythmias, including paroxysmal atrial fibrillation/flutter (PAF) and paroxysmal supraventricular tachycardia (PSVT). **Unlabeled uses:** Single dose treatment for atrial fibrillation.

Action

Slows conduction in cardiac tissue by altering transport of ions across cell membranes. **Therapeutic Effects:** Suppression of ventricular arrhythmias.

Pharmacokinetics

Absorption: Although well absorbed following oral administration, undergoes rapid hepatic metabolism (bioavailability 3–11%).
Distribution: Widely distributed; crosses the placenta.
Metabolism and Excretion: Extensively metabolized by the liver (CYP1A2, CYP2D6, and CYP3A4 enzyme systems), some metabolites have antiarrhythmic activity. >90% of patients are considered extensive metabolizers. Others metabolize propafenone more slowly.
Half-life: 2–10 hr in extensive metabolizers, 10–32 hr in slow metabolizers.

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	hrs–days	4–5 days†	hrs

†Chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cardiogenic shock; Conduction disorders including sick sinus syndrome and AV block (without a pacemaker); Bradycardia; Severe hypotension; Concurrent quinidine or amiodarone; Nonallergic bronchospasm; Electrolyte disturbances; Uncontrolled CHF.
Use Cautiously in: Severe hepatic or renal impairment (dose reduction may be necessary); Geri: Lower doses may be necessary due to age-related decrease in renal/hepatic/cardiovascular function, concurrent chronic illnesses and medications); OB, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, shaking, weakness. **EENT:** blurred vision. **CV:** SUPRAVENTRICULAR ARRHYTHMIA,

Copyright © 2008 by F.A. Davis

VENTRICULAR ARRHYTHMIAS, conduction disturbances, angina, bradycardia, hypotension. **GI:** altered taste, constipation, nausea, vomiting, diarrhea, dry mouth. **Derm:** rash. **MS:** joint pain.

Interactions

Drug-Drug: Any **inhibitors of the CYP1A2, CYP2D6 or CYP3A4 enzyme systems** may ↑ levels, including **desipramine**, **paroxetine**, **ritonavir**, **sertraline**, **ketoconazole**, **saquinavir**, **erythromycin** (blood level monitoring recommended). **Quinidine** is a strong inhibitor of CYP2D6 and significantly ↑ levels of propafenone; concurrent use is not recommended. Propafenone is also an inhibitor of CYP2D6 and may ↑ levels of **desipramine**, **imipramine**, **haloperidol**, and **venlafaxine**. Significantly ↑ serum **digoxin** levels (blood level monitoring recommended, ↓ dose may be required). ↑ blood levels of **metoprolol** and **propranolol** (↓ dose may be required). Concurrent use of **local anesthetics** may ↑ risk of CNS adverse reactions. ↑ effects of **warfarin** (↓ warfarin dose if necessary, monitor prothrombin time). Concurrent with **amiodarone** can adversely effect conduction/repolarization and should be avoided. May ↑ risk of CNS adverse reactions with **lidocaine**. May ↑ **cyclosporine** through blood levels and risk of nephrotoxicity. **Rifampin** may ↓ serum levels and effectiveness of propafenone. **Cimetidine** may ↑ serum levels.

Drug-Food: Grapefruit juice may ↑ levels.

Route/Dosage

PO (Adults): 150 mg q 8 hr; may be gradually increased at 3–4-day intervals as required up to 300 mg q 8–12 hr. *Single dose treatment of atrial fibrillation (unlabeled)*— 450 or 600 mg.

Availability (generic available)

Tablets: 150 mg, 225 mg, 300 mg. **Cost:** *Generic*—150 mg $316.95/270, 225 mg $355.00/270, 300 mg $593.95/270.

NURSING IMPLICATIONS

Assessment

- Monitor ECG or use Holter monitor prior to and periodically during therapy. May cause PR and QT prolongation.
- Monitor blood pressure and pulse periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess patients for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention). May require reduction or discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ ANA titer, which is usually asymptomatic and reversible.
- Monitor prothrombin level in patients taking warfarin; may ↑ effects of warfarin.
- ***Toxicity and Overdose:*** Signs of toxicity include hypotension, excessive drowsiness, and decreased or abnormal heart rate. Notify physician or other health care professional if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **PO:** Propafenone therapy should be initiated in a hospital with facilities for cardiac rhythm monitoring. Most serious proarrhythmic effects are seen in the first 2 wk of therapy.
- Previous antiarrhythmic therapy should be withdrawn 2–5 half-lives before starting propafenone.
- Dose adjustments should be at least 3–4 days apart because of the long half-life of propafenone.
- Correct pre-existing hypokalemia or hyperkalemia prior to instituting therapy.

Patient/Family Teaching

- Instruct patient to take medication around the clock as directed, even if feeling better. Take missed doses as soon as remembered if within 4 hr; omit if remembered later. Gradual dosage reduction may be necessary.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if fever, sore throat, chills, or unusual bleeding or bruising occurs or if chest pain, shortness of breath, diaphoresis, palpitations, or visual changes become bothersome.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Copyright © 2008 by F.A. Davis

- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in frequency of ventricular arrhythmias.
- Prolonged time to recurrence of symptomatic paroxysmal atrial arrhythmias, including paroxysmal atrial fibrillation/flutter and PSVT.

propofol (**proe**-poe-fol)
Diprivan, Disoprofol

Classification
Therapeutic: general anesthetics

Pregnancy Category B

Indications
Induction of general anesthesia in children >3 yr and adults. Maintenance of balanced anesthesia when used with other agents in children >2 months and adults. Initiation and maintenance of monitored anesthesia care (MAC). Sedation of intubated, mechanically ventilated patients in intensive care units (ICUs).

Action
Short-acting hypnotic. Mechanism of action is unknown. Produces amnesia. Has no analgesic properties. **Therapeutic Effects:** Induction and maintenance of anesthesia.

Pharmacokinetics
Absorption: Administered IV only, resulting in complete absorption.
Distribution: Rapidly and widely distributed. Crosses the blood-brain barrier well; rapidly redistributed to other tissues. Crosses the placenta and enters breast milk.
Protein Binding: 95–99%.
Metabolism and Excretion: Rapidly metabolized by the liver.
Half-life: 3–12 hr (blood-brain equilibration half-life 2.9 min).

TIME/ACTION PROFILE (loss of consciousness)

ROUTE	ONSET	PEAK	DURATION†
IV	40 sec	unknown	3–5 min

†Time to recovery is 8 min (up to 19 min if opioid analgesics have been used)

Contraindications/Precautions
Contraindicated in: Hypersensitivity to propofol, soybean oil, egg lecithin, or glycerol; Labor and delivery.

Use Cautiously in: Cardiovascular disease; Lipid disorders (emulsion may have detrimental effect); Increased intracranial pressure; Cerebrovascular disorders; Geriatric (>60 yr), debilitated, or hypovolemic patients (lower induction and maintenance dosage reduction recommended); Children <3 yr (for induction of anesthesia), children <2 mos (maintenance of anesthesia), or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache. **Resp:** APNEA, cough. **CV:** bradycardia, hypotension, hypertension. **GI:** abdominal cramping, hiccups, nausea, vomiting. **Derm:** flushing. **Local:** burning, pain, stinging, coldness, numbness, tingling at IV site. **MS:** involuntary muscle movements, perioperative myoclonia. **GU:** discoloration of urine (green). **Misc:** fever.

Interactions
Drug-Drug: Additive CNS and respiratory depression with **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics** (dosage reduction may be required). **Theophylline** may antagonize the CNS effects of propofol. Propofol may increase the serum concentrations of **alfentanil**. Cardiorespiratory instability can occur when used with **acetazolamide**. Serious bradycardia can occur with concurrent use of **fentanyl** in children. Increased risk of hypertriglyceridemia with **intravenous fat emulsion**.

Route/Dosage

General Anesthesia
IV (Adults <55 yr): *Induction*—40 mg q 10 sec until induction achieved (2–2.5 mg/kg total). *Maintenance*—100–200 mcg/kg/min. Rates of 150–200 mcg/kg/min are usually required during first 10–15 min after induction, then decreased by 30–50% during first 30 min of maintenance. Rates of 50–100 mcg/kg/min are associated with optimal recovery time. May also be given intermittently in increments of 25–50 mg.
IV (Geriatric Patients, Cardiac Patients, Debilitated Patients, or Hypovolemic Patients): *Induction*—20 mg q 10 sec until induction achieved (1–1.5 mg/kg total). *Maintenance*—50–100 mcg/kg/min (dose in cardiac anesthesia ranges from 50–150 mcg/kg/min depending on concurrent use of opioid).
IV (Adults Undergoing Neurosurgical Procedures): *Induction*—20 mg q 10 sec until

Copyright © 2008 by F.A. Davis

induction achieved (1–2 mg/kg total). *Maintenance*—100–200 mcg/kg/min.

IV (Children ≥3 yr–16 yr): *Induction*—2.5–3.5 mg/kg, use lower dose for children ASA III or IV.

IV (Children 2 mos–16 yr): *Maintenance*—200–300 mcg/kg/min (following first 30 min of maintenance, rate should be decreased to 125–150 mcg/kg/min if possible), younger children may require larger infusion rates compared to older children.

Monitored Anesthesia Care (MAC) Sedation

IV (Adults <55 yr): *Initiation*—100–150 mcg/kg/min infusion *or* 0.5 mg/kg as slow injection. *Maintenance*—25–75 mcg/kg/min infusion or incremental boluses of 10–20 mg.

IV (Geriatric Patients, Debilitated Patients, or ASA III/IV Patients): *Initiation*—Use slower infusion or injection rates. *Maintenance*—20% less than the usual adult infusion dose; rapid/repeated bolus dosing should be avoided.

ICU Sedation

IV (Adults): 5 mcg/kg/min for a minimum of 5 min. Additional increments of 5–10 mcg/kg/min over 5–10 min may be given until desired response is obtained. (Range 5–50 mcg/kg/min.) Dose should be reassessed every 24 hr.

Availability (generic available)

Injection: 10 mg/ml in 20-, 50-, and 100-ml infusion vials.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status, pulse, and blood pressure continuously throughout propofol therapy. Frequently causes apnea lasting ≥60 sec. Maintain patent airway and adequate ventilation. Propofol should be used only by individuals experienced in endotracheal intubation, and equipment for this procedure should be readily available.
- Assess level of sedation and level of consciousness throughout and following administration.
- When using for ICU sedation, wake-up and assessment of CNS function should be done daily throughout maintenance to determine minimum dose required for sedation. Maintain a light level of sedation during these assessments; do not discontinue. Abrupt discontinuation may cause rapid awakening with anxiety, agitation, and resistance to mechanical ventilation.
- ***Toxicity and Overdose:*** If overdose occurs, monitor pulse, respiration, and blood pressure continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- Do not confuse Diprivan (propofol) with Diflucan (fluconazole).
- Dose is titrated to patient response.
- Propofol has no effect on the pain threshold. Adequate analgesia should *always* be used when propofol is used as an adjunct to surgical procedures.

IV Administration

- **Direct IV:** ***Diluent:*** Usually administered undiluted. If dilution is necessary, use only D5W. Shake well before use. Solution is opaque, making detection of contaminants difficult. Do not use if separation of the emulsion is evident. Contains no preservatives; maintain sterile technique and administer immediately after preparation. ***Concentration:*** Undiluted: 10 mg/ml. If dilution is necessary, dilute to concentration ≥2 mg/ml.
- Discard unused portions and IV lines at the end of anesthetic procedure or within 6 hr. For ICU sedation, discard after 12 hr if administered directly from vial or after 6 hr if transferred to a syringe or other container. Do not administer via filter <5–micron pore size.
- Aseptic technique is essential. Solution is capable of rapid growth of bacterial contaminants. Infections and subsequent deaths have been reported. ***Rate:*** Administer over 3–5 min. Titrate to desired level of sedation. Frequently causes pain, burning, and stinging at injection site; use larger veins of the forearm, antecubital fossa, or a dedicated IV catheter. Lidocaine 10–20 mg IV may be administered prior to injection to minimize pain. Pedi: In-

Copyright © 2008 by F.A. Davis

duction doses may be administered over 20–30 seconds. Intermittent/Continuous Infusion ***Diluent:*** Administer undiluted. ***Concentration:*** 10 mg/ml. ***Rate:*** Based on patient's weight (see Route/Dosage section).

- **Solution Compatibility:** D5W, LR, D5/LR, D5/0.45% NaCl, D5/0.2% NaCl.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, ampicillin, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dexamethasone sodium phosphate, dexmedetomidine, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketamine, labetalol, levorphanol, lidocaine, lorazepam, magnesium sulfate, mannitol, meperidine, milrinone, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, paclitaxel, pentobarbital, phenobarbital, piperacillin, potassium chloride, prochlorperazine, propranolol, ranitidine, scopolamine, sodium bicarbonate, succinylcholine, sufentanil, thiopental, ticarcillin/clavulanate, vecuronium.
- **Y-Site Incompatibility:** amikacin, amphotericin B, calcium chloride, ciprofloxacin, diazepam, digoxin, doxorubicin, gentamicin, levofloxacin, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitoxantrone, phenytoin, tobramycin, verapamil.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Advise patient to avoid alcohol or other CNS depressants without the advice of a health care professional for 24 hr following administration.

Evaluation/Desired Outcomes

- Induction and maintenance of anesthesia.
- Amnesia.
- Sedation in mechanically ventilated patients in an intensive care setting.

PROPOXYPHENE

propoxyphene hydrochloride
(pro-**pox**-i-feen hye-droe-**klor**-ide)
Darvon

propoxyphene hydrochloride/aspirin/caffeine
Darvon Compound-65, Darvon Compound-32

propoxyphene napsylate
(pro-**pox**-i-feen **nap**-si-late)
Darvon N

propoxyphene napsylate/acetaminophen
Darvon A500, Darvocet-N, Propacet, Propoxyphene with APAP, Wygesic

propoxyphene napsylate/aspirin
Darvon-N with ASA

propoxyphene/aspirin/caffeine
Darvon-N Compound, 692

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists, opioid agonists/nonopioid analgesic combinations

Pregnancy Category C

See also Acetaminophen monograph and Salicylates monograph

Indications

Mild to moderate pain.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression.
Therapeutic Effects: Decrease in mild to moderate pain.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Napsylate salt is more slowly absorbed.

Copyright © 2008 by F.A. Davis

Distribution: Widely distributed. Probably crosses the placenta. Enters breast milk in small amounts.
Metabolism and Excretion: Mostly metabolized by the liver. Some conversion to norpropoxyphene, a toxic metabolite. This metabolite accumulates in elderly patients and patients with decreased renal function.
Half-life: 6–12 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	2–3 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy or lactation (avoid chronic use); Pedi: Children.
Use Cautiously in: Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Appears on Beers list. Elderly or debilitated patients require reduced dosages.; Undiagnosed abdominal pain; Prostatic hyperplasia; OB: Lactation (has been used safely).

Adverse Reactions/Side Effects

CNS: dizziness, weakness, dysphoria, euphoria, headache, insomnia, paradoxical excitement, sedation. **EENT:** blurred vision. **CV:** hypotension. **GI:** nausea, abdominal pain, constipation, vomiting. **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in unpredictable, severe, and potentially fatal reactions—decrease initial dose to 25% of usual dose). ↑ CNS depression with **alcohol**, **antidepressants**, and **sedative/hypnotics**. **Smoking** ↑ metabolism and may decrease analgesic effectiveness. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**, **buprenorphine**, or **pentazocine** may ↓ analgesia.
Drug-Natural Products: Concomitant use of **kava kava, valerian, or chamomile can ↑ CNS depression.**

Route/Dosage

Consider cumulative effects of additional acetaminophen/aspirin; if toxic levels are exceeded, change to pure propoxyphene product.
PO (Adults): 65 mg q 4 hr (hydrochloride—Darvon) or 100 mg q 4 hr (napsylate—Darvon-N) as needed (not to exceed 390 mg/day as hydrochloride or 600 mg/day as napsylate). 100 mg propoxyphene napsylate = 65 mg propoxyphene hydrochloride.

Availability (generic available)

Propoxyphene Hydrochloride
Capsules: 65 mg. **Tablets:** ✱65 mg.

Propoxyphene Napsylate
Capsules: ✱100 mg. **Tablets:** 50 mg, 100 mg.

Propoxyphene Hydrochloride/Acetaminophen
Tablets: propoxyphene 65 mg/acetaminophen 650 mg.

Propoxyphene Napsylate/Acetaminophen
Tablets: propoxyphene 50 mg/acetaminophen 325 mg, propoxyphene 100 mg/acetaminophen 650 mg, propoxyphene 100 mg/acetaminophen 500 mg.

Propoxyphene Hydrochloride/Aspirin/Caffeine
Capsules: propoxyphene 32 mg, aspirin 389 mg, caffeine 32.4 mg, propoxyphene 65 mg, aspirin 389 mg, caffeine 32.4 mg. **Tablets:** ✱propoxyphene 65 mg, aspirin 375 mg, caffeine 30 mg.

Propoxyphene Napsylate/Aspirin
Tablets: ✱propoxyphene 100 mg/aspirin 325 mg.

Propoxyphene Napsylate/Aspirin/Caffeine
Tablets: ✱propoxyphene 100 mg/aspirin 375 mg/caffeine 30 mg.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 2 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previ-

Copyright © 2008 by F.A. Davis

ous dose is ineffective and side effects are minimal.
- Use an equianalgesic chart (see Appendix J) when changing routes or when changing from one opioid to another.
- Prolonged, high-dose therapy may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive propoxyphene for pain do not develop psychological dependence. Progressively higher doses or change to a stronger opioid may be required to relieve pain with long-term therapy.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Geri: Geriatric patients may be more sensitive to CNS effects; monitor closely and assess falls risk.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- May cause ↑ AST, ALT, serum alkaline phosphatase, LDH, and bilirubin concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 ml of 0.9% NaCl and administer 0.5 ml (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 ml of 0.9% NaCl for a concentration of 10 mcg/ml and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnosis

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

Implementation

- Explain therapeutic value of medication prior to administration, to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.

Patient/Family Teaching

- Advise patient to take medication as directed and not to take more than the recommended amount. Severe and permanent liver damage may result from prolonged use or high doses of acetaminophen. Renal damage may occur with prolonged use of acetaminophen or aspirin. Doses of nonopioid agents should not exceed the maximum recommended daily dose.
- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Geri: Advise geriatric patients of increased risk for CNS effects and potential for falls.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness.

HIGH ALERT

propranolol

(proe-**pran**-oh-lole)
Apo-Propranolol, Betachron E-R, Inderal, Inderal LA, InnoPran

Copyright © 2008 by F.A. Davis

XL, Novopranol, pms Propranolol

Classification
Therapeutic: antianginals, antiarrhythmics (Class II), antihypertensives, vascular headache suppressants
Pharmacologic: beta blockers

Pregnancy Category C

Indications
Management of hypertension, angina, arrhythmias, hypertrophic cardiomyopathy, thyrotoxicosis, essential tremors, pheochromocytoma. Also used in the prevention and management of MI, and the prevention of vascular headaches. **Unlabeled uses:** Also used to manage alcohol withdrawal, aggressive behavior, antipsychotic-associated akathisia, situational anxiety, and esophageal varices. Post-traumatic stress disorder (PTSD) (Ongoing clinical trials at National Institute for Mental Health [NIMH].)

Action
Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased heart rate and blood pressure. Suppression of arrhythmias. Prevention of MI.

Pharmacokinetics
Absorption: Well absorbed but undergoes extensive first-pass hepatic metabolism.
Distribution: Moderate CNS penetration. Crosses the placenta; enters breast milk.
Protein Binding: 93%.
Metabolism and Excretion: Almost completely metabolized by the liver.
Half-life: 3.4–6 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	60–90 min†	6–12 hr
PO–ER	unknown	6 hr	24 hr
IV	immediate	1 min	4–6 hr

†Following single dose, full effect not seen until several weeks of therapy

Contraindications/Precautions
Contraindicated in: Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.

Use Cautiously in: Renal or hepatic impairment; pulmonary disease (including asthma); diabetes mellitus (may mask signs of hypoglycemia); thyrotoxicosis (may mask symptoms); history of severe allergic reactions (may ↑ intensity of response); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression. May also ↓ blood supply to the placenta, increase the risk for premature birth or fetal death, and cause intrauterine growth retardation. May ↑ risk of cardiac and pulmonary complications in the infant during the neonatal time frame. Lactation: Appears in breast milk; use formula if propranolol must be taken; Pedi: ↑ risk of hypoglycemia, especially during periods of fasting such as before surgery, during prolonged exertion, or with coexisting renal insufficiency; Geri: ↑ sensitivity to all beta blockers; initial dose reduction and careful titration recommended.

Adverse Reactions/Side Effects
CNS: fatigue, weakness, anxiety, dizziness, drowsiness, insomnia, memory loss, mental depression, mental status changes, nervousness, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, decreased libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia (increased in children). **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions
Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may decrease effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemics** (dose ad-

Copyright © 2008 by F.A. Davis

justments may be necessary). May ↓ effectiveness of **beta-adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). **Cimetidine** may ↑ blood levels and toxicity. Concurrent **NSAIDs** may ↓ antihypertensive action. **Smoking** ↑ metabolism and ↓ effects; smoking cessation may ↑ effects.

Route/Dosage

PO (Adults): *Antianginal*—80–320 mg/day in 2–4 divided doses or once daily as extended/sustained-release capsules. *Antihypertensive*—40 mg twice daily initially; may be increased as needed (usual range 120–240 mg/day; doses up to 1 g/day have been used); *or* 80 mg once daily as extended/sustained-release capsules, increased as needed up to 120 mg. *InnoPran XL* dosing form is designed to be given once daily at bedtime. *Antiarrhythmic*—10–30 mg 3–4 times daily. *Prevention of MI*—180–240 mg/day in divided doses. *Hypertrophic cardiomyopathy*—20–40 mg 3–4 times daily. *Adjunct therapy of pheochromocytoma*—20 mg 3 times daily to 40 mg 3–4 times daily concurrently with alpha-blocking therapy, started 3 days before surgery is planned. *Vascular headache prevention*—20 mg 4 times daily *or* 80 mg/day as extended/sustained-release capsules; may be increased as needed up to 240 mg/day. *Management of tremor*—40 mg twice daily; may be increased up to 120 mg/day (up to 320 mg have been used).

PO (Children): *Antihypertensive/antiarrhythmic*—0.5–1 mg/kg/day in 2–4 divided doses; may be increased as needed (usual range for maintenance dose is 2–4 mg/kg/day in 2 divided doses).

IV (Adults): *Antiarrhythmic*—1–3 mg; may be repeated after 2 min and again in 4 hr if needed.

IV (Children): *Antiarrhythmic*—10–100 mcg (0.01–0.1 mg)/kg (up to 1 mg/dose); may be repeated q 6–8 hr if needed.

Availability (generic available)

Oral solution: 4 mg/ml, 8 mg/ml. **Cost:** *Generic*—4 mg/ml $38.54/480 ml. **Tablets:** 10 mg, 20 mg, 40 mg, 60 mg, 80 mg. **Cost:** *Generic*—10 mg $8.99/100, 20 mg $7.99/100, 40 mg $12.22/100, 60 mg $86.65/100, 80 mg $15.59/100. **Sustained-release capsules (Inderal LA):** 60 mg, 80 mg, 120 mg, 160 mg. **Cost:** 60 mg $132.98/90, 80 mg $141.97/90, 120 mg $176.80/90, 120 mg $230.05/90. **Extended-release capsules:** 60 mg, 80 mg, 120 mg, 160 mg. **Cost:** *Generic*—60 mg $99.99/90, 80 mg $141.97/90, 120 mg $176.80/90, 160 mg $230.05/90. **Injection:** 1 mg/ml. ***In combination with:*** hydrochlorothiazide (Inderide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor blood pressure and pulse frequently during dose adjustment period and periodically during therapy.
- Abrupt withdrawal of propranolol may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia. Drug should be tapered over a 2 week period before discontinuation. Assess patient carefully during tapering and after medication is discontinued. Consider that patients taking propranolol for non-cardiac indications may have undiagnosed cardiac disease. Abrupt discontinuation or withdrawal over too-short a period of time (less than 9 days) should be avoided
- Pedi: Assess pediatric patients for signs and symptoms of hypoglycemia, particularly when oral foods and fluids are restricted.
- Patients receiving **propranolol IV** must have continuous ECG monitoring and may have pulmonary capillary wedge pressure (PCWP) or central venous pressure (CVP) monitoring during and for several hours after administration.
- Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- **Vascular Headache Prophylaxis:** Assess frequency, severity, characteristics, and location of vascular headaches periodically during therapy.
- **PTSD:** Assess frequency of symptoms (flashbacks, nightmares, efforts to avoid thoughts or activities that may trigger memories of the trauma, and hypervigilance) periodically throughout therapy.

Copyright © 2008 by F.A. Davis

- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↓ or ↑ in blood glucose levels. In labile diabetic patients, hypoglycemia may be accompanied by precipitous ↑ of blood pressure.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur: Hypotension may be treated with modified Trendelenburg position and IV fluids unless contraindicated. Vasopressors (epinephrine, norepinephrine, dopamine, dobutamine) may also be used. Hypotension does not respond to beta agonists, Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check the original order, dose calculations, and infusion pump settings. Also, patient harm or fatalities have occurred when switching from oral to IV *propranolol*; oral and parenteral doses are not interchangeable. IV dose is 1/10 of the oral dose. Change to oral therapy as soon as possible. Do not confuse propranolol with pravachol. Do not confuse Inderal (a brand name of propranolol) with Adderall (an amphetamine/dextroamphetamine combination drug).
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with meals or directly after eating to enhance absorption.
- Extended-release capsules should be swallowed whole; do not crush, open, or chew. *Propranolol tablets* may be crushed and mixed with food.
- Mix propranolol oral solution with liquid or semisolid food (water, juices, applesauce, puddings). To ensure entire dose is taken, rinse glass with more liquid or have patient consume all of the applesauce or pudding. Do not store after mixing.

IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted or dilute each 1 mg in 10 ml of D5W for injection. ***Concentration:*** Undiluted: 1 mg/ml. Diluted in 10 ml of D5W: 0.1 mg/ml. ***Rate:*** Administer at 0.5 mg/min for adults to avoid hypotension and cardiac arrest; do not exceed 1 mg/min. Pedi: Administer over 10 min.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 50 ml of 0.9% NaCl, D5W, D5/0.45% NaCl, D5/0.9% NaCl, or lactated Ringer's injection. ***Concentration:*** Depends on dose. ***Rate:*** Infuse over 10–15 min.
- **Syringe Compatibility:** inamrinone, milrinone.
- **Syringe Incompatibility:** pantoprazole.
- **Y-Site Compatibility:** alteplase, fenoldopam, heparin, hydrocortisone sodium succinate, inamrinone, linezolid, meperidine, milrinone, morphine, potassium chloride, propofol, tacrolimus, vitamin B complex with C.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, diazoxide, lansoprazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose (8 hr with extended-release propranolol). Inform patient that abrupt withdrawal can cause life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or blood pressure changes significantly.

Copyright © 2008 by F.A. Davis

- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to ask a health care professional before taking any OTC medications or herbal products, especially cold preparations, when taking this medication.
- Diabetic patients should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. May mask tachycardia and increased blood pressure as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.
- **Vascular Headache Prophylaxis:** Caution patient that sharing this medication may be dangerous.
- **PTSD:** Advise patient that medication may relieve distressing symptoms but that psychotherapy is the primary treatment for the disorder. Refer patient and family to a PTSD support group.

Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Control of arrhythmias without appearance of detrimental side effects.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.
- Prevention of vascular headaches.
- Management of thyrotoxicosis.
- Management of pheochromocytoma.
- Decrease in tremors.
- Management of hypertrophic cardiomyopathy.
- Decrease in symptoms associated with PTSD.

propylthiouracil

(proe-pill-thye-oh-**yoor**-a-sill)

Propyl-Thyracil, PTU

Classification

Therapeutic: antithyroid agents

Pregnancy Category D

Indications

Palliative treatment of hyperthyroidism. Adjunct in the control of hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy.

Action

Inhibits the synthesis of thyroid hormones.
Therapeutic Effects: Decreased signs and symptoms of hyperthyroidism.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.
Distribution: Concentrates in the thyroid gland; crosses the placenta and enters breast milk in low concentrations.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (effects on clinical thyroid status)

ROUTE	ONSET	PEAK	DURATION
PO	10–21 days†	6–10 wk	wks

†Effects on serum thyroid hormone concentration may occur within 60 min of a single dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Decreased bone marrow reserve; Pregnancy (may be used safely; however, fetus may develop thyroid problems); Lactation (safety not established).

Adverse Reactions/Side Effects

CNS: drowsiness, headache, vertigo. **GI:** nausea, vomiting, diarrhea, drug-induced hepa-

Copyright © 2008 by F.A. Davis

titis, loss of taste. **Derm:** rash, skin discoloration, urticaria. **Endo:** hypothyroidism. **Hemat:** AGRANULOCYTOSIS, leukopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** fever, lymphadenopathy, parotitis.

Interactions

Drug-Drug: Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Additive antithyroid effects with **lithium**, **potassium iodide**, or **sodium iodide**. Increased risk of agranulocytosis with **phenothiazines**.

Route/Dosage

PO (Adults): *Thyrotoxic crisis*—200–400 mg q 4 hr during the first 24 hr. *Hyperthyroidism*—300–900 mg once daily or in 2–4 divided doses initially (up to 1.2 g/day); maintenance dose 50–600 mg/day once daily or in 2–4 divided doses.
PO (Children >10 yr): 50–300 mg/day given once daily or in 2–4 divided doses.
PO (Children 6–10 yr): 50–150 mg/day given once daily or in 2–4 divided doses.
PO (Neonates): 10 mg/kg/day in divided doses.

Availability (generic available)

Tablets: 50 mg, ✱100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response of symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess patient for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dosage adjustment may be required.
- Assess patient for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- ***Lab Test Considerations:*** Thyroid function studies should be monitored prior to therapy, monthly during initial therapy, and every 2–3 mo throughout therapy.
- WBC and differential counts should be monitored periodically throughout course of therapy. Agranulocytosis may develop rapidly and usually occurs during first 2 mo. This necessitates discontinuation of therapy.
- May cause increased AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)
Noncompliance (Patient/Family Teaching)

Implementation

- Can be compounded by pharmacist into enema or suppository.
- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock. If a dose is missed, take as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Report significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, symptoms of hyperthyroidism or hypothyroidism, or rash to health care professional promptly.
- Instruct patient to consult health care professional before taking any OTC medications containing iodine concurrently with this medication.
- Advise patient to carry identification describing medication regimen at all times and to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Copyright © 2008 by F.A. Davis

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment of 6 mo to several years may be necessary, usually averaging 1 yr.

protamine sulfate

(**proe**-ta-meen)

Classification

Therapeutic: antidotes
Pharmacologic: antiheparins

Pregnancy Category C

Indications

Acute management of severe heparin overdosage. Used to neutralize heparin received during dialysis, cardiopulmonary bypass, and other procedures. **Unlabeled uses:** Management of overdose of heparin-like compounds.

Action

A strong base that forms a complex with heparin (an acid). **Therapeutic Effects:** Inactivation of heparin.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolic fate not known. Protamine-heparin complex eventually degrades.
Half-life: Unknown.

TIME/ACTION PROFILE (reversal of heparin effect)

ROUTE	ONSET	PEAK	DURATION
IV	30 sec–1 min	unknown	2 hr†

†Depends on body temperature

Contraindications/Precautions

Contraindicated in: Hypersensitivity to protamine or fish.
Use Cautiously in: Patients who have received previous protamine-containing insulin or vasectomized men (increased risk of hypersensitivity reactions); Pregnancy, lactation, and children (safety not established).

Adverse Reactions/Side Effects

Resp: dyspnea. **CV:** bradycardia, hypertension, hypotension, pulmonary hypertension. **GI:** nausea, vomiting. **Derm:** flushing, warmth. **Hemat:** bleeding. **MS:** back pain. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS, ANGIOEDEMA , and PULMONARY EDEMA.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults and Children): *Heparin overdose*—1 mg/100 units of heparin. If given >30 min after heparin, give 0.5 mg/100 units of heparin (not to exceed 100 mg/2 hr). Further doses should be determined by coagulation tests. If heparin was administered subcutaneously, use 1–1.5 mg protamine per 100 units of heparin, give 25–50 mg of the protamine dose slowly followed by a continuous infusion over 8–16 hours. *Enoxaparin overdose*—1 mg/each mg of enoxaparin to be neutralized (unlabeled). *Dalteparin overdose*—1 mg/100 anti-Xa IU of dalteparin. If required, a second dose of 0.5 mg/100 anti-Xa IU of dalteparin may be given 2–4 hr later if laboratory assessment indicates need (unlabeled).

Availability (generic available)

Injection: 10 mg/ml in 5- and 25-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding and hemorrhage throughout therapy. Hemorrhage may recur 8–9 hr after therapy because of rebound effects of heparin. Rebound may occur as late as 18 hr after therapy in patients heparinized for cardiopulmonary bypass.
- Assess for allergy to fish (salmon), previous reaction to or use of protamine insulin or protamine sulfate. Vasectomized and infertile men also have higher risk of hypersensitivity reaction.
- Observe patient for signs and symptoms of hypersensitivity reaction (hives, edema, coughing, wheezing). Keep epinephrine, an antihistamine, and resuscitative equipment close by in the event of anaphylaxis.
- Assess for hypovolemia before initiation of therapy. Failure to correct hypovolemia may result in cardiovascular collapse from pe-

Copyright © 2008 by F.A. Davis

ripheral vasodilating effects of protamine sulfate.

- ***Lab Test Considerations:*** Monitor clotting factors, activated clotting time (ACT), activated partial thromboplastin time (aPTT), and thrombin time (TT) 5–15 min after therapy and again as necessary.

Potential Nursing Diagnoses

Risk for injury (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- Discontinue heparin infusion. In milder cases, overdosage may be treated by heparin withdrawal alone.
- In severe cases, fresh frozen plasma or whole blood may also be required to control bleeding.
- Dose varies with type of heparin, route of heparin therapy, and amount of time elapsed since discontinuation of heparin.
- Do not administer >100 mg in 2 hr without rechecking clotting studies, as protamine sulfate has its own anticoagulant properties.

IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. If further dilution is desired, D5W or 0.9% NaCl may be used. ***Concentration:*** 10 mg/ml. ***Rate:*** Administer by slow IV push over 1–3 min. Rapid infusion rate may result in hypotension, bradycardia, flushing, or feeling of warmth. If these symptoms occur, stop infusion and notify physician. No more than 50 mg should be administered within a 10–min period.
- **Y-Site Compatibility:** amikacin, aminophylline, atropine, aztreonam, bumetanide, calcium chloride, calcium gluconate, cimetidine, clindamycin, cyclosporine, digoxin, diphenhydramine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fentanyl, fluconazole, ganciclovir, gentamicin, hydroxyzine, imipenem/cilastatin, isoproterenol, labetalol, lidocaine, meperidine, metoclopramide, metoprolol, metronidazole, midazolam, morphine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, ranitidine, sodium bicarbonate, tobramycin, vancomycin, verapamil.
- **Y-Site Incompatibility:** ampicillin, ampicillin/sulbactam, cefazolin, cefotaxime, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, dexamethasone sodium phosphate, diazepam, furosemide, hydrocortisone sodium succinate, insulin, ketorolac, methylprednisolone sodium succinate, nafcillin, penicillin G potassium, phenytoin, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain purpose of the medication to patient. Instruct patient to report recurrent bleeding immediately.
- Advise patient to avoid activities that may result in bleeding (shaving, brushing teeth, receiving injections or rectal temperatures, or ambulating) until risk of hemorrhage has passed.

Evaluation/Desired Outcomes

- Control of bleeding.
- Normalization of clotting factors in heparinized patients.

P

pseudoephedrine

(soo-doe-e-**fed**-rin)

Balminil Decongestant Syrup, Cenafed, Congestaid, Decofed, Dimetapp Maximum Strength 12–Hour Non-Drowsy Extentabs, Dimetapp Decongestant Pediatric, Drixoral 12 Hour Non-Drowsy Formula, Efidac 24, Eltor 120, Genafed, Halofed, Kid Kare, Medi-First Sinus Decongestant, Pedia-Care Infants' Decongestant Drops, Pediatric Nasal Decongestant, Simply Stuffy, Sinustop, Robidrine, Silfedrine, Sudafed, Sudafed Childrens's Non-Drowsy, Sudafed 12 Hour, Sudafed Non-Drowsy Maximum Strength, Sudodrin, Triaminic Allergy Congestion Softchews, Unifed

Classification

Therapeutic: allergy, cold, and cough remedies, nasal drying agents/decongestants

Pregnancy Category B

= Canadian drug name.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Copyright © 2008 by F.A. Davis

Indications
Symptomatic management of nasal congestion associated with acute viral upper respiratory tract infections. Used in combination with antihistamines in the management of allergic conditions. Used to open obstructed eustachian tubes in chronic otic inflammation or infection.

Action
Stimulates alpha- and beta-adrenergic receptors. Produces vasoconstriction in the respiratory tract mucosa (alpha-adrenergic stimulation) and possibly bronchodilation (beta$_2$-adrenergic stimulation). **Therapeutic Effects:** Reduction of nasal congestion, hyperemia, and swelling in nasal passages.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Appears to enter the CSF; probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Partially metabolized by the liver. 55–75% excreted unchanged by the kidneys (depends on urine pH).
Half-life: Children: 3.1 hr; Adults: 9–16 hr (depends on urine pH).

TIME/ACTION PROFILE (decongestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	4–6 hr
PO-ER	60 min	unknown	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to sympathomimetic amines; Hypertension, severe coronary artery disease; Concurrent MAO inhibitor therapy; Known alcohol intolerance (some liquid products).
Use Cautiously in: Hyperthyroidism; Diabetes mellitus; Prostatic hyperplasia; Ischemic heart disease; Glaucoma; Neonates (some products contain a metabolite of benzyl alcohol, avoid use); Pregnancy or lactation (safety not established).

Adverse Reactions/Side Effects
CNS: SEIZURES, anxiety, nervousness, dizziness, drowsiness, excitability, fear, hallucinations, headache, insomnia, restlessness, weakness. **Resp:** respiratory difficulty. **CV:** CARDIOVASCULAR COLLAPSE, palpitations, hypertension, tachycardia. **GI:** anorexia, dry mouth. **GU:** dysuria. **Misc:** diaphoresis.

Interactions
Drug-Drug: Concurrent use with **MAO inhibitors** may cause hypertensive crisis. Additive adrenergic effects with other **adrenergics**. Concurrent use with **beta blockers** may result in hypertension or bradycardia. **Drugs that acidify the urine** may decrease effectiveness. **Phenothiazines** and **tricyclic antidepressants** potentiate pressor effects. **Drugs that alkalinize the urine (sodium bicarbonate, high-dose antacid therapy)** may intensify effectiveness.
Drug-Food: Foods that acidify the urine may decrease effectiveness. **Foods that alkalinize the urine** may intensify effectiveness (see lists in Appendix L).

Route/Dosage
PO (Adults and Children >12 yr): 60 mg q 6 hr as needed (not to exceed 240 mg/day) *or* 120 mg of extended-release preparation q 12 hr *or* 240 mg extended-release preparation q 24 hr.
PO (Children 6–12 yr): 30 mg q 6 hr as needed (not to exceed 120 mg/day).
PO (Children 2–5 yr): 15 mg q 6 hr (not to exceed 60 mg/day).
PO (Children <2 yr): 4 mg/kg/day in divided doses q 6 hr.

Availability (generic available)
Tablets: 30 mg^{OTC}, 60 mg^{OTC}. **Extended-release tablets:** 120 mg^{OTC}. **Controlled-release tablets:** 240 mg^{OTC}. **Capsules:** ♣60 mg^{OTC}. **Extended-release capsules:** ♣240 mg^{OTC}. **Softgel capsules:** 30 mg^{OTC}. **Liquid (grape and others):** 15 mg/5 ml^{OTC}, 30 mg/5 ml^{OTC}. **Drops (cherry and fruit flavor):** 7.5 mg/0.8 ml^{OTC}. ***In combination with:*** antihistamines, acetaminophen, cough suppressants, and expectorants^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment
- Assess congestion (nasal, sinus, eustachian tube) before and periodically during therapy.
- Monitor pulse and blood pressure before beginning therapy and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 ml/day to decrease viscosity of secretions.

Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- Administer pseudoephedrine at least 2 hr before bedtime to minimize insomnia.
- **PO:** Extended-release tablets and capsules should be swallowed whole; do not crush, break, or chew. Contents of the capsule can be mixed with jam or jelly and swallowed without chewing for patients with difficulty swallowing.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than recommended. Take missed doses within 1 hr; if remembered later, omit. Do not double doses.
- **Instruct patient to notify health care professional if nervousness, slow or fast heart rate, breathing difficulties, hallucinations, or seizures occur, because these symptoms may indicate overdose.**
- Instruct patient to contact health care professional if symptoms do not improve within 7 days or if fever is present.

Evaluation/Desired Outcomes

- Decreased nasal, sinus, or eustachian tube congestion.

psyllium (sill-i-yum)

Alramucil, Cillium, Effer-Syllium, Fiberall, Fibrepur, Hydrocil, Karacil, Konsyl, Metamucil, Modane Bulk, Mylanta Natural Fiber Supplement, Naturacil Caramels, Natural Source Fibre Laxative, Perdiem, Prodiem, Pro-Lax, Reguloid Natural, Serutan, Siblin, Syllact, Vitalax, V-Lax

Classification

Therapeutic: laxatives
Pharmacologic: bulk-forming agents

Pregnancy Category UK

Indications

Management of simple or chronic constipation, particularly if associated with a low-fiber diet. Useful in situations in which straining should be avoided (after MI, rectal surgery, prolonged bed rest). Used in the management of chronic watery diarrhea.

Action

Combines with water in the intestinal contents to form an emollient gel or viscous solution that promotes peristalsis and reduces transit time.
Therapeutic Effects: Relief and prevention of constipation.

Pharmacokinetics

Absorption: Not absorbed from the GI tract.
Distribution: No distribution occurs.
Metabolism and Excretion: Excreted in feces.
Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	12–24 hr	2–3 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting (especially when associated with fever); Serious adhesions; Dysphagia.
Use Cautiously in: Some dosage forms contain sugar, aspartame, or excessive sodium and should be avoided in patients on restricted diets; Pregnancy and lactation (has been used safely).

Adverse Reactions/Side Effects

Resp: bronchospasm. **GI:** cramps, intestinal or esophageal obstruction, nausea, vomiting.

Interactions

Drug-Drug: May decrease the absorption of **warfarin**, **salicylates**, or **digoxins**.

Route/Dosage

PO (Adults): 1–2 tsp/packet/wafer (3–6 g psyllium) in or with a full glass of liquid 2–3 times daily. Up to 30 g daily in divided doses.
PO (Children >6 yr): 1 tsp/packet/wafer (1.5–3 g psyllium) in or with 4–8 ozglass of liquid 2–3 times daily. Up to 15 g daily in divided doses.

Availability (generic available)

Powder: 3.3–3.5 g/dose or packet[OTC]. **Effervescent powder:** 3–3.5 g/dose or packet[OTC]. **Granules:** 2.5 g/dose[OTC]. **Wafers:** 3.4 g/dose[OTC].

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.

Copyright © 2008 by F.A. Davis

- Assess color, consistency, and amount of stool produced.
- ***Lab Test Considerations:*** May cause elevated blood glucose levels with prolonged use of preparations containing sugar.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Packets are not standardized for volume, but each contains 3–3.5 g of psyllium.
- **PO:** Administer with a full glass of water or juice, followed by an additional glass of liquid. Solution should be taken immediately after mixing; it will congeal. Do not administer without sufficient fluid and do not chew granules.

Patient/Family Teaching

- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- May be used for long-term management of chronic constipation.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.

Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 12–24 hr. May require 3 days of therapy for results.

pyrazinamide

(peer-a-**zin**-a-mide)

PMS Pyrazinamide, Tebrazid

Classification

Therapeutic: antituberculars

Pregnancy Category C

Indications

Used in combination with other agents in the treatment of active tuberculosis.

Action

Mechanism not known. **Therapeutic Effects:** Bacteriostatic action against susceptible mycobacteria. **Spectrum:** Active against mycobacteria only.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed. Reaches high concentrations in the CNS (same as plasma). Excreted in breast milk.

Metabolism and Excretion: Mostly metabolized by the liver. Metabolite (pyrazinoic acid) has antimycobacterial activity; 3–4% excreted unchanged by the kidneys.

Half-life: *Pyrazinamide*—9.5 hr. *Pyrazinoic acid*—12 hr. Both are prolonged in renal impairment.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr (4–5 hr†)	24 hr

†For pyrazinoic acid

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with ethionamide, isoniazid, niacin, or nicotinic acid may exist; Severe liver impairment; Concurrent use with rifampin.

Use Cautiously in: Gout; Diabetes mellitus; Acute intermittent porphyria; Pregnancy (safety not established).

Adverse Reactions/Side Effects

GI: HEPATOTOXICITY, anorexia, diarrhea, nausea, vomiting. **GU:** dysuria. **Derm:** acne, itching, photosensitivity, skin rash. **Hemat:** anemia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** arthralgia, gouty arthritis.

Interactions

Drug-Drug: Concurrent use with **rifampin** may result in life-threatening hepatoxicity and should be avoided. May ↓ blood levels and effectiveness of **cyclosporine**. May ↓ effectiveness of **antigout agents**.

Route/Dosage

PO (Adults and Children): 15–30 mg/kg/day as a single dose. Up to 60 mg/kg/day has been used in isoniazid-resistant tuberculosis (not to exceed 2 g/day as a single dose or 3 g/day in divided doses). May also be given as 50–70 mg/kg 2–3 times weekly (not to exceed 2 g/dose on daily regimen, 3 g/dose for 3-times-weekly regimen, or 4 g/dose for twice-weekly regimen).

Patients with HIV—20–30 mg/kg/day for first

Copyright © 2008 by F.A. Davis

2 mo of therapy; further dosing depends on regimen employed.

Availability (generic available)

Tablets: 500 mg.

NURSING IMPLICATIONS

Assessment

- Perform mycobacterial studies and susceptibility tests before and periodically during therapy to detect possible resistance.
- ***Lab Test Considerations:*** Evaluate hepatic function before and every 2–4 wk during therapy. Increased AST and ALT may not be predictive of clinical hepatitis and may return to normal levels during treatment. Patients with impaired liver function should receive pyrazinamide therapy only if crucial to treatment.
- Monitor serum uric acid concentrations during therapy. May cause ↑ resulting in precipitation of acute gout.
- May interfere with urine ketone determinations.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- May be given concurrently with isoniazid.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy depends on regimen being used and underlying disease states.
- Inform diabetic patients that pyrazinamide may interfere with urine ketone measurements.
- Advise patients to notify health care professional if no improvement is noticed after 2–3 wk of therapy or if fever, anorexia, malaise, nausea, vomiting, darkened urine, yellowish discoloration of the skin and eyes, pain, or swelling of the joints occurs.
- Advise patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.

pyridostigmine

(peer-id-oh-**stig**-meen)
Mestinon, Mestinon SR, Mestinon Timespan, Regonol

Classification
Therapeutic: antimyasthenics
Pharmacologic: cholinergics

Pregnancy Category C

Indications

Used to increase muscle strength in the symptomatic treatment of myasthenia gravis. Reversal of nondepolarizing neuromuscular blocking agents. Prophylaxis of lethal effects of poisoning with the nerve agent soman.

Action

Inhibits the breakdown of acetylcholine and prolongs its effects (anticholinesterase). Effects include: Miosis, Increased intestinal and skeletal muscle tone, Bronchial and ureteral constriction, Bradycardia, Increased salivation, Lacrimation, Sweating. **Therapeutic Effects:** Improved muscular function in patients with myasthenia gravis. Reversal of paralysis from nondepolarizing neuromuscular blocking agents. Prevention of Soman nerve gas toxicity.

Pharmacokinetics

Absorption: Poorly absorbed after oral administration, necessitating large oral doses compared with parenteral doses.
Distribution: Appears to cross the placenta.
Metabolism and Excretion: Metabolized by plasma cholinesterases and the liver.
Half-life: *PO*—3.7 hr; *IV*—1.9 hr.

TIME/ACTION PROFILE (cholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	30–35 min	unknown	3–6 hr
PO-SR	30–60 min	unknown	6–12 hr
IM	15 min	unknown	2–4 hr
IV	2–5 min	unknown	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pyridostigmine or bromides; Mechanical obstruc-

Copyright © 2008 by F.A. Davis

tion of the GI or GU tract; Known alcohol intolerance (syrup only).
Use Cautiously in: History of asthma; Ulcer disease; Cardiovascular disease; Epilepsy; Hyperthyroidism; OB: Pregnancy or lactation (may cause uterine irritability after IV administration near term; 20% of newborns display transient muscle weakness).

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, weakness. **EENT:** lacrimation, miosis. **Resp:** bronchospasm, excessive secretions. **CV:** bradycardia, hypotension. **GI:** abdominal cramps, diarrhea, excessive salivation, nausea, vomiting. **Derm:** sweating, rashes.

Interactions

Drug-Drug: Cholinergic effects may be antagonized by other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **procainamide**, **quinidine**, or **disopyramide**. Prolongs the action of **depolarizing muscle-relaxing agents** and **cholinesterase inhibitors** (**succinylcholine, decamethonium**). ↑ toxicity with other **cholinesterase inhibitors**, including **demecarium**, **echothiophate**, and **isoflurophate**. Antimyasthenic effects may be ↓ by concurrent **guanadrel**.

Route/Dosage

Myasthenia Gravis

PO (Adults): *Tablets/syrup*—30–60 mg q 3–4 hr initially; then adjusted as required; usual maintenance dose is 600 mg/day in divided doses (range 60–1500 mg/day). *Extended-release tablets*—180–540 mg 1–2 times daily (dosing interval should be at least 6 hr; may be associated with increased risk of cholinergic crisis; concurrent immediate-release products may be required).
PO (Children): 7 mg/kg (200 mg/m^2)/day in 5–6 divided doses.
IM, IV (Adults): 2 mg (1/30 of oral dose); may be repeated q 2–3 hr. *During labor/delivery*—1 mg before second stage of labor is complete.
IM (Neonates Born to Myasthenic Mothers): 50–150 mcg/kg q 4–6 hr.

Antidote for Nondepolarizing Neuromuscular Blocking Agents

IV (Adults): 10–20 mg; pretreat with 0.6–1.2 mg atropine IV.

Prevention of Soman Nerve Gas Effects

PO (Adults): 30 mg every 8 hr before exposure, stopped on exposure to gas.

Availability (generic available)

Tablets: 30 mg^{Rx}, 60 mg. **Extended-release tablets:** 180 mg. **Syrup:** 60 mg/5 ml. **Injection:** 5 mg/ml in 2-ml ampules and 5-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess pulse, respiratory rate, and blood pressure before administration. Report significant changes in heart rate.
- **Myasthenia Gravis:** Assess neuromuscular status, including vital capacity, ptosis, diplopia, chewing, swallowing, hand grasp, and gait before administering and at peak effect. Patients with myasthenia gravis may be advised to keep a daily record of their condition and the effects of this medication.
- Assess patient for overdose, underdose, or resistance. Both have similar symptoms (muscle weakness, dyspnea, dysphagia), but symptoms of overdosage usually occur within 1 hr of administration, whereas symptoms of underdose occur ≥3 hr after administration. Overdose (cholinergic crisis) symptoms may also include increased respiratory secretions and saliva, bradycardia, nausea, vomiting, cramping, diarrhea, and diaphoresis. A Tensilon test (edrophonium chloride) may be used to differentiate between overdosage and underdosage.
- **Antidote to Nondepolarizing Neuromuscular Blocking Agents:** Monitor reversal of effect of neuromuscular blocking agents with a peripheral nerve stimulator. Recovery usually occurs consecutively in the following muscles: diaphragm, intercostal muscles, muscles of the glottis, abdominal muscles, limb muscles, muscles of mastication, and levator muscles of eyelids. Closely observe patient for residual muscle weakness and respiratory distress throughout the recovery period. Maintain airway patency and ventilation until recovery of normal respirations occurs.
- ***Toxicity and Overdose:*** Atropine is the antidote.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Ineffective breathing pattern (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- For patients who have difficulty chewing, pyridostigmine may be administered 30 min before meals.
- Oral dose is not interchangeable with IV dose. Parenteral form is 30 times more potent.
- When used as an antidote to nondepolarizing neuromuscular blocking agents, atropine may be ordered before or currently with large doses of pyridostigmine to prevent or to treat bradycardia and other side effects.
- **PO:** Administer with food or milk to minimize side effects. Extended-release tablets should be swallowed whole; do not crush, break, or chew. Regular tablets or syrup may be administered with extended-release tablets for optimum control of symptoms. Mottled appearance of sustained-release tablet does not affect potency.

IV Administration

- **Direct IV:** Administer undiluted. Do not add to IV solutions. May be given through Y-site of infusion of D5W, 0.9% NaCl, LR, D5/Ringer's solution, or D5/LR. ***Concentration:*** 5 mg/ml. ***Rate:*** For myasthenia gravis, administer each 0.5 mg over 1 min. For reversal of nondepolarizing neuromuscular blocking agents, administer each 5 mg over 1 min.
- **Syringe Compatibility:** glycopyrrolate.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not skip or double up on missed doses. Patients with a history of dysphagia should have a nonelectric or battery-operated back-up alarm clock to remind them of exact dose time. Patients with dysphagia may not be able to swallow medication if the dose is not taken exactly on time. Taking dose late may result in myasthenic crisis. Taking dose early may result in cholinergic crisis. Patients with myasthenia gravis must continue this regimen as a life-long therapy.
- Advise patient to carry identification describing disease and medication regimen at all times.
- Instruct patient to space activities to avoid fatigue.

Evaluation/Desired Outcomes

- Relief of ptosis and diplopia; improved chewing, swallowing, extremity strength, and breathing without the appearance of cholinergic symptoms.
- Reversal of nondepolarizing neuromuscular blocking agents in general anesthesia.
- Prevention of Soman nerve gas toxicity.

pyridoxine (peer-i-**dox**-een)

Beesix, Doxine, Nestrex, Pyri, Rodex, Vitabee 6, vitamin B_6

Classification

Therapeutic: vitamins
Pharmacologic: water soluble vitamins

Pregnancy Category A

Indications

Treatment and prevention of pyridoxine deficiency (may be associated with poor nutritional status or chronic debilitating illnesses). Treatment of pyridoxine-dependent seizures in infants. Treatment and prevention of neuropathy, which may develop from isoniazid, penicillamine, or hydralazine therapy. Management of isoniazid overdose >10 g.

Action

Required for amino acid, carbohydrate, and lipid metabolism. Used in the transport of amino acids, formation of neurotransmitters, and synthesis of heme. **Therapeutic Effects:** Prevention of pyridoxine deficiency. Prevention or reversal of neuropathy associated with hydralazine, penicillamine, or isoniazid therapy.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Stored in liver, muscle, and brain. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Converted in RBCs to pyridoxal phosphate and another active metabolite. Amounts in excess of requirements are excreted unchanged by the kidneys.
Half-life: 15–20 days.

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pyridoxine or any component.

Use Cautiously in: Parkinson's disease (treatment with levodopa only); Pregnancy (chronic ingestion of large doses may produce pyridoxine-dependency syndrome in newborn).

Adverse Reactions/Side Effects

Adverse reactions listed are seen with excessive doses only. **Neuro:** sensory neuropathy, paresthesia. **Misc:** pyridoxine-dependency syndrome.

Interactions

Drug-Drug: Interferes with the therapeutic response to **levodopa** when used without carbidopa. Requirements are increased by **isoniazid**, **hydralazine**, **chloramphenicol**, **penicillamine**, **estrogens**, and **immunosuppressants**. Decreases serum levels of **phenobarbital** and **phenytoin**.

Route/Dosage

Prevention of Deficiency (Recommended Daily Allowance)

PO (Adults and Children >14 yr): 1.2–1.7 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, penicillamine, and estrogen-containing oral contraceptives).

PO (Children 9–13 yr): 1 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, and penicillamine).

PO (Children 1–8 yr): 0.5–0.6 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, and penicillamine).

PO (Infants 6–12 months): 0.3 mg/day.

PO (Infants <6 months): 0.1 mg/day.

Treatment of Deficiency

PO (Adults): 2.5–10 mg/day until clinical signs are corrected, then 2–5 mg/day.

PO (Children): 5–25 mg/day for 3 weeks, then 1.5–2.5 mg/day.

Pyridoxine-Dependent Seizures

PO, IM, IV (Neonates and Infants): 10–100 mg initially then 50–100 mg/day orally.

Drug-Induced Neuritis

PO (Adults): Treatment—100–300 mg/day; Prophylaxis—25–100 mg/day.

PO (Children): Treatment—10–50 mg/day; Prophylaxis—1–2 mg/kg/day.

Isoniazid Overdose (>10 g)

IM, IV (Adults and Children): Amount in mg equal to amount of isoniazid ingested given as 1–4 g IV, then 1 g IM q 30 min.

Availability (generic available)

Tablets: 20 mg[OTC], 25 mg[OTC], 50 mg[OTC], 100 mg[OTC], 250 mg[OTC], 500 mg[OTC]. **Extended-release tablets:** 100 mg[OTC], 200 mg[OTC], 500 mg[OTC]. **Extended-release capsules:** 150 mg[OTC]. **Injection:** 100 mg/ml in 10- and 30-ml vials. ***In combination with:*** vitamins, minerals, and trace elements in a variety of multivitamin preparations[OTC].

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin B_6 deficiency (anemia, dermatitis, cheilosis, irritability, seizures, nausea, and vomiting) before and periodically throughout therapy. Institute seizure precautions in pyridoxine-dependent infants.
- ***Lab Test Considerations:*** May cause false elevations in urobilinogen concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- Administration of parenteral vitamin B_6 is limited to patients who are NPO or who have nausea and vomiting or malabsorption syndromes.
- Protect parenteral solution from light; decomposition will occur.
- **PO:** Extended-release capsules and tablets should be swallowed whole, without crushing, breaking, or chewing. For patients unable to swallow capsule, contents of capsules may be mixed with jam or jelly.
- **IM:** Rotate sites; burning or stinging at site may occur.
- **IV:** May be administered slowly by direct IV or as infusion in standard IV solutions. Moni-

Copyright © 2008 by F.A. Davis

tor respiratory rate, heart rate, and blood pressure when administering large IV doses.
- Pyridoxine-dependent seizures should cease within 2–3 min of IV administration. ***Rate:*** Infusion rates of 15–30 min and up to 3 hr have been used.
- **Additive Incompatibility:** alkaline solutions, riboflavin.

Patient/Family Teaching
- Instruct patient to take medication as directed. If a dose is missed, it may be omitted because an extended period of time is required to become deficient in vitamin B_6.
- Encourage patient to comply with diet recommended by health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups. Foods high in vitamin B_6 include bananas, whole-grain cereals, potatoes, lima beans, and meats.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects, such as unsteady gait, numbness in feet, and difficulty with hand coordination.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes
- Decrease in the symptoms of vitamin B_6 deficiency.

pyrimethamine
(peer-i-**meth**-a-meen)
Daraprim

Classification
Therapeutic: antimalarials, antiprotozoals

Pregnancy Category C

Indications
Used in combination with other antimalarials in the treatment of chloroquine-resistant malaria. Used in combination with a sulfonamide in the treatment of toxoplasmosis. **Unlabeled uses:** Used in combination with other agents (sulfonamides, dapsone) in the treatment of *Pneumocystis carinii* pneumonia.

Action
Binds to an enzyme in the protozoa, which results in depletion of folic acid. **Therapeutic Effects:** Death and arrested growth of susceptible organisms (protozoa).

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed with high concentrations achieved in blood cells, kidneys, lungs, liver, and spleen. Some enters CSF (13–26% of serum levels). Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver. 20–30% excreted unchanged by the kidneys.
Half-life: 4 days (shortened in patients with AIDS).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	2 wk†

†Suppressive levels

Contraindications/Precautions
Contraindicated in: Hypersensitivity; First 14–16 wk of pregnancy; Megaloblastic anemia caused by folate deficiency; Concurrent folate antagonist therapy (because of risk of megaloblastic anemia); Tablets contain lactose and potato starch and should be avoided in patients with known hypersensitivity/intolerance.
Use Cautiously in: History of seizures (high doses); Underlying anemia or bone marrow depression; Impaired liver function; G6PD deficiency; OB: Pregnancy >16 wk (may require concurrent leucovorin); OB: Lactation (large doses to mother may cause folic acid deficiency in infant).

Adverse Reactions/Side Effects
CNS: SEIZURES (high doses), headache, insomnia, light-headedness, malaise, mental depression. **Resp:** dry throat, pulmonary eosinophilia. **CV:** ARRHYTHMIAS (large doses). **GI:** atrophic glossitis (high doses), anorexia, diarrhea, nausea. **GU:** hematuria. **Derm:** abnormal pigmentation, dermatitis. **Hemat:** megaloblastic anemia (HIGH DOSES), pancytopenia, thrombocytopenia. **Misc:** fever.

Copyright © 2008 by F.A. Davis

Interactions

Drug-Drug: ↑ risk of bone marrow depression with other **bone marrow depressants**, including **antineoplastics**, **proguanil**, or **radiation therapy**. ↑ risk of megaloblastic anemia with folate antagonists (**methotrexate**); concurrent use should be avoided.

Route/Dosage

Treatment of Malaria

PO (Adults and Children >10 yr): 50 mg/day for 2 days, then 25 mg once weekly in combination with other agents.
PO (Children 4–10 yr): 25 mg daily for 2 days, then 12.5 mg once weekly in combination with other agents.

Toxoplasmosis

PO (Adults): 50–200 mg/day for 1–2 days, followed by 25–50 mg/day for 2–6 wk; given with a sulfonamide.
PO (Children): 1 mg/kg/day for 1–3 days, then 0.5 mg/kg/day for 4–6 wk; given with a sulfonamide.

Toxoplasmosis in AIDS Patients

PO (Adults): 100–200 mg/day for 1–2 days, followed by 50–100 mg/day for 3–6 wk, then 25–50 mg/day for life; given with clindamycin or sulfadiazine.

Availability

Tablets: 25 mg. ***In combination with:*** sulfadoxine (Fansidar)[Rx]. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for improvement in signs and symptoms of infection daily during therapy.
- ***Lab Test Considerations:*** Monitor CBC and platelet count periodically during therapy; semiweekly in patients with toxoplasmosis. May cause ↓ WBC and platelet counts.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Leucovorin may be administered concurrently to prevent folic acid deficiency and restore normal hematopoiesis.
- **PO:** Administer with milk or meals to minimize GI distress.
- Tablets may be crushed and mixed with saline or with other vehicles by pharmacist for patients with difficulty swallowing.

Patient/Family Teaching

- Instruct patient to take medication as directed on a regular schedule and continue full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double doses.
- Advise patient to notify health care professional promptly if sore throat, pallor, purpura, or glossitis occurs. Instruct patient to stop taking pyrimethamine and notify health care professional immediately at the first sign of a skin rash or if no improvement is seen within a few days.
- Emphasize the importance of lab tests at scheduled intervals, especially in patients taking high doses. Tests should not be delayed or missed.

Evaluation/Desired Outcomes

- Improvement in the signs and symptoms of malaria.
- Improvement in signs and symptoms of toxoplasmosis.

Copyright © 2008 by F.A. Davis

quetiapine (kwet-**eye**-a-peen)
Seroquel, Seroquel XR

Classification
Therapeutic: antipsychotics, mood stabilizers

Pregnancy Category C

Indications
Schizophrenia. Depressive episodes with bipolar disorder. Bipolar mania associated with Bipolar I as monotherapy or with lithium or divalproex.

Action
Probably acts by serving as an antagonist of dopamine and serotonin. Also antagonizes histamine H_1 receptors and alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Decreased manifestations of psychoses, depression, or acute mania.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (mostly by P450 CYP3A4 enyzme system); <1% excreted unchanged in the urine.
Half-life: 6 hr.

TIME/ACTION PROFILE (antipsychotic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8–12 hr
PO-XR	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Lactation: Discontinue drug or bottle feed.
Use Cautiously in: Cardiovascular disease, cerebrovascular disease, dehydration or hypovolemia (increased risk of hypotension); History of seizures, Alzheimer's dementia; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; Hepatic impairment (dose reduction may be necessary); Hypothyroidism (may be exacerbated); History of suicide attempt; OB, Pedi: Pregnancy or children (safety not established); Geri: May require ↓ doses; inappropriate use for dementia is associated with ↑ mortality.

Adverse Reactions/Side Effects
CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness, cognitive impairment, extrapyramidal symptoms, sedation, tardive dyskinesia. **EENT:** ear pain, rhinitis, pharyngitis. **Resp:** cough, dyspnea. **CV:** palpitations, peripheral edema, postural hypotension. **GI:** anorexia, constipation, dry mouth, dyspepsia. **Derm:** sweating. **Hemat:** leukopenia. **Metab:** weight gain. **Misc:** flu-like syndrome.

Interactions
Drug-Drug: ↑ CNS depression may occur with **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. ↑ risk of hypotension with acute ingestion of **alcohol** or **antihypertensives**. **Phenytoin** and **thioridazine** ↑ clearance and ↓ effectiveness of quetiapine (dose change may be necessary); similar effects may occur with **carbamazepine**, **barbiturates**, **rifampin**, or **corticosteroids**. Effects may be ↑ by **ketoconazole**, **itraconazole**, **fluconazole**, or **erythromycin**, as well as by other **agents that inhibit the cytochrome P450 CYP3A4 enzyme**.

Route/Dosage
PO (Adults): *Schizophrenia*—25 mg twice daily initially, increased by 25–50 mg 2–3 times daily over 3 days, up to 300–400 mg/day in 2–3 divided doses by the 4th day (not to exceed 800 mg/day); or 300 mg once daily as XR tablets, increased by 300 mg/day, up to 400–800 mg/day (not to exceed 800 mg/day). Elderly patients or patients with hepatic impairment should be started on immediate-release product and converted to extended-release product once effective dose is reached. *Bipolar mania*—100 mg/day in two divided doses on day 1, increase dose by 100 mg/day up to 400 mg/day by day 4, then may increase in 200 mg/day increments up to 800 mg/day on day 6 if required. *Depressive Bipolar Disorder*- once daily at bedtime to reach 300 mg by Day 4 with the following schedule: Day 1—50 mg; Day 2—100 mg; Day 3—200 mg; Day 4—300 mg. *Bipolar Manic Disorder*—Initially 50 mg twice daily, increasing to 400 mg/day by Day 4 in increments of up to 100 mg/day in divided doses. Further dose adjustments up to 800 mg/day should be made in increments of no >200 mg/day in divided doses.

Copyright © 2008 by F.A. Davis

Availability

Tablets: 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg. **Cost:** 25 mg $360.95/180, 50 mg $604.78/180, 100 mg $610.97/180, 200 mg $1,142.96/180, 300 mg $1,579.93/180, 400 mg $1,787.40/180. **Extended-release Tablets:** 200 mg, 300 mg, 400 mg. **Cost:** 200 mg $395.00/60, 300 mg $510.00/60, 400 mg $595.00/60.

NURSING IMPLICATIONS

Assessment

- Monitor mental status (mood, orientation, behavior) before and periodically during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure (sitting, standing, lying) and pulse before and frequently during initial dose titration. If hypotension occurs during dose titration, return to the previous dose.
- Observe patient carefully when administering to ensure medication is swallowed and not hoarded or cheeked.
- Monitor for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like faces, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control these symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** May cause asymptomatic ↑ in AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.
- May cause ↑ total cholesterol and triglycerides.
- Obtain fasting blood glucose and cholestol levels initially and throughout therapy.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- Do not confuse Seroquel (quetiapine) with Serzone (nefazodone).
- If therapy is reinstituted after an interval of ≥1 wk off, follow initial titration schedule.
- **PO:** May be administered without regard to food. Extended-release tablets should be swallowed whole, do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid extremes in temperature; this drug impairs body temperature regulation.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and OTC or herbal medications without consulting health care professional.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breastfeeding or planning to breastfeed.
- Refer patient for nutritional, weight or medical management of dyslipidemia as indicated.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly of sore throat, fever, unusual bleeding or bruising, or rash.
- Emphasize importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy as indicated to improve coping skills. Ophthalmologic

Copyright © 2008 by F.A. Davis

exams should be performed before and every 6 months during therapy.
- Refer to local support group.

Evaluation/Desired Outcomes
- Decrease in excited, manic, behavior.
- Decrease in signs of depression in patients with bipolar disorder.
- Decrease in manic episodes in patients with bipolar I disorder.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

quinapril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

QUINIDINE (kwin-i-deen)

quinidine gluconate
Apo-Quin-G

quinidine sulfate
Apo-Quinidine

Classification
Therapeutic: antiarrhythmics (class IA)

Pregnancy Category C

Indications
Restoration and maintenance of sinus rhythm in patients with atrial fibrillation or flutter. Prevention of recurrent ventricular arrhythmias. Treatment of malaria.

Action
Decrease myocardial excitability. Slow conduction velocity. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics
Absorption: Bioavailability of oral formulations is 70–80%. Extended-release preparations are absorbed slowly following oral administration.
Distribution: Widely distributed. Cross the placenta; enter breast milk.
Metabolism and Excretion: Metabolized by the liver; 5–20% excreted unchanged by the kidneys.
Half-life: 6–8 hr (increased in CHF or severe liver impairment).

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO (sulfate)	30 min	1–1.5 hr	6–8 hr
PO (sulfate-ER)	unknown	4 hr	8–12 hr
PO (gluconate)	unknown	3–4 hr	6–8 hr
IV	1–5 min	rapid	6–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Conduction defects (in the absence of a pacemaker); Myasthenia gravis.
Use Cautiously in: CHF (dose reduction recommended); Severe liver disease (dose reduction recommended); Hypokalemia or hypomagnesemia (↑ risk of torsades de pointes); Bradycardia (↑ risk of torsades de pointes); Renal impairment; OB, Lactation, Pedi: Safety not established; extended-release preparations should not be used in children.

Adverse Reactions/Side Effects
CNS: dizziness, confusion, fatigue, headache, syncope, vertigo. **EENT:** blurred vision, diplopia, mydriasis, photophobia, tinnitus. **CV:** HYPOTENSION, TORSADES DE POINTES, arrhythmias, palpitations, tachycardia. **GI:** anorexia, abdominal cramping, diarrhea, nausea, vomiting, drug-induced hepatitis. **Derm:** rash. **Hemat:** AGRANULOCYTOSIS, hemolytic anemia, thrombocytopenia. **Neuro:** ataxia, tremor. **Misc:** fever.

Interactions
Drug-Drug: May ↑ risk of QT interval prolongation when used with **tricyclic antidepressants**, **erythromycin**, **clarithromycin**, **haloperidol**, **sotalol**, or **fluoroquinolones**. ↑ serum **digoxin** levels and may cause toxicity (dose reduction recommended). **Phenytoin**, **phenobarbital**, **carbamazepine** or **rifampin** may ↑ metabolism and ↓ effectiveness. **Cimetidine**, **diltiazem**, **verapamil**, **amiodarone**, **ketoconazole**, **itraconazole**, and **protease inhibitors** ↓ metabolism and may ↑ blood levels. Excretion is delayed and effects ↑ by drugs that alkalinize the urine, including **carbonic anhydrase inhibitors**, **thiazide diuretics**, and **sodium bicarbonate**. Potentiates the effects of **neuromuscular blocking**

Copyright © 2008 by F.A. Davis

agents and **warfarin**. Additive hypotension with **antihypertensives**, **nitrates**, and acute ingestion of **alcohol**. May increase **procainamide**, **haloperidol**, **mexiletine** or **tricyclic antidepressant** levels and risk of toxicity. May antagonize **anticholinesterase therapy** in patients with myasthenia gravis. Additive anticholinergic effects may occur with **agents having anticholinergic properties** (including **antihistamines**, **tricyclic antidepressants**). **Drug-Food: Grapefruit juice** ↑ serum levels and effect (avoid concurrent use). **Foods that alkalinize the urine** (see Appendix L) may ↑ serum quinidine levels and the risk of toxicity.

Route/Dosage

Quinidine Gluconate (62% Quinidine)

PO (Adults): 324–972 mg q 8–12 hr.
IV (Adults): 200–400 mg given at a rate ≤10 mg/min until arrhythmia is suppressed, QRS complex widens, bradycardia or hypotension occurs.

Quinidine Sulfate (83% Quinidine)

PO (Adults): *Atrial/ventricular arrhythmias*—200–400 mg q 4–6 hr; may be ↑ to achieve therapeutic response (not to exceed 3–4 g/day).
PO (Children): 6 mg/kg 4–5 times daily.

Availability (generic available)

Quinidine Gluconate

Extended-release tablets: 324 mg. **Solution for Injection:** 80 mg/ml in 10-ml vials.

Quinidine Sulfate

Tablets: 200 mg, 300 mg. **Extended-release tablets:** 300 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and blood pressure continuously throughout IV administration and periodically during oral administration. IV administration is usually discontinued if any of the following occur: arrhythmia is resolved, QRS complex widens by 50%, PR or QT intervals are prolonged, or frequent ventricular ectopic beats or tachycardia, bradycardia, or hypotension develops. Patient should remain supine throughout IV administration to minimize hypotension.
- ***Lab Test Considerations:*** Monitor hepatic and renal function, CBC, and serum potassium and magnesium levels periodically during prolonged therapy.
- ***Toxicity and Overdose:*** Serum quinidine levels may be monitored periodically during dose adjustment. Therapeutic serum concentrations are 2–6 mcg/ml. Toxic effects usually occur at concentrations >8 mcg/ml: Signs and symptoms of toxicity or cinchonism include tinnitus, hearing loss, visual disturbances, headache, nausea, and dizziness. These may occur after a single dose, Cardiac signs of toxicity include QRS widening, cardiac asystole, ventricular ectopic beats, idioventricular rhythms (ventricular tachycardia, ventricular fibrillation), paradoxical tachycardia, and torsades de pointes.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- Do not confuse quinidine with quinine.
- **PO:** Administer with a full glass of water on an empty stomach either 1 hr before or 2 hr after meals for faster absorption. If GI irritation becomes a problem, may be administered with or immediately after meals. Extended-release preparations should be swallowed whole; do not break, crush, or chew.

IV Administration

- **IV:** Use only clear, colorless solution
- **Intermittent Infusion:** ***Diluent:*** Dilute 800 mg of quinidine gluconate (10 ml) in 50 ml of D5W. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** 16 mg/ml. ***Rate:*** Administer quinidine gluconate at a rate not to exceed 0.25 mg/kg/min. Administer via infusion pump to ensure accurate dose. Rapid administration may cause peripheral vascular collapse and severe hypotension.
- **Y-Site Compatibility:** amikacin, atropine, bumetanide, calcium gluconate, caspofungin, cimetidine, cyclosporine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, hydromorphone, imipenem, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, meperidine, metoclopramide, metoprolol, milrinone, morphine, nesiritide, nitroglycerin, norepinephrine, ondansetron, palonosetron, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, ranitidine, succinylcholine, tacrolimus,

Copyright © 2008 by F.A. Davis

tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.

- **Y-Site Incompatibility:** acyclovir, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, daptomycin, dexamethasone, ertapenem, furosemide, ganciclovir, hydrocortisone sodium succinate, insulin, ketorolac, methylprednisolone sodium succinate, metronidazole, nafcillin, nitroprusside, pantoprazole, penicillin G potassium, phenytoin, piperacillin/tazobacatam, sodium bicarbonate, sulfamethoxazole/trimethoprim, ticarcillin/clavulanate.

Patient/Family Teaching

- Instruct patient to take medication around the clock, exactly as directed, even if feeling well. Take missed doses as soon as remembered if within 2 hr; if remembered later, omit. Do not double doses.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness or blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that quinidine may cause increased sensitivity to light. Dark glasses may minimize this effect.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient not to take Rx, OTC, or herbal products with quinidine without consulting health care professional.
- Advise patient to consult health care professional if symptoms of cinchonism, rash, or dyspnea occur or if diarrhea is severe or persistent.
- Advise patient to carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease or cessation of cardiac arrhythmiass.
- Resolution of malarial infection.

quinine (kwi-nine)

Qualaquin

Classification

Therapeutic: antimalarials

Pregnancy Category C

Indications

Chloroquine-resistant falciparum malaria (alone or with pyrimethamine and a sulfonamide or with a tetracycline; has also be used with clindamycin and mefloquine depending on origin of illness). **Unlabeled uses:** Leg cramps (not recommended due to cardiac side effects.

Action

Disrupts metabolism of the erythrocytic phase of *Plasmodium falciparum*. Increases the refractory period of skeletal muscle, increases the distribution of calcium within muscle fibers, decreases the excitability of motor end-plate regions, resulting in decreased response to repetitive nerve stimulation and acetylcholine. **Therapeutic Effects:** Death of *P. falciparum*.

Pharmacokinetics

Absorption: Rapidly and almost completely (80%) absorbed following oral administration.
Distribution: Varies with condition and patient; does not enter CSF well. Crosses the placenta and enters breast milk.
Protein Binding: >90% in patients with cerebral malaria, pregnant women and children, 85–90% in patients with uncomplicated malaria, 70% in healthy adults.
Metabolism and Excretion: >80% metabolized by the liver; metabolites have less activity than quinine; metabolites excreted in urine. 20% excreted unchanged in urine. Excretion increased in acidic urine.
Half-life: 11 hr (increased in patients with malaria).

TIME/ACTION PROFILE (antimalarial blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3.2–5.9 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to quinine, quinidine or mefloquine; History of previous serious adverse reaction to quinine includ-

Copyright © 2008 by F.A. Davis

ing thrombotic thrombocytopenic purpura, thrombocytopenia, acute intravascular hemolysis, hemoglobinuria or hemoglobinemia; QTc prolongation or conditions predisposing to QTc prolongation including hypokalemia and bradycardia; Concurrent use of Class IA or Class III antiarrhythmics, mefloquine, pimozide, or macrolide anti-infectives (↑ risk of arrhythmias); G6PD deficiency; Myasthenia gravis; Optic neuritis; OB: Use only if potential maternal benefit outweighs fetal risk; consider alternative therapies); Lactation: Discontinue drug or breastfeeding; Geri: Avoid if possible (↑ risk of arrhythmias).

Use Cautiously in: Recurrent or interrupted malaria therapy; History of arrhythmias, especially QTc prolongation; Atrial fibrillation/flutter (may cause paradoxical increase in ventricular response); Hypoglycemia; History of thrombocytopenic purpura; Pedi: Safety not established for children <16 yr.

Adverse Reactions/Side Effects

CV: CARDIAC ARRHYTHMIAS. **GI:** abdominal cramps/pain, diarrhea, nausea, vomiting, hepatotoxicity. **Derm:** rash. **Endo:** hypoglycemia (↑ in pregnancy). **Hemat:** bleeding, blood dyscrasias, thrombotic thrombocytopenic pupura, thrombocytopenia. **Misc:** cinchonism, hypersensitivity reactions including fever and ANAPHYLAXIS, HEMOLYTIC UREMIC SYNDROME, STEVENS-JOHNSON SYNDROME.

Interactions

Drug-Drug: Concurrent use of Class IA antiarrhythmics (**quinidine procainamide disopyramide** or Class III antiarrhythmics, mefloquine, pimozide, or macrolide anti-infectives ↑ risk of arrhythmias and should be avoided. **Antacids** ↓ absorption. **Cimetidine** ↓ metabolism and may ↑ effects. **Rifampin** and **rifabutin** ↑ metabolism and may ↓ effects; concurrent use with rifampin should be avoided. May ↑ effects of **neuromuscular blocking agents**. May ↑ serum **digoxin** levels; dose adjustments may be necessary. May ↑ risk of hemolytic, ototoxic, or neurotoxic reactions when used concurrently with **agents sharing these toxicities**. Concurrent use with **quinidine** may ↑ risk of adverse cardiovascular reactions. May ↑ risk of bleeding with **warfarin**. Concurrent use with **mefloquine** ↑ risk of seizures and adverse cardiovascular reactions. **Urinary alkalinizers** including **acetazolamide** and **sodium bicarbonate** may ↑ blood levels. Quinine inhibits the CYP3A4 and CYP2D6 enzyme systems and can ↑ levels of **carbamazepine phenobarbital** and **phenytoin**. A similar effect may occur with **dextromethorphan metoprolol flecainide** and **paroxetine**. **Carbamazepine phenobarbital** and **phenytoin** induce metabolism and ↓ levels of quinine; frequent monitoring recommended.

Route/Dosage

PO (Adults): *Malaria*—648 mg every 8 hr for seven days

Renal Impairment

PO (Adults): *Severe chronic renal failure*—648 mg initially, then 324 mg every 12 hr for 7 days.

Availability

Capsules: 325 mg. **Tablets:** 324 mg.

NURSING IMPLICATIONS

Assessment

- **Malaria:** Assess patient for improvement in signs and symptoms of condition daily during therapy.
- ***Lab Test Considerations:*** May cause ↑ urinary 17-ketogenic steroids when metyrapone or Zimmerman method is used.
- ***Toxicity and Overdose:*** Plasma quinine levels of >10 mcg/ml may cause tinnitus and impaired hearing: Signs of toxicity or cinchonism include tinnitus, headache, nausea, and slightly disturbed vision; usually disappear rapidly upon discontinuing quinine.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Administer with or after meals to minimize GI distress. Aluminum-containing antacids will decrease and delay absorption; avoid concurrent use.

Patient/Family Teaching

- Instruct patient to take medication as directed and continue full course of therapy, even if feeling better. Take missed doses as soon as remembered, unless almost time for the next dose. If more than 4 hr has elapsed since missed dose, wait and take the next dose as scheduled. Do not double doses or take more than recommended. Advise patient to read the "Patient Information" leaflet prior to starting therapy and with each Rx refill.
- Review methods of minimizing exposure to mosquitoes with patients receiving quinine

Copyright © 2008 by F.A. Davis

(use insect repellent, wear long-sleeved shirt and long trousers, use screen or netting).
- Quinine may cause visual changes. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- May cause diarrhea, nausea, stomach cramps or pain, vomiting, or ringing in the ears. Advise patient to notify health care professional promptly if these become pronounced.
- Advise patient to stop quinine and notify health care professional of any evidence of allergy (flushing, itching, rash, fever, facial swelling, stomach pain, difficult breathing, ringing in the ears, visual problems).
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products with quinine.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes
- Prevention of or improvement in signs and symptoms of malaria.

quinupristin/dalfopristin
(kwin-oo-**pris**-tin/dal-foe-**pris**-tin)
Synercid

Classification
Therapeutic: anti-infectives
Pharmacologic: streptogramins

Pregnancy Category B

Indications
Treatment of serious or life-threatening infections associated with vancomycin-resistant *Enterococcus faecium* (VREF). Complicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin, susceptible) or *Streptococcus pyogenes*.

Action
Quinupristin inhibits the late phase of protein synthesis at the level of the bacterial ribosome; dalfopristin inhibits the early phase. **Therapeutic Effects:** Bacteriostatic effect against susceptible organisms. **Spectrum:** Active against vancomycin-resistant and multidrug-resistant strains of *E. faecium*, *S. aureus* (methicillin-susceptible), and *S. pyogenes*. Not active against *E. faecalis*.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: Moderate.
Metabolism and Excretion: Both are converted to compounds with additional anti-infective activity; parent drugs and metabolites are mostly excreted in feces (75–77%); 15% of quinupristin and 17% of dalfopristin excreted in urine.
Half-life: *Quinupristin*—0.85 hr; *dalfopristin*—0.7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Concurrent use of other drugs metabolized by the cytochrome P450 3A4 enzyme system (serious interactions may occur; see Drug-Drug Interactions); Hepatic impairment (dose adjustment may be necessary); Patients with a history of GI disease, especially colitis; Pregnancy, lactation, or children <16 yr (safety not established).

Adverse Reactions/Side Effects
CNS: headache. **CV:** thrombophlebitis. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** pruritus, rash. **Local:** edema/inflammation/pain at infusion site, infusion site reactions. **Misc:** allergic reactions including ANAPHYLAXIS, pain.

Interactions
Drug-Drug: Inhibits the cytochrome P450 3A4 drug metabolizing enzyme system; inhibits metabolism of **cyclosporine**, **midazolam**, and **nifedipine** and ↑ risk of toxicity (careful monitoring required). Similar effects may be expected with concurrent use of **delavirdine**, **nevirapine**, **indinavir**, **ritonavir**, **vinca alkaloids**, **docetaxel**, **paclitaxel**, **diazepam**, **verapamil**, **diltiazem**, **HMG CoA reductase inhibitors**, **tacrolimus**, **methylprednisolone**, **carbamazepine**, **quinidine**, **lidocaine**, and **disopyramide**.

Copyright © 2008 by F.A. Davis

Route/Dosage

IV (Adults): *Vancomycin-resistant E. faecium*—7.5 mg/kg q 8 hr for at least 7 days; *complicated skin/skin structure infections*—7.5 mg/kg q 12 hr for at least 7 days.

Availability

Powder for injection: 500 mg (150 mg quinupristin and 350 mg dalfopristin in 10-ml vials), 600 mg (180 mg quinupristin and 420 mg dalfopristin in 10-ml vials).

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor patient for pain or inflammation at the infusion site frequently throughout infusion. Increasing the volume of diluent from 250 ml to 500 ml or 750 ml or infusing via a peripherally inserted central catheter or central venous catheter may be required.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Assess patient for myalgia and arthralgia after infusion. May be severe. Reducing dose frequency to every 12 hr may decrease pain. Symptoms usually resolve upon discontinuation of medication.
- ***Lab Test Considerations:*** May cause ↑ serum total bilirubin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute the 500-mg vial with 5 ml and the 600 mg vial with 6 mL of D5W or sterile water for injection, respectively, for a concentration of 100 mg/ml. Avoid shaking to prevent foam formation. Allow solution to sit until all foam has disappeared. Dilute further with 250 ml of D5W (100 ml can be used for central line administration). May dilute in 500 ml or 750 ml of D5W if severe venous irritation occurs after peripheral administration. Reconstituted vials should be used within 30 min. Infusion is stable for 5 hr at room temperature or 54 hr if refrigerated. ***Rate:*** Infuse over 60 min. Flush line before and after infusion with D5W.
- **Y-Site Compatibility:** amikacin, amiodarone, anidulafungin, aztreonam, caspofungin, cimetidine, ciprofloxacin, cyclosporine, daptomycin, diltiazem, diphenhydramine, dolasetron, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, fenoldopam, fentanyl, fluconazole, granisetron, haloperidol, hydromorphone, hydroxyzine, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, meperidine, metoclopramide, metoprolol, midazolam, milrinone, morphine, nicardipine, nitroglycerin, ondansetron, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, tacrolimus, tirofiban, tobramycin, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, ampicillin, ampicillin/sulbacatam, azithromycin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, dexamethasone sodium phosphate, diazepam, digoxin, ertapenem, furosemide, ganciclovir, heparin, hydrocortisone sodium succinate, imipenem/cilastatin, insulin, ketorolac, meropenem, methylprednisolone sodium succinate, nitroprusside, pantoprazole, phenytoin, piperacillin/tazobactam, potassium phosphate, ranitidine, sodium bicarbonate, trimethoprim/sulfamethoxazole, ticarcillin/clavulanate.
- **Solution Incompatibility:** 0.9% NaCl.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

Copyright © 2008 by F.A. Davis

rabeprazole (ra-**bep**-ra-zole)
Aciphex, Pariet

Classification
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications
Gastroesophageal reflux disease (GERD). Duodenal ulcers (including combination therapy with clarithromycin and amoxicillin to eradicate *h. pylori* and prevent recurrence). Pathological hypersecretory conditions, including Zollinger-Ellison syndrome.

Action
Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics
Absorption: Delayed-release tablet is designed to allow rabeprazole, which is not stable in gastric acid, to pass through the stomach intact. Subsequently 52% is absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96.3%.
Metabolism and Excretion: Mostly metabolized by the liver (hepatic cytochrome P450 3A and 2C19 enzyme systems); 10% excreted in feces; remainder excreted in urine as inactive metabolites.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	unknown	24 hr†

†Suppression continues to increase over the first week of therapy

Contraindications/Precautions
Contraindicated in: Hypersensitivity to rabeprazole or related drugs (benzimidazoles).
Use Cautiously in: Severe hepatic impairment (dosage reduction may be necessary); Geri: Increased risk of hip fractures in patients using high-doses for >1 year; Pregnancy, lactation, or children (breastfeeding not recommended; use in pregnancy only if needed; safety not established).

Adverse Reactions/Side Effects
CNS: dizziness, headache, malaise. **GI:** abdominal pain, constipation, diarrhea, nausea. **Derm:** photosensitivity, rash. **MS:** neck pain. **Misc:** allergic reactions, chills, fever.

Interactions
Drug-Drug: Rabeprazole is metabolized by the CYP450 enzyme system and may interact with other drugs metabolized by this sytem. ↓ blood levels of **ketoconazole**. ↑ blood levels of **digoxin**. May alter the effects of **drugs whose absorption is pH dependent**. May increase the risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage
PO (Adults): *GERD, duodenal ulcers*—20 mg once daily; *prevention of duodenal ulcer recurrence*—20 mg twice daily for 7 days with amoxicillin 1000 mg twice daily for 7 days and clarithromycin 500 mg twice daily for 7 days; *hypersecretory conditions*—60 mg once daily initially, may be adjusted as needed and continued as necessary; doses up to 100 mg daily or 60 mg twice daily have been used.

Availability
Delayed-release tablets: 20 mg. **Cost:** 20 mg $419.97/90.

NURSING IMPLICATIONS

Assessment
- Assess routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.

Potential Nursing Diagnoses
Acute pain (Indications)

Implementation
- **PO:** Administer doses before meals, preferably in the morning. Tablets should be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching
- Instruct patient to take medication as directed for the full course of therapy, even if feel-

Copyright © 2008 by F.A. Davis

ing better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Caution patients to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

Evaluation/Desired Outcomes
- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD. Therapy is continued for 4–8 wk after initial episode.

raloxifene (ra-**lox**-i-feen)
Evista

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: selective estrogen receptor modulators

Pregnancy Category X

Indications
Treatment and prevention of osteoporosis in postmenopausal women. Reduction of the risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

Action
Binds to estrogen receptors, producing estrogen-like effects on bone, resulting in reduced resorption of bone and decreased bone turnover. **Therapeutic Effects:** Prevention of osteoporosis in patients at risk. Decreased risk of breast cancer.

Pharmacokinetics
Absorption: Although well absorbed (>60%), after oral administration, extensive first-pass metabolism results in 2% bioavailability.
Distribution: Highly bound to plasma proteins; remainder of distribution unknown.
Protein Binding: Highly bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by the liver; undergoes enterohepatic cycling; excreted primarily in feces.
Half-life: 27.7 hr.

TIME/ACTION PROFILE (effects on bone turnover)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; History of thromboembolic events; OB: Women with childbearing potential; OB, Pedi: Pregnancy, lactation, or children.
Use Cautiously in: Potential immobilization (increased risk of thromboembolic events); History of stroke or transient ischemic attack; Atrial fibrillation; Hypertension; Cigarette smoking.

Adverse Reactions/Side Effects
CV: STROKE, deep vein thrombosis, pulmonary embolism, retinal vein thrombosis. **MS:** leg cramps. **Misc:** hot flashes.

Interactions
Drug-Drug: Cholestyramine ↓ absorption (avoid concurrent use). May alter effects of **warfarin** and other **highly protein-bound drugs**. Concurrent systemic **estrogen** therapy is not recommended.

Route/Dosage
PO (Adults): 60 mg once daily.

Availability
Tablets: 60 mg. **Cost:** $269.96/90.

NURSING IMPLICATIONS

Assessment
- Assess patient for bone mineral density with x-ray, serum, and urine bone turnover markers (bone-specific alkaline phosphatase, osteocalcin, and collagen breakdown products) before and periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ apolipoprotein A-I and reduced serum total cholesterol, LDL cholesterol, fibrinogen, apolipoprotein B, and lipoprotein.
- May cause ↑ hormone-binding globulin (sex steroid-binding globulin, thyroxine-

Copyright © 2008 by F.A. Davis

binding globulin, corticosteroid-binding globulin) with ↑ total hormone concentrations.
- May cause small ↓ in serum total calcium, inorganic phosphate, total protein, and albumin.
- May also cause slight decrease in platelet count.

Potential Nursing Diagnoses
Risk for injury (Indications)

Implementation
- **PO:** May be administered without regard to meals.
- Calcium supplementation should be added to diet if daily intake is inadequate.

Patient/Family Teaching
- Instruct patient to take raloxifene as directed. Discuss the importance of adequate calcium and vitamin D intake or supplementation. Advise patient to discontinue smoking and alcohol consumption.
- Emphasize the importance of regular weight-bearing exercise. Advise patient that raloxifene should be discontinued at least 72 hr before and during prolonged immobilization (recovery from surgery, prolonged bedrest). Instruct patient to avoid prolonged restrictions of movement during travel because of the increased risk of venous thrombosis.
- Advise patient that raloxifene will not reduce hot flashes or flushes associated with estrogen deficiency and may cause hot flashes.
- OB: Advise patient that raloxifene may have teratogenic effects. Instruct patient to notify health care provider immediately if pregnancy is planned or suspected.
- Instruct patient to read the patient package insert when initiating therapy and again with each prescription refill.

Evaluation/Desired Outcomes
- Prevention of osteoporosis in postmenopausal women.
- Reduced risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

ramelteon (ra-**mel**-tee-on)
Rozerem

Classification
Therapeutic: sedative/hypnotics
Pharmacologic: melatonin receptor agonists

Pregnancy Category C

Indications
Treatment of insomnia characterized by difficult sleep onset.

Action
Activates melatonin receptors, which promotes maintenance of circadian rhythm, a part of the sleep-wake cycle. **Therapeutic Effects:** Easier onset of sleep.

Pharmacokinetics
Absorption: Well absorbed (84%), but bioavailability is low (1.8%) due to extensive first pass liver metabolism. Absorption in increased by a high fat meal.
Distribution: Widely distributed to body tissues.
Metabolism and Excretion: Extensively metabolized by the liver; mainly by CYP1A2 enzyme system. Metabolites are excreted mostly in urine (88%); 4% excreted in feces.
Half-life: 1–2.6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	30–90 min	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe hepatic impairment; Concurrent fluvoxamine; OB: lactation; Pedi: safety not established.
Use Cautiously in: Depression or history of suicidal ideation; Moderate hepatic impairment; Concurrent use of CYP3A4 inhibitors, such as ketoconazole; Concurrent use of CYP2C9 inhibitors, such as fluconazole; OB: use only if maternal benefit outweighs fetal risk.

Adverse Reactions/Side Effects
CNS: abnormal thinking, behavior changes, dizziness, fatigue, hallucinations, headache, insomnia (worsened), sleep–driving. **GI:** nausea. **Endo:** ↑ prolactin levels, ↓ testosterone levels.

Interactions
Drug-Drug: Blood levels and effects are ↑ by **fluvoxamine**, potent inhibitor of the CYP1A2

Copyright © 2008 by F.A. Davis

enzyme system; concurrent use is contraindicated. Levels and effects may be ↓ by Id **rifampin**, an inducer of CYP enzymes. Concurrent use of CYP3A4 inhibitors, such as **ketoconazole** may ↑ levels and effects; use cautiously. Concurrent use of CYP2C9 inhibitors, such as **fluconazole** may ↑ levels and effects; use cautiously. ↑ risk of excessive CNS depression with other CNS depressants including **alcohol**, **benzodiazepines**, **opioids**, and other **sedative/hypnotics**.

Route/Dosage

PO (Adults): 8 mg within 30 min of going to bed.

Availability

Tablets: 8 mg.

NURSING IMPLICATIONS

Assessment

- Assess sleep patterns before and periodically throughout therapy.

Potential Nursing Diagnoses

Insomnia (Indications)
Risk for injury (Side Effects)

Implementation

- Do not administer with or immediately after a high fat meal.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- **PO:** Administer within 30 min prior to going to bed.

Patient/Family Teaching

- Instruct patient to take ramelteon as directed, within 30 minutes of going to bed and to confine activities to those necessary to prepare for bed.
- Causes drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.

Evaluation/Desired Outcomes

- Relief of insomnia.

ramipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

ranitidine, See HISTAMINE H_2 ANTAGONISTS.

ranolazine (ra-**nole**-a-zeen)

Ranexa

Classification

Therapeutic: antianginals

Pregnancy Category C

Indications

Chronic angina pectoris not adequately controlled by conventional antianginals (amlodipine, beta blockers, nitrates).

Action

Does not decrease blood pressure or heart rate; remainder of mechanism is not known. **Therapeutic Effects:** Decreased frequency of angina.

Pharmacokinetics

Absorption: Highly variable.
Distribution: Unknown.
Metabolism and Excretion: Metabolized in the gut (P-glycoprotein) and by the liver (primarily CYP3A and less by CYP2D6); <5% excreted unchanged in urine and feces.
Half-life: 7 hr

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pre-existing QTc prolongation or concurrent use of other medications causing QTc prolongation; Potent inhibitors of CYP3A (ketoconazole, verapamil, diltiazem); Hepatic impairment; Lactation.
Use Cautiously in: Geri: Patients >75 yr (↑ risk of adverse reactions; Severe renal impairment (may ↑ blood pressure); OB: Pregnancy (use only when use outweighs risk to fetus); Pedi: Children (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** tinnitus. **CV:** palpitations, QTc prolongation. **GI:** abdominal pain, constipation, dry mouth, nausea, vomiting.

Interactions

Drug-Drug: ↑ blood levels of **simvastatin** and its active metabolite. Partially inhibits

Copyright © 2008 by F.A. Davis

CYP2D6 enzyme system; may ↓ metabolism and increase effects of **tricyclic antidepressants** and **antipsychotics**, dosage adjustments may be necessary. Inhibits P-glycoprotein (P-gp) which may lead to ↑ **digoxin** levels; dosage adjustment may be required.

Route/Dosage

PO (Adults): 500 mg twice daily initially, may be increased to 1000 mg twice daily.

Availability

Extended-release tablet: 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor ECG at baseline and periodically during therapy to evaluate effects on QT interval.
- ***Lab Test Considerations:*** May cause ↑ serum creatinine. Usually has a rapid onset, but does not progress during therapy and is reversible with discontinuation of ranolazine.
- May cause transient eosinophilia.
- May cause small mean ↓ in hematocrit.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications, Indications)
Activity intolerance (Indications)

Implementation

- Ranolazine should be used in combination with amlodipine, beta blockers, or nitrates.
- Do not administer with grapefruit juice or grapefruit products.
- **PO:** May be administered without regard to food. Tablets should be swallowed whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take ranolazine as directed. If a dose is missed, take the usual dose at the next scheduled time; do not double doses. Explain to patient that ranolazine is used for chronic therapy and will not help an acute angina episode.
- Advise patient to avoid grapefruit juice and grapefruit products when taking ranolazine.
- May cause dizziness and light-headedness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that ranolazine may cause changes in the ECG. Patient should inform health care professional if they have a personal or family history of QTc prolongation, congenital long QT syndrome, or proarrhythmic conditions such as hypokalemia.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products.

Evaluation/Desired Outcomes

- Decrease in frequency of angina attacks.

rasagiline (raza-ji-leen)
Azilect

Classification
Therapeutic: antiparkinson agents
Pharmacologic: monoamine oxidase type B inhibitors

Pregnancy Category C

Indications

Parkinson's disease (monotherapy and adjunctive to levodopa).

Action

Irreversibly inactivates monoamine oxidase (MAO) by binding to it at type B (brain sites); inactivation of MAO leads to increased amounts of dopamine available in the CNS. Differs from selegiline by its nonamphetamine characteristics. **Therapeutic Effects:** Improvement in symptoms of Parkinson's disease, allowing increase in function.

Pharmacokinetics

Absorption: 36% absorbed following oral administration.
Distribution: Readily crosses the blood-brain barrier.
Metabolism and Excretion: Extensively metabolized by the liver (CYP1A2 enzyme) to an inactive metabolite); less than 1% excreted in urine.
Half-life: 1.3 hr; does not correlate with duration of MAO-B inhibition.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	40 days*

*Recovery of MAO-B function.

Copyright © 2008 by F.A. Davis

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent meperidine, tramadol, propoxyphene, methadone, sympathomimetic amines, dextromethorphan, mirtazapine, cyclobenzaprine, cocaine or St. John's wort; Moderate to severe hepatic impairment; Elective surgery requiring general anesthesia; allow 14 days after discontinuation; Pheochromocytoma.

Use Cautiously in: Mild hepatic impairment (↑ blood levels); OB: Pregnancy and lactation, use only if maternal benefit outweighs fetal risk; may inhibit lactation; Pedi: Safety in children has not been established.

Adverse Reactions/Side Effects

CNS: depression, dizziness, hallucinations, malaise, vertigo. **EENT:** conjunctivitis, rhinitis. **Resp:** asthma. **CV:** chest pain, postural hypotension (may ↑ levodopa-induced hypotension), syncope. **GI:** anorexia, dizziness, dyspepsia, gastroenteritis, vomiting. **GU:** albuminuria, ↓ libido. **Derm:** alopecia, ecchymosis, ↑ melanoma risk, rash. **Endo:** weight loss. **Hemat:** leukopenia. **MS:** arthralgia, arthritis, neck pain. **Neuro:** dyskinesia (may ↑ levodopa-induced dyskinesia), paresthesia. **Misc:** allergic reactions, flu-like syndrome, ↑ fall risk, fever.

Interactions

Drug-Drug: ciprofloxacin and other **inhibitors of the CYP1A2 enzyme** ↑ rasagiline levels; dose adjustment is recommended. **Meperidine** has resulted in life-threatening reactions when used with other MAO inhibitors; wait at least 14 days after discontinuation of rasagiline to initiate meperidine. Similar reactions may occur with **tramadol**, **methadone**, **propoxyphene**; concurrent use should be avoided. Concurrent use with **dextromethorphan** may result in psychosis/bizarre behavior and should be avoided. Risk of adverse reactions in ↑ with **mirtazapine** and **cyclobenzapine**; concurrent use should be avoided. Hypertensive crisis may occur with **sympathomimetic amines** including **amphetamines**, **cold products**, and some **weight loss products** containing **vasoconstrictors** such as **pseudoephedrine**, **phenylephrine**, or **ephedrine**; avoid concurrent use. Risk of CNS toxicity is ↑ with **tricyclic antidepressants**, **SSRI antidepressants**, **NSRI antidepressants**, and other **MAO inhibitors**; rasagiline should be discontinued at least 14 days prior to initiation of antidepressants (**fluoxetine** should be discontinued at least 5 weeks prior to rasagiline therapy). Hypertensive crisis may also occur when rasagiline is used with **other MAO inhibitors**; allow at least 14 days between usage.

Drug-Natural Products: Risk of toxicity is ↑ with **St. John's wort.**

Drug-Food: Ingestion of **tyramine-rich foods or beverages** may result in life-threatening hypertensive crisis.

Route/Dosage

PO (Adults): *Monotherapy*—1 mg daily; *adjunct therapy*—0.5 mg daily, may be increased to 1 mg daily; *concurrent ciprofloxacin or other CYP1A2 inhibitors*—0.5 mg daily.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment*—1 mg daily; *adjunct therapy*—0.5 mg daily, may be increased to 1 mg daily.

Availability

Tablets: 0.5 mg, 1 mg.

NURSING IMPLICATIONS

Assessment

- Assess signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Monitor blood pressure periodically during therapy.
- Assess skin for melanomas periodically during therapy.
- ***Lab Test Considerations:*** May cause albuminuria, leukopenia, and abnormal liver function tests.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- If used in combination with levodopa, a reduction in levodopa dose may be considered based on individual results.
- **PO:** Administer once daily.

Patient/Family Teaching

- Instruct patient to take rasagiline as directed. Missed doses should be omitted and next

Copyright © 2008 by F.A. Davis

dose taken at usual time the following day. Do not double doses.

- Caution patient to avoid alcohol, CNS depressants, and foods or beverages containing tyramine (see Appendix L) during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis develop.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products. Caution patient to avoid use of St. John's Wort and the analgesics meperidine, propoxyphene, tramadol, or methadone during therapy.
- Caution patient to avoid elective surgery requiring general anesthesia, cocaine, or local anesthesia containing sympathomimetic vasoconstrictors within 14 days of discontinuing rasagiline. If surgery is necessary sooner, benzodiazepines, mivacurium, rapacuronium, fentanyl, morphine, and codeine may be used cautiously.
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Advise patient to monitor for melanomas frequently and on a regular basis.
- Advise patient to notify health care professional immediately if severe headache, neck stiffness, heart racing or palpitations, occur.

Evaluation/Desired Outcomes

- Improvement in symptoms of Parkinson's disease, allowing increase in function.

rasburicase (ras-byoor-i-case)

Elitek

Classification

Therapeutic: antigout agents, antihyperuricemics

Pharmacologic: enzymes

Pregnancy Category C

Indications

Initial management of increased uric acid levels in children with leukemia, lymphoma or other malignancies who are being treated with antineoplastics which are expected to produce hyperuricemia.

Action

An enzyme which promotes the conversion of uric acid to allantoin, an inactive, water-soluble compound. Produced by recombinant DNA technology. **Therapeutic Effects:** Decreased sequelae of hyperuricemia (nephropathy, arthropathy).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 18 hr.

TIME/ACTION PROFILE (decrease in uric acid)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	4–24 hr

Contraindications/Precautions

Contraindicated in: G6–PD deficiency; Previous allergic reaction, hemolysis or methemoglobinemia from rasburicase; Lactation.
Use Cautiously in: OB: Pregnancy (use only if clearly needed).

Adverse Reactions/Side Effects

CNS: headache. **Resp:** respiratory distress. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, mucositis. **Derm:** rash. **Hemat:** HEMOLYSIS, METHEMOGLOBINEMIA, neutropenia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, fever, sepsis.

Interactions

Drug-Drug: None known.

Route/Dosage

IV (Children): 0.15 or 0.2 mg/kg daily as a single dose for 5 days.

Availability

lyophilized powder for reconstitution: 1.5 mg/vial in cartons of 3 vials with specific diluent[Rx].

Copyright © 2008 by F.A. Davis

NURSING IMPLICATIONS

Assessment

- Monitor patients for signs of allergic reactions and anaphylaxis (chest pain, dyspnea, hypotension, urticaria). If these signs occur, rasburicase should be immediately and permanently discontinued.
- ***Lab Test Considerations:*** Monitor patients for hemolysis. Screen patients at higher risk for G6PD deficiency (patients of African American or Mediterranean ancestry) prior to therapy. If hemolysis occurs, discontinue and do not restart rasburicase.
- Monitor patients for methemoglobinemia. Discontinue rasburicase and do not restart in patients who develop methemoglobinemia.
- May cause spuriously low uric acid levels in blood samples left at room temperature. Collect blood for uric acid levels in pre-chilled tubes containing heparin and immediately immerse and maintain in an ice water bath. Uric acid must be analyzed in plasma. Plasma samples must be assayed within 4 hr of collection.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Chemotherapy is initiated 4–24 hr after first dose of rasburicase.

IV Administration

- **Intermittent Infusion:** Determine number of vials of rasburicase needed based on patient's weight and dose/kg. ***Diluent:*** Reconstitute in diluent provided. Add 1 ml of diluent provided to each vial and mix by swirling very gently. Do not shake or vortex. Solution should be clear and colorless. Do not use solutions that are discolored or contain particulate matter. ***Concentration:*** Remove dose from reconstituted vials and inject into infusion bag of 0.9% NaCl for a final total volume of 50 ml. Administer within 24 hr of reconstitution. Store reconstituted or diluted solution in refrigerator for up to 24 hr. ***Rate:*** Administer over 30 min. Do not administer as a bolus.
- **Y-Site Incompatibility:** Infuse through a separate line. Do not use a filter with infusion. If separate line is not possible, flush line with at least 15 ml of 0.9% NaCl prior to rasburicase infusion.

Patient/Family Teaching

- Inform patient and family of purpose of rasburicase infusion.

Evaluation/Desired Outcomes

- Decrease in plasma uric acid levels in pediatric patients receiving antineoplastics expected to result in tumor lysis and subsequent elevation of plasma uric acid levels.

repaglinide (re-pag-gli-nide)

Gluconorm, Prandin

Classification

Therapeutic: antidiabetics
Pharmacologic: meglitinides

Pregnancy Category C

Indications

Type 2 diabetes mellitus, with diet and exercise; may be used with metformin, rosigliazone, or pioglitazone.

Action

Stimulates the release of insulin from pancreatic beta cells by closing potassium channels, which results in the opening of calcium channels in beta cells. This is followed by release of insulin.
Therapeutic Effects: Lowering of blood glucose levels.

Pharmacokinetics

Absorption: Well absorbed (56%) following oral administration.
Distribution: Unknown.
Protein Binding: >98%.
Metabolism and Excretion: Mostly metabolized by the liver; metabolites are excreted primarily in feces.
Half-life: 1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	60–90 min	<4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation; Diabetic ketoacidosis; Insulin-dependent diabetes.
Use Cautiously in: Impaired liver function (longer dosing intervals may be necessary); Severe renal impairment (dosage reduction recommended); Geri: Consider age-related decrease in renal/hepatic/cardiovascular function; OB, Pedi: Pregnancy and children

Copyright © 2008 by F.A. Davis

(safety not established; insulin recommended to control diabetes during pregnancy).

Adverse Reactions/Side Effects

CV: angina, chest pain. **Endo:** HYPOGLYCEMIA, hyperglycemia.

Interactions

Drug-Drug: Ketoconazole, **miconazole**, **gemofibrozil**, **itraconazole**, and **erythromycin** may ↓ metabolism and ↑ risk of hypoglycemia. Effects may also be ↑ by **NSAIDs**, **hormonal contraceptives**, **simvastatin**, **sulfonamides**, **chloramphenicol**, **warfarin**, **probenecid**, **MAO inhibitors**, and **beta blockers**. Effects may be ↓ by **corticosteroids**, **phenothiazines**, **thyroid preparations**, **estrogens**, **hormonal contraceptives**, **phenytoin**, **nicotinic acid**, **sympathomimetics**, **isoniazid**, and **calcium channel blockers**.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): 0.5–4 mg taken before meals (not to exceed 16 mg/day)

Renal Impairment

PO (Adults): *Severe renal impairment*—start with 0.5 mg/day and titrate carefully.

Availability

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** 0.5 mg $385.64/270, 1 mg $377.70/270, 2 mg $377.97/270.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety). Hypoglycemia may be difficult to recognize in geriatric patients and in patients taking beta blockers. Hypoglycemia is more likely to occur with insufficient caloric intake, following intense prolonged exercise, or when alcohol or more than one hypoglycemic agent is used.
- ***Lab Test Considerations:*** Monitor fasting serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold repaglinide and reinstitute after resolution of acute episode.
- Repaglinide therapy should be temporarily discontinued from patients requiring surgery involving restricted intake of food and fluids.
- There is no fixed dose of repaglinide. Dose is based on periodic monitoring of blood glucose and long-term response is based on glycolysated hemoglobin levels. If adequate response is not achieved, metformin may be added to regimen. If combination therapy is unsuccessful, oral hypoglycemic therapy may need to be discontinued and replaced with insulin.
- When replacing other oral hypoglycemic agents, repaglinide may be started on the day following discontinuation of the other agent. Monitor blood glucose closely. Discontinuation of long-acting oral hypoglycemics may require monitoring for a week or more.
- Short-term repaglinide therapy may be used for patients well controlled with diet experiencing transient loss of control.
- **PO:** Administer up to 30 min before meals. Patients who skip a meal or add an extra meal should skip or add a dose, respectively, for that meal.

Patient/Family Teaching

- Instruct patient to take repaglinide before each meal, exactly as directed.
- Explain to patient that repaglinide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.

R

Copyright © 2008 by F.A. Davis

- Instruct patient in proper testing of blood glucose. These tests should be monitored closely during periods of stress or illness and a health care professional notified if significant changes occur.
- Caution patient to avoid taking other Rx, OTC or herbal products, or alcohol during repaglinide therapy without consulting health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

reteplase, See THROMBOLYTIC AGENTS.

$Rh_o(D)$ IMMUNE GLOBULIN

(arr aych oh dee im-**yoon glob**-yoo-lin)

$Rh_o(D)$ immune globulin standard dose IM
HyperRHO S/D Full Dose, RhoGAM

$Rh_o(D)$ immune globulin microdose IM
HyperRHO S/D Mini-Dose, MICRhoGAM, Mini-Gamulin R

$Rh_o(D)$ immune globulin IV
WinRho SDF

$Rh_o(D)$ immune globulin microdose IM, IV
Rhophylac

Classification
Therapeutic: vaccines/immunizing agents
Pharmacologic: immune globulins

Pregnancy Category C

Indications

IM, IV: Administered to $Rh_o(D)$-negative patients who have been exposed to $Rh_o(D)$-positive blood by: Pregnancy or delivery of a $Rh_o(D)$-positive infant, Abortion of a $Rh_o(D)$-positive fetus, Fetal-maternal hemorrhage due to amniocentesis, other obstetrical manipulative procedure, or intra-abdominal trauma while carrying a $Rh_o(D)$-positive fetus, Transfusion of $Rh_o(D)$-positive blood or blood products to a $Rh_o(D)$-negative patient. **IV:** Management of immune thrombocytopenic purpura (ITP).

Action

Prevent production of anti-$Rh_o(D)$ antibodies in $Rh_o(D)$-negative patients who were exposed to $Rh_o(D)$-positive blood. Increase platelet counts in patients with ITP. **Therapeutic Effects:** Prevention of antibody response and hemolytic disease of the newborn (erythroblastosis fetalis) in future pregnancies of women who have conceived a $Rh_o(D)$-positive fetus. Prevention of $Rh_o(D)$ sensitization following transfusion accident. Decreased bleeding in patients with ITP.

Pharmacokinetics

Absorption: Completely absorbed with IV administration. Well absorbed from IM sites.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: approximately 25–30 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	5–10 days	unknown
IV†	unknown	2 hr	unknown

†When given for ITP, platelet counts start to rise in 1–2 days, peak after 5–7 days, and last for 30 days

Contraindications/Precautions

Contraindicated in: Prior hypersensitivity reaction to human immune globulin; $Rh_o(D)$- or Du-positive patients.
Use Cautiously in: ITP patients with pre-existing anemia (decrease dose if Hgb <10 g/dl). May also cause disseminated intravascular coagulation in ITP patients.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** hypertension, hypotension. **Derm:** rash. **GI:** diarrhea, nausea,

Copyright © 2008 by F.A. Davis

vomiting. **Hemat:** *ITP*— anemia, intravascular hemolysis. **MS:** arthralgia, myalgia. **Local:** pain at injection site. **Misc:** fever.

Interactions

Drug-Drug: May decrease antibody response to some **live-virus vaccines (measles, mumps, rubella)**.

Route/Dosage

Rh$_0$(D) Immune Globulin (for IM use only)

Following Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) within 72 hr of delivery.

Before Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) at 26–28 wk.

Termination of Pregnancy (<13 wk Gestation)

IM (Adults): *HyperRHO S/D Mini-Dose, MICRhoGAM*—1 vial of microdose (50 mcg) within 72 hr.

Termination of Pregnancy (>13 wk Gestation)

IM (Adults): *RhoGAM*—1 vial standard dose (300 mcg) within 72 hr.

Large Fetal-Maternal Hemorrhage (>15 ml)

IM (Adults): *RhoGAM*—20 mcg/ml of Rh$_0$(D)-positive fetal RBCs.

Transfusion Accident

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—(Volume of Rh-positive blood administered × Hct of donor blood)/15 = number of vials of standard dose (300 mcg) preparation (round to next whole number of vials).

Rh$_0$(D) Immune Globulin IV (for IM or IV Use)

Following Delivery

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr of delivery. *Rhophylac*—1500 IU (300 mcg) within 72 hr of delivery.

Prior to Delivery

IM, IV (Adults): *WinRho SDF, Rhophylac*—1500 IU (300 mcg) at 28 wk; if initiated earlier in pregnancy, repeat q 12 wk.

Following Amniocentesis or Chorionic Villus Sampling

IM, IV (Adults): *WinRho SDF (before 34 wk gestation)*—1500 IU (300 mcg) immediately; repeat q 12 wk during pregnancy. *Rhophylac*—1500 IU (300 mcg) within 72 hr of procedure.

Termination of Pregnancy, Amniocentesis, or Any Other Manipulation

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr after event.

Large Fetal-Maternal Hemorrhage/Transfusion Accident

IM (Adults): *WinRho SDF*—6000 IU (1200 mcg) q 12 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).
IV (Adults): 3000 IU (600 mcg) q 8 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).

Immune Thrombocytopenic Purpura

IV (Adults and Children): *WinRho SDF, Rhophylac*—50 mcg (250 IU)/kg initially (if Hgb <10 g/dl, ↓ dose to 25–40 mcg [125–200 IU]/kg); further dosing/frequency determined by clinical response (range 25–60 mcg [125–300 IU]/kg). Each dose may be given as a single dose or in 2 divided doses on separate days.

Availability

Rh$_0$(D) Immune Globulin (for IM Use)

Injection: 50 mcg/vial (microdose - MICRhoGAM, HyperRHO S/D Mini-Dose), 300 mcg/vial (standard dose—RhoGAM, HyperRHO S/D Full Dose).

Rh$_0$(D) Immune Globulin Intravenous (for IM or IV Use)

Injection: 600 IU (120 mcg)/vial, 1500 IU (300 mcg)/vial, 2500 IU (500 mcg)/vial, 5000 IU (1000 mcg)/vial, 15000 IU (3000 mcg)/vial.
Prefilled syringes: 1500 IU (300 mcg/2 ml).

NURSING IMPLICATIONS

Assessment

- **IV:** Assess vital signs periodically during therapy in patients receiving IV Rh$_0$(D) immune globulin.
- **ITP:** Monitor patient for signs and symptoms of intravascular hemolysis (IVH) (back pain, shaking chills, fever, hemoglobinuria), anemia, and renal insufficiency. If transfusions

Copyright © 2008 by F.A. Davis

are required, use $Rh_o(D)$ negative packed red blood cells to prevent exacerbation of IVH.

- ***Lab Test Considerations:*** *Pregnancy:* Type and crossmatch of mother and newborn's cord blood must be performed to determine need for medication. Mother must be $Rh_o(D)$-negative and Du-negative. Infant must be $Rh_o(D)$-positive. If there is doubt regarding infant's blood type or if father is $Rh_o(D)$-positive, medication should be given.
- An infant born to a woman treated with $Rh_o(D)$ immune globulin antepartum may have a weakly positive direct Coombs' test result on cord or infant blood.
- *ITP:* Monitor platelet counts, RBC counts, hemoglobin, and reticulocyte levels to determine effectiveness of therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not give to infant, to $Rh_o(D)$-positive individual, or to $Rh_o(D)$-negative individual previously sensitized to the $Rh_o(D)$ antigen. However, there is no more risk than when given to a woman who is not sensitized. When in doubt, administer $Rh_o(D)$ immune globulin.
- Do not confuse IM and IV formulations. Rh immune globulin for IV administration is labeled 'Rh Immune Globulin Intravenous.' Rh Immune Globulin Intravenous may be given IM; however, Rh Immune Globulin (microdose and standard dose) is for IM use only and cannot be given IV.
- When using prefilled syringes, allow solution to reach room temperature before administration.
- **IM:** Reconstitute $Rh_o(D)$ immune globulin IV for IM use immediately before use with 1.25 ml of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake.
- Administer into the deltoid muscle. Dose should be given within 3 hr but may be given up to 72 hr after delivery, miscarriage, abortion, or transfusion.

IV Administration

- **Direct IV:** Reconstitute $Rh_o(D)$ immune globulin IV for IV administration immediately before use with 2.5 ml of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake. ***Rate:*** Administer over 3–5 min.

Patient/Family Teaching

- **Pregnancy:** Explain to patient that the purpose of this medication is to protect future $Rh_o(D)$-positive infants.
- **ITP:** Explain purpose of medication to patient.

Evaluation/Desired Outcomes

- Prevention of erythroblastosis fetalis in future $Rh_o(D)$-positive infants.
- Prevention of $Rh_o(D)$ sensitization following incompatible transfusion.
- Decreased bleeding episodes in patients with ITP.

ribavirin (rye-ba-**vye**-rin)
Copegus, Rebetol, Virazole

Classification
Therapeutic: antivirals
Pharmacologic: nucleoside analogues

Pregnancy Category X

Indications

Inhaln: Treatment of severe lower respiratory tract infections caused by the respiratory syncytial virus (RSV) in infants and young children. **PO:** *Rebetol*—with interferon alfa-2b (*Intron A*) or peginterferon alfa-2b (*PEG-Intron*) in the treatment of chronic hepatitis C in patients who have failed previous therapy. **PO:** *Copegus*—with peginterferon alfa-2a (Pegasys) in the treatment of chronic hepatitis C in patients who have failed previous therapy. **Unlabeled uses:** Early (within 24 hr of symptoms) secondary treatment of influenza A or B in young adults.

Action

Inhibits viral DNA and RNA synthesis and subsequent replication. Must be phosphorylated intracellularly to be active. **Therapeutic Effects: Inhaln:** Virustatic action. **PO:** Decreased progression and sequelae of chronic hepatitis C.

Pharmacokinetics

Absorption: Systemic absorption occurs following nasal and oral inhalation. Rapidly and extensively absorbed following oral administration, but undergoes first-pass hepatic metabolism (64% bioavailability).
Distribution: 70% of inhaled drug is deposited in the respiratory tract. Appears to concentrate in the respiratory tract and red blood cells. Enters breast milk.

Copyright © 2008 by F.A. Davis

Metabolism and Excretion: Eliminated from the respiratory tract by distribution across membranes, macrophages, and ciliary motion. Metabolized primarily by the liver; metabolites are renally excreted.
Half-life: *Inhaln*—9.5 hr (40 days in RBCs); *oral*—43.6 hr (single dose); 12 days (multiple dose).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Inhaln	unknown	end of inhaln	unknown
PO	unknown	1.7–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Inhalation** Patients receiving mechanically assisted ventilation; **Oral** OB: Pregnancy or lactation; OB: Male partners of pregnant patients; CCr <50 ml/min; Significant/unstable cardiovascular disease; Hemoglobinopathies; Autoimmune hepatitis or hepatic decompensation before/during treatment (for combined therapy with interferon alfa-2b or peginterferon alfa-2a); Concurrent use of didanosine, stavudine or zidovudine.
Use Cautiously in: PO: Sarcoidosis (may exacerbate condition; Anemia (dose reduction/discontinuation may be required); Any pre-existing cardiac disease; OB: Patients with childbearing potential.

Adverse Reactions/Side Effects

Inhalation **CNS:** dizziness, faintness. **EENT:** blurred vision, conjunctivitis, erythema of the eyelids, ocular irritation, photosensitivity. **CV:** CARDIAC ARREST, hypotension. **Derm:** rash. **Hemat:** hemolytic anemia (with interferon alpha 2b), reticulocytosis.
Oral (may reflect combination with interferon). **CNS:** emotional lability (↑ in children), fatigue (↓ in children), impaired concentration (↓ in children), insomnia (↓ in children), irritability (↓ in children). **EENT:** dry mouth. **Resp:** dyspnea (↓ in children). **GI:** anorexia (↑ in children), dyspepsia (↓ in children), vomiting (↑ in children). **Hemat:** hemolytic anemia. **Derm:** pruritus (↓ in children). **MS:** arthralgia (↓ in children). **Misc:** fever (↑ in children).

Interactions

Drug-Drug: Oral. May ↓ the antiretroviral action of **stavidine** and **zidovudine**. May ↑ hematologic toxicity of **zidovudine**. May ↑ blood levels and risk of toxicity of **didanosine**. Although used together in the management of hepatitis, concurrent use with **interferon alpha 2b** ↑ risk of hemolytic anemia.

Route/Dosage

Inhaln (Infants and Young Children): 300 ml of 20 mg/ml solution delivered via mist for 12–18 hr/day.

Rebetol (with interferon alfa-2b or peginterferon alfa-2b)

PO (Adults >75 kg): 600 mg in the morning, then 600 mg in the evening for 6 mo.
PO (Adults ≤75 kg and Children >61 kg): 400 mg in the morning, then 600 mg in the evening for 6 mo.
PO (Children 50–61 kg): 400 mg in the morning and evening.
PO (Children 37–49 kg): 200 mg in the morning and 400 mg in the evening.
PO (Children 25–36 kg): 200 mg in the morning and evening.

Copegus—viral genotype 1 or 4 (with peginterferon alfa-2a)

PO (Adults ≥75 kg): 600 mg twice daily for 48 wk.
PO (Adults <75 kg): 500 mg twice daily for 48 wk.

Copegus—viral genotype 2 or 4 (with peginterferon alfa-2a)

PO (Adults): 400 mg twice daily for 24 wk.

Availability

Powder for reconstitution for aerosol use: 6 g/vial. **Capsules (Rebetol):** 200 mg. **Tablets (Copegus):** 200 mg, 400 mg. ***In combination with:*** Rebetrol with interferon alfa-2b (Intron A) as combination therapy for chronic hepatitis C (Rebetron). See Appendix B; *Copegus* is intended for combined therapy with pegylated interferon alfa-2a (*Pegasys*).

NURSING IMPLICATIONS

Assessment

- **RSV:** Assess patient for infection (vital signs, sputum, WBC) at beginning and during therapy.

Copyright © 2008 by F.A. Davis

- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results
- Assess respiratory (lung sounds, quality and rate of respirations) and fluid status prior to and frequently throughout therapy.
- **Chronic Hepatitis C:** Monitor symptoms of hepatitis during therapy.
- Assess patient for signs of depression during therapy.
- Assess patient for cardiovascular disorders (pulse, blood pressure, chest pain). May cause myocardial infarction
- Assess patients for signs of colitis (abdominal pain, bloody diarrhea, fever) and pancreatitis (nausea, vomiting, abdominal pain) during therapy. Discontinue therapy if these occur; may be fatal
- Assess pulmonary status (lung sounds, respirations) periodically during therapy. May require discontinuation.
- ***Lab Test Considerations:*** **Chronic Hepatitis C:** Monitor CBC with differential and platelet count prior to initiation, at week 2, and week 4, and regularly during therapy. If hemoglobin <10 g/dl in patients with no history of cardiac disease or ↓ more than 2 g/dl in any 4 wk treatment period in patients with history of stable cardiac disease, decrease ribavirin dose to 600 mg (200 mg in AM and 400 mg in PM). If hemoglobin <8.5 g/dl in patients with no history of cardiac disease or <12 g/dl despite dose reduction in patients with history of stable cardiac disease, discontinue combination therapy permanently.
- Monitor liver function tests and thyroid stimulating hormone prior to and periodically during therapy.
- OB: Monitor pregnancy tests prior to, monthly during and for 6 mo following discontinuation of therapy in women of childbearing age. Ribavarin should be started following a negative pregnancy test.
- May cause ↑ serum bilirubin and uric acid levels.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Impaired gas exchange (Indications)

Implementation

Inhaln: Infants requiring assisted ventilation should be suctioned every 1–2 hr and pulmonary pressures monitored every 2–4 hr.

- Ribavirin treatment should begin within the first 3 days of RSV infection to be effective.
- Ribavirin aerosol should be administered using the Viratek SPAG model SPAG-2 only. Do not administer via other aerosol-generating devices. Usually administered using an infant oxygen hood attached to the SPAG-2 aerosol generator. Administration by face mask may be used if the oxygen hood cannot be used.
- Reconstitute ribavirin 6-g vial with preservative-free sterile water for injection or inhalation. Transfer to clean, sterilized Erlenmeyer flask of the SPAG-2 reservoir and dilute to a final volume of 300 ml. This recommended concentration (20 mg/ml) in the reservoir provides a concentration of aerosol ribavirin of 190 mcg/liter of air over a 12-hr period. Solution should be discarded and replaced every 24 hr.
- Aerosol treatments should be administered continuously 12–18 hr/day for 3–7 days.
- **PO:** Administer with food. Capsules should be swallowed whole; do not open, crush, or chew.

Patient/Family Teaching

- **RSV:** Explain the purpose and route of treatment to the patient and parents.
- Inform patient and parents that ribavirin may cause blurred vision and photosensitivity.
- **Chronic Hepatitis C:** Instruct patient to take ribavirin for the full course of therapy Emphasize the importance of routine lab test to monitor for side effects.
- Advise patient to brush teeth twice daily, have regular dental examinations, and rinse mouth thoroughly after vomiting to prevent dental and periodontal disorders.
- Inform patient about teratogenic effects of ribavirin. Instruct women with childbearing potential, and men, to use 2 forms of effective contraception during and for at least 6 mo following conclusion of therapy. Men must use a condom.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that ribavirin may not reduce the risk of transmission of HCV to others or prevent cirrhosis, liver failure, or liver cancer.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of RSV.
- Decreased progression and sequelae of chronic hepatitis C.

Copyright © 2008 by F.A. Davis

rifabutin (riff-a-**byoo**-tin)
Mycobutin

Classification
Therapeutic: agents for atypical mycobacterium

Pregnancy Category B

Indications
Prevention of disseminated *Mycobacterium avium* complex (MAC) disease in patients with advanced HIV infection. **Unlabeled uses:** Treatment of *Helicobacter pylori* ulcer disease which has failed on other regimens (with pantoprazole and amoxicillin).

Action
Appears to inhibit DNA-dependent RNA polymerase in susceptible organisms. **Therapeutic Effects:** Antimycobacterial action against susceptible organisms. **Spectrum:** Active against *M. avium* and most strains of *M. tuberculosis*.

Pharmacokinetics
Absorption: Well absorbed following oral administration (50–85%). Absorption is decreased in HIV-positive patients (20%).
Distribution: Widely distributed to body tissues and fluids.
Metabolism and Excretion: Mostly metabolized by the liver; <5% excreted unchanged by the kidneys.
Half-life: 45 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity. Cross-sensitivity with other rifamycins (rifampin) may occur; Active tuberculosis; Concurrent ritonavir or delavirdine.
Use Cautiously in: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects
EENT: brown-orange discoloration of tears, ocular disturbances. **Resp:** dyspnea. **CV:** chest pain, chest pressure. **GI:** brown-orange discoloration of saliva, altered taste, drug-induced hepatitis. **GU:** brown-orange discoloration of urine. **Derm:** rash, skin discoloration. **Hemat:** hemolysis, neutropenia, thrombocytopenia. **MS:** arthralgia, myositis. **Misc:** brown-orange discoloration of body fluids, flu-like syndrome.

Interactions
Drug-Drug: Increases metabolism and may decrease the effectiveness of other drugs, including **amprenavir**, **efavirenz**, **indinavir**, **nelfinavir**, **nevirapine**, **saquinavir**, (dosage adjustment may be necessary), **delavirdine**, (concurrent use should be avoided), **corticosteroids**, **disopyramide**, **quinidine**, **opioid analgesics**, **oral hypoglycemic agents**, **warfarin**, **estrogens**, **estrogen-containing contraceptives**, **phenytoin**, **verapamil**, **fluconazole**, **quinidine**, **tocainide**, **theophylline**, **zidovudine**, and **chloramphenicol**. **Ritonavir** increases blood levels of rifabutin (concurrent use is contraindicated), similar effects occur with **efavirenz** and **nevirapine**.

Route/Dosage
PO (Adults): 300 mg once daily. If GI upset occurs, may give as 150 mg twice daily with food. *H. pylori*—300 mg/day (unlabeled).

Availability
Capsules: 150 mg.

NURSING IMPLICATIONS

Assessment
- Monitor patient for signs of active tuberculosis (purified protein derivative [PPD], chest x-ray, sputum culture, blood culture, urine culture, biopsy of suspicious lymph nodes) prior to and throughout therapy. Rifabutin must not be administered to patients with active tuberculosis.
- ***Lab Test Considerations:*** Monitor CBC periodically throughout therapy. May cause neutropenia and thrombocytopenia.

Potential Nursing Diagnoses
Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation
- Do not confuse rifabutin with rifampin.
- **PO:** May be administered without regard to meals. High-fat meals slow rate but not extent of absorption. May be mixed with foods such as applesauce. If GI upset occurs, administer with food.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- Advise patient to take medication exactly as directed. Do not skip doses or double up on missed doses. Emphasize the importance of continuing therapy even if asymptomatic.
- Advise patient to notify health care professional promptly if signs and symptoms of neutropenia (sore throat, fever, signs of infection), thrombocytopenia (unusual bleeding or bruising), or hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- Instruct patient to report symptoms of myositis (myalgia, arthralgia) or uveitis (intraocular inflammation) to health care professional promptly.
- Inform patient that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.
- Advise patient that this medication has teratogenic properties and may decrease the effectiveness of oral contraceptives. Counsel patient to use a nonhormonal form of contraception throughout therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Prevention of disseminated MAC in patients with advanced HIV infection.

rifampin (rif-**am**-pin)
Rifadin, Rimactane, ✱Rofact

Classification
Therapeutic: antituberculars
Pharmacologic: rifamycins

Pregnancy Category C

Indications

Active tuberculosis (with other agents). Elimination of meningococcal carriers. **Unlabeled uses:** Prevention of disease caused by *Haemophilus influenzae* type B in close contacts.

Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms. **Therapeutic Effects:** Bactericidal action against susceptible organisms. **Spectrum:** Broad spectrum notable for activity against: *Mycobacterium* spp, *Staphylococcus aureus*, *H. influenzae*, *Legionella pneumophila*, *Neisseria meningitidis*.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Widely distributed; enters CSF. Crosses placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; 60% eliminated in feces via biliary elimination.
Half-life: 3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	12–24 hr
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent indinavir, nelfinavir, pyrazinamide, or saquinavir.
Use Cautiously in: History of liver disease; Concurrent use of other hepatotoxic agents; Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: ataxia, confusion, drowsiness, fatigue, headache, weakness. **EENT:** red discoloration of tears. **GI:** abdominal pain, diarrhea, flatulence, heartburn, nausea, vomiting, drug-induced hepatitis, red discoloration of saliva. **GU:** red discoloration of urine. **Hemat:** hemolytic anemia, thrombocytopenia. **MS:** arthralgia, myalgia. **Misc:** red discoloration of all body fluids, flu-like syndrome.

Interactions

Drug-Drug: ↑ risk of hepatotoxicity with other **hepatotoxic agents**, including **alcohol**, **ketoconazole isoniazid**, **pyrazinamide** (concurrent use with **pyrazinamide** may result in potentially fatal hepatotoxicity and should be avoided). Rifampin significantly ↓ blood levels of **delavirdine**, **indinavir**, **nelfinavir**, and **saquinavir**; concurrent use is contraindicated. Rifampin stimulates liver enzymes, which may ↑ metabolism and ↓ effectiveness of other drugs, including **ritonavir**, **nevirapine**, and **efavirenz** (dosage adjustment may be necessary), **corticosteroids**, **disopyramide**, **quinidine**, **opioid analgesics**, **oral hypoglycemic agents**, **warfarin**, **estrogens**,

Copyright © 2008 by F.A. Davis

phenytoin, **verapamil**, **fluconazole**, **ketoconazole**, **itraconazole**, **quinidine**, **tocainide**, **theophylline**, **chloramphenicol**, and **hormonal contraceptive agents**.

Route/Dosage

Tuberculosis

PO, IV (Adults): 600 mg/day or 10 mg/kg/day (up to 600 mg/day) single dose; may also be given 2–3 times weekly.
PO, IV (Children): 10–20 mg/kg/day single dose (not to exceed 600 mg/day); may also be given 2–3 times weekly.

Asymptomatic Carriers of Meningococcus

PO, IV (Adults): 600 mg q 12 hr for 2 days.
PO, IV (Children ≥1 mo): 10 mg/kg q 12 hr for 2 days.
PO (Infants <1 mo): 5 mg/kg q 12 hr for 2 days.

Prevention of *H. influenzae* Type B Infection

PO (Adults): 600 mg/day for 4 days.
PO (Children): 20 mg/kg/day for 4 days.

Availability (generic available)

Capsules: 150 mg, 300 mg. **Powder for injection:** 600 mg/vial. ***In combination with:*** isoniazid (Rifamate); isoniazid and pyrazinamide (Rifater). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Perform mycobacterial studies and susceptibility tests prior to and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- ***Lab Test Considerations:*** Evaluate renal function, CBC, and urinalysis periodically and during therapy.
- Monitor hepatic function at least monthly during therapy. May cause ↑ BUN, AST, ALT, and serum alkaline phosphatase, bilirubin, and uric acid concentrations.
- May cause false-positive direct Coombs' test results. May interfere with folic acid and vitamin B assays.
- May interfere with dexamethasone suppression test results; discontinue rifampin 15 days prior to test.
- May interfere with methods for determining serum folate and vitamin B levels and with urine tests based on color reaction.
- May delay hepatic uptake and excretion of sulfobromophthalein (SBP) during SBP uptake and excretion tests; perform test prior to daily dose of rifampin.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse rifampin with rifabutin.
- **PO:** Administer medication on an empty stomach at least 1 hr before or 2 hr after meals with a full glass (240 ml) of water. If GI irritation becomes a problem, may be administered with food. Antacids may also be taken 1 hr prior to administration. Capsules may be opened and contents mixed with applesauce or jelly for patients with difficulty swallowing.
- Pharmacist can compound a syrup for patients unable to swallow solids.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 600-mg vial with 10 ml of sterile water for injection for a concentration of 60 mg/ml. Dilute further in 100 ml or 500 ml of D5W or 0.9% NaCl. Reconstituted vials are stable for 24 hr at room temperature. Infusion is stable at room temperature for 4 hr (in D5W or 24 hr (in 0.9% NaCl). ***Concentration:*** Final concentration of infusion should not exceed 6 mg/ml. ***Rate:*** Administer solutions diluted in 100 ml over 30 min and solutions diluted in 500 ml over 3 hr.
- **Y-Site Compatibility:** amiodarone, bumetanide, midazolam, pantoprazole, vancomycin.
- **Y-Site Incompatibility:** diltiazem.

Patient/Family Teaching

- Advise patient to take medication once daily (unless biweekly regimens are used), as directed, and not to skip doses or double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy for tuberculosis depends on regimen being used and underlying disease states. Patients on short-term prophylactic therapy should also be advised of the importance of compliance with therapy.

R

Copyright © 2008 by F.A. Davis

- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) or of thrombocytopenia (unusual bleeding or bruising) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- Instruct patient to report the occurrence of flu-like symptoms (fever, chills, myalgia, headache) promptly.
- Rifampin may occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.
- Advise patient that this medication has teratogenic properties and may decrease the effectiveness of oral contraceptives. Counsel patient to use a nonhormonal form of contraception throughout therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decreased fever and night sweats.
- Diminished cough and sputum production.
- Negative sputum cultures.
- Increased appetite.
- Weight gain.
- Reduced fatigue.
- Sense of well-being in patients with tuberculosis.
- Prevention of meningococcal meningitis.
- Prevention of *H. influenzae* type B infection. Prophylactic course is usually short-term.

rifaximin (ri-**fax**-i-min)
Xifaxan

Classification
Therapeutic: anti-infectives
Pharmacologic: rifamycins

Pregnancy Category C

Indications

Travelers' diarrhea due to noninvasive strains of *Escherichia coli*.

Action

Inhibits bacterial RNA synthesis by binding to bacterial DNA-dependent RNA polymerase. **Therapeutic Effects:** Decreased severity of travelers' diarrhea. **Spectrum:** *Escherichia coli* (enterotoxigenic and enteroaggregative strains).

Pharmacokinetics

Absorption: Poorly absorbed (<0.4%), action is primarily in GI tract.
Distribution: 80–90% concentrated in gut.
Metabolism and Excretion: Almost exclusively excreted unchanged in feces.
Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rifaximin or other rifamycins; Diarrhea with fever or bloody stools; Diarrhea caused by other infections agents; Lactation.
Use Cautiously in: Pregnancy (use only benefits outweigh risk to fetus); Children <12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: dizziness. **GI:** PSEUDOMEMBRANOUS COLITIS.

Interactions

Drug-Drug: Although rifaximin induces the CYP3A4 enzyme system, since it is not absorbed, drug interactions are unlikely.

Route/Dosage

PO (Adults and Children ≥12 yr): 200 mg three times daily for 3 days.

Availability

Tablets: 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.
- ***Lab Test Considerations:*** May cause lymphocytosis, monocytosis, and neutropenia.

Potential Nursing Diagnoses

Diarrhea (Indications)
Risk for deficient fluid volume (Indications)

Copyright © 2008 by F.A. Davis

Implementation
- **PO:** Administer with or without food, 3 times daily for 3 days.

Patient/Family Teaching
- Instruct patient to take rifaximin as directed and to complete therapy, even if feeling better. Caution patient to stop taking rifaximin if diarrhea symptoms get worse, persist more than 24–48 hr, or are accompanied by fever or blood in the stool. Consult health care professional if these occur.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise female patients to notify health care professional if pregnant or if pregnancy is suspected.

Evaluation/Desired Outcomes
- Decreased severity of travelers' diarrhea.

risedronate (riss-**ed**-roe-nate)
Actonel

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Pregnancy Category C

Indications
Prevention and treatment of postmenopausal and corticosteroid-induced osteoporosis. Management of Paget's disease of bone in patients who: have a serum alkaline phosphatase level of at least twice normal, have symptoms, are at risk for complications. Increase bone mass in men with osteoporosis.

Action
Inhibits bone resorption by binding to bone hydroxyapatite, which inhibits osteoclast activity.
Therapeutic Effects: Reversal of the progression of osteoporosis with decreased fractures and other sequelae. Reduced bone turnover and resorption; normalization of serum alkaline phosphatase with reduced complications of Paget's disease.

Pharmacokinetics
Absorption: Rapidly but poorly absorbed following oral administration (0.63% bioavailability).
Distribution: 60% of absorbed dose distributes to bone.
Metabolism and Excretion: 40% of absorbed dose is excreted unchanged by kidneys; unabsorbed drug is excreted in feces.
Half-life: *Initial*—1.5 hr; *terminal*—220 hr (reflects dissociation from bone).

TIME/ACTION PROFILE (effects on serum alkaline phosphatase)

ROUTE	ONSET	PEAK	DURATION
PO	within days	30 days	up to 16 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypocalcemia; Lactation; Severe renal impairment (CCr <30 ml/min).
Use Cautiously in: History of upper GI disorders; Other disturbances of bone or mineral metabolism (correct abnormalities before initiating therapy); Dietary deficiencies (supplemental vitamin D and calcium may be required); OB, Pedi: Pregnancy or children (safety not established; use in pregnancy only if potential benefit justifies potential risks).

Adverse Reactions/Side Effects
CNS: weakness. **EENT:** amblyopia, conjunctivitis, dry eyes, eye pain/inflammation, tinnitus. **CV:** chest pain, edema. **GI:** abdominal pain, diarrhea, belching, colitis, constipation, dysphagia, esophagitis, esophageal ulcer, gastric ulcer, nausea. **Derm:** rash. **MS:** arthralgia, bone pain, leg cramps, myasthenia. **Misc:** flu-like syndrome.

Interactions
Drug-Drug: Concurrent use with **NSAIDs** or **aspirin** ↑ risk of GI irritation. Absorption is ↓ by **calcium supplements** or **antacids**.
Drug-Food: Food decreases absorption (administer at least 30 min before breakfast).

Route/Dosage
PO (Adults): *Postmenopausal Osteoporosis*—5 mg once daily; taken 30 min before breakfast *or* 35 mg once weekly; *or* 75 mg taken on two consecutive days for a total of 2 tablets each month; *Osteoporosis in Men*—35 mg once weekly; *Glucocorticoid-induced Osteoporosis*—5 mg daily; *Paget's disease*—30 mg once daily for 2 mo; taken 30 min before breakfast. Retreatment may be considered after 2 mo off therapy.

Copyright © 2008 by F.A. Davis

Availability

Tablets: 5 mg, 30 mg, 35mg, 75 mg. **Cost:** 5 mg $272.31/90, 30 mg $1,282.24/90, 35 mg $90.97/4, 75 mg $97.47/2. ***In combination with:*** **calcium carbonate**.

NURSING IMPLICATIONS

Assessment

- **Osteoporosis:** Assess patients via bone density study for low bone mass before and periodically during therapy.
- **Paget's disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- ***Lab Test Considerations:*** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient ↑ of calcium and phosphate.
- *Paget's disease:* Monitor alkaline phosphatase prior to and periodically during therapy to monitor effectiveness of therapy.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- **PO:** Administer first thing in the morning with 6–8 oz of plain water, 30 min prior to other medications, beverages, or food.
- Calcium-, magnesium-, or aluminum-containing agents may interfere with absorption of risedronate and should be taken at a different time of day with food.

Patient/Family Teaching

- Instruct patient on the importance of taking exactly as directed, first thing in the morning, 30 min prior to other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Risedronate should be taken with 6–8 oz of plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. Do not discontinue without consulting health care professional.
- Caution patients to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if she is nursing.

Evaluation/Desired Outcomes

- Reversal of the progression of osteoporosis with decreased fractures and other sequelae.
- Decrease in serum alkaline phosphatase and the progression of Paget's disease.

risperidone (riss-**per**-i-done)
Risperdal, Risperdal M-TAB, Risperdal Consta

Classification

Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: benzisoxazoles

Pregnancy Category C

Indications

Schizophrenia in adults and adolescents age 13–17 yrs. Bipolar mania (oral only) in adults and children 10–17 yrs in adults and children 10–17 yrs; can be used with lithium or valproate (adults only). Treatment of irritability associated with autistic disorder in children age 5–16 yrs.

Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of psychoses, bipolar mania, or autism.

Pharmacokinetics

Absorption: 70% after administration of tablets, solution or orally disintegrating tablets. Following IM administration, small initial release of drug, followed by 3-wk lag; the rest of release starts at 3 wk and lasts 4–6 wk.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver. Metabolism is genetically determined; extensive metabolizers (most patients) convert risperidone to 9-hydroxyrisperidone rapidly. Poor metabolizers (6–8% of whites) convert it more slowly. The 9-hydroxy-

Copyright © 2008 by F.A. Davis

risperidone is an antipsychotic compound. Risperidone and its active metabolite are renally eliminated.

Half-life: *Extensive metabolizers*—3 hr for risperidone, 21 hr for 9-hydroxyrisperidone. *Poor metabolizers*—20 hr for risperidone and 30 hr for 9-hydroxyrisperidone.

TIME/ACTION PROFILE (clinical effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	unknown	up to 6 wk†
IM	3 wk	4–6 wk	up to 6 wk†

†After discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Discontinue drug or bottle feed.

Use Cautiously in: Debilitated patients, patients with renal or hepatic impairment (initial dose reduction recommended); Underlying cardiovascular disease (may be more prone to arrhythmias and hypotension); History of seizures; History of suicide attempt or drug abuse; Diabetes or risk factors for diabetes (may worsen glucose control); Patients at risk for aspiration; OB, Pedi: Safety not established; Geri: Initial dosage reduction recommended. ↑ cardiovascular morbidity/mortality in elderly patients with dementia-related psychoses.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, aggressive behavior, dizziness, extrapyramidal reactions, headache, increased dreams, increased sleep duration, insomnia, sedation, fatigue, impaired temperature regulation, nervousness, tardive dyskinesia. **EENT:** pharyngitis, rhinitis, visual disturbances. **Resp:** cough, dyspnea. **CV:** arrhythmias, orthostatic hypotension, tachycardia. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, anorexia, dyspepsia, increased salivation, vomiting, weight gain, weight loss, polydipsia. **GU:** decreased libido, dysmenorrhea/menorrhagia, difficulty urinating, polyuria. **Derm:** itching/skin rash, dry skin, increased pigmentation, increased sweating, photosensitivity, seborrhea. **Endo:** galactorrhea, hyperglycemia. **MS:** arthralgia, back pain.

Interactions

Drug-Drug: May ↓ the antiparkinsonian effects of **levodopa** or other **dopamine agonists**. **Carbamazepine**, **phenytoin**, **rifampin**, **phenobarbital**, and other **enzyme inducers** ↑ metabolism and may ↓ effectiveness; dose adjustments may be necessary. **Fluoxetine** and paroxetine ↑ blood levels and may ↑ effects; dose adjustments may be necessary. **Clozapine** ↓ metabolism and may ↑ effects of risperidone. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antihistamines**, **sedative/hypnotics**, or **opioid analgesics**.

Drug-Natural Products: Kava kava, valerian or chamomile can ↑ CNS depression.

Route/Dosage

Schizophrenia

PO (Adults): 1 mg twice daily, increased by 1–2 mg/day no more frequently than every 24 hrs to 4–8 mg daily.

PO (Children 13–17 yrs): 0.5 mg once daily, increased by 0.5–1.0 mg no more frequently than every 24 hr to 3 mg daily. May administer half the daily dose twice daily if drowsiness persists.

IM (Adults): 25 mg every 2 wk; some patients may require larger dose of 37.5 or 50 mg every 2 wks.

Bipolar Mania

PO (Adults): 2–3 mg/day as a single daily dose, dose may be increased at 24–hr intervals by 1 mg (range 1–5 mg/day).

PO (Children 13–17 yrs): 0.5 mg once daily, increased by 0.5–1.0 mg no more frequently than every 24 hr to 2.5mg daily. May administer half the daily dose twice daily if drowsiness persists.

PO (Geriatric Patients or Debilitated Patients): Start with 0.5 mg twice daily; increase by 0.5 mg twice daily, up to 1.5 mg twice daily; then increase at weekly intervals if necessary. May also be given as a single daily dose after initial titration.

Irritability Associated with Autistic Disorder

PO (Children 5–16 yrs weighing <20 kg): 0.25 mg/day initially. After at least 4 days of therapy, may increase to 0.50 mg/day. Dose increases in increments of 0.25 mg/day may be considered at 2 wk or longer intervals. May be as a single or divided dose.

PO (Children 5–16 yrs weighing >20 kg): 0.50 mg/day initially. After at least 4 days of ther-

R

Copyright © 2008 by F.A. Davis

apy, may increase to 1.0 mg/day. Dose increases in increments of 0.5 mg/day may be considered at 2 wk or longer intervals. May be as a single or divided dose.

Renal Impairment

Hepatic Impairment

PO (Adults): Start with 0.5 mg twice daily; increase by 0.5 mg twice daily, up to 1.5 mg twice daily; then increase at weekly intervals if necessary. May also be given as a single daily dose after initial titration.

Availability

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** 0.25 mg $605.97/180, 0.5 mg $671.96/180, 1 mg $751.93/180, 2 mg $1,219.95/180, 3 mg $1,489.95/180, 4 mg $1,831.84/180. **Orally disintegrating tablets (Risperdal M-Tabs):** 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** 0.5 mg $122.93/28, 1 mg $138.95/28, 2 mg $130.68/28, 3 mg $148.49/28, 4 mg $194.02/28. **Oral solution:** 1 mg/ml in 30-ml bottles. **Cost:** $136.66/30 ml. **Microspheres for injection (Risperdal Consta) (requires specific diluent for suspension):** 12.5 mg/vial kit, 25 mg/vial kit, 37.5 mg/vial kit, 50 mg/vial kit.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Assess weight and BMI initially and throughout therapy. Obtain fasting blood glucose and cholesterol levels initially and throughout therapy.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure (sitting, standing, lying down) and pulse before and frequently during initial dose titration. May cause prolonged QT interval, tachycardia, and orthostatic hypotension. If hypotension occurs, dose may need to be decreased.
- Observe patient when administering medication to ensure medication is swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** May cause ↑ serum prolactin levels.
- May cause ↑ AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)
Risk for aspiration (Side Effects)

Implementation

- Do not confuse risperidone with reserpine.
- When switching from other antipsychotics, discontinue previous agents when starting risperidone and minimize the period of overlapping antipsychotic agents.
- If therapy is reinstituted after an interval off risperidone, follow initial titration schedule.
- For IM use, establish tolerance with oral dosing before IM use and continue oral dosing for 3 wk following initial IM injection. Do not increase dose more frequently than every 4 wks.
- **PO:** Daily doses can be taken in the morning or evening.
- For orally disintegrating tablets, open blister pack by pealing back foil to expose tablet; do not try to push tablet through foil. Use dry hands to remove tablet from blister and immediately place entire tablet on tongue. Tablets disintegrate in mouth within seconds and can be swallowed with or without liquid. Do not attempt to split or chew tablet. Do not try to store tablets once removed from blister.
- Oral solution can be mixed with water, coffee, orange juice, or low fat milk; do not mix with cola or tea.
- **IM:** Reconstitute with 2 ml of diluent provided by manufacturer. Administer via deep gluteal injection using enclosed safety needle; al-

Copyright © 2008 by F.A. Davis

ternate buttocks with each injection. Allow solution to warm to room temperature prior to injection. Administer immediately after mixed with diluent; shake well to mix suspension. Must be administered within 6 hr of reconstitution. Store dose pack in refrigerator.
- Do not combine dose strengths in a single injection.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and OTC medications or herbal products without consulting health care professional.
- Refer as appropriate for nutrition/weight management and medical management.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breastfeeding or planning to breastfeed.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, or tremors occur.
- Emphasize the importance of routine follow up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.
- Refer to local support group.

Evaluation/Desired Outcomes
- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decreased aggression toward others, deliberate self—injury, temper tantrums, and mood changes in children with autism.
- Decrease in negative symptoms (social withdrawal, flat, blunted affects) of schizophrenia.

ritonavir (ri-**toe**-na-veer)
Norvir

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Pregnancy Category B

Indications
HIV infection (with other antiretrovirals).

Action
Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics
Absorption: Appears to be well absorbed after oral administration.
Distribution: Poor CNS penetration.
Protein Binding: 98–99%.
Metabolism and Excretion: Highly metabolized by the liver (by P450 CYP3A and CYP2D6 enzymes); one metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.
Half-life: 3–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr*	12 hr

*Nonfasting

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of alprazolam, alfuzosin, amiodarone, bupropion, clorazepate, clozapine, diazepam, dihydroergotamine, encainide, ergotamine, estazolam, flecainide, flurazepam, fluticasone (inhalation), meperidine, midazolam, pimozide, piroxicam, propafenone, propoxyphene, quinidine, rifabutin, triazolam, or zolpidem; Hypersensitivity or intolerance to alcohol or castor oil (present in capsules and liquid).

Copyright © 2008 by F.A. Davis

Use Cautiously in: Impaired hepatic function, history of hepatitis; Diabetes mellitus; Hemophilia (increased risk of bleeding); OB, Pedi: Pregnancy, lactation, or children <12 yr (safety not established; breast feeding not recommended in HIV-infected patients).

Adverse Reactions/Side Effects

CNS: SEIZURES, abnormal thinking, weakness, dizziness, headache, malaise, somnolence, syncope. **EENT:** pharyngitis, throat irritation. **Resp:** ANGIOEDEMA, bronchospasm. **CV:** orthostatic hypotension, vasodilation. **GI:** abdominal pain, altered taste, anorexia, diarrhea, nausea, vomiting, constipation, dyspepsia, flatulence. **GU:** renal insufficiency. **Derm:** rash, skin eruptions, sweating, urticaria. **Endo:** hyperglycemia. **F and E:** dehydration. **Metab:** hyperlipidemia. **MS:** increased creatine phosphokinase, myalgia. **Neuro:** circumoral paresthesia, peripheral paresthesia. **Misc:** hypersensitivity reactions including STEVENS-JOHNSON SYNDROME and ANAPHYLAXIS, fat redistribution, fever.

Interactions

Drug-Drug: Produces large ↑ in blood levels and effects of **amiodarone**, **alfuzosin**, **bupropion**, **clozapine**, **encainide**, **flecainide**, **fluticasone (inhalation)**, **meperidine**, **piroxicam**, **propafenone**, **propoxyphene**, **quinidine**, and **rifabutin**; because of the increased risk of serious arrhythmias, hematologic toxicity, hypotension, corticosteroid effects or seizures, these agents should not be used with ritonavir. Ergot toxicity may occur with concurrent use of **ergotamine** or **dihydroergotamine**; concurrent use should be avoided. Should not be used with **pimozide**. ↑ blood levels and the risk of excessive sedation and/or respiratory depression from **alprazolam**, **clorazepate**, **diazepam**, **estazolam**, **flurazepam**, **midazolam**, **triazolam**, and **zolpidem**; concurrent use should be avoided. May also increase blood levels and effects of some **opioid analgesics (alfentanil**, **fentanyl**, **hydrocodone**, **oxycodone)**, **tramadol**; some **NSAIDs (diclofenac**, **ibuprofen**, **indomethacin)**; some **antiarrhythmics (disopyramide**, **lidocaine**, **mexiletine)**; some **anti-infectives (clarithromycin**, **erythromycin)**; many **antidepressants (amitriptyline**, **clomipramine**, **desipramine**, **imipramine**, **nortriptyline**, **nefazodone**, **sertraline**, **trazodone**, **fluoxetine**, **paroxetine**, **venlafaxine)**; some **antiemetics (dronabinol**, **ondansetron)**; some **beta blockers (metoprolol**, **pindolol**, **propranolol**, **timolol)**; many **calcium channel blockers (amlodipine**, **diltiazem**, **felodipine**, **isradipine**, **nicardipine**, **nifedipine**, **nimodipine**, **nisoldipine**, **verapamil)**; some **antineoplastics (etoposides**, **paclitaxel**, **tamoxifen**, **vinblastine**, **vincristine)**; some **corticosteroids (dexamethasone**, **prednisone)**, most **HMG CoA reductase inhibitors**; some **immunosuppressants (cyclosporine**, **tacrolimus)**; some **antipsychotics (chlorpromazine**, **haloperidol**, **perphenazine**, **risperidone**, **thioridazine)**; and also **quinidine**, **saquinavir**, **methamphetamine**, and **warfarin**. Dosage ↓ may be necessary. ↓ blood levels and effects of **hormonal contraceptives**, **zidovudine**, and **theophylline**; dose alteration or alternative therapy may be necessary. Levels may be ↑ by **clarithromycin** or **fluoxetine**.

Drug-Natural Products: St. John's wort decreases levels and may promote resistance.

Drug-Food: Food ↑ absorption.

Route/Dosage

PO (Adults): 300 mg twice daily for 1 day, then 400 mg twice daily for 3 days, then 500 mg twice daily for 1 day, then 600 mg twice daily as maintenance.

PO (Children): 250 mg/m^2 twice daily initially; increase by 50 mg/m^2 twice daily q 2–3 days up to 400 mg/m^2 twice daily (if unable to get up to 400 mg/m^2 twice daily, additional antiretroviral therapy is required).

Availability

Capsules: 100 mg. **Oral solution:** 600 mg/7.5 ml (80 mg/ml) in 240-ml bottles.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- May cause hyperglycemia.
- May cause ↑ serum AST, ALT, GGT, total bilirubin, CPK, triglycerides, and uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

Copyright © 2008 by F.A. Davis

Implementation

- Do not confuse with Retrovir (zidovudine).
- **PO:** Administer with a meal or light snack.
- Oral powder may be mixed with chocolate milk, Ensure, or Advera within 1 hr of dosing to improve taste. Capsules should be stored in the refrigerator and protected from light. Use calibrated oral dosing syringe for oral solution. Oral solution does not require refrigeration if used within 30 days and stored below 77°F in the original container. Keep cap tightly closed.
- If nausea occurs on dose of 600 mg twice daily, may titrate by 300 mg twice daily for 1 day, then 400 mg twice daily for 2 days, then 500 mg twice daily for 1 day, then 600 mg twice daily thereafter.
- Patients initiating concurrent therapy with nucleoside analogues may have less GI intolerance by initiating ritonavir for 2 wk and then adding the nucleoside analogue.

Patient/Family Teaching

- Emphasize the importance of taking ritonavir exactly as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that ritonavir should not be shared with others.
- Advise patient to avoid taking other medications, prescription or OTC, without consulting health care professional.
- Inform patient that ritonavir does not cure AIDS or prevent associated or opportunistic infections. Ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of ritonavir are unknown at this time.
- Inform patient that ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during ritonavir therapy.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

rituximab (ri-tux-i-mab)
Rituxan

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

R

Indications

Treatment of low-grade or follicular, CD20-positive, B-cell non-Hodgkin's lymphoma alone, with, or following treatment with cyclophosphamide, vincristine, and prednisolone (CVP). Moderately to severely active rheumatoid arthritis with methotrexate in patients who have had an inadequate response to one of more TNF antagonist therapies.

Action

Binds to the CD20 antigen on the surface of lymphoma cells, preventing the activation process for cell cycle initiation and differentiation.
Therapeutic Effects: Death of lymphoma cells. Reduced signs and symptoms of rheumatoid arthritis.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Binds specifically to CD20 binding sites on lymphoma cells.
Metabolism and Excretion: Unknown.
Half-life: 59.8–174 hr (depending on tumor burden).

Copyright © 2008 by F.A. Davis

TIME/ACTION PROFILE (B-cell depletion)

ROUTE	ONSET	PEAK	DURATION
IV	within 14 days	3–4 wk	6–9 mo†

†Duration of depletion after 4 wk of treatment

Contraindications/Precautions

Contraindicated in: Hypersensitivity to murine (mouse) proteins; OB: Can pass placental barrier potentially causing fetal B-cell depletion. Give only if clearly needed; Lactation: Potential for immunosuppresion in infant. Discontinue nursing.

Use Cautiously in: Pre-existing bone marrow depression; Hepatitis B infection (may reactivate infection during and for several months after treatment); Systemic lupus erythematosus (may cause fatal progressive multifocal leukoencephalopathy); HIV infection (may increase risk of HIV-associated lymphoma); Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: headache. **Resp:** bronchospasm, cough, dyspnea. **CV:** ARRHYTHMIAS, hypotension, peripheral edema. **GI:** abdominal pain, altered taste, dyspepsia. **Derm:** MUCOCUTANEOUS SKIN REACTIONS, flushing, urticaria. **Endo:** hyperglycemia. **F and E:** hypocalcemia. **Hemat:** ANEMIA, NEUTROPENIA, THROMBOCYTOPENIA. **MS:** arthralgia, back pain. **Misc:** allergic reactions including ANAPHYLAXIS and ANGIOEDEMA, infections, INFUSION REACTIONS, TUMOR LYSIS SYNDROME, fever/chills/rigors (infusion related).

Interactions

Drug-Drug: None known.

Route/Dosage

Relapsed or refractory, low-grade or follicular, CD20–positive, B-cell Non-hogkins lymphoma

IV (Adults): 375 mg/m^2 once weekly for 4–8 doses.

Retreatment Therapy

IV (Adults): 375 mg/m^2 once weekly for 4 doses.

Previously untreated follicular, CD20–positive, B-cell Non-hogkins lymphoma

IV (Adults): 375 mg/m^2 given on Day 1 of each cycle of CVP for up to 8 doses.

Previously untreated low-grade, CD20–positive, B-cell Non-hogkins lymphoma

IV (Adults): For patients who have not progressed following 6–8 cycles of CVP chemotherapy, 375 mg/m^2 given once weekly for 4 doses given every 6 months for up to 16 doses.

Diffuse Large B-cell Non-hogkins lymphoma

IV (Adults): 375 mg/m^2 given on Day 1 of each cycle of CVP for up to 8 infusions.

Rheumatoid Arthritis

IV (Adults): Two 1000 mg separated by 2 wks.

Availability

Solution for injection (requires dilution): 10 mg/ml in 100 mg and 500-mg vials.

NURSING IMPLICATIONS

Assessment

- Monitor patient for fever, chills/rigors, nausea, urticaria, fatigue, headache, pruritus, bronchospasm, dyspnea, sensation of tongue or throat swelling, rhinitis, vomiting, hypotension, flushing, and pain at disease sites. These infusion-related events occur frequently within 30 min–2 hr of beginning first infusion and may resolve with slowing or discontinuing infusion and treatment with IV saline, diphenhydramine, and acetaminophen. Patients with increased risk (females, patients with pulmonary infiltrates, chronic lymphocytic leukemia, or mantle cell leukemia) may have more severe reactions, which may be fatal. Signs of severe reactions include hypotension, angioedema, hypoxia, or bronchospasm and may require interruption of infusion. May result in pulmonary infiltrates, adult respiratory distress syndrome, MI, ventricular fibrillation, and cardiogenic shock. Monitor closely. Incidence decreases with subsequent infusions.
- Monitor patient for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia) usually occurring 12–24 hr after first infusion. Risks are higher in patients with greater tumor burden; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Assess patient for hypersensitivity reactions (hypotension, bronchospasm, angioedema)

Copyright © 2008 by F.A. Davis

during administration. May respond to decrease in infusion rate. Premedication with diphenhydramine and acetaminophen is recommended. Treatment includes diphenhydramine, acetaminophen, bronchodilators, or IV saline as indicated. Epinephrine, antihistamines, and corticosteroids should be readily available in the event of a severe reaction. If severe reactions occur, discontinue infusion; may be resumed at 50% of the rate when symptoms have resolved completely.

- Monitor ECG during and immediately after infusion in patients with pre-existing cardiac conditions (arrhythmias, angina) or patients who have developed arrhythmias during previous infusions of rituximab. Life-threatening arrhythmias may occur.
- ***Lab Test Considerations:*** Monitor CBC and platelet count regularly during therapy and frequently in patients with blood dyscrasias. May cause anemia, thrombocytopenia, or neutropenia.
- Frequently causes B-cell depletion with an associated ↓ in serum immunoglobulins in a minority of patients; does not appear to cause an increased incidence of infection.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Implementation

- Transient hypotension may occur during infusion; antihypertensive medications may be held for 12 hr before infusion.
- **Rheumatoid Arthritis:** Administer 100 mg methylprednisolone Iv or equivalent 30 min prior to each infusion to minimize infusion reactions.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 1–4 mg/ml. Gently invert bag to mix. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion remaining in vial. Solution is stable for 12 hr at room temperature and for 24 hr if refrigerated. ***Rate:*** Do not administer as an IV push or bolus.
- *First infusion:* Administer at an initial rate of 50 mg/hr. If hypersensitivity or infusion-related events do not occur, rate may be escalated in 50 mg/hr increments every 30 min to a maximum of 400 mg/hr.
- *Subsequent infusions:* May be administered at an initial rate of 100 mg/hr and increased by 100-mg/hr increments at 30-min intervals to a maximum of 400 mg/hr.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Inform patient of the purpose of the medication.
- Advise patient to report infusion-related events or symptoms of hypersensitivity reactions immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to use contraception throughout therapy.
- Advise patient to consult health care professional prior to receiving any vaccinations.

Evaluation/Desired Outcomes

- Decrease in spread of malignancy.
- Reduced signs and symptoms of rheumatoid arthritis.

rivastigmine

(rye-va-**stig**-meen)
Exelon, Exelon Patch

Classification

Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Pregnancy Category B

Indications

PO: Mild to moderate dementia associated with Alzheimer's disease. **Transdermal:** Treatment

Copyright © 2008 by F.A. Davis

of mild to moderate dementia associated with Alzheimer's disease and Parkinson's disease.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. Does not cure the disease. **Therapeutic Effects:** Decreased dementia (temporary) associated with Alzheimer's disease and Parkinson's disease. Enhanced cognitive ability.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Transdermal patch is slowly absorbed over 8 hrs.
Distribution: Widely distributed.
Metabolism and Excretion: Rapidly and extensively metabolized by the liver; metabolites are excreted by the kidneys.
Half-life: *PO*—1.5 hr; *Transdermal*—24 hr.

TIME/ACTION PROFILE (improvement in dementia)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	up to 12 wk	unknown
transdermal	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rivastigmine or other carbamates.
Use Cautiously in: History of asthma or obstructive pulmonary disease; History of GI bleeding; Sick sinus syndrome or other supraventricular cardiac conduction abnormalities; **Transdermal:** Patients weighing <50 kg; at risk for ↑ adverse reactions; OB, Pedi: Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

CNS: weakness, dizziness, drowsiness, headache, sedation (unusual). **CV:** edema, heart failure, hypotension. **GI:** anorexia, dyspepsia, nausea, vomiting, abdominal pain, diarrhea, flatulence, weight gain (unusual). **Neuro:** tremor. **Misc:** fever, weight loss.

Interactions

Drug-Drug: Nicotine use may increase metabolism and decrease blood levels.

Route/Dosage

PO (Adults): 1.5 mg twice daily initially; after at least 2 weeks, dose may be increased to 3 mg twice daily. Further increments may be made at 2-week intervals up to 6 mg twice daily.

Transdermal (Adults): *Initial Dose*—One patch 4.6 mg/24 hr intially. After a minimum of 4 wks; *Maintenance Dose*—With good tolerability, may increase to one patch 9.5 mg/24.

Availability

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg. **Oral Solution:** 2 mg/ml in 120-ml bottle. **Transdermal Patch:** 4.6 mg/24 hr, 9.5 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically throughout therapy.
- Monitor patient for nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.

Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired environmental interpretation syndrome (Indications)
Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- Rivastigmine oral solution and capsules may be interchanged at equal doses.
- Patients switching from oral doses of <6 mg to transdermal doses should use 4.6 mg/24 hr patch. Patients taking oral doses of 6 mg–12 mg may be converted directly to 9.5 mg/24 hr patch. Apply patch on the day following the last oral dose.
- **PO:** Administer in the morning and evening with food.
- Oral solution may be administered directly from syringe provided or mixed with a small glass of water, cold fruit juice, or soda. Mixture should be stirred prior to drinking. Ensure patient drinks entire mixture. Oral solution is stable for 4 hours at room temperature when mixed with cold fruit juice or soda. Do not mix with other solutions. **Transdermal:** Apply patch to clean, dry, hairless area that will not be rubbed by tight clothing. Upper or lower back is recommended, may also use upper arm or chest. Do not apply to red, irritated or cut skin. Rotate sites to prevent irritation, do not use same site within 14 days. Remove adhesive liner and apply by pressing patch firmly until edges stick well. May be worn during bathing and hot weather. Each 24 hrs, remove old patch and discard by folding in half and apply new patch to a new area.

Copyright © 2008 by F.A. Davis

Patient/Family Teaching

- **PO:** Emphasize the importance of taking rivastigmine at regular intervals as directed.
- Explain to patient and caregiver how to use oral dosing syringe provided with oral solution. Remove syringe from protective case and push down and twist child resistant closure to open bottle. Insert syringe into opening in white stopper in bottle. Hold the syringe and pull plunger to the level corresponding to the prescribed dose. Before removing syringe from bottle, push out larger bubbles (small bubbles will not alter dose) by moving plunger up and down a few times. After large bubbles are gone, move plunger to level of dose. Remove syringe from bottle.
- **Transdermal:** Instruct patient and caregiver on the correct application, rotation, and discarding of patch. Patch should be folded in half and discarded out of reach of children and pets; medication remains in discarded patch. Replace missed doses immediately and apply next patch at usual time. Advise patient and caregiver to avoid contact with eyes and to wash hands after applying patch. Avoid exposure to heat sources (excessive sunlight, saunas, heating pads) for long periods.
- Caution patient and caregiver that rivastigmine may cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, or weight loss occur. If adverse effects become intolerable during treatment with *transdermal patch,* instruct patient to discontinue patches for several days and then restart at same or next lower dose level. If treatment is interrupted for more than several days, lowest dose level should be used when restarting and titrate according to Route and Dosage section.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient and caregivers that improvement in cognitive functioning may take weeks to months and that the degenerative process is not reversed.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.
- Improvement in cognitive function and overall functioning in patients with Parkinson's disease.

rizatriptan (riz-a-**trip**-tan)
Maxalt, Maxalt-MLT

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Pregnancy Category C

Indications
Acute treatment of migraine headache.

Action
Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics
Absorption: Completely absorbed after oral administration, but first-pass metabolism results in 45% bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized by monoamine oxidase-A (MAO-A); minor conversion to an active compound; 14% excreted unchanged in urine.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–1.5 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Ischemic or vasospastic cardiovascular, cerebrovascular, or peripheral vascular syndromes; History of significant cardiovascular disease;

Copyright © 2008 by F.A. Davis

Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy; Phenylketonuria (orally disintegrating tablet contains aspartame).
Use Cautiously in: Severe renal impairment, especially in patients on dialysis; Moderate hepatic impairment; Pregnancy, lactation, or children <18 yr (safety not established).
Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, weakness. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, chest pain, myocardial ischemia. **GI:** dry mouth, nausea. **Misc:** hypersensitivity reactions including ANGIOEDEMA, toxic epidermal necrolysis, pain.

Interactions

Drug-Drug: Concurrent use with **MAO-A inhibitors** ↑ blood levels and adverse reactions (concurrent use or use within 2 wk or MAO inhibitor is contraindicated). Concurrent use with other **5-HT agonists** or **ergot-type compounds (dihydroergotamine)** may result in ↑ vasoactive properties (avoid use within 24 hr of each other). **Propranolol** ↑ blood levels and risk of adverse reactions (dosage reduction recommended). Concurrent use with **SSRI antidepressants** may result in weakness, hyperreflexia, and incoordination.
Drug-Natural Products: Increased risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 5–10 mg (use 5-mg dose in patients receiving propranolol); may be repeated in 2 hr; not to exceed 3 doses/24 hr. Dose is same for both types of tablets.

Availability

Tablets: 5 mg, 10 mg. **Cost:** 5 mg $107.44/6, 10 mg $231.99/12. **Orally disintegrating tablets (Maxalt-MLT) (peppermint flavor):** 5 mg, 10 mg. **Cost:** 5 mg $116.58/6, 10 mg $113.99/6.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets should be swallowed whole with liquid.
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.

Patient/Family Teaching

- Inform patient that rizatriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer rizatriptan as soon as symptoms of a migraine attack appear, but it may be administered at any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 30 mg in any 24-hr period.
- If first dose does not relieve headache, additional rizatriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take rizatriptan within 24 hr of other vascular headache suppressants.
- Advise patient that lying down in a darkened room after rizatriptan administration may further help relieve headache.
- Caution patient not to use rizatriptan if she is pregnant, suspects she is pregnant, plans to become pregnant, or is breastfeeding. Adequate contraception should be used during therapy.
- Advise patient to notify health care professional before next dose of rizatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or

Copyright © 2008 by F.A. Davis

sickness develop, discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during rizatriptan use.

Evaluation/Desired Outcomes
- Relief of migraine attack.

ropinirole (roe-pin-i-role)
Requip

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications
Management of signs and symptoms of idiopathic Parkinson's disease. Restless legs syndrome.

Action
Stimulates dopamine receptors in the brain.
Therapeutic Effects: Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics
Absorption: 55% absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (by cytochrome P450 CYP1A2 enzyme system); <10% excreted unchanged in urine.
Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Geri: ↑ risk of hallucinations in patients >65 yr; Hepatic impairment (slower titration may be required); Severe cardiovascular disease; OB, Pedi: Pregnancy, lactation, or children (safety not established; may inhibit lactation).

Adverse Reactions/Side Effects
CNS: SLEEP ATTACKS, dizziness, syncope, confusion, drowsiness, fatigue, hallucinations, headache, increased dyskinesia, weakness. **EENT:** abnormal vision. **CV:** orthostatic hypotension, peripheral edema. **GI:** constipation, dry mouth, dyspepsia, nausea, vomiting. **Derm:** increased sweating.

Interactions
Drug-Drug: Drugs that alter the activity of cytochrome P450 CYP1A2 enzyme system may affect the activity of ropinirole. Effects may be ↑ by **estrogens**. Effects may be ↓ by **phenothiazines**, **butyrophenones**, **thioxanthenes**, or **metoclopramide**. May ↑ effects of **levodopa** (may allow dose reduction of levodopa).

Route/Dosage
PO (Adults): *Parkinson's disease*—0.25 mg 3 times daily for 1 wk, then 0.5 mg 3 times daily for 1 wk, then 0.75 mg 3 times daily for 1 wk, then 1 mg 3 times daily for 1 wk; then may increase by 1.5 mg/day every wk, up to 9 mg/day; then may increase by up to 3 mg/day every wk up to 24 mg/day. *Restless legs syndrome*—0.25 mg once daily initially, 1 to 3 hours before bedtime. After 2 days, increase to 0.5 mg once daily and to 1 mg once daily by the end of first week of dosing, then increase by 0.5 mg weekly, up to 4 mg/day as needed/tolerated.

Availability
Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg. **Cost:** 0.25 mg $569.92/270, 0.5 mg $569.92/270, 1 mg $568.84/270, 2 mg $575.94/270, 3 mg $638.87/270, 4 mg $638.87/270, 5 mg $639.98/270.

NURSING IMPLICATIONS

Assessment
- Assess blood pressure periodically during therapy.
- Assess patient for drowsiness and sleep attacks. Drowsiness is a common side effect of ropinirole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum ropinirole levels (see Interactions). May require discontinuation of therapy.

R

Copyright © 2008 by F.A. Davis

- **Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- **Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.
- ***Lab Test Considerations:*** May cause ↑ BUN.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- **PO:** May be administered with or without food. Administration with food may decrease nausea.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as possible, but not if almost time for next dose. Do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to avoid alcohol and other CNS depressants concurrently with ropinirole.
- Advise patient that increasing fluids, sugarless gum or candy, ice, or saliva substitutes may help minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

ropivacaine, See EPIDURAL LOCAL ANESTHETICS.

rosiglitazone

(roe-zi-**glit**-a-zone)
Avandia

Classification
Therapeutic: antidiabetics
Pharmacologic: thiazolidinediones

Pregnancy Category C

Indications

Type 2 diabetes mellitus (with diet and exercise); may be used with metformin, sulfonylureas or insulin.

Action

Improves sensitivity to insulin by acting as an agonist at receptor sites involved in insulin responsiveness and subsequent glucose production and utilization. Requires insulin for activity.
Therapeutic Effects: Decreased insulin resistance, resulting in glycemic control without hypoglycemia.

Pharmacokinetics

Absorption: Well absorbed (99%) following oral administration.
Distribution: Unknown.
Protein Binding: 99.8% bound to plasma proteins.
Metabolism and Excretion: Entirely metabolized by the liver.
Half-life: 3.2–3.6 hr (increased in liver disease).

TIME/ACTION PROFILE (effects on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Diabetic ketoacidosis; Clinical evidence of active liver disease or increased ALT (>2.5 times upper limit of normal); Renal disease or dysfunction (creatinine over 1.5 mg/dL in males or 1.4 mg/dL in females; OB, Lactation: Potential for fetal or infant harm. Insulin monotherapy should be used.; Pedi: Safety and effectiveness not established.
Use Cautiously in: Edema; CHF (avoid use in moderate to severe CHF unless benefits outweigh risks); Concurrent use with insulin (may increase risk of adverse cardiovascular reactions); Hepatic impairment; OB: May restore ovulation and risk of pregnancy in premenopausal women; Geri: Dose reduction and careful titration recommended due to age-related

Copyright © 2008 by F.A. Davis

decline in renal function. Avoid maximum dose. Should not be given to patients older than 80 yr.

Adverse Reactions/Side Effects

CV: CHF, edema. **EENT:** new onset and worsening diabetic macular edema. **Derm:** urticaria. **GI:** hepatitis, ↑ liver enzymes. **Hemat:** anemia. **Metab:** **LACTIC ACIDOSIS**, ↑ total cholesterol, LDL and HDL, weight gain. **Misc:** ANGIOEDEMA (rare), fractures (arm, hand, foot) in female patients.

Interactions

Drug-Drug: Concurrent use with **rifampin** ↓ levels and may ↓ effectiveness. **Gemfibrozil** ↑ levels and may ↑ risk of hypoglycemia (↓ dose of rosiglitazone).

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

PO (Adults): 4 mg as a single dose once daily or 2 mg twice daily; after 8 weeks, may be increased if necessary to 8 mg once daily or 4 mg twice daily.

Availability

Tablets: 2 mg, 4 mg, 8 mg. **Cost:** 2 mg $218.99/90, 4 mg $338.96/90, 8 mg $575.95/90. ***In combination with:*** metformin (Avandamet), glimepiride (Avandaryl). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemia (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess patient for edema and signs of CHF (dyspnea, rales/crackles, peripheral edema, weight gain, jugular venous distension). May require discontinuation of rosiglitazone.
- Assess patient for signs of lactic acidosis (malaise, myalgias, respiratory distress, somnolence, nonspecific abdominal distress).
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.
- Monitor CBC with differential periodically during therapy. May cause ↓ in hemoglobin, hematocrit, and WBC, usually during the first 4–8 wk of therapy; then levels stabilize.
- Monitor AST and ALT prior to initiating therapy and periodically thereafter or if jaundice or symptoms of hepatic dysfunction occur. May cause irreversible ↑ in AST and ALT or hepatic failure (rare). If ALT increases to >3 times the upper limit of normal, recheck ALT promptly. Discontinue rosiglitazone if ALT remains >3 times normal.
- May cause ↑ in total cholesterol, LDL, and HDL and ↓ in free fatty acids.
- Monitor renal function tests prior to initiating therapy and periodically thereafter (BUN, creatinine, creatinine clearance), especially in older adults.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered with or without meals.

Patient/Family Teaching

- Instruct patient to take medication as directed. If dose for 1 day is missed, do not double dose the next day.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional immediately if signs of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine, jaundice), CHF,

Copyright © 2008 by F.A. Davis

or lactic acidosis (malaise, myalgias, respiratory distress, somnolence, nonspecific abdominal distress, hypothermia, hypotension, and bradyarrhythmias) occur.
- Advise patient to inform health care professional of medication regimen prior to treatment, studies using IV contrast, or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.
- OB: Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients that higher doses of oral contraceptives or a form of contraception other than oral contraceptives may be required and to notify health care professional promptly if pregnancy is planned or suspected.

Evaluation/Desired Outcomes
- Control of blood glucose levels.

rosuvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

rotigotine transdermal system (ro-ti-go-teen)
Neupro

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications
Symptomatic management of early-stage idiopathic Parkinson's disease.

Action
Acts as an agonist of dopamine in the CNS, primarily at D2 receptor sites. **Therapeutic Effects:** Improvement in symptoms of Parkinson's disease.

Pharmacokinetics
Absorption: 45% absorbed from patch over 24 hr.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized and excreted in urine as metabolites (71%); 11% excreted in feces.
Half-life: Biphasic: initial half-life 3 hr; terminal half-life 5–7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
transdermal	1–3 hr	15–18 hr (rage 4–27 hr)	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to rotigotine or sulfites; OB: Lactation.
Use Cautiously in: Severe cardiovascular disease (may increase risk of postural hypotension); Severe hepatic impairment; Geri: Skin changes in patients >80 yr may result in higher blood levels; OB: use only if maternal benefits outweigh risk to fetus; Pedi: Safe use in children not established.

Adverse Reactions/Side Effects
CNS: DROWSINESS, insomnia, confusion, dizziness, hallucinations, headache, malaise, sudden sleep attacks. **CV:** peripheral edema, postural hypotension, syncope. **GI:** nausea, vomiting, anorexia, dry mouth, dyspepsia, ↑ liver enzymes. **GU:** urinary incontinence. **Derm:** application site reactions, ↑ risk of melanoma, ↑ sweating, pruritus, purpura. **Metab:** weight gain. **MS:** leg pain. **Neuro:** abnormal gait, ataxia, dyskinesia, hypertonia, hypoesthesia, neuralgia, paresthesia. **Misc:** fever.

Interactions
Drug-Drug: Concurrent use of **dopamine antagonists** including some **antipsychotics** or **metoclopramide** may ↓ effectiveness.

Route/Dosage
Transdermal (Adults): 2 mg/24 hr initially, may increase by 2 mg/24 hr weekly, up to 6 mg/24 hr.

Availability
Transdermal system: 2 mg/24 hr (contains 4.5 mg rotigotine/10 cm^2), 4 mg/24 hr (contains 9 mg rotigotine/20 cm^2), 6 mg/24 hr (contains 13.5 mg rotigotine/30 cm^2).

NURSING IMPLICATIONS

Assessment
- Assess for allergy to sulfite, may be more common in asthmatics.
- Assess frequently for drowsiness, a common side effect of rotigotine. Episodes of falling asleep during activities that require active participation may occur without warning. Pa-

Copyright © 2008 by F.A. Davis

tients may not acknowledge drowsiness unless directly questioned about drowsiness during specific activities. May occur as late as i year after initiation of therapy. Assess patient for concomitant medications that have sedating effects. May require discontinuation of therapy.

- Monitor blood pressure, sitting and standing, periodically during therapy, especially during dose escalation. May also cause syncope.
- Assess for application site reactions (erythema, edema, pruritus). If persistent, (more than a few days), increasing in severity, or spreading outside application site, determine risk/benefit ratio. If generalized skin reaction (allergic macular-papular rash) occurs, discontinue rotigotine.
- Assess for hallucinations. May require discontinuation.
- Monitor for weight gain; usually associated with peripheral edema.
- Assess for development of new or increased gambling urges, sexual urges, or other urges during therapy.
- ***Lab Test Considerations:*** May cause ↓ hemoglobin and serum albumin and glucose levels.
- May cause ↑ BUN and GGT levels.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Adverse Reactions)

Implementation

Transdermal: Apply once daily to clean, dry, intact skin on abdomen, thigh, hip, flank, shoulder, or upper arm. Hold in place for 20–30 seconds to make sure of good contact, especially around edges. If applied to hairy area, shave area at least 3 days prior to application. Do not apply to areas that could be rubbed by tight clothing, are under a waistband, or to skin folds. Do not apply to skin that is red, irritated, or impaired. Do not apply creams, lotions, ointments, oils, or powders to skin areas where patch will be placed. Wash hands following application to remove any drug and do not touch eyes. Rotate patch site daily; do not use same application site more than once every 14 days. Do not cut or damage patch. Remove patch slowly and carefully to avoid irritation. Fold over so it sticks to itself and discard. Wash application site with soap and water to remove drug or adhesive. May use baby or mineral oil to remove excess residue. Avoid using alcohol or other solvents, may cause skin irritation. If therapy is discontinued, decrease gradually by 2 mg/24 hrs every other day until complete withdrawal.

Patient/Family Teaching

- Instruct patient on proper method of patch application. Advise patient to wear patch continuously for 24 hrs and to apply system at the same time each day; if patch change is missed, apply as soon as possible and replace at usual time the following day. Patients may bathe, shower or swim with patch on. If patch falls off, apply a new on immediately to a different site and change according to regular schedule. Do not stop therapy without consulting health care professional. withdrawal.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to notify health care professional if application site reaction occurs.
- Inform patient that rotigotine may cause hallucinations.
- Advise patient to remove rotigotine patch prior to magnetic resonance imaging or cardioversion.
- Caution patient to avoid exposing patch to external heat (heating pad, electric blanket, heat lamp, sauna, hot tub, heated water bed, prolonged direct sunlight).
- Advise patient to consult health care professional porior to taking other Rx, OTC, or herbal products or alcohol.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Advise patient to notify health care professional if they experience new or increased gambling, sexual or other intense urges during therapy. May require discontinuation.
- Advise patient to have health care professional check their skin for skin cancer regularly due to increase risk of melanoma.

Evaluation/Desired Outcomes

- Improvement in signs and symptoms of early-stage Parkinson's disease.

magnesium salicylate
(mag-**neez**-ee-um sal-**i**-sil-ate)
Doan's Backache Pills, Doan's Regular Strength Tablets, Magan, Mobidin

salsalate (**sal**-sa-late)
Amigesic, Anaflex, Disalcid, Marthritic, Mono-Gesic, Salflex, Salgesic, Salsitab

sodium salicylate
(**soe**-dee-yum sal-**i**-sil-ate)
Dodd's Extra Strength, Dodd's Pills, Gin Pain Pills

Classification
Therapeutic: antipyretics, nonopioid analgesics
Pharmacologic: salicylates

Pregnancy Category D (aspirin–first trimester), C (magnesium salicylate, salsalate–first trimester)

Indications

Inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain. Fever. **Aspirin:** Prophylaxis of transient ischemic attacks and MI.

Action

Produce analgesia and reduce inflammation and fever by inhibiting the production of prostaglandins. Aspirin Only Decreases platelet aggregation. **Therapeutic Effects:** Analgesia. Reduction of inflammation. Reduction of fever. Aspirin. Decreased incidence of transient ischemic attacks and MI.

Pharmacokinetics

Absorption: *Aspirin*—Well absorbed from the upper small intestine; absorption from enteric-coated preparations may be unreliable; rectal absorption is slow and variable. *Choline and magnesium salicylates*—Well absorbed after oral administration. *Salsalate*—Splits into 2 molecules of salicylic acid after oral administration; absorbed in the small intestine.
Distribution: All salicylates are rapidly and widely distributed; cross the placenta and enter breast milk.
Metabolism and Excretion: Extensively metabolized by the liver; inactive metabolites excreted by the kidneys. Amount excreted unchanged by the kidneys depends on urine pH; as pH increases, amount excreted unchanged increases from 2–3% up to 80%.
Half-life: 2–3 hr for low doses; up to 15–30 hr with larger doses because of saturation of liver metabolism.

TIME/ACTION PROFILE (analgesia/fever reduction†)

ROUTE	ONSET	PEAK	DURATION
aspirin–PO	5–30 min	1–3 hr	3–6 hr
aspirin–PO-ER	5–30 min	2–4 hr	8–12 hr
aspirin–Rect	1–2 hr	4–5 hr	7 hr
all other salicylates–PO	5–30 min	1–3 hr	3–6 hr

†Antirheumatic effect may take 2–3 wk of chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aspirin, tartrazine (FDC yellow dye #5), or other salicylates; Cross-sensitivity with other NSAIDs may exist (less with nonaspirin salicylates); Bleeding disorders or thrombocytopenia (more important with aspirin); Children or adolescents with viral infections (may increase the risk of Reye's syndrome); **Salsalate:** Peri-operative

Copyright © 2008 by F.A. Davis

pain from coronary artery bypass graft (CABG) surgery.

Use Cautiously in: History of GI bleeding or ulcer disease; Chronic alcohol use/abuse; Severe renal disease (magnesium toxicity may occur with magnesium salicylate); Severe hepatic disease; Salsalate. Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Geri: Geriatric patients (↑ risk of adverse reactions especially GI bleeding; more sensitive to toxic levels); OB: Pregnancy; salicylates may have adverse effects on fetus and mother and in general should be avoided during pregnancy, especially during the 3rd trimester; Lactation: Lactation (safety not established).

Adverse Reactions/Side Effects

EENT: tinnitus. **GI:** GI BLEEDING, dyspepsia, epigastric distress, nausea, abdominal pain, anorexia, hepatotoxicity, vomiting. **Derm:** *salsalate*— EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **Hemat:** *aspirin*— anemia, hemolysis, increased bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS and LARYNGEAL EDEMA.

Interactions

Drug-Drug: Aspirin may ↑ the risk of bleeding with **warfarin**, **heparin**, **heparin-like agents**, **thrombolytic agents**, **ticlopidine**, **clopidogrel**, **abciximab**, **tirofiban**, or **eptifibatide**, although these agents are frequently used safely in combination and in sequence. Ibuprofen may negate the cardioprotective antiplatelet effects of low-dose aspirin. Aspirin may ↑ risk of bleeding with **cefoperazone**, **cefotetan**, and **valproic acid**. May ↑ activity of **penicillins**, **phenytoin**, **methotrexate**, **valproic acid**, **oral hypoglycemic agents**, and **sulfonamides**. May ↓ beneficial effects of **probenecid** or **sulfinpyrazone**. **Corticosteroids** may ↓ serum salicylate levels. **Urinary acidification** ↑ reabsorption and may ↑ serum salicylate levels. **Alkalinization of the urine** or the ingestion of large amounts of **antacids** ↑ excretion and ↓ serum salicylate levels. May blunt the therapeutic response to **diuretics**, and **antihypertensives**. ↑ risk of GI irritation with **NSAIDs**.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk when using aspirin with **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Drug-Food: Foods capable of acidifying the urine (see Appendix L) may ↑ serum salicylate levels.

Route/Dosage

Aspirin

Pain/Fever

PO, Rect (Adults): 325–1000 mg q 4–6 hr (not to exceed 4 g/day). *Extended-release tablets*—650 mg q 8 hr or 800 mg q 12 hr.
PO, Rect (Children 2–11 yr): 10–15 mg/kg q 4–6 hr (not to exceed 4 g/day).

Inflammation

PO (Adults): 2.4 g/day initially; increased to maintenance dose of 3.6–5.4 g/day in divided doses (up to 7.8 g/day for acute rheumatic fever).
PO (Children): 60–100 mg/kg/day in divided doses (up to 130 mg/kg/day for acute rheumatic fever).

Prevention of Transient Ischemic Attacks

PO (Adults): 50–325 mg once daily.

Prevention of Myocardial Infarction

PO (Adults): 80–325 mg once daily.
PO (Children): 3–10 mg/kg once daily (round dose to a convenient amount.

Kawasaki Disease

PO (Children): 80–100 mg/kg/day in 4 divided doses until fever resolves; may be followed by maintenance dose of 3–5 mg/kg/day as a single dose for up to 8 wk.

Choline Salicylate

435 mg of choline salicylate is equivalent to 325 mg of aspirin
PO (Adults): *Analgesic/antipyretic*—435–669 mg (1/2–3/4 tsp) q 3 hr or 425–870 mg (1/2–1 tsp) q 4 hr or 870–1305 mg (1–1 1/2 tsp) q 6 hr as needed. *Anti-inflammatory*—4.8–7.2 g/day in divided doses.
PO (Children): *Pain/fever*—2 g/m²/day in 4–6 divided doses. *Inflammation*—107–133 mg/kg/day in 4–6 divided doses (up to 174 mg/kg).

Magnesium Salicylate

PO (Adults): 304 mg q 4 hr or 467 mg q 6 hr.

Choline and Magnesium Salicylates

5 ml of liquid equivalent to 500 mg salicylate or 650 mg of aspirin. Tablet strength expressed in mg of salicylate: 500-mg tablet equivalent to 650 mg of aspirin, 750-mg tablet equivalent to 975

Copyright © 2008 by F.A. Davis

mg of aspirin, 1000-mg tablet equivalent to 1.3 g of aspirin

PO (Adults): *Anti-inflammatory*—3 g/day of salicylate at bedtime or in 2–3 divided doses (not to exceed 4.5 g/day).

PO (Children >37 kg): 2.25 g of salicylate/day in 2 divided doses.

PO (Children <37 kg): 50 mg of salicylate/kg/day in 2 divided doses.

Salsalate

PO (Adults): 1 g 3 times daily initially; further titration may be required.

Sodium Salicylate

PO (Adults): *Pain/fever*—325–650 mg q 4 hr. *Inflammation*—3.6–5.4 g/day in divided doses.

PO (Children): *Pain/fever*—1.5 g/m²/day in 4–6 divided doses. *Inflammation*—80–100 mg/kg/day in 4–6 divided doses.

Availability

Aspirin

Tablets: 81 mg[OTC], 162.5 mg[OTC], 325 mg[OTC], 500 mg[OTC], 650 mg[OTC], ✱975 mg[OTC]. **Chewable tablets:** ✱80 mg[OTC], 81 mg[OTC]. **Chewing gum:** 227 mg[OTC]. **Dispersible tablets:** 325 mg[OTC], 500 mg[OTC]. **Enteric-coated (delayed-release) tablets:** 80 mg[OTC], 165 mg[OTC], ✱300 mg[OTC], 325 mg[OTC], 500 mg[OTC], ✱600 mg[OTC], 650 mg[OTC], 975 mg[OTC]. **Extended-release tablets:** ✱325 mg[OTC], 650 mg[OTC], 800 mg. **Delayed-release capsules:** ✱325 mg[OTC], ✱500 mg[OTC]. **Suppositories:** 60 mg[OTC], 120 mg[OTC], 125 mg[OTC], 130 mg[OTC], ✱150 mg[OTC], ✱160 mg[OTC], 195 mg[OTC], 200 mg[OTC], 300 mg[OTC], ✱320 mg[OTC], 325 mg[OTC], 600 mg[OTC], ✱640 mg[OTC], 650 mg[OTC], 1.2 g[OTC]. ***In combination with:*** antihistamines, decongestants, cough suppressants[OTC], and opioids. See Appendix B.

Choline Salicylate

Oral solution: 870 mg/5 ml[OTC].

Magnesium Salicylate

Tablets: 304 mg[OTC], 467 mg[OTC], 545 mg, 600 mg, 650 mg.

Choline and Magnesium Salicylates (listed as salicylate content)

Tablets: 500 mg, 750 mg, 1000 mg. **Liquid:** 500 mg/5 ml.

Salsalate

Tablets: 500 mg, 750 mg. **Cost:** *Disalcid*—500 mg $22.90/20, 750 mg $41.87/30; *generic*—500 mg $32.74/100, 750 mg $41.04/100.

Sodium Salicylate

Tablets: 325 mg[OTC], 650 mg[OTC]. **Delayed-release tablets:** 324 mg[OTC], 325 mg[OTC], 650 mg[OTC].

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and at the peak (see Time/Action Profile) after administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- ***Lab Test Considerations:*** Monitor hepatic function before antirheumatic therapy and if symptoms of hepatotoxicity occur; more likely in patients, especially children, with rheumatic fever, systemic lupus erythematosus, juvenile arthritis, or pre-existing hepatic disease. May cause ↑ serum AST, ALT, and alkaline phosphatase, especially when plasma concentrations exceed 25 mg/100 ml. May return to normal despite continued use or dose reduction. If severe abnormalities or active liver disease occurs, discontinue and use with caution in future.
- Monitor serum salicylate levels periodically with prolonged high-dose therapy to determine dose, safety, and efficacy, especially in children with Kawasaki disease.
- *Aspirin:* Prolongs bleeding time for 4–7 days and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.
- ***Toxicity and Overdose:*** Monitor patient for the onset of tinnitus, headache, hyperventilation, agitation, mental confusion, lethargy, diarrhea, and sweating. If these symptoms appear, withhold medication and notify physician or other health care professional immediately.

Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

Copyright © 2008 by F.A. Davis

Implementation

- Use lowest effective dose for shortest period of time.
- **PO:** Administer after meals or with food or an antacid to minimize gastric irritation. Food slows but does not alter the total amount absorbed.
- Do not crush or chew enteric-coated tablets. Do not take antacids within 1–2 hr of enteric-coated tablets. Chewable tablets may be chewed, dissolved in liquid, or swallowed whole. Some extended-release tablets may be broken or crumbled but must not be ground up before swallowing. See manufacturer's prescribing information for individual products.

Patient/Family Teaching

- Instruct patient to take salicylates with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Advise patient to report tinnitus; unusual bleeding of gums; bruising; black, tarry stools; or fever lasting longer than 3 days.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding. Caution patient to avoid taking concurrently with acetaminophen or NSAIDs for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Teach patients on a sodium-restricted diet to avoid effervescent tablets or buffered-aspirin preparations.
- Tablets with an acetic (vinegar-like) odor should be discarded.
- Advise patients on long-term therapy to inform health care professional of medication regimen before surgery. Aspirin may need to be withheld for 1 wk before surgery.
- Pedi: Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.
- **Transient Ischemic Attacks or MI:** Advise patients receiving aspirin prophylactically to take only prescribed dose. Increasing the dose has not been found to provide additional benefits.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Increased ease of joint movement. May take 2–3 wk for maximum effectiveness.
- Reduction of fever.
- Prevention of transient ischemic attacks.
- Prevention of MI.

salmeterol (sal-**me**-te-role)
Serevent

Classification
Therapeutic: bronchodilators
Pharmacologic: adrenergics

Pregnancy Category C

Indications

Long-term control of reversible airway obstruction due to asthma and for maintenance treatment of asthma and prevention of bronchospasm. Prevention of exercise-induced asthma. Maintenance treatment to prevent bronchospasm in COPD including chronic bronchitis and emphysema.

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at $beta_2$-adrenergic receptors. Relatively specific for beta (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Minimal systemic absorption follows inhalation.
Distribution: Action is primarily local.
Metabolism and Excretion: Unknown.
Half-life: 3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
inhalation	10–25 min	3–4 hr	12 hr†

†9 hr in adolescents

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attack of asthma (onset of action is delayed).
Use Cautiously in: Cardiovascular disease (including angina and hypertension); Convulsive disorders; Diabetes; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); Pregnancy, lactation, or children <4 yr (dry powder inhalation may be used in children 4–12 yr; aerosol inhalation may be used in chil-

Copyright © 2008 by F.A. Davis

dren >12 yr; may inhibit contractions during labor).

Adverse Reactions/Side Effects

CNS: headache, nervousness. **CV:** palpitations, tachycardia. **GI:** abdominal pain, diarrhea, nausea. **MS:** muscle cramps/soreness. **Neuro:** trembling. **Resp:** paradoxical bronchospasm, cough.

Interactions

Drug-Drug: Beta blockers may ↓ therapeutic effects of salmeterol. **MAO inhibitors** and **tricyclic antidepressants** potentiate cardiovascular effects.

Drug-Natural Products: Use with caffeine-containing herbs **(cola nut, guarana, mate, tea, coffee) ↑ stimulant effect.**

Route/Dosage

Inhaln (Adults and Children ≥4 yr): Diskus—50 mcg (one inhalation as dry powder) twice daily (approximately 12 hr apart); Inhaler 42 mcg (2 puffs) twice daily, 12 hours apart. *Exercise-induced bronchospasm*—Inhaler—42 mcg (two puffs) 30–60 min before exercise.

Availability

Powder for inhalation (Serevent Diskus): 50 mcg/blister. **Aerosol for oral inhalation (Serevent Inhaler):** 25 mcg/actuation (delivers 21 mcg/inhalation) 6.5 g (60 inhalations), 13 g (120 inhalations). ***In combination with:*** fluticasone (Advair Diskus, see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and blood pressure before administration and periodically during therapy.
- Monitor pulmonary function tests before initiating therapy and periodically during course to determine effectiveness.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). Frequently occurs with first use of new canister or vial. If condition occurs, withhold medication and notify physician or other health care professional immediately.
- ***Lab Test Considerations:*** May cause ↑ serum glucose concentrations; occurs rarely with recommended doses and is more pronounced with frequent use of high doses.
- May cause ↓ serum potassium concentrations, which are usually transient and dose related; rarely occurs at recommended doses and is more pronounced with frequent use of high doses.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased blood pressure, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting: Treatment includes discontinuing salmeterol and other beta-adrenergic agonists and providing symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Do not confuse salmeretol with Salbutamol (albuterol). **Inhaln:** Once removed from foil overwrap, discard discus when every blister has been used or 6 wk have passed, whichever comes first.
- Do not use a spacer with powder for inhalation.

Patient/Family Teaching

- Instruct patient on proper technique for use of powder for inhalation and advise patient to take salmeterol as directed. Do not use more than the prescribed dose. If a regularly scheduled dose is missed, use as soon as possible and resume regular schedule. Do not double doses. If symptoms occur before next dose is due, use a rapid-acting inhaled bronchodilator.
- Instruct patient using *powder for inhalation* never to exhale into diskus device and always to hold device in a level horizontal position. Mouthpiece should be kept dry; never wash.
- Caution patient not to use salmeterol to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks.
- Advise patients on chronic therapy not to use additional salmeterol to prevent exercise-induced bronchospasm. Patients using salmeterol for prevention of exercise-induced bronchospasm should not use additional doses of

S

Copyright © 2008 by F.A. Davis

salmeterol for 12 hr after prophylactic administration.
- Advise patient to notify health care professional immediately if difficulty in breathing persists after use of salmeterol, if condition worsens, if more inhalations of rapid-acting bronchodilator than usual are needed to relieve an acute attack, or if using 4 or more inhalations of a rapid-acting bronchodilator for 2 or more consecutive days or more than 1 canister in an 8-wk period.
- Salmeterol is often used with inhaled corticosteroids and is not a substitute for corticosteroids or adrenergic bronchodilators. Advise patients using inhalation or systemic corticosteroids to consult health care professional before stopping or reducing therapy.
- Emphasize the importance of regular follow-up exams to determine progress during therapy.

Evaluation/Desired Outcomes
- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.

saquinavir (sa-**kwin**-a-vir)
Invirase

Classification
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Pregnancy Category B

Indications
HIV infection with ritonavir (may also add other antiretrovirals).

Action
Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Slowing of the progression of HIV infection and its sequelae. Increased CD4 cell counts and decreased viral load.

Pharmacokinetics
Absorption: Incompletely absorbed after oral administration; rapidly undergoes extensive first-pass hepatic metabolism. Absorption of Invirase and Fortovase is not the same; products are not interchangeable.
Distribution: Distributes into tissues, but CNS penetration is poor.
Protein Binding: 98%.
Metabolism and Excretion: Mostly metabolized by the liver. <1% excreted unchanged in urine.
Half-life: 13 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent dihydroergotamine (or other ergot derivatives), midazolam, rifabutin, rifampin, lovastatin, simvastatin, and triazolam; OB: Lactation (breast-feeding not recommended in HIV-infection).
Use Cautiously in: Diabetes mellitus (may exacerbate hyperglycemia; hyperglycemia may progress to ketoacidosis); Hemophilia (increased risk of bleeding); Hepatic impairment (may exacerbate liver dysfunction caused by hepatitis B or C or other causes); OB, Pedi: Pregnancy or children <16 yr (safety not established).

Adverse Reactions/Side Effects
CNS: SEIZURES, confusion, headache, mental depression, psychic disorders, weakness. **CV:** thrombophlebitis. **GI:** abdominal discomfort, diarrhea, increased liver enzymes, jaundice, nausea. **Derm:** photosensitivity, severe cutaneous reactions. **Endo:** hyperglycemia. **Hemat:** acute myeloblastic leukemia, hemolytic anemia, thrombocytopenia. **Neuro:** ataxia. **Misc:** STEVENS-JOHNSON SYNDROME.

Interactions
Drug-Drug: **Rifampin** and **rifabutin** significantly ↓ saquinavir levels; concurrent use is contraindicated. **Dihydroergotamine** and **ergotamine** (↑ risk of vasoconstriction); **midazolam** and **triazolam** (↑ CNS depression); **lovastatin** and **simvastatin** (↑ risk of myopathy); concurrent use is contraindicated. Coadministration with **clarithromycin** significantly ↑ saquinavir levels and ↓ clarithromycin levels. Saquinavir levels are also significantly ↑ by **indinavir**, **delavirdine**, **nelfinavir**, **ritonavir**, and **ketoconazole** (dose adjustments may be necessary). **Carbamazepine**, **phenobarbital**, **phenytoin**, **nevirapine**, and **dexamethasone** may ↓ saquinavir levels. Concurrent use with proton pump inhibitors may ↑ saquinavir levels. May ↑ serum cortisol levels

Copyright © 2008 by F.A. Davis

with **fluticasone**. May ↑ serum **trazodone** levels.
Drug-Natural Products: St. John's wort ↓ levels and effectiveness; may promote development of drug resistance.
Drug-Food: Grapefruit juice ↑ serum levels and effects. Food significantly increases ↑ the absorption of saquinavir. **Garlic** can significantly ↓ levels.

Route/Dosage

Invirase

PO (Adults): 600 mg 3 times daily within 2 hr of a meal *or* 1000 mg twice daily.

Availability

Invirase

Capsules: 200 mg. **Tablets:** 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of symptoms of HIV and for symptoms of opportunistic infections during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 count regularly during therapy.
- May cause hyperglycemia, which may result in diabetic ketoacidosis.
- Monitor hematologic and hepatic function before and periodically during therapy. May cause anemia, thrombocytopenia, and ↑ liver enzymes. Use with rifampin greatly ↑ risk of hepatitis and ↑ serum transaminases.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- **PO:** Administer within 2 hr after a full meal to increase effectiveness. Taking without food causes decreased blood concentrations and may result in no antiviral activity.
- Capsules are stable until expiration date if refrigerated or for 3 months when brought to room temperature.

Patient/Family Teaching

- Instruct patient to take saquinavir as directed at the same time each day, within 2 hr after a full meal. Take missed doses as soon as possible if not almost time for next dose; do not double doses. Do not discontinue without consulting health care professional. Changes from Invirase to Fortovase should be made under supervision of health care professional.
- Instruct patient that saquinavir should not be shared with others.
- Inform patient that saquinavir does not cure HIV or prevent associated or opportunistic infections. Saquinavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading HIV to others. Advise patient that the long-term effects of saquinavir are unknown at this time.
- Advise patient not to take other medications, prescription or OTC, or herbal products concurrently without consulting health care professional.
- Inform patient that saquinavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs. Rare but serious bullous skin eruptions with polyarthritis may also occur.
- Inform patient that long-term effects of saquinavir are unknown at this time.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Slowing of the progression of HIV infection and its sequelae.
- Decrease in viral load and improvement in CD4 cell counts.

sargramostim

(sar-**gram**-oh-stim)
Leukine, rHu GM-CSF (recombinant human granulocyte/macrophage colony-stimulating factor)

Classification
Therapeutic: colony-stimulating factors
Pharmacologic: biologic response modifiers

Pregnancy Category C

Indications

Acceleration of bone marrow recovery after: Autologous bone marrow transplantation in pa-

Copyright © 2008 by F.A. Davis

tients with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, or Hodgkin's disease, Allogenic bone marrow transplantation from HLA-matched donors. Management of bone marrow transplant failure or engraftment delay. After induction chemotherapy for acute myelogenous leukemia (AML) in patients ≥55 yr. Mobilization and after transplant of autologous peripheral blood progenitor cells (PBPCs); increases harvest by leukapheresis.

Action

Consists of a glycoprotein produced by recombinant DNA technique that is capable of binding to and stimulating the production, division, differentiation, and activation of granulocytes and macrophages. **Therapeutic Effects:** Accelerated recovery of bone marrow after autologous bone marrow transplantation, resulting in decreased risk of infection and other complications.

Pharmacokinetics

Absorption: After IV administration, absorption is essentially complete. Well absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (noted as effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
subcut, IV	rapid	unknown	3–7 days

Contraindications/Precautions

Contraindicated in: Presence of ≥10% leukemic myeloid blast cells in bone marrow or peripheral blood; Hypersensitivity to granulocyte macrophage colony-stimulating factor (GM-CSF), yeast products, or additives (mannitol, tromethamine, or sucrose); Products containing benzyl alcohol should not be used in newborns.
Use Cautiously in: Pre-existing fluid retention, CHF, or pulmonary infiltrates; Pre-existing cardiac disease; Myeloid malignancies; Previous extensive radiation or chemotherapy (response may be limited); OB: Pregnancy (use only if clearly needed); Lactation or children (safety not established).

Adverse Reactions/Side Effects

CNS: headache, malaise, weakness. **Resp:** dyspnea. **CV:** pericardial effusion, peripheral edema, transient supraventricular tachycardia. **GI:** diarrhea. **Derm:** itching, rash. **MS:** arthralgia, bone pain, myalgia. **Misc:** chills, fever, first-dose reaction.

Interactions

Drug-Drug: Lithium or **corticosteroids** may potentiate myeloproliferative effects of sargramostim (concurrent use should be undertaken cautiously).

Route/Dosage

After Bone Marrow Transplantation

IV (Adults): 250 mcg/m²/day for 21 days.

Failure/Delay of Engraftment after Bone Marrow Transplantation

IV (Adults): 250 mcg/m²/day for 14 days; may be repeated after a 7-day rest between courses; if results are inadequate, a 3rd course at 500 mcg/m²/day for 14 days may be given after a 7-day rest.

After Chemotherapy for AML

IV (Adults): 250 mcg/m²/day started around day 11 or 4 days after induction if day 10 bone marrow is hypoplastic with <5% blast cells and continued until absolute neutrophil count (ANC) >1500 cells/mm³ for 3 consecutive days (not to exceed 42 days); if adverse reactions occur, decrease dose by 50% or temporarily discontinue.

Mobilization of PBPCs

IV, Subcut (Adults): 250 mcg/m²/day continued throughout collection of PBPCs.

After PBPC Transplantation

IV, Subcut (Adults): 250 mcg/m²/day continued until ANC >1500 cells/mm³ for 3 consecutive days.

Availability

Powder for injection: 250 mcg/vial, 500 mcg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate, blood pressure, and respiratory status during and immediately after infusion. If dyspnea develops, slow infusion rate by half. Reassess; medication may need to be discontinued. Assess for peripheral edema daily throughout therapy. Capillary leak syndrome (swelling of feet or lower legs, sudden weight gain, dyspnea) and pleural or pericardial effusion may occur, usually at doses >32 mcg/kg/day.

Copyright © 2008 by F.A. Davis

- Monitor for first-dose reaction (flushing, hypotension, syncope, weakness). Does not recur with first dose of each course but may occur with first dose of more than 1 course.
- Assess patient for fever daily during therapy. Usually mild and dose related and resolves with discontinuation or administration of antipyretics.
- Assess patient for arthralgias and myalgias, usually in lower extremities, which tend to occur when granulocyte counts are returning to normal. May also cause mild to moderate bone pain, possibly from bone marrow expansion. Usually occurs over a 1–3-day period before myeloid recovery and occurs in the sternum, spine, pelvis, and long bones. Treat with analgesics.
- ***Lab Test Considerations:*** Obtain a CBC with differential and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC; may increase rapidly. If ANC >20,000/mm^3 or 10,000/mm^3 after the nadir has occurred or if platelet count >500,000/mm^3, interrupt administration and reduce dose by half or discontinue. Excessive blood levels usually return to baseline 3–7 days after discontinuation of therapy. If blast cells appear, sargramostim should be discontinued.
- Monitor renal and hepatic function before and biweekly throughout therapy in patients with renal or hepatic dysfunction. May cause ↑ BUN, creatinine, and hepatic enzymes.
- May cause ↓ serum albumin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Do not confuse Leukine (sargramostim) with leukeran (chlorambucil) or leucovorin.
- Administer 2–4 hr after bone marrow transplant and no earlier than 24 hr after cytotoxic chemotherapy or 12 hr after last dose of radiotherapy.
- Refrigerate but do not freeze powder, reconstituted solution, or diluted solution. Reconstitute with 1 ml of sterile water without preservatives injected toward side of vial. Swirl gently to avoid foaming. Do not shake. Solution should be clear and colorless. Discard if left at room temperature for >6 hr. Vial is for 1-time use only.
- **Subcut:** Administer reconstituted solution without further dilution.

IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in 0.9% NaCl. ***Concentration:*** If final concentration is <10 mcg/ml, add 1 mg human albumin per 1 ml of 0.9% NaCl before addition of sargramostim to prevent absorption of the components of the drug delivery system. Do not administer with an in-line filter. ***Rate:*** Usually infused over 2–4 hr. Has been administered over 30–60 min, over 5–12 hr, and as a continuous infusion over 24 hr.
- *After bone marrow transplantation or failure of engraftment:* Administer over 2 hr.
- *Chemotherapy for AML:* Administer over 4 hr.
- *Mobilization of PBPCs or PBPC transplant:* Administer as a continuous infusion over 24 hr.
- **Y-Site Compatibility:** amikacin, aminophylline, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dexamethasone sodium phosphate, diphenhydramine, dopamine, doxorubicin, doxycycline, droperidol, etoposide, famotidine, fentanyl, floxuridine, fluconazole, fluorouracil, furosemide, gentamicin, granisetron, heparin, idarubicin, ifosfamide, immune globulin, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, teniposide, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, ampicillin, ampicillin/sulbactam, chlorpromazine, ganciclovir, haloperidol, hydrocortisone, hydromorphone, imipenem/cilastatin, lorazepam, methylprednisolone sodium succinate, mitomycin, morphine, nalbuphine, ondansetron, sodium bicarbonate, tobramycin.

S

Copyright © 2008 by F.A. Davis

- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Instruct patient to notify nurse or physician if dyspnea or palpitations occur.

Evaluation/Desired Outcomes

- Acceleration of bone marrow recovery and decreased incidence of infection in patients after autologous and allogenic bone marrow transplantation, bone marrow transplant failure or engraftment delay, chemotherapy for AML, and PBPC transplantation.

scopolamine

(scoe-**pol**-a-meen)
Isopto Hyoscine, Transderm-Scop, Transderm-V

Classification
Therapeutic: antiemetics
Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Transdermal: Prevention of motion sickness. Management of nausea and vomiting associated with opioid analgesia or general anesthesia/recovery from anesthesia. **IM, IV, Subcut** Preoperatively to produce amnesia and to decrease salivation and excessive respiratory secretions.

Action

Inhibits the muscarinic activity of acetylcholine. Corrects the imbalance of acetylcholine and norepinephrine in the CNS, which may be responsible for motion sickness. **Therapeutic Effects:** Reduction of nausea and vomiting. Preoperative amnesia and decreased secretions.

Pharmacokinetics

Absorption: Well absorbed following IM, subcut, and transdermal administration.
Distribution: Crosses the placenta and blood-brain barrier.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 8 hr.

TIME/ACTION PROFILE (antiemetic, sedative properties)

ROUTE	ONSET	PEAK	DURATION
PO, IM, subcut	30 min	1 hr	4–6 hr
IV	10 min	1 hr	2–4 hr
transdermal	4 hr	unknown	72 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bromides (injection only); Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis.
Use Cautiously in: OB, Geri: Geriatric patients, infants, and children (increased risk of adverse reactions); Possible intestinal obstruction; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; OB: Pregnancy or lactation (safety not established); to minimize exposure to fetus, apply 1 hr prior to cesarean section.

Adverse Reactions/Side Effects

CNS: drowsiness, confusion. **EENT:** blurred vision, mydriasis, photophobia. **CV:** tachycardia, palpitations. **GI:** dry mouth, constipation. **GU:** urinary hesitancy, urinary retention. **Derm:** decreased sweating.

Interactions

Drug-Drug: ↑ anticholinergic effects with **antihistamines**, **antidepressants**, **quinidine**, or **disopyramide**. ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. May ↑ GI mucosal lesions in patients taking oral **wax-matrix potassium chloride preparations**.
Drug-Natural Products: ↑ anticholinergic effects with **jimson weed and scopolia.**

Route/Dosage

Transdermal (Adults): *Motion sickness*—1.5 mg. Transderm-Scop system delivers 1 mg over 72 hr; apply 4 hr prior to travel (US product); *Recovery from anesthesia/surgery*—1.5 mg. Transderm-Scop system delivers 1 mg over 72 hr; apply evening before surgery or 1 hr prior to cesarean section.
IM, IV, Subcut (Adults): *Antiemetic/anticholinergic*—0.3–0.6 mg; *antisecretory effect*—0.2–0.6 mg; *amnestic effect*—0.32–0.65 mg; *sedation*—0.6 mg 3–4 times daily.
IM, IV, Subcut (Children): *Antiemetic/anticholinergic*—6 mcg/kg or 0.2 mg/m^2.
IM (Children 8–12 yr): *Antisecretory*—0.3 mg.
IM (Children 3–8 yr): *Antisecretory*—0.2 mg.

Copyright © 2008 by F.A. Davis

IM (Children 7 mo–3 yr): *Antisecretory*—0.15 mg.
IM (Children 4–7 mo): *Antisecretory*—0.1 mg.

Availability (generic available)

Transdermal therapeutic system: Transderm-Scop—1.5 mg scopolamine/patch releases 0.5 mg scopolamine over 3 days in packs of 4 units, ✱Transderm-V—1.5 mg scopolamine/patch releases 1 mg scopolamine over 3 days. **Injection:** 0.3 mg/ml in 1-ml vials, 0.4 mg/ml in 0.5-ml ampules and 1-ml vials, 0.86 mg/ml in 0.5-ml ampules, 1 mg/ml in 1-ml vials.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of urinary retention periodically during therapy.
- Monitor heart rate periodically during parenteral therapy.
- Assess patient for pain prior to administration. Scopolamine may act as a stimulant in the presence of pain, producing delirium if used without morphine or meperidine.
- **Antiemetic:** Assess patient for nausea and vomiting periodically during therapy.

Potential Nursing Diagnoses

Impaired oral mucous membrane (Indications, Side Effects)
Risk for injury (Side Effects)

Implementation

IV Administration
